Some Bodies heated by Motion or Fermentation, if the Heat grow intenſe, fume copiouſly; and if the Heat be great enough, the Fumes will ſhine and become Flame. Metals in Fuſion uſually don't Flame for want of a copious Sulphur; except Spelter, which Fumes copiouſly, and thereby flames.

All Flaming Bodies, as Old Tallow, Wax, Wood, Foſſil-Coals, Pitch, Sulphur, *&c.* by Flaming waſte and vaniſh into burning Smoke; which Smoke, if the Flame be put out, is very thick and viſible, and ſometimes ſmells ſtrongly, but in the Flame loſes its Smell by Burning; and according to the Nature of the Smoke, the Flame is of ſeveral Colours, as that of Sulphur is Blue, that of Copper open'd with Sublimate, Green, that of Tallow, Yellow, *&c.* Smoke paſſing through Flame cannot but grow red hot, and red hot Smoke can have no other appearance but that of Flame.

As great Bodies probably conſerve their Heat the longeſt, ſo the Reaſon of it ſeems to be, That their Parts heat one another: Whence *great denſe*, and *fix'd Bodies*, when heated beyond ſuch a Degree, may emit Light ſo copiouſly, as by the Emiſſion and Reaction of its Light, and the Reflections and Reactions of its Rays within its Pores to grow ſtill hotter, till it come to ſuch a Period of Heat, as is that of the Sun: Wherefore we may ſuppoſe the Sun and fix'd Stars to be great Earths vehemently hot, whoſe Heat is conſerved by the Greatneſs of the Bodies, and the mutual Action and Reaction between them and the Light which they emit; and whoſe Parts are kept from fuming away, not only by their Fixity, but alſo by the vaſt Weight and Denſity of the Atmoſpheres incumbent upon them, and very ſtrongly preſſing them, and condenſing the Vapours which ariſe from them. *See* Vol. II.

HEAVE, at Sea, ſignifies to throw away, or to fling any thing over-board, this they call, *Heaving it over-board*; alſo turning about the Capſtan, is called, *Heaving at the Capſtan*; likewiſe when a Ship being at Anchor, riſeth and falleth by the force of the Waves, ſhe is ſaid, *To Heave and Set*.

HEAULME, (or as they write it, *Heawme*) is the Herald's Term for an Helmet, or Head-piece.

HEAVY *Bodies Deſcent*: See *Deſcent of heavy Bodies*.

HEBRAISM, is the proper Idiom of the *Hebrew* Tongue.

HECTICA, is a Continued Fever, ariſing from the very Habit of the Body, and introduced in a long Time, and has ſo rooted it ſelf into the very Conſtitution, that it is very difficult ever to cure it: For the moſt part it is accompanied with an Ulcer of the Lungs, Leanneſs, and a Cough. *Blanchard.*

HEEL; that part of the Foot of any Maſt which is pared away ſlanting on the aftward ſide of the Foot, in order that the Maſt may be *ſtayed afterward on*, the Seamen call the *Heel of the Maſt*; but the *Heels of the Top-maſts* are Squares, and in that they put the Fid of the Top-maſt.

Alſo if a Ship lie on one ſide, whether ſhe be *a-ground* or *a-float*, they ſay *She Heels offward*, or to the Shore, *a-ſtarboard*, or *a-port*.

HEGEMONICÆ, are the Principal Actions in a Humane Body, as the Actions Animal and Vital. *Blanchard.*

HEGIRA, a Term in Chronology, ſignifying the *Epocha*, or Account of Time uſed by the *Arabians* and *Turks*, who begin their Computation from the Day that *Mahomet* was forced to make his Eſcape from the City of *Mecca*, which happen'd on *Friday*, *July* 16. *A. D.* 622. under the Reign of the Emperor *Heracleus*.

HEIGHT *of a Figure*, is the Perpendicular Line drawn from the Top to the Baſe (ſometimes produced) either within the Figure or without it.

HEIGHT *of the Pole*: See *Altitude of the Pole*.

HEIR, a Word having not altogether the ſame Signification with *Civilians*; who call *Heredem, qui ex teſtamento ſuccedit in univerſum jus Teſtatoris*; as in Common Law, which calls him *Heir* that ſucceeds by Right of Blood in any Man's Lands or Tenements in Fee; for by the Common Law nothing paſſeth *Jure Hæreditatis*, but only Fee: Moveables, or Chattels immovable, are given by Teſtament to whom the Teſtator liſteth, or elſe are at the Diſpoſition of the Ordinary, to be diſtributed as he in Conſcience thinketh meet. Every *Heir*, having Lands by Deſcent, is bound by the binding Acts of his Anceſtors, if he be named, *Qui ſentit commodum, ſentire debet & onus.*

HELCYDRA, are certain little Ulcers, thick and red; and in the Skin of the Head, like the Nipples of the Breaſts, which ſend forth Matter. *Blanchard.*

HELIACAL-RISING, is when a Star, having been under the Sun's Beams, gets from the ſame ſo as to be ſeen again.

HELIACAL-SETTING, is when a Star, by the near Approach of the Sun, firſt becomes inconſpicuous; this is reckon'd in the Moon but at 17 Degrees diſtance, or thereabouts; but in other Stars, 'tis aſſoon as they get diſtant, or come near the Sun by the Space of a whole Sign.

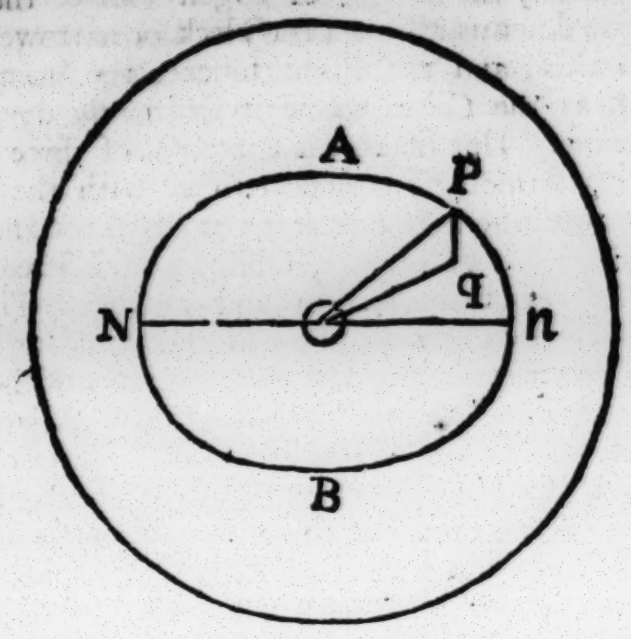
HELICE *Major* and *Minor*, the ſame with *Urſa Major* and *Minor*.

HELICOSOPHY, is the Art of Delineating all ſorts of *Spiral Lines in Plano*.

HELIOCENTRICK *Place of a Planet*, is ſaid to be ſuch, as it would appear to us from the Sun, if our Eye were fix'd in its Center.

Heliocen-

Heliocentrick Latitude of a Planet.



If the outer Circle repreſent the Orbit of the Earth round the Sun, and then the inner one be placed ſo as to be inclined to the Plane of the other (for which reaſon it appears in the form of an Ellipſis) when the Planet is in *N* or *n* (which Points are call'd its *Nodes*) it will appear in the Ecliptick, and ſo have no *Latitude*; but if it move to *P*, then being ſeen by the Sun, it will appear to decline from the Ecliptick, or to have Latitude, and the Inclination of the Line ☉ *P* to the Plane of the Ecliptick, is called the Planet's *Heliocentrick Latitude*, and the Meaſure of it is the Angle *P* ☉ *q*, ſuppoſing the Line *P q* to be perpendicular to the Plane of the Ecliptick: And this Heliocentrick Latitude will be continually increaſing till it come to the Point *A*, which they call the *Limit* or utmoſt Extent of it, and then it will decreaſe again till it come to nothing in *N*; after which it will increaſe again till it come to *B*; and laſtly, be decreaſing again till the Planet come to be in *n*, &c.

HELIOSCOPES, are a ſort of Teleſcopes fitted ſo as to look on the Body of the Sun without Offence to the Eyes.

Of theſe Dr. *Hook* hath written a little Tract, and propoſes, that by inſerting 4 Reflecting Glaſſes into a Teleſcope, the Sun's Rays ſhall come to the Eye, but with $\frac{1}{2500}$ part of their uſual Strength. And this Way the Doctor prefers to all others.

But without any ſuch long Apparatus, Mr. *Hugen*'s Way, of only uſing a Plane-Glaſs black'd at the Flame of a Lamp or Candle on one Side and placed between the Eye-Glaſs and the Eye, will anſwer the Deſign of an Helioſcope very well: The Truth of which I have often found my ſelf by Experience.

HELIX, is the Exterior Brim of the Ear, ſo called from its winding. The Interior is called *Scapha*.

HELIX, in Geometry, is the ſame with *Spiral*; which ſee.

HELLENISM, is the Imitation in *Latin*, or any other Language, of the proper Idiom of the *Greek* Tongue.

HELM, or Tiller of a Ship, is that Beam or Piece of Timber that is faſtened into the Rudder, and ſo comes forward into the Steerage, where he that ſtands at Helm ſteers the Ship, by holding the Whip-ſtaff in his Hand, a piece of Wood for that purpoſe, faſtened into the *Helm*.

The Terms of Art belonging to the Helm, are,

1. *Port the Helm*: That is, Put the Helm over to the Left Side of the Ship.

2. *Starboard the Helm*; That is, Put it to the Right ſide of the Ship.

3. *Right the Helm*, or *Helm a Mid-ſhip*; that is, Keep it even with the Middle of the Ship.

Bear up the Helm; That is, Let the Ship go more large before the Wind.

5. *Bear up round*; That is, Let the Ship go directly before the Wind, in the Middle between her two Sheets.

HELM alſo, with the Chymiſts, is the Head of any Still or Alembick, becauſe 'tis in Figure ſomething like an Helmet, or Steel Cap, uſed by the Cavalry in War: So that *to bring a thing over the Helm*, is the ſame as to force it by Fire up to the Top of the Veſſel, that it may diſtil down into the Receiver by the Noſe or Beak of the Head; and when they ſay, That ſuch a Thing cannot be brought over the Helm, they mean, 'tis of too fix'd a Nature to be raiſed into Vapour, or Salt, by the Force of Fire.

HELMINTHAGOGUES, or *Helminthicks*, are Medicines that expel Worms, or bring 'em away by Stool. *Blanchard.*

HELOS, or *Clavus*, is a round, white, callous Swelling of the Foot like the Head of a Nail, and fixed in the Roots of the hard Skin of the Foot. *Blanchard.*

HEMERALOPIA, or *Acies nocturna*, is when one ſees better in the Night than in the Day. *Blanchard.*

HEMICRANIA, is a Head-ach in either Part of the Brain.

HEMIPAGIA, the ſame that *Hemicrania.*

HEMIPLEGIA, is a Palſie on one Side below the Head, proceeding from an Obſtruction in one part or other of the Spinal Marrow; or from a Blow; whence it comes to paſs, that the Animal Spirits are obſtructed in their Paſſage. *Blanchard.*

HEMIPLEXIA, the ſame with *Hemiplegia.*

HEMISPHERE, is the Half of a Globle or Sphere when 'tis ſuppoſed to be cut thro' the Center in the Plane of one of its greateſt Circles. Thus the Equator divides the Terreſtrial Globe into the Northern and Southern Hemiſphere; and the Equinoctial, the Heavens after the ſame manner.

The Horizon alſo divides the Earth into 2 Hemiſpheres, the one Light, and the other Dark, according as the Sun is above or below that Circle.

Alſo Maps or Prints of the Heavens, Conſtellations, &c. paſted on Boards, are ſometimes called *Hemiſpheres*, but uſually *Planiſpheres*.

The Writers of *Opticks* prove, that a Glaſs *Hemiſphere* unites the Parallel Rays at the Diſtance of a Diameter and one third of a Diameter from the Pole of a Glaſs. *Molyneux Dioptr. Nov.* p. 94.

HEMITRITÆUS, an Irregular Intermitting Fever that returns every Day, but with this Difference from a Quotidian, that the Fit comes twice every other Day.

HENDECAGON, in Geometry, is a Figure that hath 11 Sides, and as many Angles.

Hendecagon, in Fortification, is taken for a Place defended by 11 Baſtions.

HENIOCHUS, one of the Northern Conſtellations of fix'd Stars: See *Auriga.*

HEPAR, the *Liver*, is a Fleſhy large *Viſcus*, placed in the Right *Hypochondrium*; its Convex and Upper-ſide reaches a little beyond the *Cartilago Xiphoides*, and touches the *Diaphragm*; its Concave and Under-ſide covers the *Pylorus*, and part of the Stomach, as alſo part of the *Colon*, all the *Duode-*

num: a part of the *Jejunum*, and of the *Omentum*; and when we are ſtanding, its loweſt Extremity reaches near to the Navel.

Its Figure is almoſt round and pretty thick; its upper Convex-ſide being ſmooth and equal, but the lower Concave one by no means ſo. In its Middle and Fore-part it is divided into two, by a Fiſſure where the Umbilical Veſſels enter. The Gall-Bladder is faſtened to its Under-ſide, where are three Eminences that the Ancients called *Portæ*, of which one paſſes for a little Lobe.

When it is full of Blood, it is of a dark red Colour; but when the Blood is waſh'd out of it, it looks pale and feels ſoft.

It is faſten'd to the Body by two Ligaments:

The firſt, which is large and ſtrong, comes from the *Peritonæum*, that covers the *Diaphragm*, and penetrating the Subſtance of the Liver, joins the *Capſula* of the *Porta*.

The ſecond is the Umbilical Vein, it comes from the Navel, and enters by the great Fiſſure of the Liver to join the *Porta*: After the Birth it degenerates into a Ligament, but is of little Uſe for the faſtening the Liver: 'Tis covered with a common Membrane from the *Peritonæum*, beſides that every Lobe and Gland has its proper Membrane: The common Membrane of the Liver being raiſed, its Subſtance appears, which is compoſed of ſeveral Lobes of Glands, of a Conick Figure, not eaſily to be diſtinguiſh'd in the Liver of Men: Theſe Lobes are diſpoſed all along the Sides of each Branch of the Veſſels in the Liver, they are every one cover'd with a proper Membrane, and ty'd to one another by other Membranes in ſuch a manner, as that they leave alſo little Intervals betwixt them, which are more viſible in Fiſh, and other imperfect Animals; every Lobe receives ſmall Veſſels, which are continued to the little Glands of which each Lobe is compoſed.

The Veſſels of the Liver, are the *Vena Cava* and the *Porta*; they are accompanied with many ſmall Branches of the Arteries, which come from the *Cæliack* and *Meſenterica Superior*, which two bring the Blood for the Nouriſhment of the Liver: The *Porta* brings the Blood full of Bile for Secretion, and the *Cava* carries back the Blood that remains from both: The *Vena Porta* and the *Cava* enter the Liver by its Concave-ſide, and are equally diſtributed through all its Subſtance: Where ever there is a Branch of the one, there is a Branch of the other; ſo that each Lobe, and each Gland in the Lobe, whether on the Convex, or on the Concave-ſide, receive the ſame Veſſels.

The *Vena Porta* diſcharges by the Extremity of its Branches, the Blood, as yet full of Bile, into the little Glands which form the Lobes, of which the *Parenchyma* of the Liver is compoſed, where being ſeparated from the Bile, which is taken up by the Bilary Veſſels (which accompany the Branches of the *Porta*) and carried to the Gall-Bladder or *Duodenum*, it is carried back by the Branches of the *Cava*: it receives its Nerves from the *Plexus Hepaticus* of the Intercoſtal Nerve.

Beſides theſe Veſſels, the Liver has Lymphatick Veſſels, moſt of which open into the conglobated Glands, near the *Porta*, on the Concave-ſide of the Liver, from thence the *Lympha* is carried by other Lymphaticks to the *Receptaculum Chyli*.

We come now to the Excretory Veſſels of the Liver; which are, the *Veſicula Fellis*, and *Porus Bilarius*: The *Veſicula Fellis*, or Gall-Bladder, is fixed to the Concave-ſide of the Liver; its Figure is like that of a Pear; 'tis of a different Bigneſs almoſt in every Subject; the biggeſt is about the Bigneſs of a little Hen's Egg; when the Liver is in its natural Situation, the bottom or largeſt Part of the Bladder is downwards, and the Neck or narroweſt Part upwards, and the Point touches the Stomach, as well as the *Colon*, where it frequently dyes them Yellow. This Bladder is compoſed of three Coats, the outermoſt is common to it with the Liver; the next which is proper to it, is thick and ſolid, compoſed of Tranverſe, Oblique, and Streight Fibres: The third is thin and nervous: This laſt Coat is cover'd within by a kind of Cruſt or Mucus, which preſerves it againſt the Acrimony of the Bile: *Malpighius* has remarked ſome little Glands between its Coats, where the Cyſtick Arteries end; which gave him Ground to think that it was the ſame in the *Porus Bilarius*. The Bile is brought into the Gall-Bladder by ſome ſmall Veſſels which ariſe from the neighbouring Glands, and uniting, form one or two Pipes which open at the Neck of the Bladder: Theſe Ducts I could never diſcover in any Liver but an Ox's, though I have reaſon to think they are likewiſe in an Human. From the Neck of the Gall-Bladder there goes a Pipe, not in a ſtreight Line with the Bladder, but as it were more depreſs'd in the Liver; it is called *Ductus Chyſticus*; ſome ſmall Bilary Ducts open likewiſe into it, and its inner Membrane has ſeveral *Rugæ*, which retard the Motion of the Bile. To this Pipe (which is about the bigneſs of a Gooſe Quill) is joyn'd another, called, *Ductus Hepaticus*, or *Porus Bilarius*; theſe two together make the *Ductus Communis Choledochus*, which goes obliquely to the lower end of the *Duodenum*, or the beginning of *Jejunum*: After it has pierced the firſt Coat, it runs near two Fingers breadth between the Coats, before it opens the Cavity of the Inteſtine; which oblique Inſertion ſerves inſtead of a Valve, to hinder the Bile to return into *Ductus Communis*, having once enter'd the Inteſtine. The Gall-Bladder has two Veins from the *Porta*, which are called *Cyſticæ Gemellæ*; it has ſome ſmall Arteries from the *Cæliaca Dextra*, and ſome Lymphaticks.

The *Porus Bilarius* is another Excretory Veſſel of the Liver; it has as many Branches as the *Vena Porta*, which it accompanies through every Lobe and Gland in the Liver; where ever there is a Branch of the one, there is a Branch of the other, and theſe two are encloſed in one common Capſule, as in a Sheath: The Uſe of this Capſule is to facilitate the Blood and Bile, by the Contraction of its Fibres. All theſe Branches unite, and make one Pipe of the Bigneſs of a ſmall Quill, which joins, as we have ſaid, at the end of the *Ductus Cyſticus*, for the carrying the Bile from the Liver to the Inteſtines, by the *Ductus Communis Cholydochus*.

The Inſertion of the *Porus Bilarius* into the *Ductus Cyſticus*, is Oblique, with its Mouth looking towards the *Ductus Communis*; by which means it is impoſſible that the Bile which comes from the *Cyſtus*, can enter the *Porus*.

The Bile which is found in the Gall-Bladder, is thinner, and different from that which is in the *Porus Bilarius*. This *Malpighius* proves by an Experiment, which is this, That having tied the *Ductus Cyſticus*, he remarked, that the Bile which came by the *Porus Bilarius* was of a different Taſte, Smell, Colour, and Conſiſtency from that in the Gall-Bladder.

The Uſe of the Bile is to ſheath or blunt the Acids of the Chyle; becauſe they being entangled with its Sulphurs, thicken it ſo, as that it cannot be ſufficiently diluted by the *Succus Pancreaticus* to enter the *Lacteal Veſſels*; this appears not only from the

the Analyſis of the Bile, which yields more of a Lixivious than of a Volatile Alkaline Salt; but likewiſe from what *Lubenhoeck* has obſerved, That of the great quantity of Acid Salts he has ſeen amongſt the Aliments of the Stomach, he never could find any in the Chyle, after it had paſſed the *Duodenum*.

Becauſe ſome Chyle is almoſt always paſſing through the *Duodenum*, therefore it was neceſſary that the Bile likewiſe ſhould be continually poured into it from the *Ductus Hepaticus*. In a Dog, whoſe *Ductus Communis Cholidochus*, was near as big as in a Man, I have gather'd it at the rate of 2 Drachms in an Hour; but becauſe a great Quantity of Aliments requires a greater Quantity of Bile, therefore according as the Stomach is more or leſs diſtended with Food, it preſſes out of the Gall-Bladder a proportionable Quantity of Gall, to be mix'd with the Chyle in the Guts. Dr. *Keil*.

HEPATICK *Medicines* are, for the moſt part, ſuch as are both *Diaphoretical* and *Diuretical*.

HEPATICA *Vena*, the ſame with *Baſilica*.

HEPATICK *Aloes*, is the fineſt ſort of Aloes, brought commonly from an Iſland in *Perſia*, called *Succotra*, whence the Name *Aloes Succotrina*: 'Tis called *Hepatick*, becauſe 'tis near the Colour of the Liver.

HEPATICUS *Morbus*, or *Hepatick Flux*, is a Dejection, of a watery ſharp Blood, like the waſhing of Fleſh, when the nervous Juice, or watery Blood, being not rightly concocted, but ſharp, is diſcharged into the Guts: Alſo when black ſhining dried Blood is driven into the Guts. The Diſeaſe is ſo called, becauſe they attributed Sanguification to the Liver. *Blanchard*.

HEPIALA: See *Epiala*.

HEPTAGON, in Geometry, is a Figure of ſeveral Sides and Angles; and is call'd a *Regular Heptagon*, if thoſe Sides and Angles be equal.

HEPTAGON, in Fortification, is taken for a Place that hath 7 Baſtions for its Defence.

HEPTANGULAR *Figure*, in Geometry, is that which conſiſteth of 7 Angles.

HEPTHEMIMERIS, is a *Cæſura* in a *Latin* Verſe, where after the third Foot there is an odd Syllable, which ſerves to help make a Foot with the next Word; as in this:

Ille latus niveum molli fultus hyacintho.

HERCULIUS *Morbus*, the ſame with *Epilepſia*.

HEREDITAMENTS, in Law, ſignifies all ſuch Things immoveable, be they corporeal, or incorporeal, as a Man may have to himſelf and his Heirs, by way of Inheritance; or not being otherwiſe bequeathed, do naturally and of courſe deſcend to him and his next Heir of Blood, and fall not within the Compaſs of an Executor or Adminiſtrator, as Chattels do. It is a Word of large extent, and much uſed in Conveyances; for by the Grant of *Hereditaments*, Iſles, Seigniories, Mannors, Houſes and Lands of all Sorts, Charters, Rents, Services, Advowſons, Commiſſions, and whatever may be inherited, will paſs.

HERETICO *Comburendo*: See *Hæretico Comburendo*.

HERISSON, in Fortification, is a Beam arm'd with a great Quantity of ſmall Iron Spikes or Nails, having their Points outward, and is ſupported by a Pivot, upon which it turns, and ſerves inſtead of a Barrier to block up any Paſſage. They are frequently placed before the Gates, and more eſpecially the Wicket-Doors of a Town or Fortreſs, to ſecure thoſe Paſſages which muſt of Neceſſity be often open'd and ſhut.

HERMETICAL *Philoſophy*, is that which pretends to ſolve and explain all the Phænomena of Nature, by the three Chymical Principles, Salt, Sulphur, and Mercury.

HERMETICAL *Phyſick*, is that Hypotheſis in the Medicinal Art, which refers the Cauſe of all Diſeaſes to Salt, Sulphur, and Mercury.

HERMETICAL *Seal*, or *Hermes's Seal*, or to Seal or Stop up any Glaſs *Hermetically*, is to heat the Neck of the Glaſs till 'tis juſt ready to melt, and then with a pair of hot Pincers to pinch or cloſe it together. This way are all *Thermometers* ſealed up, and the Chymiſts ſeal up thus a Liquor in a Matraſs, or Bolt-head, when they deſign it ſhould be long circulated in a gentle Heat.

HERMETICK *Art*, is the ſame with Chymiſtry. 'Tis ſo called from *Hermes*, or *Mercury*, whom the Chymiſts will needs aſſert to have been the firſt and moſt famous Chymiſt.

HERNIA, or *Ramex*, is properly the Falling of the Inteſtines, Cawl, &c. by the Proceſſes of the *Peritonæum* dilated into the Groin: Alſo a Protuberance of the Navel. The Falling down of the Womb is improperly ſo called; as alſo ſwelling in the *Larynx*; winding Tumours of the Spermatick Veſſels; Diſtenſions from Flatulent Matter; watery Humours, or Swellings. *Blanchard*.

HERPES, a ſpreading and winding Inflammation, is two-fold; either *Miliaris*, or *Puſtularis*, like Millet-ſeed, which ſeizes the Skin only, and itches; or *Exedens*, conſuming; which not only ſeizes the Skin, but the Muſcles underneath: The Cauſe of it is, That the Glandules of the Skin are too much ſtuffed with Salt Particles, which are kept there by others that are viſcous, whence proceed the little Ulcers like Millet-ſeed, that occaſion an itching in the Skin, which if the Peccant Humour abound, they grow into a Cruſt, and eat the Parts they lie upon. *Blanchard*.

HERSE, in Fortification, is a *Lattice*, or *Portcullice*, made in the Form of a Harrow, and beſet with many Iron Spikes. It is uſually hung by a Cord faſten'd to a Moulinet, which is cut in caſe of Surprize, or when the firſt Gate is broken with a *Petard*, to the End that the *Herſe* may fall, and ſtop up the Paſſage of the Gate, or other Entrance of a Fortreſs. Theſe *Herſes* are alſo often laid in the Roads to incommode the March as well of the Horſe, as of the Infantry.

HERSILLON, in Fortification, is a Plank ſtuck with Iron Spikes, for the ſame Uſe as the *Herſe*.

HETEROCLITES, in Grammar, are ſuch Nouns as are of different Declenſions in one Number, from what they are in the other.

HETEROCRANIA, is a Pain in one Part or other of the Head.

HETEROGENEAL *Nouns*, in Grammar, are ſuch as have one Gender in the Singular Number, and another in the Plural, as *Tartarus*, *Tartara*; *Locus*, *Loca*, &c.

HETEROGENEAL *Numbers*, are mix'd Numbers conſiſting of Whole ones (or Integers) and of Fractions.

HETEROGENEAL *Surds*, are ſuch as have different Radical Signs; as

$\sqrt[2]{aa}$: and $\sqrt[5]{}:bb:\sqrt[5]{}:7$, and $\sqrt[3]{}:19$.

How to reduce Surds to Homogeneal ones, ſee under *Surds*.

HETEROGENEAL *Light*, is by our admirable Sir *Iſaac Newton* ſaid to be that which conſiſts of Rays of differing Degrees of Refrangibility: Thus, the

the common Light of the Sun or Clouds is *Heterogeneal*, being a Mixture of all Sorts of Rays. See *Colours*.

HETEROGENEOUS *Particles*, are ſuch as are of different Kinds, Natures, and Qualities, of which, generally, all Bodies are compoſed: And therefore, when in Chymiſtry a Body is analyſed or diſſolved by the Fire, or any *Menſtruum*; if Parts or Principles of different Natures (ſuch as Salt, Oil, Spirit, Water, and Earth) can be ſeparated from it; thoſe are called *Heterogeneities* (by *Helmont*) becauſe they are all of very different Kinds or Natures from one another.

HETEROSCII, in Coſmography, are ſuch Inhabitants of the Earth as have their Shadows falling but one way; as thoſe who live between the Tropicks and Polar Circles, whoſe Shadows at Noon in North Latitude, are always to the Northward, and in South Latitude to the Southward.

HEXACHORD, a certain Interval of Muſick or Concord, commonly called a *Sixth*; and is twofold, *viz.* the *Greater* and *Leſſer*.

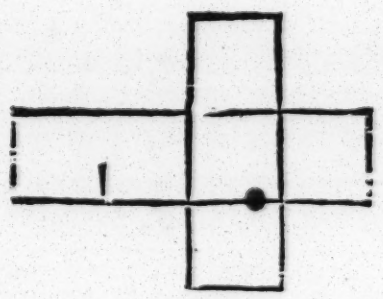
The *Greater Hexachord* is compoſed of two greater Tones, two leſſer Tones, and one greater Semi-Tone, which are five Intervals: But the *Leſſer Hexachord* conſiſts only of two Greater Tones, one Leſſer Tone, and two Greater Semi-Tones.

The Proportion of the former, in Numbers, is as 3 to 5; and that of the other, as 5 to 8.

HEXAGON, in Geometry, is a Figure of ſix Sides and Angles; and if thoſe Sides and Angles be equal, 'tis called a *Regular Hexagon*.

HEXAHEDRON, is the ſame with the Cube, being a Regular Solid of ſix equal Sides or Faces. See *Regular Bodies*.

The following Figure, being cut in Paſte-board and folded up, will repreſent the *Hexahedron* or *Cube*.



HEXASTYLE, an Ancient Building which had ſix Columns in the Face before, and ſix alſo behind, and is the ſame with the *Pſeudodipteron*.

HIDROA, are Pimples about the Secret Parts, proceeding from a ſharp Humour. *Blanchard*.

HIDRONOSUS, is a Fever, wherein the Patient ſweats extremely: The *Engliſh* call it the *Sweating-Sickneſs*. *Blanchard*.

HIDROTICK *Medicines*, are thoſe that procure and promote Sweating: See *Sudorificks*.

HIPPEUS, or *Equinus*, a Comet that ſome Writers will needs have to reſemble a Horſe: But the Shape of this kind of Comet is not always alike, as being ſometimes *Oval*, and ſometimes imitating a *Rhomboides*.

Its Train, in like manner, is ſometimes ſpread from the Front or Fore Part; and at other times from the Hinder Part: Therefore they are diſtinguiſhed into *Equinus Barbatus*, *Equinus Quadrangularis*, and *Equinus Ellipticus*.

HIPPUS, is an Affection of the Eyes, wherein they continually ſhake and tremble, and now and then twinckle, as it happens in riding. *Blanchard*.

HIRCUS, *Hirci*, or *Hirqui*, the Corners of the Eyes: See *Canthus*. *Blanchard*.

HIRCUS, a fix'd Star; the ſame with *Capella*.

HIRCUS, a Name given by ſome Writers to a ſort of a Comet encompaſſed by a kind of Main, ſeeming to be rough and hairy, by reaſon of its Rays appearing like Hairs: It is alſo ſometimes without any Train or Buſh.

HIRQUUS, the ſame with *Canthus*.

HITCH, is a Sea Word, to catch hold of any Thing with a Hook or a Rope, and to hold it faſt. Thus ſay they, when the Boat is to be hoiſed in, *Hitch the Tackles into the Rings of the Boat*; ſo *Hitch the Fiſh-hook to the Fluke of the Anchor*, when they are about to weigh the Anchor.

HOISE: See *Hoyſe*.

HOLD, of a Ship, is all that Part of it which lies between the Keelſon and the Lower-Deck; wherein, divided by Bulk-heads, are the Steward's Room, the Powder-Room, the Bread-Room, and the Boatſwain's-Room; and in a Merchant-Man, the Goods or Lading in general.

HOLD-OFF, is a Term at Sea, uſed about heaving in the Cable at the Capſtan: For if it be very ſtiff and great, or have lain long in a Slimy or Oazy Ground, unleſs that Part which is heaved in by, be haled away hard from the Capſtan, the Cable will *ſurge* or ſlip back; therefore it muſt be haled away as faſt as it comes in, that the Cable may keep cloſe about the Whelps: And this Work is called *Holding-off*, and may be done by Hand with a ſmall Cable; but in all great Ships they either *hold-off* with Nippers, or elſe bring the Cable alſo to the Jeer-Capſtan.

HOLLOW-TOWER, in Fortification, is a Rounding made of the Remainder of two Briſures, to join the Curtain to the *Orillon*, where the Small-Shot are plaid, that they may not be ſo much expoſed to the View of the Enemy. And the

HOLLOW-SQUARE, is a Body of Foot drawn up, with an empty Space in the Middle for the Colours, Drums, and Baggage, facing and covered by the Pikes every way to oppoſe the Horſe.

HOMAGE, is the Submiſſion, Promiſe, and Oath of Service and Loyalty which a Tenant makes to his Lord, when he is firſt admitted to his Land, which he holds of the Lord in Fee ('tis probably derived from the Word *Homo*:) becauſe the Form, as appointed by *Stat.* 17. *Edw.* 2. in theſe Words; When a Free-man ſhall do *Homage* to his Lord, of whom he holdeth in Chief, he ſhall hold his Hands together between the Hands of his Lord, and ſhall ſay thus;

I become your Man from this Day forth for my Life, for Member, and for Worldly Honour; and ſhall owe you my Faith for the Land I hold of you, ſaving the Faith that I owe unto our Sovereign Lord the King, and to mine other Lords.

And in this manner the Lord of the Fee, for which *Homage* is due, taketh *Homage* of every Tenant as he cometh to the Land or Fee.

HOMAGE is ſometimes uſed for the Jury in a Court-Baron, where it conſiſteth moſt commonly of ſuch as owe *Homage* unto the Lord of the Fee.

HOMAGE *Anceſtral*, is where a Man and his Anceſtors, time out of Mind, held their Land of their Lords and his Anceſtors by *Homage*: And if ſuch Lord have received *Homage*, he is bound to acquit the Tenant againſt all other Lords above him, of every manner of Service. And if the Tenant

nant hath done *Homage* to his Lord, and is impleaded, and vouches the Lord to Warranty, the Lord is bound to warrant him; and if the Tenant loſe, he ſhall recover in Value againſt the Lord ſo much of the Lands as he had at that time of the Voucher, or any time after.

HOMAGIO *Reſpectuando*, is a Writ directed to the Eſcheator, commanding him to deliver Seiſin of Lands to the Heir that is full Age, notwithſtanding his *Homage* not done, which ought to be performed before the Heir have Livery, or his Lands, except there fall out ſome reaſonable Cauſe to hinder it.

HOMICIDE, in Common Law, ſignifies the Killing of a Man, and it is divided into *Voluntary* and *Caſual*.

Homicide Voluntary, is that which is deliberate, and committed of a ſet Mind and Purpoſe to kill, and is either with a precedent Malice, or without: The former is Murder, and is a Fellonious Killing, through Malice prepenſed, of any Perſon living in this Realm under the King's Protection: See *Murder*, *Man-ſlaughter*, *Chance-medley*.

Homicide Caſual, is either *merely Caſual* or *mixt*.

Merely Caſual, is when the Slayer kills a Man by pure Miſchance, being about his lawful Occaſions: as in the Caſe of an Axe ſlipping out of a Man's Hand, or falling off while he is felling a Tree.

But 'tis accounted *Mixt*, when there is Negligence, or ſome other unwarrantable Circumſtance, ſeized with the Action.

HOMINE *capto in Withernamium*, is a Writ to take him that hath taken any Bond-man or Woman, and let him or her out of the Country, ſo that he or ſhe cannot be replevied according to Law.

HOMINE *eligendo ad cuſtodiendam peciam ſigilli pro mercatoribus æditi*, is a Writ directed to a Corporation, for the Choice of a new Man to keep the one Part of the Seal, appointed for *Statutes-Merchant*, when the other is Dead.

HOMINE *replegiendo*, is a Writ to bail a Man out of Priſon: In what Caſe it lies, ſee the *New Book of Entries*.

HOMOCENTRICK, the ſame with *Concentrick*.

HOMOGENEAL, ſignifies of the ſame Kind or Sort, or that which differs not in Nature, &c. The ſame with *Homogeneous*.

HOMOGENEAL *Numbers*, are thoſe of the ſame Nature and Kind; And

HOMOGENEAL *Surds*, are ſuch as have one commo Radical Sign; As

$$\sqrt[3]{:27}, \text{ and } \sqrt[3]{:3}.$$

HOMOGENEOUS *Particles*, are ſuch as are all of the ſame Kind, Nature, and Properties: As the Parts of pure Water, of mere Earth without Salt in it; or the Parts of the finer Metals, ſuch as Gold, Silver, &c. 'Tis uſed in Oppoſition to *Heterogeneous*: which ſee.

HOMOGENEAL *Light*, is that whoſe Rays are all of one Colour and Degree of Refrangibility, without any Mixture of others: See *Colours*.

HOMOGENEUM *Comparationis*, ſo *Vieta* calls the *Abſolute Number* in a Quadratick or Cubick, &c. Equation; and this Number always poſſeſſeth one Side of the Equation, and is the Product of the Roots multiplied one into another; therefore *Oughtred* expreſſes it by this Character Æ, becauſe 'tis a Rectangle between the two Roots *A* and *E*. The Reaſon of the Name is, that all the Roots, which being multiplied into one another, do produce the Abſolute Number, muſt be Homogeneous one to another: See *Abſolute Number*.

HOMOIOMERICAL *Principles* of *Anaxagoras*: This Ancient Philoſopher ſuppoſed, that there were in all mixt Bodies, (ſuch as Fleſh, Fruits, &c.) determinate Numbers of ſuch *Similar Principles*, as when they came to become Parts (*ex. gr.*) of an Animal Body, would there make ſuch Maſſes and Combinations as their Nature required, *viz.* the *Sanguinary Particles* would then meet all together, and make *Blood*; the *Urinous Particles* would conſtitute *Urine*; the *Oſſeous* ones *Bones*; the *Carneous* ones *Fleſh*, &c.

HOMOLOGOUS, in Geometry, ſignifies thoſe Quantities which are alike to one another in *Reaſon*; as when we ſay, there is the ſame *Reaſon* of *A* to *B*, as of *C* to *D*: Here *A* is Homologous to *C*, as *B* to *D*, becauſe of the Similitude between Antecedents and Conſequents: So that the two Antecedents, and the two Conſequents, are the Homologous Terms in any Proportion; and when Triangles are Similar, the Sides which are the two Antecedents or the two Conſequents, are called the Homologous Sides: And ſuch Triangles are always to one another as the Squares of ſuch Homologous Sides, as you will find proved under *Triangles*.

HOMOLOGOUS *Things*, in Logick, are ſuch as agree only in Name, but are of very different Natures; and therefore are the ſame with what they otherwiſe call Equivocal Terms.

HOMOPLATA, *Scapulæ Spatulæ*, *Scapulæ Apertæ*, the Shoulder-Blades, are two large, broad, and triangular Bones, which conſtitute the Breadth of the Shoulder; thin, eſpecially in the Middle, but thick in its Proceſſes, and are ſituated on each Side of the Upper and Back-part of the *Thorax*; the upper Edge of them is called *Coſta Superior*; their lower *Coſta Inferior*. Each has three Proceſſes; of which, the Firſt runs all along the Middle of their Outſide, and is called their *Spine*, whoſe End, which receives the *Clavicula*, is called the *Acromion*, or the Shoulder-point. *Caracoides*, or *Anchoralis*, is the Name of the Second Proceſs; as the Third is called *Cervix*: Theſe two latter are tied together by a ſtrong Ligament, which ſerves to keep the Head of the *Humerus* in the Cavity of the *Cervix*. The Uſe of the *Homoplata*, or *Scapulæ*, is to receive the Extremities of the *Claviculæ* and *Humeri* for the eaſier Motion of the Arm, and to give Eaſe to the Muſcles which move it.

HOMOTONA, is a continued Fever that acts always alike. *Blanchard*.

HONOUR-POINT, in an Eſcutcheon: See *Eſcutcheon*.

HONEY-COMBS, are certain Holes or Cavities within the Body of a great Gun, wherein there is Danger of ſome Sparks of Fire being lodged, or Pieces of Cartridges, where they uſe Paper Cartridges.

HOOKS, of a Ship, are all thoſe forked Timbers which are placed directly upon the Keel, as well in her *Run*, as in her *Rake*.

HOOP-WHEEL: See *Detent-Wheel*.

HOPLO *Chryſma*, the *Armarium* or *Weapon Salve*: See *Armarium*.

HORDEATUM, is a liquid Medicine taken inwardly, prepared of Barley beat and boil'd, with the Addition of ſuitable and well-ſtrained Liquors; to which are frequently added Almonds, and the Seeds of White Poppies, &c. *Blanchard*.

HORDEOLUM, the ſame with *Critha*.

HORIZON, is that Great Circle which divides the Heavens and the Earth into two Parts or Hemiſpheres, diſtinguiſhing the upper from the lower: It's either *Senſible* or *Apparent*, or the *Rational* or *True Horizon*,

The *Senſible* or *Viſible Horizon*, is that Circle which limits our Sight, and may be conceived to be made by ſome great Plain, or the Surface of the Sea.

It divides the Heavens and Earth into two Parts, the one Light, and the other Dark, which are ſometimes greater or leſſer, according to the Condition of the Place, &c.

It determines the Riſing and Setting of the Sun, Moon, or Stars, in any particular Latitude; for when any of theſe appears juſt at the Eaſtern Part of the *Horizon*, we ſay it Riſes; and when it doth ſo at the Weſtern Part, we ſay it Sets: And from hence alſo the Altitude of the Sun or Stars is accounted, which is their Height above the *Horizon*.

The *Rational*, *Real*, or *True Horizon*, is a Circle which encompaſſes the Earth exactly in the Middle, and whoſe Poles are the *Zenith* and *Nadir*; that is, the two Points, one exactly over our Heads, and the other under Feet.

Horizon on the *Globe* or *Sphere*, is a broad wooden Circle encompaſſing it round, and repreſenting the *Rational Horizon*, having two Notches in the North and South Parts of it for the Brazen Meridian to ſtand in.

On this broad wooden *Horizon* ſeveral Circles are drawn, the innermoſt of which is the Number of Degrees of the 12 Signs of the Zodiack, *viz.* 30 Degrees to each Sign.

Next to this you have the Names of thoſe Signs; then the Days of the Month, according to the *Julian* Account, or Old Stile, with the Calendar; and then a Calendar according to the Foreign Account, called New Stile: And without theſe is a Circle divided into 32 equal Parts, which make 32 Rhumbs, or Points of the Mariner's Compaſs, with the firſt Letters of their Names annexed.

The Uſes of this Circle on the Globe arẽ,

1. To determine the Riſing and Setting of the Sun, Moon, or Stars; and to ſhew the Time of it by the Hour-Circle and the Index.

2. To limit the Increaſe and Decreaſe of Day and Night: For when the Sun riſes due Eaſt, and ſets Weſt, the Days and Nights are equal: When he riſes and ſets to the North of the Eaſt and Weſt, the Days are longer than the Nights: But the Nights are longer than the Days, when the Sun riſes and ſets to the Southward of the Eaſt and Weſt Points of the *Horizon*.

3. To ſhew the Amplitude and Point of the Compaſs the Sun riſes and ſets upon.

HORIZONTAL, or *Baſe-Line of a Hill*, how to find: See *Surveying*.

HORIZONTAL *Dials*, are thoſe whoſe *Planes* lie parallel to the Horizon of any Place.

For the drawing of theſe *Dials*, you muſt have always given the *Latitude of the Place*, or Height of the Pole above the Horizon, (*which is equal to the Height of the Style*) by the Help of which you may find the *Hours Diſtance from the Meridian* by the following Proportion:

As the Radius: Is to the Sine of the *Styles Height*:: So is the Tangent of the Hour (or *Angle at the Pole*):
To the Tangent of the *Hours Diſtance from* 12, (or the *Hour-Arch*.)

Example.

Suppoſe an *Horizontal Dial* was to be drawn for the Latitude of 51 Degrees 32 Minutes.

Firſt, Find the Diſtance of the Hours 1 and 11 from the Meridian, according to the preceding *Canon*:

Thus,

To the S. of the *Styles Height*---51° 32'---9.893745
Add the Tangent of the Hour--15 00---9.428052

Sum---Rad.=T. of the *H. Arc.* 11° 50---19.321797

Which is the Diſtance of 1 and 11 from the *Meridian Line*.

In like manner find the reſt of the *Hours Diſtances*, and place them in a Table:

Thus,

Latitude 32 Degrees 51 Minutes North.

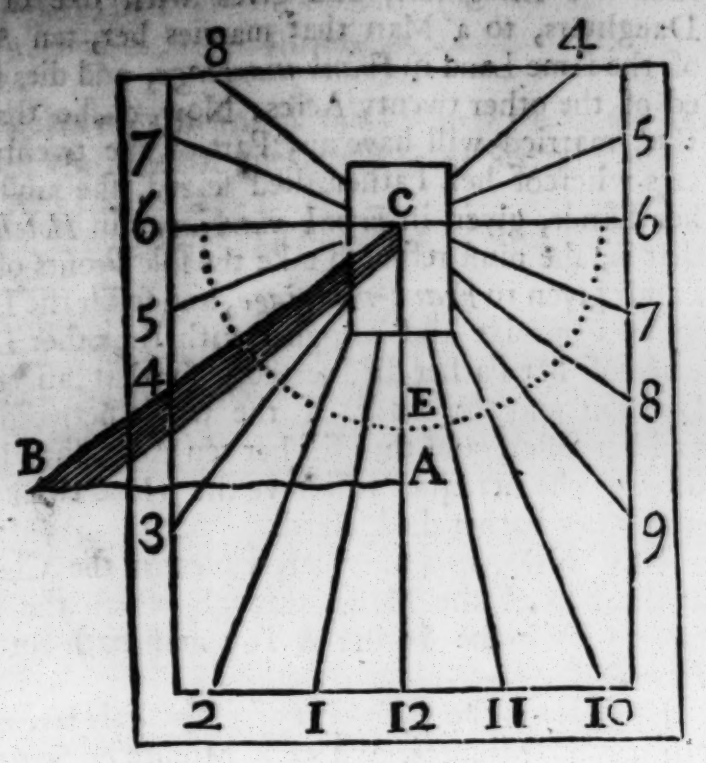
Hours.		Angle at Pole.		Hour Arches.	
		G.	M.	G.	M.
12		00	00	00	00
11	1	15	00	11	50
10	2	30	00	24	20
9	3	45	00	38	03
8	4	60	00	53	35
7	5	75	00	71	06
6		90	00	90	00

For the Style, make the Angle *BCA*= to the Latitude of the Place.

So ſhall *B C A* be the Style or Cock, which muſt ſtand perpendicularly on *C*: 12, and Point due North.

If you would Calculate for every half Quarter, you muſt ſay,

As *R*: *S* Latitude:: *T*, 1 Degree 52 Minutes:
To the Tangent of the firſt half Quarter's Diſtance from the Meridian::
So *T*, 3 Degrees 45 Minutes: To *T*, of the firſt Quarter of an Hour's Diſtance::
So *T*, 5 Degrees 37 Minutes: To a Quarter and half Quarter's Diſtance::
So *T*, 7 Degrees 30 Minutes; To the half Hour's Diſtance, &c.



To deſcribe the Dial, Reſpect muſt be had to the Bigneſs of the Plane, and the Place for the Center *C* determined; and then through *C* draw *C* 12 for the Meridian (which will alſo be the Subſtilar-Line and Hour-Line of 12) and at Right Angles to it 6 *C* 6 for the Hour-Line of Six. Then on *C*, with a Line of Chords, whoſe Radius is proper for the Largeneſs of the Dial, draw a Circle, and from *E*, both ways, ſet the ſeveral Diſtances of the Hour-Arks, found by Calculation, in the Circumference of that Circle: Then lay a Ruler to *C*, and draw Lines from thence through all thoſe Diviſions, they will be the true Hour-Lines on the Plane of the Dial.

N. B This Practice ſerves to draw an *Erect Vertical Dial*; only in Calculation you muſt uſe the Complement of the Latitude inſtead of the Latitude, and the Hours muſt be numbered differently.

To draw an Horizontal Dial Geometrically.

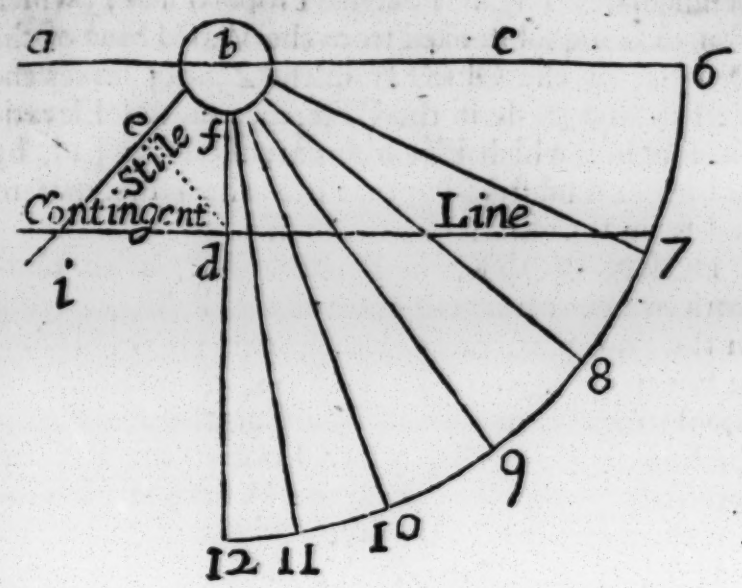
Let two Lines be drawn Square-wiſe, *viz. b d* for the Hour of 12, and *b c* for the Hour of 6; draw the *Style b e* ſo, that the Angle *e b d* may be equal to the Elevation of the Pole; take (where you pleaſe) any Point in the Meridian Line, ſuppoſe *d*, from which, unto the *Style*, let fall a Perpendicular as *d e*, and transfer it into the Meridian in *d f*: Then draw *i d* perpendicular to the Meridian in *d*, for a *Line of Contingence*.

From *f*, as a Center, deſcribe a Circle repreſenting the Equinoctial at any conſiderable Diſtance (the bigger the better) and divide it into 24 Parts for Hours, and 48 Parts for Half-Hours: But it is enough for an *Horizontal Dial*, if one Quadrant betwixt the Hours of 12 and 6 be divided into 6 Parts or 12.

Make Points in the *Contingent*, where it ſhall be cut by a Ruler applied to the Center and every Diviſion in the Equinoctial.

Draw the Hour-Lines from the Center *b*, and every correſpondent Point in the *Contingent*, erecting the *Style* over the *Meridian*, according to the Angle *i b d*.

Horizontal Dial.



HORIZONTAL *Line*, any Line drawn parallel to the Horizon upon a Plane: See *Line*.

HORIZONTAL *Parallax*: See *Parallax*.

HORIZONTAL *Projection*: See *Projection*.

HORIZONTAL *Range*, or *Level Range*, of a Piece of Ordnance, is the Line it deſcribes parallel to the Horizon or Horizontal Line.

Capt. *Halley*, in *Philoſ. Tranſ.* N. 216. gives two very ready Theorems, the one to find the greateſt Horizontal Range at 45 Degrees Elevation, by any Shot made upon any inclined Plane, with any Elevation of the Piece whatſoever; and the other to find Elevations proper to ſtrike a given Object with any Force greater than what ſuffices to reach it with the middle Elevation.

PROP. I.

A Shot being made on an inclined Plane, having the Horizontal Diſtance of the Object it ſtrikes, with the Elevation of the Piece, and the Angle at the Gun between the Object and the Perpendicular; To find the greateſt Horizontal Range of that Piece, laden with the ſame Charge; that is, half the Latus Rectum *of all the* Parabolæ *made with the ſame* Impetus.

RULE.

Take half the Diſtance of the Object from the *Nadir*, and take the Difference of the given Elevation from that half; the Verſed Sine of that Difference ſubſtract from the Verſed Sine of the Diſtance of the Object from the *Zenith*: Then ſhall the Difference of thoſe Verſed Sines: Be to the Sine of the Diſtance of the Object from the *Zenith*:: As the Horizontal Diſtance of the Object ſtruck: To the greateſt Range at 45 Degrees.

PROP. II.

Having the greateſt Horizontal Range of a Gun, the Horizontal Diſtance and Angle of Inclination of an Object to the Perpendicular; To find the two Elevations neceſſary to ſtrike that Object.

RULE.

Halve the Diſtance of the Object from the *Nadir*; this half is always equal to the half Sum of the two Elevations ſought: Then ſay, As the greateſt

Horizontal Range: Is to the Horizontal Diſtance of the Object: : So is the Sine of the Angle of Inclination, or Diſtance of the Object from the Perpendicular: To a Fourth Proportional; which Fourth being ſubſtracted from the Verſed Sine of the Diſtance of the Object from the *Zenith*, leaves the Verſed Sine of half the Difference of the Elevations ſought; which Elevations are therefore had, by adding and ſubſtracting that half the Difference to and from the aforeſaid half Sum.

HORN-WORK, in Fortification, is an Outwork which advanceth toward the Field, carrying in the Fore-part, or its Head, two Demi-Baſtions in Form of *Horns*. Theſe Horns, Epaulments, or Shouldrings, being joined by a Curtain, ſhut up on the Side by two Wings parallel one to another, are terminated at the Gorge of the Work, and ſo preſent themſelves to the Enemy.

HOROLOGIOGRAPHY, the Art of making *Dials*, *Clocks*, or other Inſtruments, to ſhew the Time of the Day.

HOROMETRY, the Art of meaſuring or dividing the Hours, and keeping Account of Time.

HOROPTER, in Opticks, is a Right Line drawn through the Point of Concourſe, parallel to that which joins the Center of the Eye.

HOROSCOPE, a Word in great Requeſt with the Canting Aſtrologers; and ſometimes they put either for a Figure of the Twelve Houſes (as they call the Signs of the Zodiack) erected to tell other Men's Fortunes, and to ſhew their own Folly; or elſe for the Degree of the Aſcendants, or the Star aſcending above the Horizon, at the Time the Queſtion is put, any thing enquired for, or a Native born: But moſt properly *Horoſcope* ſignifies the firſt Houſe or Aſcendant, and is that Part of the Zodiack which is riſing at the Time of the Scheme.

HORRIFICA *Febris*, is that Fever in which the Patient is often ſeized with ſhaking Fits and horrible Agonies; 'tis otherwiſe called *Phricodes*; which ſee. *Blanchard.*

HORS *de ſon fee*, is an Exception to avoid an Action brought for Rent, iſſuing out of certain Land by him that pretendeth to be the Lord, or for ſome Cuſtom and Services; for if he can juſtify that the Land is without the Compaſs of his Fee, the Action falls.

HORSE, is a Rope in a Ship, made faſt to one of the Fore-maſt Shrouds, having a Dead Man's Eye at its End, through which the Pendant of the Sprit-ſail Sheets is reeved. Its Uſe is only to keep the Sprit-ſail Sheets clear of the Flukes of the Anchor: Alſo he that heaves the Lead out of the Shrouds, has a Rope which is there faſtened to preſerve him from falling into the Sea, which alſo is called a *Horſe*, and ſo alſo is the *Wap* called, which is that whereby the Shrouds are ſet Taught, alſo thoſe little ſhort *Waps* ſeized to the Middle of the Top-maſt and Top-gallant-maſt Stay, wherein are reeved the Top-ſail and Top-gallant-ſail Bowlings, are alſo called *Horſes*.

HORSE-SHOE, in Fortification, is a Work ſometimes of a round, and ſometimes of an oval Figure, raiſed in the Ditch of a Marſhy Place, or in low Grounds, and bordered with a Parapet. It is made to ſecure a Gate, or to ſerve as Lodgment for Soldiers to prevent Surprizes, or to relieve an over-tedious Defence.

HOTCHPOT, in Law, ſignifies a Commixture, or putting together of Lands of ſeveral Tenures, for the equal Diviſion of them: As if a Man, ſeized of thirty Acres of Land in Fee, hath Iſſue two Daughters, and gives with one of his Daughters, to a Man that marries her, ten Acres of the ſame Land in *Frank-marriage*, and dies ſeized of the other twenty Acres: Now if ſhe that is thus married will have any Part of the twenty Acres whereof her Father died ſeized, ſhe muſt put her Lands, given in *Frank-marriage*, in *Hotchpot*; that is, ſhe muſt refuſe to take the ſole Profits of the Lands given in *Frank-marriage*, and ſuffer the Land to be commixt and mingled with the other Land whereof her Father died ſeized; ſo that an equal Diviſion may be made of the whole between her and her Siſter, and thus for her ten Acres ſhall have fifteen, elſe her Siſter will have the whole twenty of which her Father died ſeized.

HOUNDS, in a Ship, are Holes in the Cheeks at the Top of the Maſts, through which the Ties run to hoiſe the Yards: A Top-maſt hath but one *Hound.*

HOUR, is the 24th Part of a Natural Day, containing 60 Minutes, and each Minute 60 Seconds, *&c.* Theſe are *Aſtronomical Hours*, which always begin at the Meridian, and are reckoned from Noon to Noon.

But ſome *Hours* are begun to be accounted from the Horizon, which, when the Account begins at the Sun's Riſing, are called *Babyloniſh Hours*; who begin with the Sun's Riſing, and reckoned on 24 *Hours* to his Riſing again the next Day.

Others are reckoned after the ſame manner, only begin at the Sun's Setting inſtead of his Riſing; and theſe are called the *Italian Hours*, becauſe the *Italians* account their Time after this Faſhion.

There is yet another Kind of *Hours*, which are called the *Jewiſh Hours*, becauſe of old the *Jews* accounted their Time this way: Theſe are one 12th Part of the Day or Night, reckoned from the Sun Riſing to Sun Setting (be the Days or Nights long or ſhort;) and theſe were called, as we find in Holy Scripture, the Firſt, Second, or Third, *&c. Hour* of the Day or Night.

HOUR-CIRCLES, the ſame with *Meridians*, are Great Circles meeting in the Poles of the World, and croſſing the *Equinoctial* at Right Angles: They are ſuppoſed to be drawn thro' every 15th Degree of the *Equinoctial* and *Equator*, and on both Globes are ſupplied by the *Meridian*, *Hour-Circle*, and *Index.*

The Planes of the *Hour-Circles* are perpendicular to the Plane of the Equinoctial, which they divide into 24 equal Parts.

HOUR-LINES, on a Dial, ariſe from the Interſection of the Plane of the Dial, with the ſeveral Planes of the Hour-Circles in the Sphere, and therefore muſt be all Right Lines.

To find the Hour of the Day Trigonometrically, having the Latitude of the Place, the Sun's Altitude at Six, and preſent Altitude given.

In *Summer.*

Say, As the Co-ſine of the Latitude: Is to the Difference of the Sines of the Altitude at Six, and preſent Altitude: :
So is the Radius: To the Sine of the Hour from Six.

In

In *Winter*.

Say, As the Co-ſine of the Latitude: Is to the Sum of the Sines of the Altitude at Six, and preſent Altitude::
So is the Radius: To the Sine of the Hour from Six.

To find the Hour of the Day, having the Co-Latitude of the Place = 38 Degrees 30 Minutes.
The Sun's Co-Altitude = 60 Degrees, and his Co-Declination = 76 Degrees 53 Minutes;

Proceed and ſet all things thus;

Co-Latitude	38° 30′	whoſe Compl. Arithm. Sine	= 0.205853
Co-Declinat.	76 53	whoſe Compl. Arithm. Sine	= 0.011481
Difference	38 23		
Co-Altitude	60 00		
Sum	98 23		
Difference	21 37		
Half Sum	49 11	Sine	9.878984
Half Differ.	10 48	Sine	9.272726
		Sum of all the 4 Sines	19.379044
		Their half Sum	9.689522

Which laſt Logarithm is the Sine of 29 Degrees 17 Minutes, and this doubled, gives 58 Degrees, 17 Minutes; and then converted into Time, gives 38 Hours 51 Minutes, and ſo much did it want of Noon then; that is, 'twas 8 a-Clock, and 9 Minutes before Noon.

HOUSED-IN, the Seamen ſay of a Ship, which, after the Breadth of her Bearing, is brought in too narrow to her upper Works, that ſhe is *Houſed-in* or *Pinched-in* too much.

HOWLE, when the Foot-hooks of a Ship are ſcarfed into the Ground-Timbers and boulted, and then the Plank laid on them up to the Orlop, the Carpenters ſay, they begin to make the Ship *Howle*.

HOY, is a ſmall Veſſel or Bark, whoſe Yards are not a-croſs, nor the Sails ſquare like thoſe of Ships; but her Sails are like a Miſſen, and ſo ſhe can lie nearer the Wind than a Veſſel with croſs Sails can do: A *Ketch* is a ſmaller Veſſel of this Kind.

HOYSE, is the Sea Word for haling up any thing into the Ship for getting up a Yard, &c. Thus they ſay, *Hoiſe* up the Yard! *Hoiſe* the Water in! &c.

HUE-AND-CRY: *Manwood*, in *Foreſt Law*, c. 19. *Num.* 11. ſaith, That *Hue* ſignifies the Complaint of the Party, and *Cry* is the Purſuit of the Felon upon the High-way upon that Complaint; for if the Party robbed, or any in the Company of one robbed or murdered come to the Conſtable of the next Town, and will him to raiſe the *Hue-and-Cry*, (that is, make the Complaint known, and follow the Purſuit) after the Offender, deſcribing the Party, and ſhewing, as near as he can, which way he went; the Conſtable ought forthwith to call upon the Pariſh for Aid in ſeeking the Felon; and if he be not found there, then to give the next Conſtable Notice, and the next, until he be apprehended, or at leaſt, until he be thus purſued unto the Sea-ſide.

HUROSCOPE: See *Hygroſcope*.

HULL *of a Ship*, is her Main Body, without any Maſts, Yards, Sails, or Rigging.

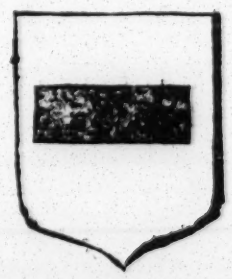
To *Hull*, or lie a *Hull*, is ſpoken of a Ship, when either in a dead Calm (to preſerve her from beating her Sails againſt the Maſts) or in a Storm when ſhe can't carry 'em, all her Sails are taken in to preſerve them, ſo that nothing but her *bare Poles*, her Maſts, Yards, and Rigging are abroad; this is called *Hulling*; her Helm is tied down to the Lee-ſide of the Ship, and then if ſhe be a good Sailer, ſhe will lie eaſily under the Sea, and make her way one Point before the *Beam*.

HULLOCK *of a Sail*, is when in a great Storm ſome ſmall Part of a Sail is cut and left looſe: It's chiefly uſed in the Miſſen-ſail, to keep the Ship's Head to the Sea, then all the reſt of the Sail is made up, except a little at the Miſſen-yard Arm: Alſo when a Ship will not *Weather-Coyl*, to lay her Head the other way, they looſe a *Hullock* of her Fore-ſails; and then changing the Helm to the Weather-ſide, ſhe is then made to fall off, and to lay her Head where her Stern lay before.

HUMECTATION, is the moiſtening of any mixt thing, in order to prepare it for ſome Operation, or that its beſt or fineſt Parts may the better be extracted: Thus *Agarick* &c. are moiſtened while they are pounding, leſt they ſhould exhale too faſt; and *Caſſia* is moiſtened, the better to extract its Pulp.

HUMERUS, the Shoulder-bone, being the firſt Bone of the Arm: 'tis long and round, its Subſtance or Fibres are pretty ſolid and compact; it has a wide and long Cavity in its Middle, in which is contained its Marrow. At its upper-end it has a round Head covered with a Cartilage, which is received into the Cavity of the Neck of the *Scapula*; but becauſe this Head is much larger than the Cavity, therefore it is ſurrounded with a ſtrong Ligament, which riſes from the Edge of the Cavity of the *Scapula*. At its lower End it has two Protuberances; the one External, which receives the Extremity of the *Radius*; the other Internal, which is received into the Semi-circular *Sinus* of the *Ulna*: On the Fore-ſide of this Protuberance there is a ſmall *Sinus*, which receives the fore Proceſs of the *Ulna*; and on the back-ſide there is another large *Sinus*, which receives the *Olecranium*. There is another ſmall Protuberance on the Side of this, from which the Muſcles that lie on the Inſide of the Arm ariſe.

HUMID: *Bloom*, in his Heraldry, gives you a *Feſſe* of this Form, which he calls *Feſſe Humid*.



HUMIDITY, is the Quality which we call Moiſture, or the Power of wetting others, which ſome Liquors and Fluids are endowed with. This differs very much from *Fluidity*, as you may ſee under that Word; and ſeems to be merely a relative thing depending on the Congruity of the Component Particles of the Liquor, to the Pores of ſuch particular Bodies as it is capable of adhering to, penetrating a little into, or wetting.

Thus, for Inſtance, Quickſilver is not a moiſt Liquor, as to our Hands or Cloaths; but may be called ſo in reference to Gold, Tin, or Lead, to whoſe Surfaces it will preſently adhere. Now even Water it ſelf that wets almoſt every thing, and is the great Standard of Moiſtured and *Humidity*, is

not capable, as it appears, of wetting every thing; for it ſtands, and runs eaſily off in Globular Drops on the Leaves of Cabbages and many other Plants, and will not wet the Feathers of Ducks, Swans, and other Water-Fowl, as it will other Things. And that Texture only may cauſe a Fluid to be *Humid*, is plain from hence, That though neither Quickſilver alone, Lead, or Biſmuth will adhere to Glaſs; yet being mixed together, they will form a Maſs that will do ſo; as is plain from ſuch a Compoſition being frequently uſed to Foliate Looking-Glaſſes, Vid. *Mr.* Boyle's *Hiſtory of Fluids and Firmneſs*, Pag. 187.

HUMILIS: See *Deprimens*.

HUMOURS: The Ancients made four *Humours* in the Blood, the Bilous, Pituitous, (Yellow and Black Choler) Melancholick, and the Blood, properly ſo called, and that according to the four Peripapetick Elements: But this Opinion is caſhier'd, ſince the Invention of the Circulation of the Blood; yet they are found when the Blood preternaturally departs from its due Temperature; but they do not conſtitute an integral Part of the Blood, for the Blood is only one *Humour*; if otherwiſe, Tartar in Wine, and Dregs in Beer, were conſtituent Parts of Wine and Beer. In Blood that is let, there appear only three different Species of Bodies; for in the Surface you ſee a Kind of a Fibrous Cruſt of coagulated Blood, which ſpreads it ſelf over the whole Maſs; then you ſee certain red Particles amongſt the Fibres, which grow black about the Bottom by reaſon of their Fewneſs: Laſtly, you ſee the *Serum* wherein it ſwims. But if any one will proceed more accurately, diſtil the Blood, and diſſolve it Chymically, he ſhall find five pure Bodies in it; to wit, Spirit, Sulphur, or Oil, Water, Salt and Earth.

There are three general *Humours* which waſh the whole Body, Blood, Lympha, (a ſort of pure Water) and the Nervous Juice; but there are ſeveral particular *Humours*, as Chyle, Bile, Spittle, Pancreatick Juice, Seed, &c.

There are alſo *Humours* in the three Membranes that cloath the *Fœtus* in the Womb, which are three in thoſe Animals that have Bladders: At the Beginning, when the Egg falls down from the *Ovaria* into the Womb, the *Humours* which are to this Purpoſe in the Bottom of the Womb, firſt ſink into the Membrane called *Chorion*, and then into the *Amnion*; but in Proceſs of Time, when the *Fœtus* is formed, and the Navel-Veſſels are extended to the *Chorion* and the *Amnium*, we imagine that the Nutritious *Humour*, being received by the Opening of the Veins, is carried to the *Fœtus*, and thence, by the Arteries, ſome Part of it is carried into the *Amnion*, as into the Child's Store-houſe; ſo that at the ſaid time the Liquor of the *Membrane Amnion* may be increaſed upon this double Account. *Blanchard*.

At laſt, when the Time of Delivery draws near, that way of Sweating through ſeems to ceaſe, and the others only take Place; unleſs (as *Wharton* writes) the Nutritious *Humour* deſcend from the *Placenta* by the Navel-String, and by the little ſoft Protuberances, thence paſs into the Cavity of the *Amnion*: The Uſe of theſe *Humours* is to nouriſh the *Fœtus* at the Mouth.

The Third *Humour* is the Urine, which flows from the Bladder by the Urinary Paſſage, into the Urinary Membrane.

HUMOURS *of the Eye*, are Three: The *Watery* or *Aqueous*, which is contained between the *Tunica Cornea* and *Uvea*.

2. The *Cryſtalline* or *Icy Humour*, which is contained in the *Tunica Uvea*, and is thicker than the reſt.

3. The *Vitrious* or *Glaſſy Humour*, bigger than any of the reſt, fills the backward Cavity of the Eye.

The *Aqueous Humour* ſerves to moiſten and levigate the two other denſer *Humours*, as alſo the *Tunica Uvea* and *Retina*, and perhaps (ſaith *Diemerbroeck*) to nouriſh them too: When this fails, grows dreggy, or too thick, the Sight preſently grows dull and imperfect. If it be ſo dreggy as that pretty large Particles are formed, and ſwim about in it, the Perſon fancies he ſee Flies and Motes always before his Eyes; and if theſe Particles grow altogether in a Film or Membrane, and ſo come to cover the Pupil, 'tis called a *Suffuſion*, which is the Beginning of a *Cataract*.

The *Vitrious Humour*, ſome ſay, ſerves to dilate the Rays which it receives from the *Cryſtalline*, and to bring them to the *Retina*; or, as others think, it helps to collect the Rays refracted by the *Cryſtalline* into one Point, that the Viſion may be the more diſtinct and vivid.

The *Cryſtalline Humour*, which ſome call *Glacialis*, is the primary Inſtrument of Viſion, in reſpect of its Collecting and Reception of the Rays, which coming hither, dilated by the *Aqueous Humour*, are collected and conveyed to the *Retina*.

HURDLES, or *Clays*, in Fortification, are made of thick and ſmall Twigs of Willows or Oſiers, being 5 or 6 Foot high, and from 3 to 4 Foot broad. They are interwoven very cloſe together, and uſually laden with Earth, that they may ſerve to render Batteries firm, or to conſolidate the Paſſage over muddy Ditches; or to cover Traverſes and Lodgments for the Defence of the Workmen, againſt the Artificial Fires or Stones that may be caſt upon them.

HURTS, a Term in Blazony: See *Balls*.

HUSTINGS, a Court held before the Lord-Mayor and Aldermen of *London*; an Error or Attaint lies there of a Judgment or falſe Verdict in the Sheriff's-Court.

HYALOIDES, is the Vitreous Humour of the Eye, contained betwixt the *Tunica Retina* and the *Uvea*.

HYBERNAL *Occident*: See *Occident*.

HYBERNAL *Orient*: See *Orient*.

HYBONA, is an Incurvation of all the Vertebres.

HYDATIDES, are little Watery Bladders in the Liver, Spleen, or ſome other Viſcus, common to Hydropical Perſons: But Dr. *Tyſon* ſuppoſes them to be a Species of Worms, or imperfect Animals.

HYDATOIDES, is the Watery Humour of the Eye, contained betwixt the *Tunica Cornea* and *Uvea*.

HYDRA, a Southern Conſtellation, conſiſting of 26 Stars, and imagined to repreſent a *Water-Serpent*.

HYDRAGIA: See *Venæ Lymphaticæ*.

HYDRAGOGUES, are Medicines which, by Fermentation and Precipitation, purge out the Watery Humours.

The Ancients thought this was done by ſome peculiar Texture, and that thence its Virtue aroſe to purge away Seroſities or Watery Humours only.

HYDRAULICS, the Art of making all ſorts of Engines to carry or raiſe Water, or which are moved by Water, and ſerve for other Uſes: The Word

Word ſignifies Sound made by Water, becauſe when Organs were firſt found out, they were blown by the Fall of Water inſtead of Bellows.

You have many Ancient Water-Engines deſcribed by *Hiron*, and which are called *Machinæ Hydraulicæ*. *Athenæus* attributes the Invention of the Water-Organ to *Cteſibius* but others ſay *Plato* firſt found out the ſounding *Clepſydra*, which told the Hour of the Night by the Noiſe of Pipes blown by the Air forced by the Fall of Water: Mr. *Ozonam* confounds this Word with *Hydroſtaticks*.

HYDRAULO-PNEUMATICAL *Engines*, are ſuch as raiſe Water by means of the Spring (either Natural or Forced) of the Air.

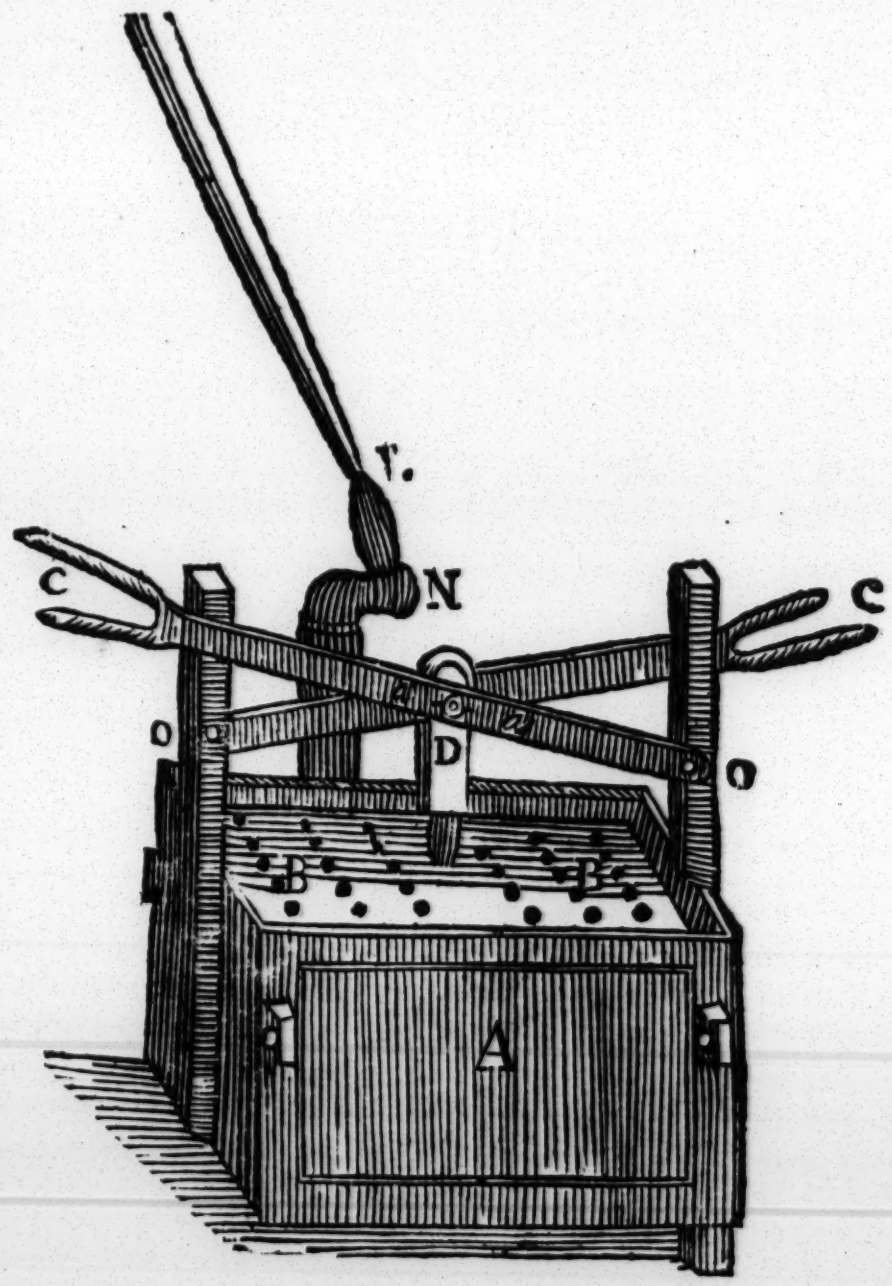
The Honourable Mr. *Boyle* mentions a very pretty Fountain, which he calls *Hydraulo-Pneumatical*, and which was made by the Spring of the Air preſſing up Water in a Pipe, when in the Exhauſted Receiver the Weight of the Atmoſphere was taken off: See *Continuation of Phyſico-Mechanical Experiments*, Exper. 4.

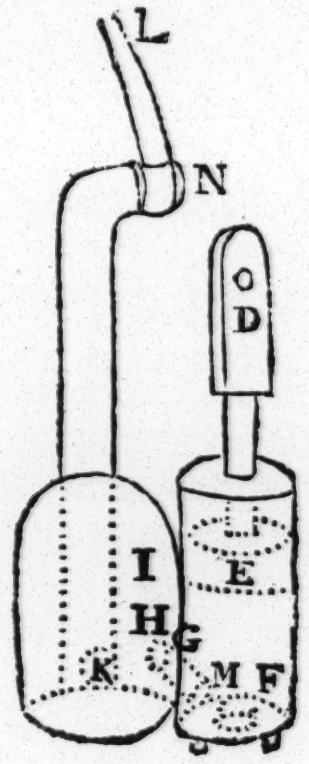
And you may eaſily try the thing, if you fill but any middle ſiz'd Vial about half full of Water; and then, with Sealing-Wax or Cement, faſten in its Neck a long ſlender Glaſs Pipe, (a Piece of Tobacco-pipe or Quill will do) one of whoſe Ends ſhall be below the Surface of the Water in the Glaſs; for then, if the Mouth of the Bottle be accurately ſtopp'd, the Warmth of your Hand only will ſo increaſe the Spring of the included Air, that it will make the Water riſe up, and run out at the Top of the Pipe; and if you blow ſtrongly in at the Top, and force a good Quantity of Air into the Bottle, the Spring of the Air ſo forced in, will, on the Removal of your Mouth, drive the Water up the Pipe with a great Force; and if the Orifice be very ſlender, or the Cavity of the Pipe very ſmall, it will make the Water imitate an Artificial Fountain, which will keep running for near half a Minute.

A Deſcription of the Common Hydraulick Engine *uſed to quench Fire*, &c. *from* Philoſoph. Tranſ. Numb. 128.

The Engine is a Cheſt of Copper, as *A*, tranſportable by means of two wooden Bars, like a Sedan or Chair. This Cheſt is pierced with many Holes above *B B*, and holds within it the Body of a Pump *E F M*, whoſe Sucker *D E* is raiſed and abaſed by two Leavers *C O*: Theſe Leavers have each of them two Arms, and each Arm being fitted to be laid hold on by both Hands of a Man. Each Leaver is pierced in the Middle by a Mortiſe *a a*, in which an Iron Nail, which paſſes through the Handle of the Sucker, turns round when that Sucker is raiſed or lowered.

Near the Body of the Pump there is a Copper-Pot *I H K*, join'd to it by the Tube *G*; and having another Tube *K N L*, which in *N* may be turned every way.





To make this Engine play, Water is poured upon the Cheſt, to enter in at the Holes that are in the Cover thereof: This Water is drawn into this Body of the Pump at the Hole *F*, at the Time when the Sucker is raiſed; and when the ſame is let down, the Valve of the ſame Hole *F* ſhuts, and forces the Water to paſs thro' the Hole: For in the Tube *G* of which the Valve *H* being lifted up, the Water

enters

enters into the Pot, and filling the Bottom, it enters thro' the Hole *K* into the Tube *KNL*, in ſuch a manner, that when the Water is higher than the Tube *KNL*, and the Hole of the Tube *G* is ſhut by the Valve *H*, the Air incloſed in the Pot hath no Iſſue; and it comes to paſs, that when you continue to make the Water enter into the Pot by the Tube *G*, which is much thicker than the Aperture of the End *L*, at which it muſt iſſue, it muſt needs be, that the Surplus of the Water that enters into the Pot, and exceeds that which at the ſame time iſſues through the ſmall End of the Jet, compreſſes the Air to find Place in the Pot, which makes that, whilſt the Sucker is rais'd again, to make new Water by the Force of its Spring, mean time that a new Compreſſion of the Sucker makes new Water to enter, and cauſes alſo a new Compreſſion of Air: And thus the Courſe of the Water which iſſues by the Jet, is always entertained in the ſame State, becauſe that proportionably, as the Impulſe is ſtrong, the Water entring faſter, and conſequently in greater Quantity into the Pot, makes a greater Compreſſion of the Air, which, the more ſtrongly it is compreſs'd and penn'd in, returns alſo with the greater Force into its Native State, by means of its Spring, and therefore throws out the Water with greater Force.

HYDRENTEROCELE, is a Falling of the Inteſtines, together with Water, into the *Scrotum*. *Blanchard.*

HYDROA, are certain little, broad, moiſt, itching Pimples, like Millet-ſeed; ſometimes without itching, which render the Skin ulcerous and rough; tho' to expel the Sweat by the Skin, is hindred ſometimes by its Thickneſs; ſo that the Matter being lodged there, and the ſubtler Parts being either carried back by the Lymphatick Veſſels, or evaporated, the Skin ſwells. This Diſtemper is familiar and common to Boys and young Men, eſpecially of a hot Conſtitution, when they uſe too much Exerciſe in Summer: It infects the Neck, Shoulder-blades, Breaſts, Arms, Thighs, yet more frequently the Secret Parts and the Fundament. *Blanchard.*

HYDROBELE, is a ſwelling of the outermoſt Skin of the *Scrotum*, proceeding from a Watery Humour. *Blanchard.*

HYDROCEPHALUM, is a Swelling of the Head, by reaſon of a watery Humour; whence the Sutures of the Brain are forced aſunder; it proceeds ſometimes from a Burſting of the Lymphatick Veſſels. *Blanchard.*

HYDROGRAPHICAL-CHARTS, are certain Sea Maps, delineated for the Uſe of Pilots and other Mariners; wherein are mark'd all the Rhumbs or Points of the Compaſs and Meridians parallel to one another, with the Shelves, Shallows, Rocks, Capes, &c.

HYDROGRAPHY, is an Art which teacheth how to deſcribe and meaſure the Sea; giving an Account of its Tides, Counter-Tides, Soundings, Bays, Gulphs, Creeks, &c. As alſo the Rocks, Shelves, Sands, Shallows, Promontories, Harbours, Diſtance from one Port to another, and other things remarkable on the Coaſts.

HYDROMANCY, a pretended Divination by Water.

HYDROMEL, Mead, is a Decoction of Water and Honey.

HYDROMPHALUM, is a Protuberance of the Navel, proceeding from Watery Humours in the *Abdomen*. *Blanchard.*

HYDROPHOBIA, is a Diſtemper highly Convulſive, accompanied with Fury, and ſhunning of all things that are Liquids and Splendid; ſometimes with a *Delirium*, a Fever, and other Symptoms, and not without great Danger of Life, proceeding from the Bite of a mad Dog, or a Contagion analagous to it.

In *Philoſoph. Tranſact. N.* 147. there is an Inſtance of one having this Diſeaſe, occaſioned by the Bite of a mad Dog.

HYDROPICA, are Medicines that expel the Watery Humour in a Dropſie.

HYDROPS, a Stagnation of the Watery Humour in the Habit of the Body, or ſome Cavity of it: And it is either General, as an *Anaſarca*, and *Aſcites*; to which ſome add a Tympany, but ill: Or Particular, confined to one Part, as a Dropſie in the Head, Breaſts, Hand, Foot, &c. *Blanchard.*

HYDROPS *ad Matulam*, the ſame with *Diabetes.*

HYDROSTATICKS, is that Part of Staticks which relates to the Gravities and *Æquilibria* of Liquors; and alſo comprehends the Art of Weighing Bodies in Water, or ſome other proper Liquor, thereby to eſtimate their Specifick Gravity, and to deduce thence many other uſeful Theorems.

And *this* (as is obſerved by the Honourable Mr. *Boyle*) is a Part of Philoſophy which ought to be looked upon as the moſt ingenious of any: The Theorems and Problems of this Art, being handſome Productions of Reaſon, and affording Diſcoveries, not only pleaſing, but alſo ſurprizing and wonderful: Nay, very many of the moſt familiar, as well as moſt abſtruſe Phænomena of Nature, can hardly ever be throughly underſtood without Hydroſtatical Principles 'Tis an Art alſo not only delightfully Speculative, but practically Uſeful: It may be of the higheſt Importance to Shipping and Navigation, to thoſe that deal in Salt-works, and to thoſe whoſe Buſineſs 'tis to enquire into the Gravities and Magnitudes of ſome Bodies; the exact Knowledge of which would very much conduce to their Intereſt. But of the great Uſefulneſs of this Art, ſee more under *Specifick Gravity.*

And that Admirable Gentleman, the Honourable Mr. *R. Boyle*, conſidering that all Perſons are not acquainted with, and cannot readily digeſt rigid Mathematical Demonſtrations, that it might be of great Advantage to prove the Truth of ſuch uſeful Propoſitions, as thoſe given us by Hydroſtatical Writers, in a Senſible and Phyſical way: As alſo, That ſome things before paſſing for receiv'd Truths, would then be diſcover'd to be palpable Errors, as well as many Noble and uſeful Diſcoveries this way communicated to the World:

Conſidering this, I ſay, That Noble Author reduced the chiefeſt of the Hydroſtatical Theorems into the following Paradoxes; which you will ſee he made clearly out by Experiment and ſenſible Proof.

Though before he comes to them, he thinks fit to premiſe theſe things as *Poſtulata* or *Lemmata.*

1. That if a Pipe, or Tube, open'd at both Ends, and placed perpendicularly to the Horizon, have its lower Oriſice under Water, there will paſs an Imaginary Plane or Surface parallel, as to Senſe, to the upper Surface of the Water, which ſhall touch that lower Orifice of the Tube.

2. That each Part of this Surface or Plane will be alike preſſed (if at all) by the Weight of the perpendicularly incumbent Water, which cannot but be granted, ſince the Water being ſuppoſed an homogenous Fluid of equal Gravity every where, and equally high above the aforeſaid Plane, there can

no reaſon be aſſign'd why any one Part of it ſhould be more or leſs preſſed than any other.

3. That though in this Caſe the Liquor will keep its former Poſition, yet if any one Part of it comes to have a greater Weight incumbent on it than another, then that Part will be diſplaced and depreſſed; as is the Caſe when a Stone or other Body, ſpecifically heavier than Water, ſinks down in it, and tends to the Bottom.

For in what Part ſoever of the Water the Stone is, that part being more preſſed upon than the reſt, muſt yield and give way to the Motion of the Stone downward, till it come to the Bottom.

And on the other Hand, if any Part of this imaginary Surface be leſs preſſed upon than the reſt, it muſt, by the greater Preſſure of the reſt, be impelled upwards, till it have an height equivalent to balance the Preſſure made on the other Parts of the Water; which latter Part will appear highly reaſonable and grantable by any attentive Conſiderer.

And its Truth in Fact he proves by this Experiment:

If a ſmall Tube, open at both Ends, be held or placed perpendicularly a little beneath the Surface of the Water, in any Veſſel; [Note, *'Tis beſt to uſe one of Glaſs, that the Experiment may be the more viſible*;] then will the Water riſe in the Tube as high and a little higher (for a Reaſon which you will find given hereafter) than the Surface of the Water without: But if you gently pour Oil of Turpentine, or any other Liquor which will not mix with Water, upon that contained in the Veſſel, you will ſee, that as the Oil grows higher and higher on the Surface of the Water, and preſſes conſequently more and more upon it, ſo will the Water riſe within the Orifice of the Tube, and deſcend again proportionably as you take off the Oil; which plainly proves, That the Weight of the Oil preſſing more on the Surface of the Water without the Tube, than the bare Air only can do within it, forces up the Water ſo high in the Tube, till the Cylinder of Water within the Tube, doth as much gravitate on that Part of the Water under the Orifice of the Tube, as the Air, Oil and Water together do on all the others, without it.

PARADOX I.

That the Upper Parts of all Fluids, as Water, &c. do preſs upon the Lower.

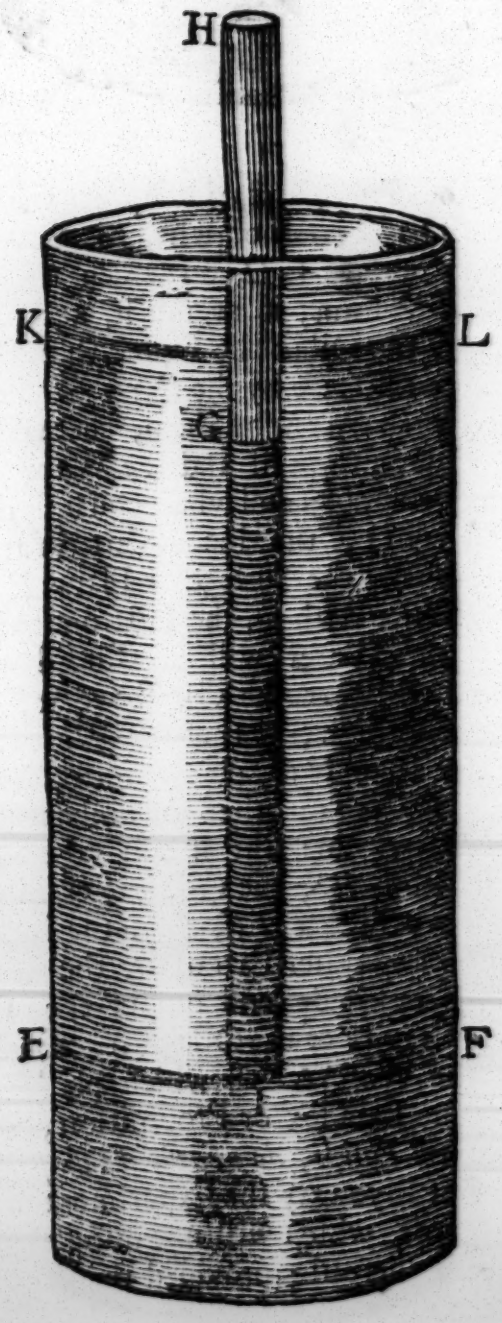
Provide a Glaſs Jarr, near of the Shape in the Figure annexed; (though a long Drinking-glaſs, like that uſed for Mum, may do well enough.) Fill it with Water near full, as up to AB: Then take a ſmall Glaſs Pipe or Tube, open at both Ends, and dipping the lower End into Oil of Turpentine, you may, by ſtopping the Top with your Finger, ſuſpend as much of the Oil as you pleaſe in the Tube: This done, move the Tube into the Glaſs of Water, and thruſt it down till the upper Surface of the Oil in the Tube, be near as low as the upper Surface of the Water: And when you take your Finger from the Top of the Tube, you will ſee the Oil will not run out at the lower Orifice of the Tube. Nay, if you thruſt the Tube lower down into the Water, that Liquor will riſe up into the Tube, and bear the Oil above it; but if you raiſe the Tube up, ſo that the upper Surface of the Oil in it be higher conſiderably than that of the Water, the Oil will

drop out of the Tube, and riſe up to the Top of the Water. The Reaſon of which is this: When the Imaginary Surface *GH*, on which the End *Q* of the Tube *PQ* leans, is as much, and no more, preſſed upon by the Oil in the Pipe, than the other Parts of that Surface are by the Parts of the Water perpendicularly incumbent on them, there is an *Æquilibrium* between the Oil and the Water, and ſo the Oil cannot run out; and when you ſink the Tube down as low as *O*, the incumbent Water doth more gravitate on the Surface or Plane *EF*, than the Oil in the Tube doth on the Part under it; and conſequently the Water will be forced up into the Tube, and will bear the Oil above it; and the Water will riſe ſo high, as that the Water and Oil together in the Tube *NO*, do gravitate as much on the Surface *EF*, as the other incumbent Parts of the external Water do: But if you raiſe the Tube up into the Poſition *RS*, the Oil in it preſſing more on the Imaginary Surface *IK*, than the incumbent Water doth on any other Part of it, the Oil muſt run out, till ſo much deſcend out of the Tube as will bring the Gravity of the Oil to an *Æquilibrium* with that of the Water. All which plainly prove the Truth of the Paradox or Propoſition, *That the upper Parts of all Fluids, do gravitate or preſs upon the Lower.* For if you try the Experiment with any two other Liquors, which will not mingle one with another, it will ſucceed; provided the Bore of the Pipe be not too large.

PARADOX II.

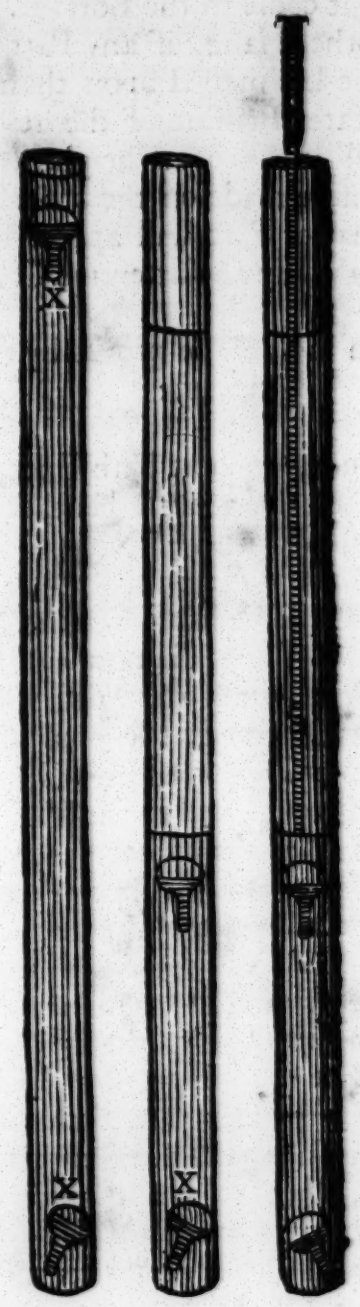
That a lighter Fluid may gravitate or preſs upon a heavier.

Fill the former Jarr with Oil of Turpentine, inſtead of Water, and then place in it a Tube of the ſame Bore as the former, in which you ſhall have ſuſpended a Column of Water, as before you had of Oil: And you will find that though the Water be heavier than Oil of Turpentine, yet if you do not take your Finger from the upper Orifice till ſuch time as you have ſunk the Pipe ſo low as that the upper Surface of the Water in it be a little below the Surface of the Oil in the Glaſs; I ſay, that then on taking off your Finger, you will find the Water in the Pipe will not run out: That if you ſink the Tube lower, or pour more Oil into the Veſſel, the Oil will riſe up in its Lower End; and that if you raiſe it higher, the Water will run or drop out, and fall to the Bottom of the Veſſel. Which plainly ſhews, That a Liquor lighter in Specie, may buoy up and keep ſuſpended one that is heavier; and the Reaſons are in effect the ſame as thoſe given for the Solution of the Phænomena of the Firſt Paradox; the only Difference being, that the Oil and the Water have changed Places, the Oil now being in the Jarr, and the Water in the Tube.



This Second Paradox our Author alſo very ingeniouſly illuſtrates and confirms by the following Experiment.

Into a long Glaſs Pipe, ſealed at one End, and whoſe Bore was about half an Inch in Diameter, he poured a Quantity of Water; and then having a ſmall Glaſs Bubble about the Bigneſs of a Pea, with a very ſmall and ſlender Stem, as you ſee in the Figure annexed; which Bubble was ſo exactly



poiſed, by forcing Water into it, that tho' it would not ſink in a Veſſel of Water, yet a very little more Weight would make it do ſo.

This Bubble being put into the Glaſs Pipe, did ſwim on the Top of the Water contained in it; but when he poured Oil of Turpentine (very gently, to prevent confounding the Two Liquors) on the Water in the Pipe, and that till it had attained a convenient Height above the Surface of the Water, he found that the Bubble, which before ſwam on the Surface of the Water, did now ſink down to the Bottom, and ſtay there as long as the Oil was kept upon the Water; but if either the Tube was very much inclined any way, or if the Oil, by a Siphon or otherwiſe, were drawn off, the Bubble would then emerge to the Top.

The Reaſon of which Phænomenon he truly ſtates to be this, That when the Oil was poured on, that did (though a lighter Fluid by its proper Gravity) preſs on the Water on which it was incumbent, and by that Means did force ſome of it to enter in at the little Stem of the Bubble; which, by that means being rendred in the whole more heavy, did ſink to the Bottom: But when the perpendicular Preſſure of

of the Oil upon the Water was taken off, by inclining the Tube, or removed by drawing off the Oil quite, the Air in the Bubble, which before was compreſt, did now by its Spring force out the newly admitted Water again, and ſo reduce the Bubble to its former Degree of Gravity, ſo that it would be ſuſpended in the Water as before.

He found alſo, that pouring on *more Water* would produce the ſame Phænomenon, if, by a Wire, he firſt thruſt down to, and then kept at the Bottom of the Tube the aforeſaid poiſed Bubble; for though it would readily emerge on the removal of the Rod or Wire, when no more Water was poured into the Tube, yet, that if the Wire kept the Bubble at the Bottom till he had poured in more Water, to about two or three Foot high, into the Pipe, the Bubble would then, on the removal of the Wire, ſtay there, and not riſe at all till the ſame Quantity of Water was taken out which was before added: Which Experiment doth Nobly Illuſtrate and Prove his firſt Propoſition, *That the upper Parts of the ſame Fluid, do preſs or gravitate on the lower.*

PARADOX III.

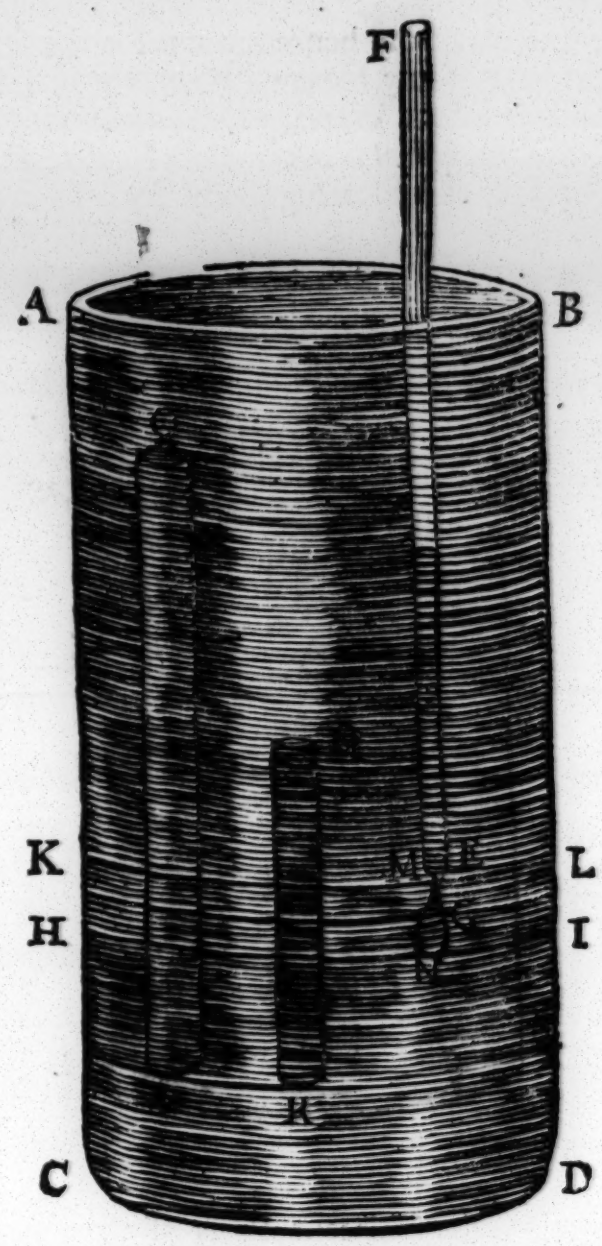
If a Body contiguous to the Water be altogether, or in Parts, lower than the upper Surface of the Water, the lower Part of the Body will be preſſed upward by the Water which toucheth it beneath.

This appears from the *Firſt Experiment*, where the Oil of Turpentine was kept in an open Tube from deſcending, or running out of it, by the Preſſure upwards of the Water on its lower Parts.

And by the *Second Paradox* it appears, that Oil, a lighter Fluid, could preſs upwards, or keep Water, a Fluid in Specie heavier than it, ſuſpended in an open Pipe.

But in order to eſtimate how much the Preſſure of the Water againſt the lower Parts of any Body doth amount to, let us ſuppoſe a Parcel of Oil, heavier than Water, as ſuppoſe that of Cinnamon, Cloves, Guaicum, &c. were taken up into a Tube, and then that Tube were, as in the former manner, immerſed into a Veſſel of Water, and there placed ſo ſhallow, that the Oil, on removing of the Finger from the Top of the Tube, would drop out. The Drop *G*, being heavier in Specie than Water, would (by *Lemma* 3.) ſink to the Bottom, but not ſo quickly as it would in the Air; and ſince, if it were of a Matter equi-ponderant to Water, 'tis plain it could not ſink at all, any more than emerge; it doth now ſink by no greater a Degree of Gravity, than that by which it ſurmounts a Quantity of Water equal to it in Bulk: And therefore *it will loſe in the Water juſt as much of the Weight it would have in the Air, as ſo much Water as is equal to it in Bulk, if weighed in the Air alſo, would amount to*: which is a Phyſical Demonſtration of the *Grand Theorem of Hydroſtaticks*, firſt put in a clear Light by our Noble Author Mr. *Boyle*.

The Preſſure of Water alſo againſt the lower Parts of any immerſed Body, is confirmed by attending to the *Reaſon* why any Body lighter in Specie than Water, doth emerge out of it; which is this, That there is a greater Preſſure or Weight on every other Part of the imaginary Surface of the Water (as ſuppoſe *I K* in *Fig.* 1.) than there is on that, on which the emerging or riſing Body leans; and conſequently to produce an *Æquilibrium* in the Fluid, the Parts immediately under the riſing Body being preſſed by the reſt every way, muſt continually force it upwards, till it attain the upper Surface of the Water: For the emerging Body is



continually preſſed upon by two Columns of Water, one bearing againſt its upper, and the other againſt the lower Parts; the Length of both which Columns being to be accounted from the Top of the Water, that which preſſes on the lower Part, will be the longer by the Thickneſs of the aſcending Body, and conſequently over-balance it by the Weight of as much Water as will fill the Space that Body takes up: Wherefore the greater Diſparity there is between the Specifick Gravities of Water and the emerging Body, and the larger the Particles are that emerge, the ſwifter will they aſcend.

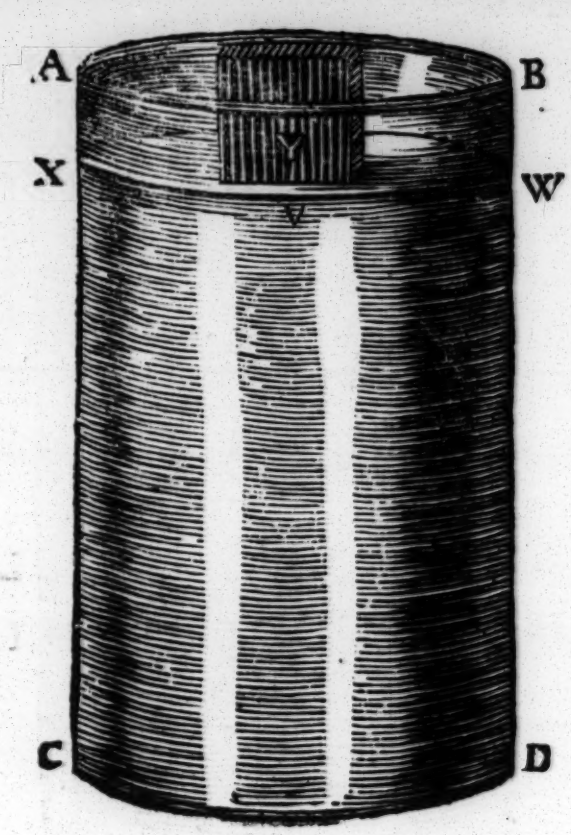
And this will help us to account for theſe things.

1. For the Reaſon of that Experiment, That if two Pieces of a Stick of the ſame Bigneſs, but of unequal Length, as *O P*, and *Q R*, are permitted to riſe from the Bottom of a Veſſel of Water at the ſame time, the longeſt will come firſt to the Top, which muſt be becauſe the Columns of Water which preſs againſt the lower Ends of both, being equal, but that ſhorter which preſſes on the upper End of the longer Piece, it muſt be leſs preſſed downwards than the other, and ſo by the general Preſſure upwards will riſe faſteſt.

2. From hence we may eaſily conceive one Reaſon, (for I aſſert not that 'tis the only one) why very minute Corpuſcles, either higher or heavier in Specie than the Liquor they are mingled with, may be kept there a good while without emerging to the Top, or precipitating to the Bottom: For their

Thickneſs being indefinitely made ſmall, the Difference between the two Columns before mentioned, will be ſo too, and conſequently either of them can very little over-ballance the other.

3. We may from hence account for the Quantity of that Part of any Floating Body which is beneath the Surface of the Water, *which is always in Bulk equal to as much Water as the whole Floating Body doth weigh:* For this Floating Body doth by its lower



Part preſs on the ſubjacent Parts of the imaginary Surface of the Water *XW*, juſt as much as the Columns of Water to the Altitude *AX* or *BW* do on all other Parts; that is, juſt as much as the Water would do if it were in the Space which the Part immerſed takes up, or as much as a Quantity of Water equal in Bulk to the immerſed Part would do.

And from hence 'tis clear, That the Weight of that mighty Ship, the *Royal Sovereign*, is the ſame with that of ſo much Water as is in Bulk equal to the immerſed Part of her, or to that Part of her Hull which is underneath the Surface of the Sea. Which Aſſertion Mr. *Boyle* found accurately enough to hold true by the following Experiment:

A broad ſhallow Veſſel of Glaſs being near filled with Water, he placed floating in it a Glaſs Tumbler or ſhort Drinking Glaſs; and to make it a little reſemble a Ship, he fitted a Wooden Deck, with a Maſt, &c. to it; and then he ſunk it by ballaſting it with Sand, and made it draw as much Water (as the Seamen ſay) as he thought fit: Then did he, by accurate Marks, diſtinguiſh how high the Water in the containing Glaſs did riſe on the Sides of the Veſſel: This done, he took the Tumbler out, wiped it dry, and weighed it, and then found a Quantity of Water exactly equal to that Weight: which Water, when put into the broad Glaſs, roſe up to thoſe Marks exactly which he had before obſerved the Tumbler had raiſed the Water to.

PARADOX IV.

That to account for the raiſing of Water in Pumps, &c. there needs only the competent Weight of an External Fluid.

Take up in a ſlender Glaſs Tube about an Inch in height of any deeply tinged Liquor (ſuch as an Infuſion of Brazil-wood and Cochineel, &c. in Water, for elſe the Phænomena will not be conſpicuous) and then ſtopping the upper End with your Finger, place it in a Glaſs Veſſel filled with the ſame tinged Liquor, and that ſo low, that the upper Surface of the Liquor in the Tube be at leaſt an Inch below that of the Liquor of the Veſſel: Then pour on Oil of Turpentine for about 3 or 4 Inches height above the Water in the Veſſel, and you will ſee, on the removal of your Finger from the Top of the Tube, that the tinged Water will be raiſed or impelled upward near as high as the Surface of the Oil.

Now here no *abhorrence of a Vacuum* can be pretended, as the Cauſe of the Aſcent of the Water, for the Tube is full of Air, and the External Air hath a free Ingreſs into it: But the plain Reaſon is this, That there being a greater Preſſure made by the Oil and Water together on the imaginary Plane that paſſes by the lower Orifice of the Tube without the Tube, than within it, (for within there is a Preſſure only of an Inch of Water, and of a Column of Air) the Parts of the Water at the Bottom of the Pipe muſt be thruſt upwards into it, till it riſe ſo high as to gain an *Æquilibrium* with the reſt.

And this will eaſily account for the Aſcent of the Water in the Pumps:

Where the external Air preſſing every where on the Surface of the Water in the Well, but not on that within the Pump, becauſe 'tis taken off by the Sucker; which is therefore with ſoft Leather, &c. made ſtanch on purpoſe.

On the raiſing therefore of the Sucker, the Water muſt follow it (if the Pump be good) becauſe the Weight of the whole Atmoſphere preſſes on the Surface of the Water in the Well, (but not at all within the Body of the Pump) and ſo raiſes or forces it up into the Cavity of the Pump. And that this Preſſure of the Air is the Cauſe of the Waters riſe, is more than probable, becauſe no Pump can ever raiſe Water above 33 or 34 Foot; which is found to be exactly agreeable to the different Gravities of Air and Water, allowing for the great Height of the Atmoſphere: *Of which more elſewhere.*

PARADOX V.

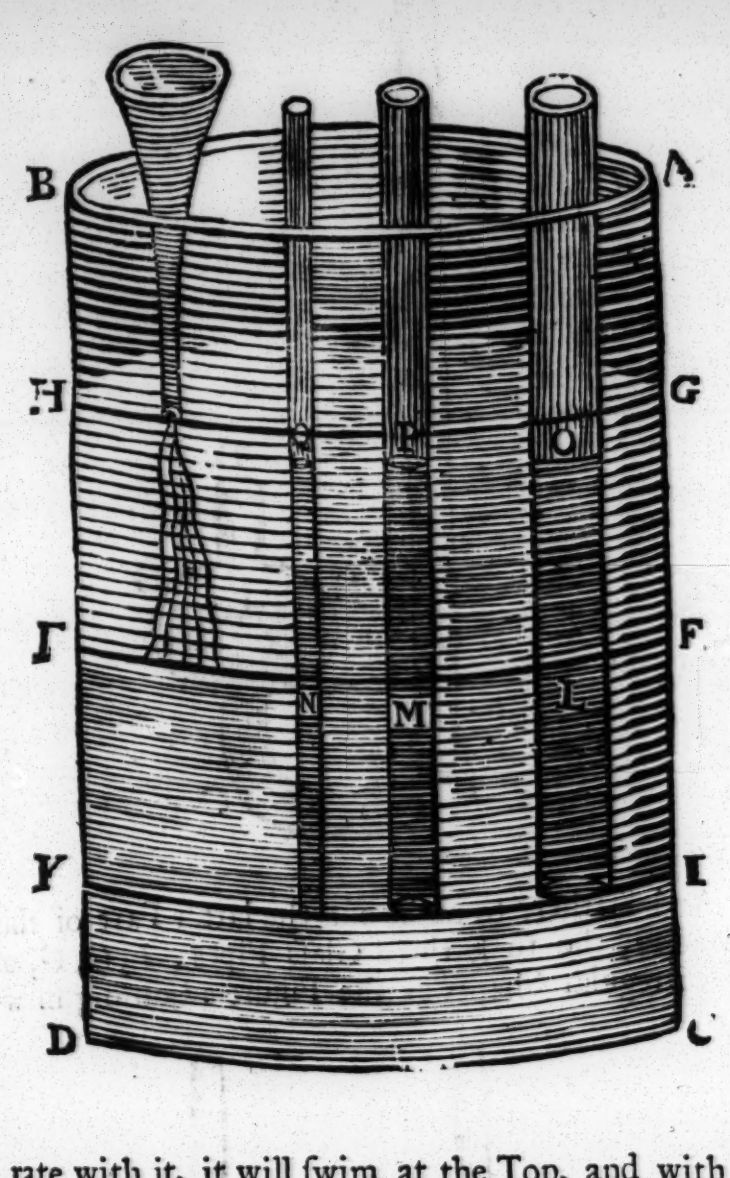
That the Preſſure of an External Fluid, is able to keep an Heterogeneous Liquor ſuſpended at the ſame Height in ſeveral Pipes, though they be of different Diameters.

Take a pretty wide-mouth'd Glaſs, (as in *Fig.* 5. following) of a convenient Depth, and put into it a ſufficient Quantity of Water well tinged with Brazil, &c. then fit to it a Cover of Cork, through which bore, with a red-hot taper Iron, ſeveral round Holes, to admit Tubes of different Bigneſſes or Sizes. Let theſe Tubes ſtand nearly upright in the Veſſel, and reach all with their lower Orifices below the Surface of the Water: Then at an Hole purpoſe-

purpoſely left for it, pour in gently, by a Glaſs Funnel, a good Quantity of Oil of Turpentine, and you will plainly ſee the tinged Water riſe equally, (*i. e.* to equal Heights) in all the Tubes, tho' of very different Bores and Sizes.

The Reaſon of which will thus appear.

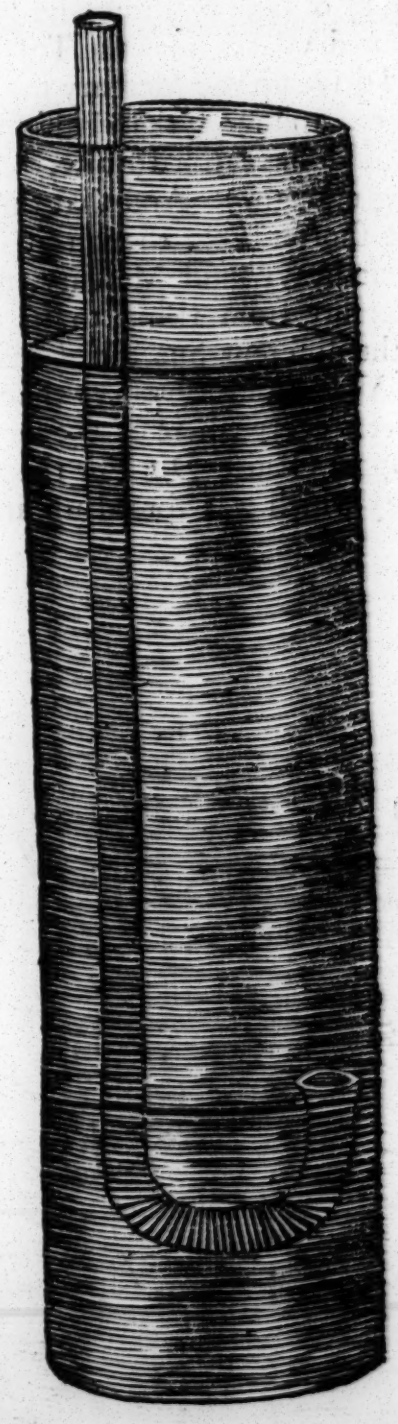
Let *E F* repreſent the Surface of the Water in the Veſſel; when the Oil comes to be poured upon it, not being of a Nature fit to mingle or incorporate with it, it will ſwim at the Top, and with an equal Gravity preſs upon all Parts of the Surface of the Water, and conſequently will raiſe or preſs up the Water in the Tubes, till it come near to the ſame Height in them, as the Oil is at in the Glaſs, to bring the Liquors to a Balance. But there is no Reaſon why the Water ſhould be raiſed to a greater Height in any one Tube than in another; becauſe the Oil preſſes uniformly and equally on all Parts of the Surface of the Water; and conſequently can force up the Water no higher in the ſmalleſt Tube than in the greateſt; for ſhould it do ſo, the Water in the ſmall Tube muſt be of a larger Length than the correſponding Column of Oil (whoſe Diameter is equal to the Orifice of that Tube, and which keeps it up by equi-ponderating with it) doth require: But then it muſt be heavier than it, and ſo would ſink down, and drive the ſubjacent Water away to make room for its Deſcent: Wherefore no Cylinder of Water in any Tube, can be higher than an equal Cylinder of Oil that bears or buoys it up; and this being the Caſe with them all, they muſt be all of the ſame Height; that is, the Water will riſe as high in one Tube as in another, be their Bores never ſo different; and the Reaſon is, becauſe each one is born up by a correſponding Column or Cylinder of Oil, whoſe Diameter is the ſame with that of the Orifice of the Tube.



PARADOX VI.

If a Body be placed under Water, with its uppermoſt Surface parallel to the Horizon, the direct Preſſure *which it ſuſtains, is no more than that of a Column of Water, having the Horizontal Superficies of the Body for its Baſe, and the Perpendicular Depth of the Water for its Height. And if the Water that leans on the Body be contained in Pipes open at both Ends, the Preſſure of the Water is to be eſtimated by the Weight of a Pillar of Water, whoſe Baſe is equal to the lower Orifice of the Pipe, and its Height equal to a Perpendicular reaching from thence to the Top of the Water; though the Pipe be much inclined any way, or though it be never ſo irregularly ſhaped; and much broader in ſome other Places than at the Bottom.*

Take a ſlender Glaſs Pipe of an even Bore, turned up at one End like this in the Figure; dip this Tube (open at both Ends) into Oil of Turpentine,

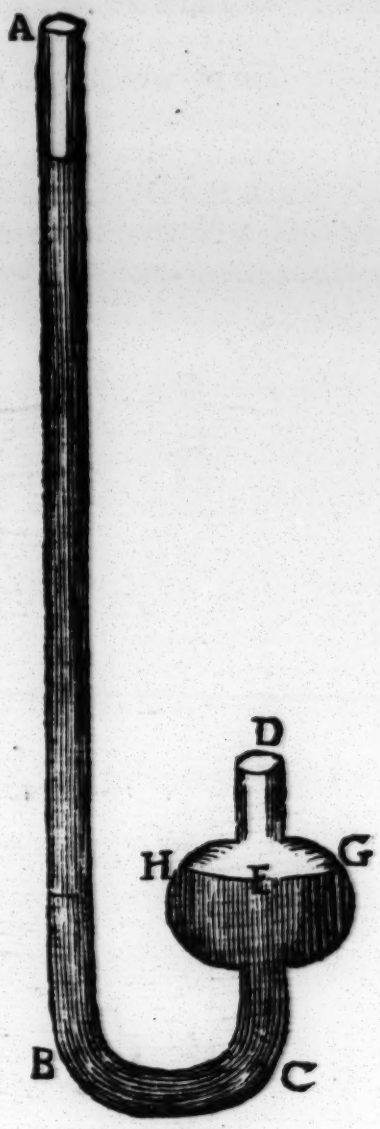


till the Liquor be riſen up to two or three Inches in the longer Leg, whoſe upper Orifice then ſtop with your Finger; and then remove the Tube into a Glaſs of Water, and hold it ſo that the Surface of the Oil in the longer Leg of the Pipe be but a very little higher than that of the Water: And then, if you take away your Finger that ſtopt the Pipe, you will ſee the Oil will keep its ſtation, and not at all, or at leaſt but very little, riſe or fall; but if you ſink the Tube lower, the Oil will riſe;

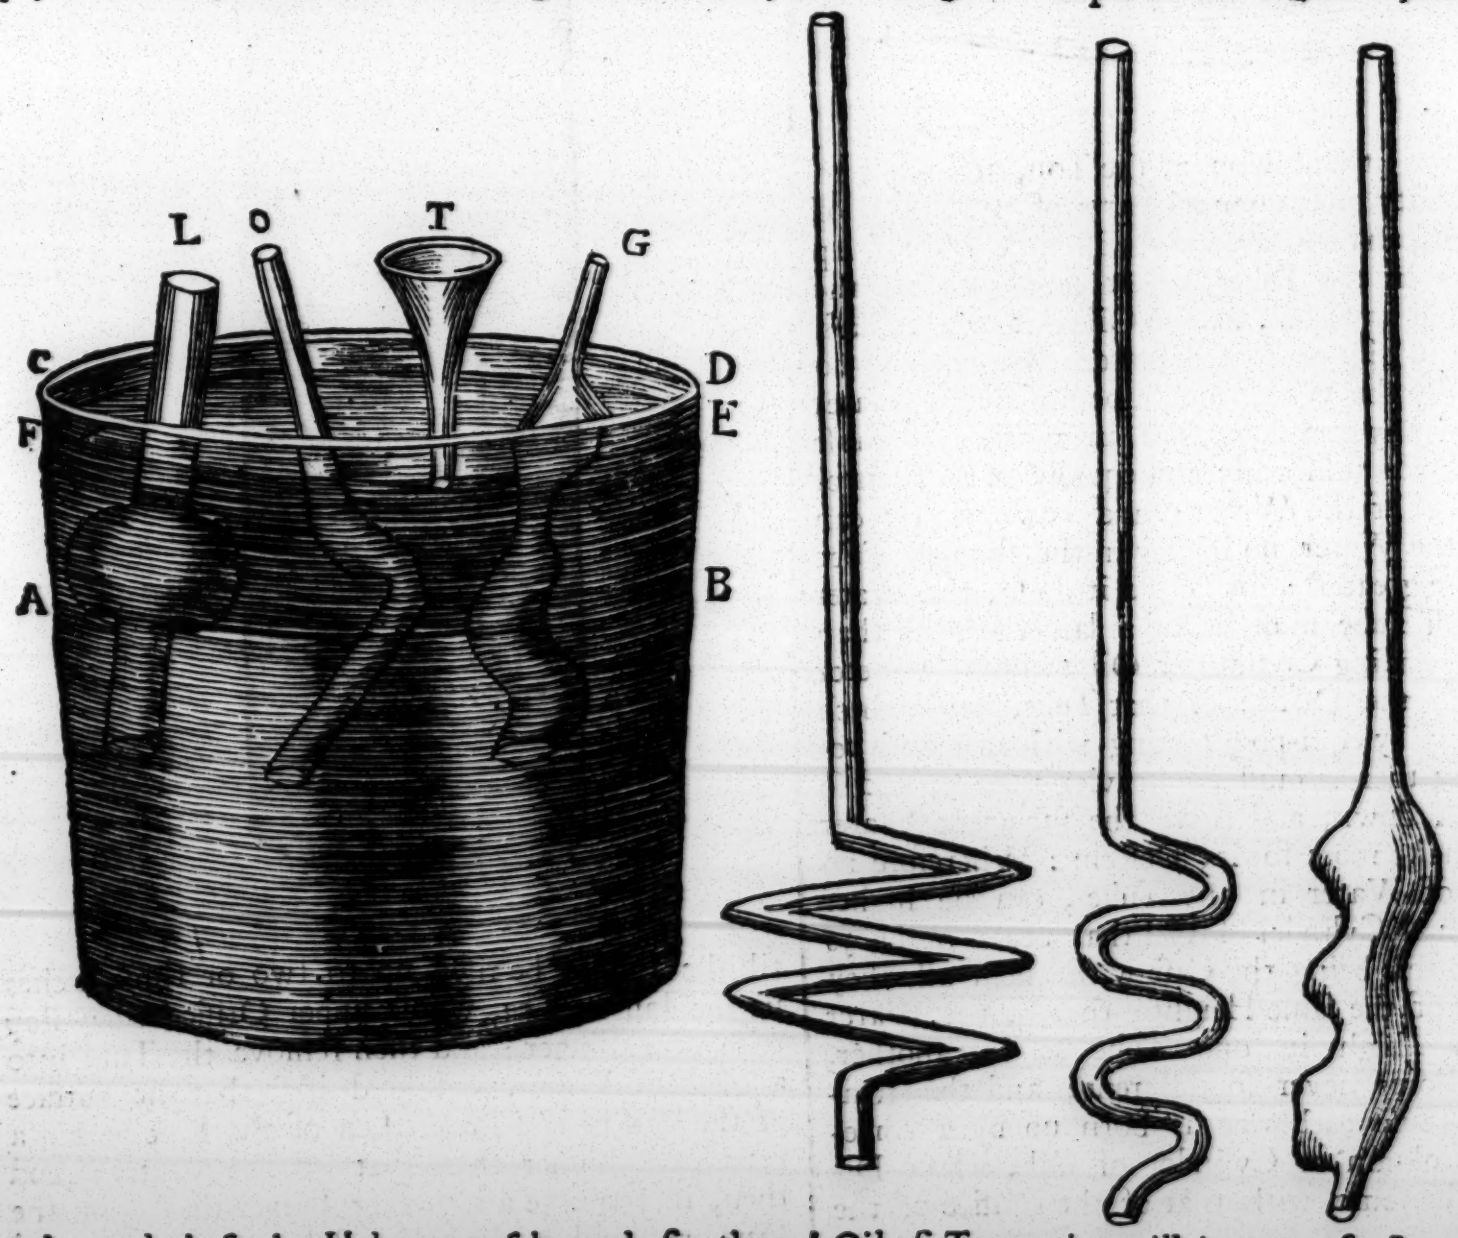
if you raiſe the Tube higher; the Oil will run out at the lower End: From whence it appears, That of all the Water in the Glaſs, no more preſſed on the Orifice of the Pipe, than a Cylinder equal to it in Diameter, and in Length equal to the Diſtance between the Orifice of the Pipe and the Top of the Water (as you may alſo eaſily find if you make a Siphon, whoſe ſhorter Leg ſhall be long enough to contain ſuch a Cylinder of Water as will counterpoiſe the Oil in the longer.) For when, by raiſing up the Pipe, you ſhorten that Cylinder, the Oil will run out: As when by ſinking it lower, and ſo lengthening the Cylinder of Water, the Oil will be forced up higher into the longer Leg of the Tube.

You will find alſo by Experiment, That this Paradox will hold, whatever be the Figure of the ſhorter Leg of the Tube, whether opening broad like a Tunnel by Degrees, or whether it have a Spherical, or otherwiſe figured Cavity of conſiderable Dimenſions in the Middle of it.

For our Noble Author found, by providing a Syphon of the Figure annexed, and pouring in Mercury till it reached up to the Bottom of the Globular Part of the ſhorter Leg, and to an equal Height in the longer Leg of the Syphon; he found, I ſay, that if he poured Water in at the Top of the longer Leg, it would drive up the Mercury into the Ball of the ſhorter Leg, and more than half fill its Cavity; (which it would have filled quite, had the other Leg been long enough.) And that this Ball in the Middle of the ſhorter Leg, though it held a great Weight of that heavy fluid Mercury, did no more hinder the Mercury from riſing to its due Height, according to the different Specifick Gravity of thoſe two Liquors, Water and Mercury, than if the ſhorter Leg had been every where of the ſame Dimenſions with its upper Orifice *D*: For the great Quantity of Mercury which was forced up into the Ball, was there, in a good Meaſure, ſupported by the Bottom and Sides of it, and no more gravitated on *C*, than what lay perpendicularly over it between *B* and *C*.



And farther, to make out the latter Part of this Paradox, he took three Glaſs Pipes, *L*, *O*, G, of ſuch irregular Shapes as the Figure adjoining ſhew-



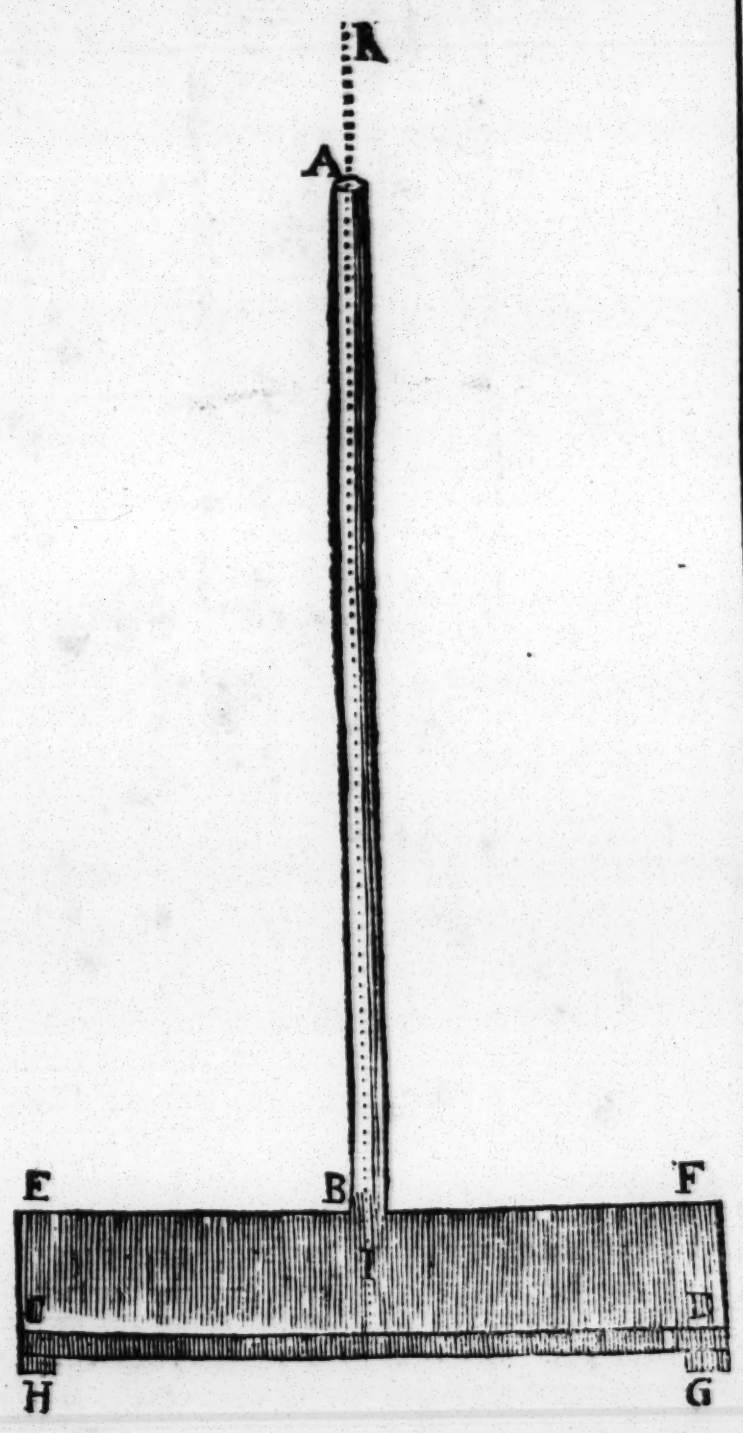
eth; and theſe, by Holes purpoſely made for them in a Covert of Cork, he placed obliquely within a Glaſs Veſſel filled with Water up to *AB*. Then by the help of the Tunnel *T*, he gently poured in Oil of Turpentine, till its upper Surface reached to *FE*; which Oil he found did, by its Preſſure on the Surface of the Water, raiſe it up to an equal Height in all the three Pipes.

SCHOLIUM.

If a Cylindrical, or otherwiſe Figured Veſſel, have, by a Hole made in its Cover or Lid, a Pipe of any length faſtened there, and the Veſſel by that Pipe be filled with Water, as alſo the Pipe it ſelf; the Baſis of that Veſſel doth ſuſtain a Preſſure equal to that of a Column of Water, whoſe Baſe is the ſame with the Bottom of the Veſſel, and its Height that of the Veſſel, Pipe and all.

This Paradox *Stevinus* adds by way of Appendix to the laſt: but the ways he propoſes to Experiment its Truth, are not ſuch as will anſwer trial; and therefore Mr. *Boyle* deviſed the following Experiment, which (though not ſo accurate as ſome other) doth yet very well deſerve to be conſidered.

He ordered a Tin or Laton Veſſel to be made of the adjoining Shape, which had a looſe Bottom,



C D, made of a flat Piece of Wood, covered with a ſoft Piece of Bladder, and greaſed on the lower Side near the Edges, that ſo leaning on the Rim of Wood *G H*, contiguous every where to the Inſide of the Laton, it might eaſily be lifted off from it, and yet lie ſo cloſe upon it at other times, that the Water ſhould not get between them. To the Middle of the looſe Bottom was faſtened a long String, that came up through the Body of the Pipe *A B*.

The Inſtrument thus fitted, there was Water poured in at *A*, which preſſed againſt the falſe Bottom *C D*, and kept it ſo tight down, that no Water ran out. When the Veſſel and Pipe were both filled with Water, the upper End of the String *K I* was faſtened to the Beam of a good Pair of Scales, and then as much Weight was put into the oppoſite Scale, as did lift up the falſe Bottom, *C D*, from the Rim *G H*, and ſo let out the Water; and this Weight he found to be very conſiderably more than what would have ſerved to lift up as much Water as that Veſſel did contain, had it been in an open one of the common Shape: But he neither tells us the Meaſure of the Veſſel, the Height of the Tube, nor the Weight which was required to raiſe the Bottom; which if he had done, 'twere very eaſy to have calculated the Quantity and Weight of a Column of Water, which ſhould have had the Bottom for its Baſe, and the united Length of Tube and Veſſel for its Altitude.

This Paradox, in the *Memoirs Mathematique & de Phyſique*, *A. D.* 1692. *P.* 12. is thus ſtated by Mr. *Varignon*.

If there be two Tubes or Veſſels, having the ſame Heights and Baſes, both filled with Water, but one of them made ſo tapering upwards, that it ſhall contain but 20 Ounces of Water, whereas the other holds 200; the Bottoms of theſe two Tubes ſhall ſuſtain an equal Preſſure of Water, *viz.* each of them that of the Weight of 200 Ounces, the Quantity of the Liquid contained in the greater Tube.

This is undoubted Fact, and agreed upon by all to be true, as long as the contained Liquor continues Fluid: but if it ſhould freeze, then it will by no means hold, the leſſer Quantity of Ice (to be ſure) being much lighter than the greater.

This Reaſon therefore of this ſurprizing Phænomenon ſeems to depend much on the Nature of Fluidity; and accordingly Mr. *Varignon* eſpouſes the Opinion of thoſe who aſſert, That the 20 Ounces of Water in the tapering, or otherwiſe unequally form'd Tube, as long as the Water continues liquid, do preſs and effectively charge *the Bottom* of the Veſſel, as much as 200 Ounces would do in a uniform Cylindrical Tube of the ſame Baſe and Altitude.

Others ſay the ſtraitned Sides of the unequal Tube, by hindering the riſing of the Water, do help to ſuſtain the Weight; and that the *Bottom alone* is not charged with the whole Preſſure, but a good Part of it taken off by the Sides.

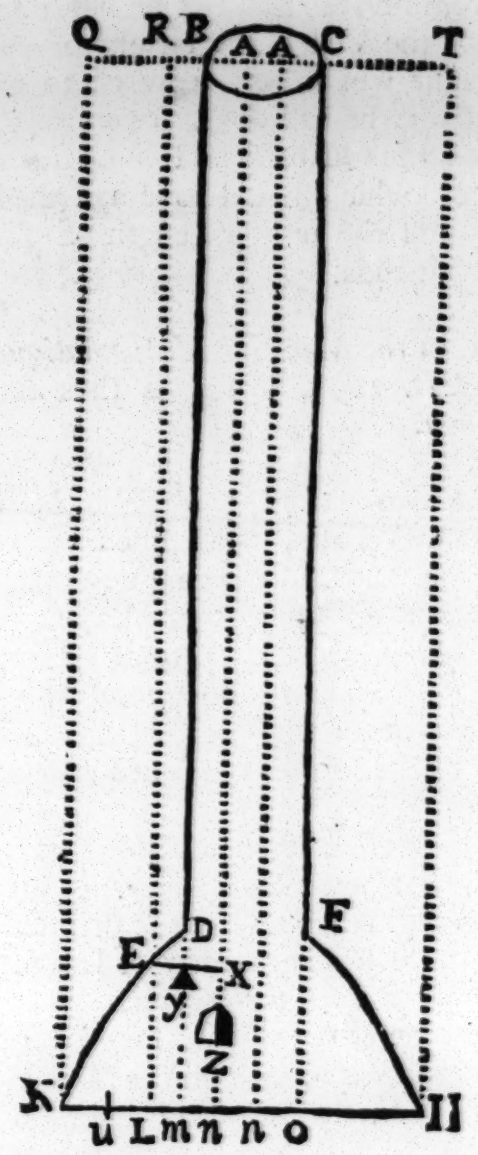
Mr. *Varignon* thinks the Matter eaſily ſolvable in the former way, thus:

The Tube *B A C F H K E D B* (*See the following Figure*) having its bottom Part *D K H F* much larger than its upper Shank *B C F D*; I ſay, hath its Bottom *K H* charged with as great a Weight or Preſſure of Water, as if it were a Cylindrical Veſſel, as *Q T H K*, of the ſame Baſe and Altitude with the unequally ſhaped Tube.

Draw the Lines, as you ſee in the Figure, ſo ſhall *Q V* repreſent a Column of Water in the ſuppoſed truly Cylindrical Veſſel, having the Diameter of its Baſe double to that of *R L*, *B M*, or *A O*.

Then will the Column of Water *B N*, bearing upon the Arm *M N* of the *Libra L N*, whoſe *Hypomochlion* is imagined to be at *M*, be a Counterbalance to the Column of Water *E M*, which is kept down from aſcending any higher by the Side of the Veſſel *E L*, juſt as the Weight at *Z*, at the End *X*, of the *Libra F X*, whoſe *Hypomochlion* is at *Y*, is balanced by the Side of the Veſſel *E D*, which hinders the Arm *E Y* from aſcending. Now *E Y* being = *Y X*, the Weight ſuſtained by the *Hypomochlion*

pomochlion at *Y*, is double to that at *Z*; wherefore the ſubjacent Point *M*, or that part of the Bottom of the Veſſel *L N*, muſt be charged with double the Weight of the Column of Water *B N*; or which is all one, will be preſſed with the Weight of the Column of Water *R N*, which may be ſuppoſed to reach quite up to the Top.



Let us then take *A N L K E D*, as equivalent to ſuch a Column; then will that Water be a Balance on the *Hypomochlion L*, to the Water leaning on the other Arm of the *Libra K L*, and kept down by the Side of the Veſſel *K E*; and conſequently, the part of the Bottom *K N*, will ſuſtain a Preſſure equal to that of the Column of Water *Q N*; for this, by the above-mention'd way of arguing, is the ſame as that of the Water contained in the Space *A N K D B*.

And thus, on the other Side, it may be proved, That the remaining part of the Bottom *N H*, is preſſed upon by the Water *A N H F C*, equivalent to the Weight of the Column of Water *T N*, reaching up to the Top.

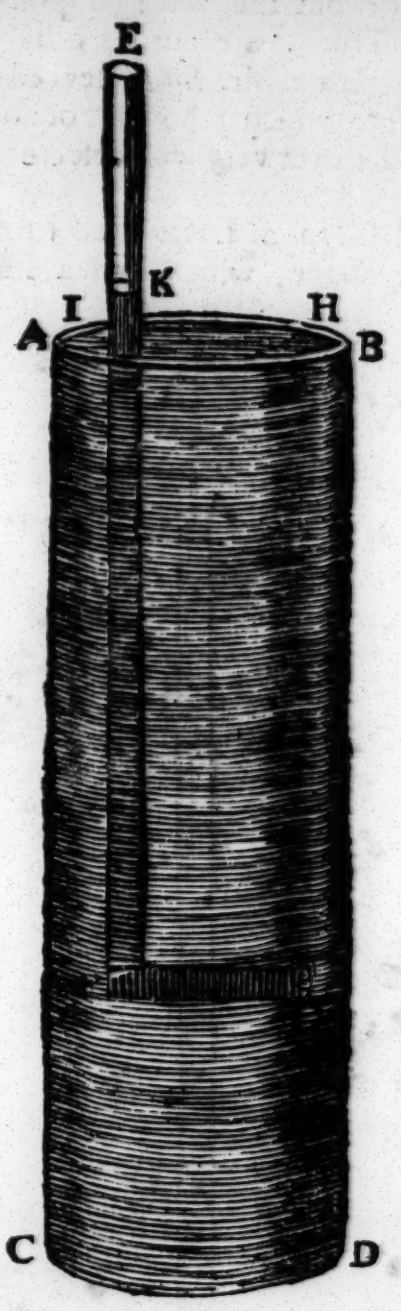
From whence it follows plainly, That the Water in the Tube *B D K H F C*, preſſes or gravitates on the Bottom equally with the Weight of the Cylindrical Column *Q T H K*, having an equal Baſe with it.

All which Method of Arguing, will be clear enough to one that conſiders 'tis the Property of all Fluids, from the known Laws of *Hydroſtaticks*, to have their infinitely ſmall Columns, of which they conſiſt, to be every where a Balance to one another.

PARADOX VII.

That a Body immerſed in a Fluid, ſuſtains a lateral Preſſure from the Fluid; which alſo increaſeth as the Body is placed deeper beneath the Surface of the Fluid.

Take a ſlender Glaſs Tube, and let it be bent ſo near the Bottom, that the lower Part *F G* may very nearly make a Right Angle with the other Part



E F. Dip this Pipe or Syphon in Oil of Turpentine, and take up about 3 or 4 Inches of it in the Pipe, which you may keep there by applying your Finger to the upper Orifice.

This done, move the Syphon into a Glaſs of Water, and place it ſo there, that the longer Leg may ſtand perpendicularly to its Surface, and that the other lower Leg may be ſo far below the Surface of the Water, as that the upper Surface of the Oil in the longer Leg, be but a little higher than that of the Water in the Glaſs: For then if you remove your Finger from the Top, the Oil in the Tube will very little, if at all, change its Station; which ſhews plainly, that there is a lateral Preſſure againſt the Oil at the lower Orifice *G*, which hinders its running out, though preſſed by the Cylinder of Oil contained in the perpendicular Leg. And as if you raiſe the Pipe up higher (keeping it ſtill in its perpendicular Poſture) the Oil will drop out; ſo if you ſink it lower, the Water will get in at *G*, and force the Oil all out of that Leg *G F*, and raiſe the Oil proportionably in the perpendicular one *E F*: Nay, if you thruſt it low enough, the Water will riſe up into the longer Leg, and bear the Oil above it; which laſt Circumſtance proves, That Water hath

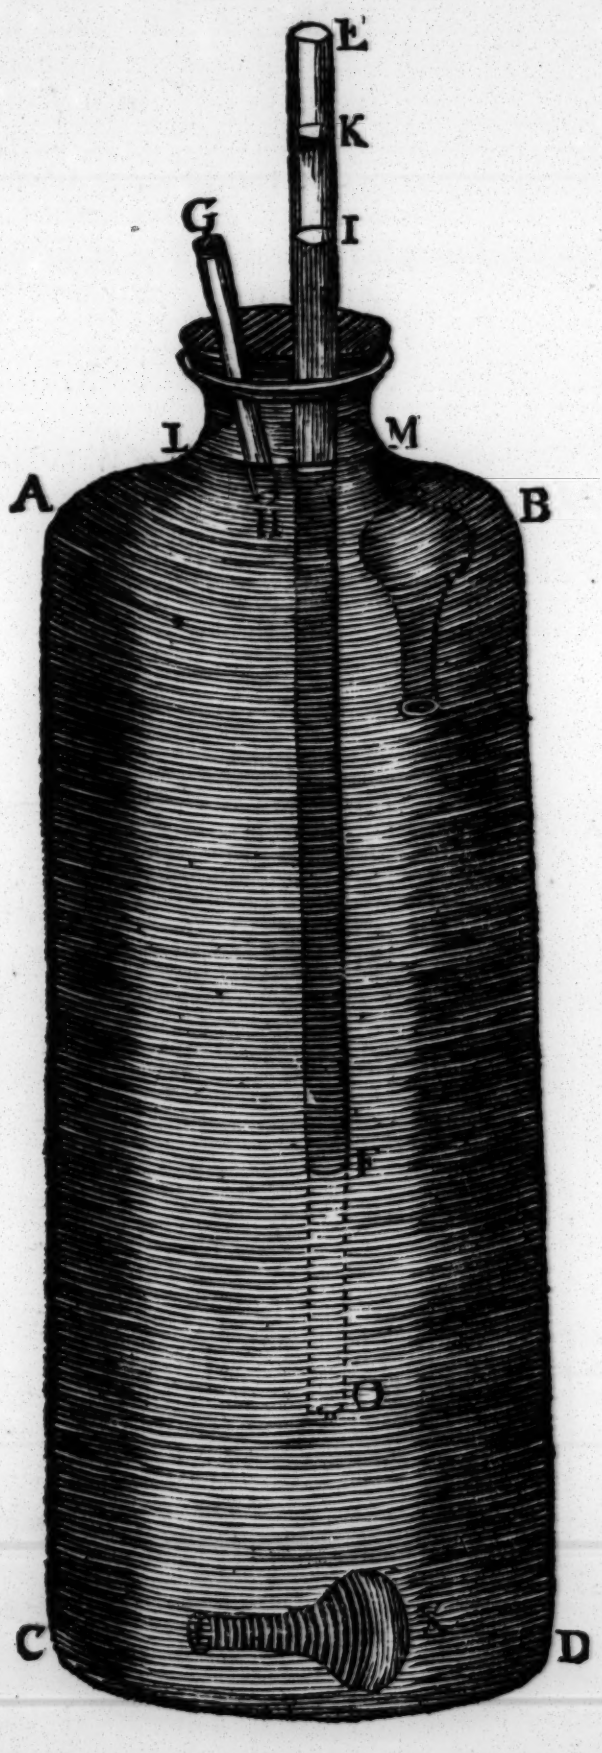
a lateral

a lateral Preſſure againſt it ſelf, as great as the perpendicular one from above, ſince that only can force the Water up into the perpendicular Leg.

If alſo keeping the Tube at the ſame Depth, you turn the Horizontal Leg here and there, or place its Orifice G in any Part of the imaginary Plane *F G*, the Oil will keep its former Station in the Tube, and neither riſe nor ſink; which ſhews, That this lateral Preſſure is equable and uniform in all Places or Parts of a Veſſel of Water, at the ſame Diſtance from its Surface.

Our Noble Author confirms the Truth of this Paradox by the following Experiment:

A ſmall Glaſs Bubble *X*, of the Figure in the Scheme annexed, with a very ſlender Neck, and ſo well poiſed, as that it could juſt float in the Water,



and no more, being provided, was put into a wide-mouth'd Glaſs Veſſel, near filled with Water, and there left to float at the Surface of that Liquor. Then a Cover or Stopple of Cork was well fitted to the Mouth of the Glaſs, and was thruſt hard into it; after which there was an Hole burnt (with a hot Iron) thro' the middle of the Cork, into which was put a long ſlender Glaſs Pipe, reaching a good way into the Glaſs, and ſtanding perpendicularly to the Surface of the Cork.

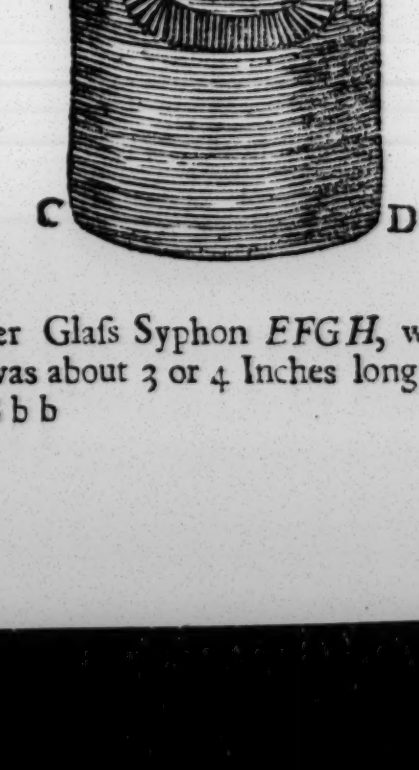
Alſo in another Part of the Stopple was another ſmall Hole burnt, and into that was fitted another ſmall Glaſs Tube, which lay ſloping, but yet reached a pretty way down below the Cork.

The upper Orifice of this ſloping Tube was well ſtopt with Cement: With the ſame Matter alſo were all the Junctures between the Cork and the Glaſs, and between the Tubes and the Cork, carefully ſtopt.

This all done, the Veſſel was inclined ſeveral ways, that the Bubble *X* might get as far as it could from the Pipe; and then more Water being poured in at the upper Orifice of the open Pipe *EF*, till it reached to a good Height, as ſuppoſe to *K* in the ſaid Tube, the Bubble *X* would preſently ſink to the Bottom of the Veſſel, and there continue as long as the Water was continued at the ſame Height in the Tube *EF* (the reaſon of which you have already in *Experiment* 2. *Paradox* 2.) Now this proves, That the Preſſure of the Water contained in the Tube *E F*, doth not only affect the Parts of the Water immediately ſubjacent to it, but alſo thoſe that are remote from it; nay, and above it, ſince it could force the Water into the Bubble *X*, and ſo make it ſink, tho' it lay not near the Orifice *F* of the open Tube.

PARADOX VIII.

That Water may be made to depreſs a Body lighter than it ſelf, as well as to buoy it up.

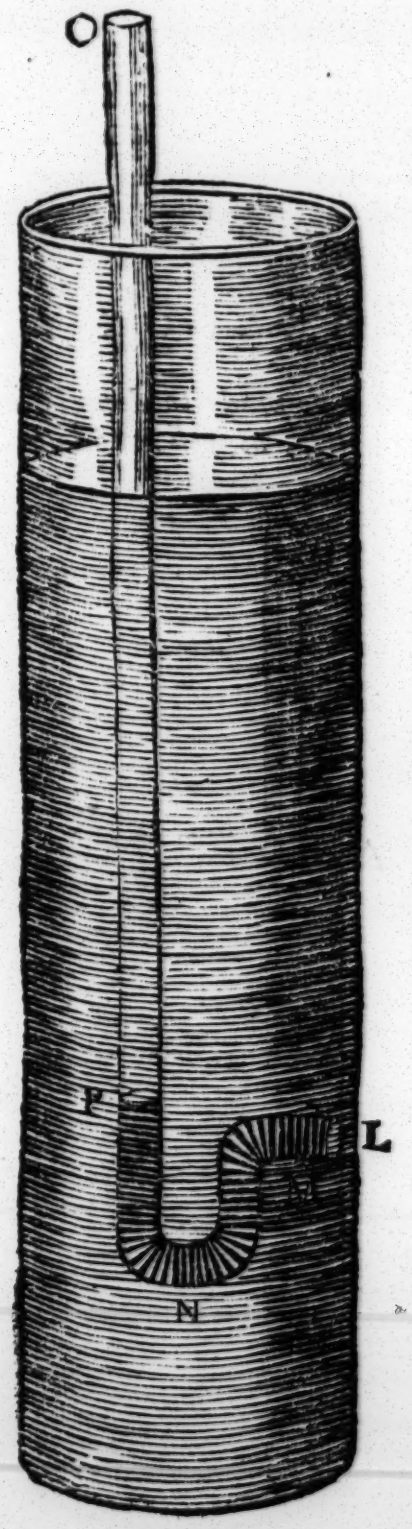


A ſlender Glaſs Syphon *EFGH*, whoſe ſhorter Leg *GH* was about 3 or 4 Inches long, and turn'd

up as near as could be parallel to the longer *EF*, was dipt in Oil of Turpentine, till the Oil filled the ſhorter Leg, and roſe to an equal Height in the longer.

Then the Orifice *E* being ſtopt with the Finger, the Pipe was moved into a Glaſs Veſſel of fair Water, and ſunk down there till the Surface of that Liquor was about an half Inch above the Surface of the Oil in the Syphon: And then the Finger being removed from the Top, the Oil in the ſhorter Leg was immediately driven downwards about an Inch; and as the Tube was ſunk lower, much more, till at laſt the Oil was driven out of that Leg quite, and the Water following it ſupported the Oil in the longer Leg, raiſing it alſo in the ſame Proportion. The reaſon of which is obvious from what hath been ſaid in the former Paradoxes.

Our Author found alſo, that when he uſed a Syphon of the Figure annexed, the Water would



firſt preſs the Oil Horizontally from *L* to *M*, then downwards from *M* to *N*, and at laſt (by ſinking the Tube ſtill lower) upwards from *N* to *P*: From whence it appears, that Water preſſes againſt any Body placed in it all manner of Ways, and that proportionably to the Depth of the Body in it.

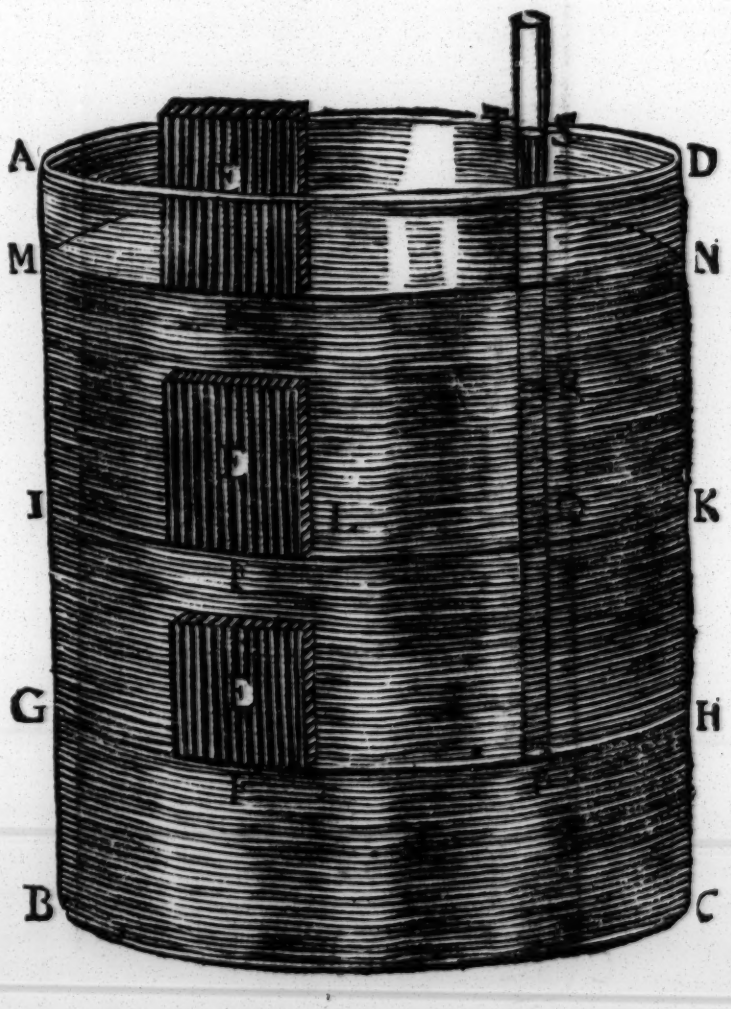
PARADOX IX.

That whatever hath been ſaid of Poſitive Levity, a Parcel of Oil, lighter than Water, may be kept in that Liquor without aſcending in it.

This may very eaſily be experimented, by taking only a ſmall Glaſs Tube, and immerſing it an Inch or two under Water: Stop the upper Orifice with the Pulp of your Finger, and then a Column of Water of an Inch or two in length will remain ſuſpended in the Tube: Keep it ſo, and next dip the ſame Tube into a Veſſel of Oil of Turpentine, and removing your Finger, as much Oil of Turpentine as you pleaſe will riſe into the Tube; which, by putting on your Finger to the upper Orifice, may be there eaſily ſuſpended, as the Water was before. Keep it ſo, and then immerſe the Tube in a Glaſs of Water 3 or 4 Inches beneath its Surface, and you will find on the removal of your Finger, that the Water will riſe up into the Tube, and keep the parcel of Oil ſuſpended between two little Columns of Water. The Reaſon of which is ſufficiently accountable from many things already delivered.

PARADOX X.

That the Cauſe of the Aſcenſion of Water in Syphons, and its flowing thro' them, may be explicated without having recourſe to Nature's Abhorrence of a Vacuum.

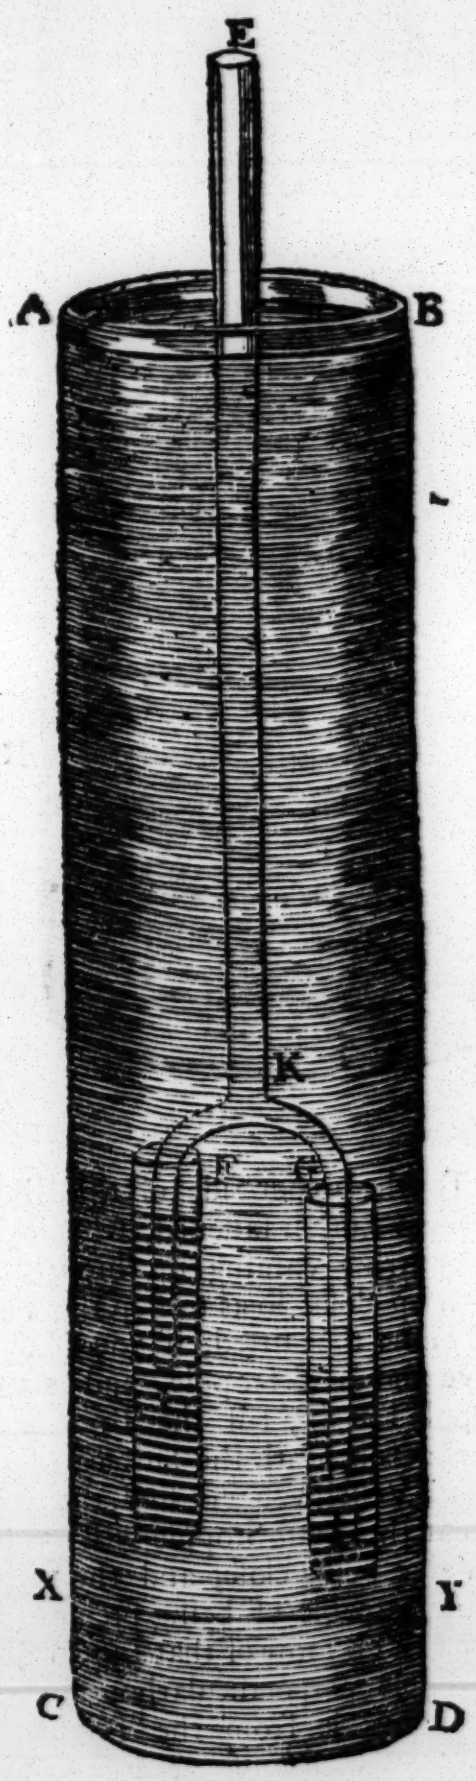


Provide a pretty large Cylindrical Glaſs Tube Veſſel of about 18 Inches, or two Foot long, as *ABCD*; provide alſo a Syphon of two Legs, *KF* and *KG*, with a hollow Pipe, as *KE*, opening into, or communicating with them; to each of theſe two Legs of the Syphon (one of which muſt be longer than the other) tie with a String a Tube of Glaſs *I* and *H*, ſealed at the Bottom. Pour then in Water at *E*, and let it run out at *I* and *H*, till it hath filled the Tubes hanging at the Ends of the

the Legs of the Syphon ſo far, that the End of each Leg be a little beneath the Surface of the Water.

This done, and the Pipe and Syphon faſtened in its true erect Poſition, if you fill the Veſſel *ABCD* with Oil of Turpentine, till it reach higher than the Syphon *K*, ſtopping in the mean time, if you pleaſe, the upper Orifice of the Pipe *E K* with your Finger.

After this you will find the Oil to preſs ſo on the Water in the Tubes *I* and *H*, as to force it up into the Legs of the Syphon as high as *K*; and that on the removing of your Finger from the Top *E*, the Water will begin to run out of the upper Tube *I* into the lower one *H*, as in or thro' a common Syphon or Crane.



Now 'tis plain, in this ingeniouſly contrived Experiment, that the Water runs through the Legs of the Syphon, tho' the Air coming down by *E K*, hath a free Communication with them both, ſo that here no *fuga Vacui* can be pretended as the Cauſe of the Waters running; but that 'tis plainly occaſioned by the Preſſure of the (lighter Fluid) Oil of Turpentine, on the Surface of the Water in the Tube *I*, till it force it up into the empty Leg of the inſerted Syphon as high as *K*, and then it deſcends down into the lower Veſſel or Tube *H*, thro' the other longer Leg of the Syphon. Indeed the Oil will gravitate on the Surface of the Water in both the Tubes *I* and *H*; and there being a longer Column of Oil over *H*, than there is over *I*, by about an Inch in length, the Preſſure will be greater on the Surface of the Water in *H*, by the Weight of an Inch of Oil of Turpentine. But then it muſt be conſidered, that the Column of Water which deſcends in the Leg *G*, though reſiſted in its motion by the Weight of an Inch of Oil, more than the Water which tends downwards in the Leg *F*, is yet alſo longer by an Inch than the other Column of Water in the ſhorter Leg *F*; and an Inch of Water of the ſame Dimenſions being heavier than an Inch of Oil, the Tendency or Motion of the Water muſt be from *F* towards *G*, not from *G* towards *F*; and conſequently the Syphon will work or run that way.

The Application of this Experiment to the Solution of the Motion of Water through Cranes or Syphons is very eaſy:

For when once a Syphon, by Suction or otherwiſe, is filled with the Liquor 'tis to tranſmit; if the Legs of it be not above 34 or 35 Foot in length, and one of them be longer than the other, the Liquor muſt continue to run thro' it as long as there is any to riſe in it, or that the Syphon hold ſtanch: For ſince the Preſſure or Weight of the incumbent Atmoſphere is capable of raiſing Water in Pipes (where it cannot come to preſs) to the Height of 34 or 35 Feet, as our Noble Virtuoſo proves in his *Phyſico-Mechanical Experiments*; and here being manifeſtly no Gravitation of the Air on the Water included in the Syphon, as long as the Syphon is right and ſtanch, the Water muſt continue to keep running, becauſe the Difference of the Preſſure of the Air on the lower Veſſel of Water, and on the upper, being nothing near ſo conſiderable as the Difference between the Weight of the Water in the longer Leg of the Syphon, and that in the ſhorter, the Tendency or Motion muſt be out of the ſhorter into the larger.

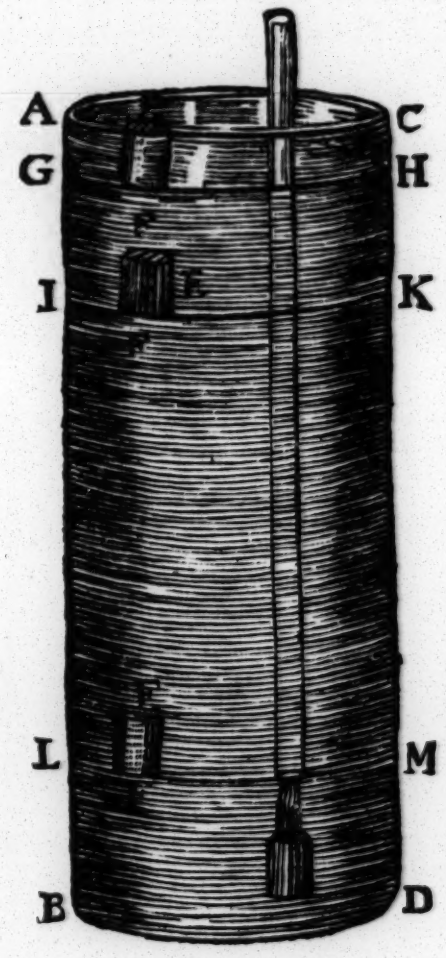
But then, if never ſo little an Hole be made in the Crane or Syphon, or any Leak be there, the Water can no longer run, becauſe the Air now comes to preſs on the Water within the Syphon, as well as on that without it, and conſequently muſt hinder it's Courſe of running.

PARADOX XI.

That a Solid Body, as ponderous as any known, tho' on the Surface of the Water it will ſink by its own Weight; yet if it be placed in a greater Depth than that of 20 Times its own Thickneſs, it will not ſink, if its Deſcent be not aſſiſted by the Weight of the incumbent Water.

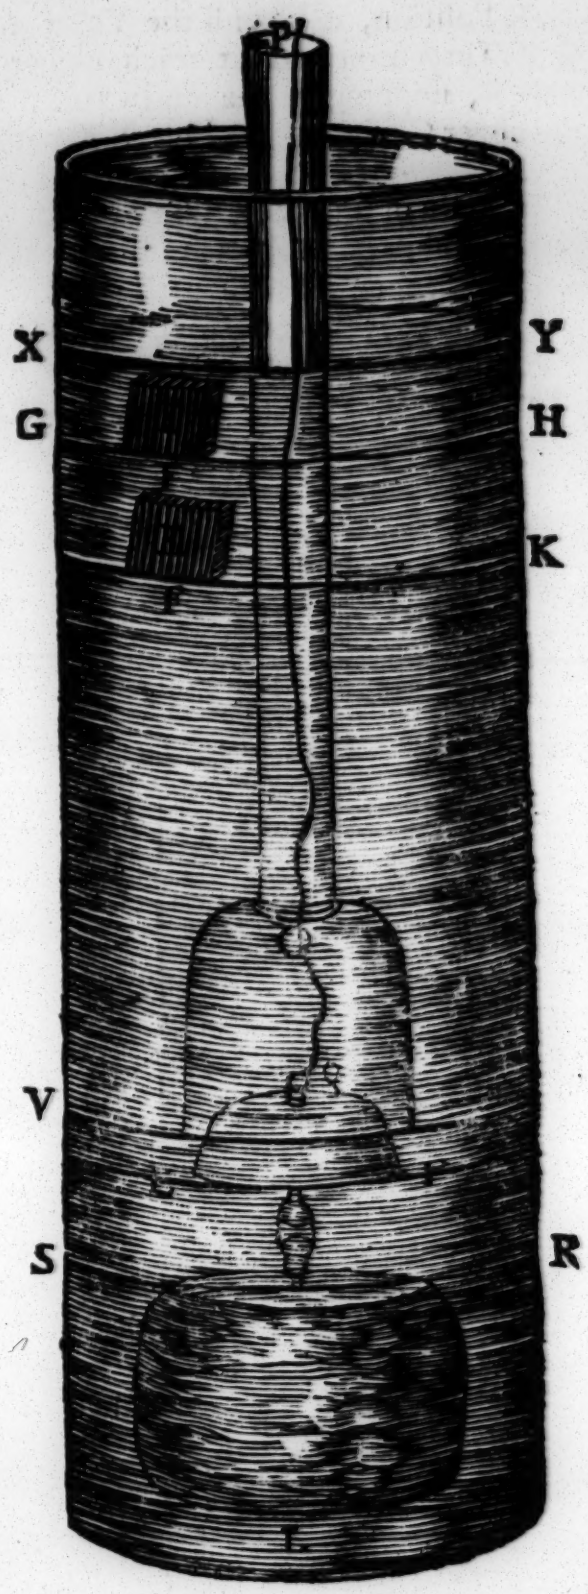
Fill a deep Glaſs Veſſel, of about 2 or 3 Feet in length (a large Tube, ſealed at the End, will do very well) with Water, as in the Figure: If then a little Cylinder or Cube of ſolid Braſs, as *E*, be any where placed, either at the Surface, Middle, or towards the Bottom of the Veſſel, ſtill it muſt ſink to the Bottom, becauſe the compound Column of Water and Braſs together (which Braſs is al-

moſt 9 times as heavy as common Water) will gravitate or preſs more than any Column of Water only of the ſame Length and Diameter; and conſequently the Braſs will diſplace the Water under it, and ſink lower and lower till it come to the Bottom; and this is the Caſe of a Stone, or any other heavy Body, &c. But yet, if you ſuppoſe this Piece of Braſs placed on the imaginary Surface *L M*, above 9 times its depth under Water, and that it were poſſible to keep off the Preſſure of the Water perpendicularly incumbent upon it, it is not reaſonable to ſuppoſe, That the Braſs ſhould ſink at all, but be ſupported and buoyed up there: For the Braſs can in this Caſe charge the Water under it at *F*, with no more than juſt its own proper and abſolute Weight; whereas all the other Parts of the Surface *L M*, are charged or preſſed upon by Columns of Water, which, ſuppoſing them to be of the ſame Diameter with the Piece of Braſs, or ſingly heavier than the Braſs, becauſe they are above 9 times as long as the Braſs is thick; and therefore preſſing or gravitating more on *L M* than the Braſs doth, muſt keep the Braſs ſuſpended; which cannot ſink, becauſe it cannot remove a Weight of Water heavier than it ſelf. And from the ſame Principles 'tis plain from Reaſon, That if the Braſs be placed yet lower, and the Preſſure of the incumbent Water be, as before, taken off, inſtead of ſinking, it muſt needs riſe, and be forcibly lifted upward. This alſo muſt be the Caſe of a Piece of Gold, if it were placed in theſe Circumſtances, in a Veſſel of Water, where the perpendicularly incumbent Preſſure was kept off, and the Gold above 19 Times its own Thickneſs in the Liquor.



To make good which probable Reaſoning by Experiment, our Author proceeded thus:

A large deep Glaſs Veſſel was provided, of the Figure annexed, which was filled with Water near to the Top, as to *XY*: Then at the Bottom of a Glaſs Tube, open at both Ends, there was, by good Cement, faſtened a Braſs Valve, into which was turned and fitted a Piece of ſolid Braſs *EF*, which, tho' it would ſtop the Valve exactly, would yet eaſily fall out, if not ſuſpended or ſupported by



any thing: To the upper Side of this Braſs Piece *EF* let there be a Button faſtened, whereby it may, by means of a String coming up through the Pipe *PO*, be drawn up cloſe, ſo as to ſtop the Valve.

All things being thus fitted, if you ſink the Tube with its Valve and Braſs Stopple, and by the String keep the Stopple faſt in, till the Braſs be about 9 times its Thickneſs beneath the Surface of the Water in the Glaſs Veſſel, you will find, tho' you looſen the String, that the Braſs Stopple will not fall out; becauſe the Valve being cloſe, and the Sides of the Glaſs Tube not capable of being premeated by the Water, there can no more of that Liquor preſs upon the Braſs Stopple perpendicularly; but whatever Preſſure it ſuſtains, is from the Tendency of the Water upwards, which muſt needs ſerve to ſupport it, ſince that is greater than the Weight of the Braſs. But if you raiſe the Tube up towards the Top of the Water, the Braſs Weight over-balancing there the Preſſure of the Water upward, it will ſoon, if not held by the String, ſlip out of the Valve and fall down, and the Water will immediately riſe in the Tube.

And if, inſtead of raiſing the Tube up towards the Surface of the Water *XY*, you ſhould ſink it down much deeper toward the Bottom, you will find that

that this Braſs Stopple, which will fall out readily in the former Station, will now ſupport a conſiderable Weight (as *L*) faſtened to it by a Bottom made on the under Surface of it; but that on the raiſing of the Tube upward, this additional Weight will make the Stopple drop out much ſooner than before: As ſuppoſe, when the Tube is raiſed only to the Height of 3 or 4 Inches, *&c.* which Experiments do abundantly confirm the Truth of this Paradox; and no doubt can be made, but that if a Gold Stopple had been uſed inſtead of a Braſs one, and the Tube let down into the Veſſel, till the Gold had been above 19 times its Thickneſs under Water, even that ponderous Metal would have there remained without ſinking.

N. B. This Experiment may moſt readily and eaſily be tried (as I have often done my ſelf) with Mercury: If you take a ſlender Glaſs Tube or Pipe, of about $\frac{1}{4}$ of an Inch Bore, or rather leſs, and dipping the lower End into a Veſſel of Mercury, you then ſtop the upper End with your Finger, by which means you may keep half an Inch, more or leſs, of that ponderous Fluid ſuſpended in the Pipe; and then if, keeping your Finger thus, you immerſe the Tube into a long Glaſs of Water, till the little Column of Mercury be more than 13 or 14 times its length under Water, you will find on removing your Finger, that the Mercury will be kept ſuſpended in the Tube by the Preſſure of the Water upwards; but that if you raiſe the Tube up but a very little above the former Station, the Mercury will immediately run out: Whereas, if before you had removed your Finger from the Top, you had ſunk the Pipe ſo low, as that the Mercury were 12 or 14 Inches, *&c.* below the Surface of the Water, that then the Mercury would be violently forced up, and make ſeveral Aſcents and Deſcents in the Tube, till by degrees it had gained its proper Station in it, according to the Laws of Specifick Gravity.

Indeed this Experiment will not be of a very long Continuance, becauſe the Water will by degrees get up between the Mercury and the Sides of the Tube; but it will laſt a few Minutes, and longer if the Tube be very ſlender, which is time enough to ſatisfy any one of the Truth of this Paradox.

From hence may the Adheſion of the two poliſhed Marbles together, when the upper is ſuſpended, and a great Weight hung to the latter, be eaſily accounted for: For ſince the Atmoſphere preſſes or gravitates with its whole Weight on the under Surface and Sides of the lower Marble, but cannot do ſo at all on its upper Surface, which is cloſely contiguous to the upper and ſuſpended Marble, it muſt needs keep the Stone buoyed up or pendulous, 'till ſuch time as either the Air inſinuate it ſelf in between the Stones, or that a Weight be affixed to the lower Stone, which exceeds the Weight of a Pillar of Air, whoſe Diameter is that of the Marble, and its Height reaching to the Top of the Atmoſphere: And that this is the reaſon of their Coheſion, is plain, becauſe when they are thus ſuſpended, and do adhere to each other in the Receiver of the Air-Pump, on a very few Pumpings of the Air out of the Receiver, they will immediately disjoin and fall aſunder.

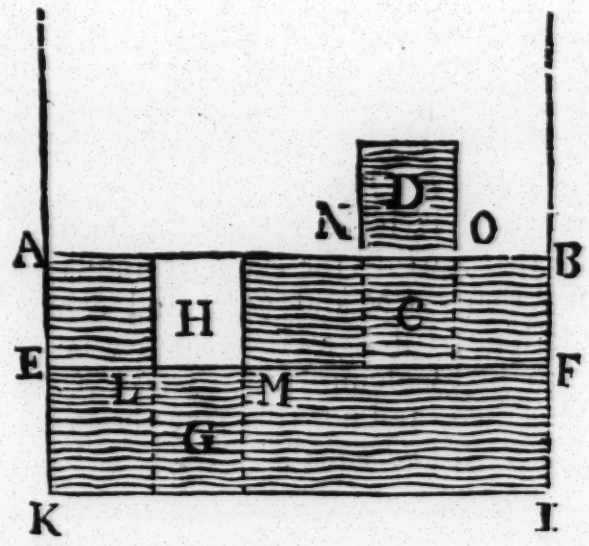
Thus far went this Excellent Gentleman; But that the Mathematical Reader may alſo be pleaſed in his way too, he has the following ſhort Account of *Hydroſtaticks*, drawn up from Dr. *Wallis* and ſome other Authors.

PROP. I.

Let the Veſſel AKIB be fill'd with Water, or any other Fluid, whoſe Surface we ſuppoſe to be even; (which, though in reality it will not be a Plane, but part of the Surface of a Sphere concentrical with the Earth; yet we ſhall all along conſider it as a Plane, or as differing inſenſibly from one;) I ſay, if this Surface be ſuppoſed even at firſt, 'twill ſtill remain ſo.

Which is thus demonſtrated:

Let the even Surface *AB* of the Veſſel *AKIB* (See *Fig.* 1.) be either not preſſed at all, or elſe preſſed equally in every Part, as will be the Caſe, allowing the Preſſure of the Air, which is an Homogeneal Body with reſpect to Gravity, and preſſes equally in all the Parts of ſo ſmall a Surface. Now ſince the Parts of the Fluid below are all acted upon by Gravitation, they cannot aſcend, and ſo elevate any part of the Surface *AB*; nor can the Fluid ſubſide in one part, and ſo be elevated in another, being the Preſſure againſt the Bottom is every where equal, and conſequently hinders one another's Subſidence, ſuppoſing the Fluid divided into any number of equal Columns: Hence it follows, from the contrary Preſſure of theſe equal Columns at the Bottom of the Veſſel, that there can be no Motion; that is, the Surface will remain even without any manner of Diſturbance. *Q. E. D. See Dr.* Wallis's *Mecha. Prop.* 8. *Cap.* 2. *de deſcenſu gravium.*



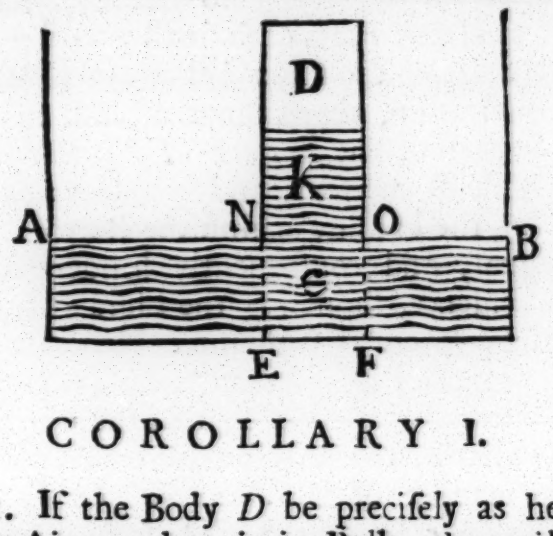
But if the Fluid be put out of this State by ſome external Force, ſo that one part of it, as *D* (*Fig.* 1.) be elevated above the reſt, do but remove the Force, and it will return to its former Horizontal Poſition, partly upon the Account of its Fluidity; the Parts above flowing down into thoſe Places that are below them, and alſo becauſe the ſubjected Part *C* being more preſt than the other Parts of the Surface *AB*, this Preſſure will be continued to the Bottom of the Veſſel; where, by reaſon of the reſiſtance made by the Bottom, it will be communicated to thoſe Parts that are leſs preſt, forcing them to aſcend ſo long till the *Æquilibrium* be again reſtored, *i. e.* till *AB* become even and parallel to the Horizon: So that altho' the Surface be not a Plane, as it was ſuppoſed in the foregoing Propoſition, yet if the force be removed that made its Surface unequal, it will again recover its former State.

There

There may be ſome Accidental Variations which we ſhall not at preſent conſider, as that the Parts of the Fluid may happen to be tenacious, &c.

If the Fluid be preſſed more in one part than another, as in *C*, by reaſon of the incumbent Body *D* (*Fig.* 1.) (which Body is ſuppos'd to be ſpecifically heavier than Air) then will the part of the Fluid *C* ſubſide, forcing the other Parts of *AB* to riſe, in order to make way for it; and this will happen till ſuch time as *C* is no more preſſed than any other Parts of the Surface *AB*.

And what we have ſaid of *AB* is equally true of any parallel Surface with the Fluid; as of *EF*, whoſe Surface is Horizontal, and will remain ſo, the Preſſure being every where equal: But if the immerged Body *A* be ſpecifically heavier than the Fluid, the ſubjected Part G, as ſuſtaining a greater Weight, will be depreſt, forcing the Fluid to riſe in the parts about *EL* and *MF*, which parts have a leſs Preſſure upon them than the part *LM*.

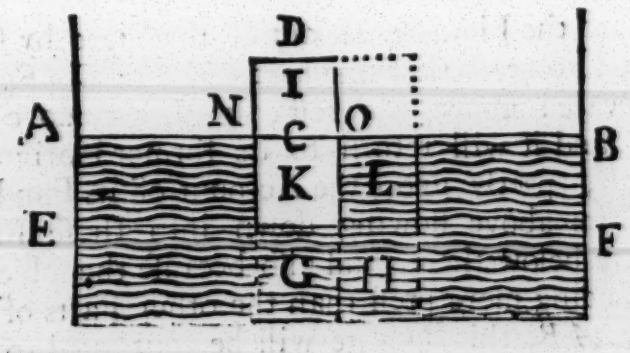


COROLLARY I.

Fig. 1. If the Body *D* be preciſely as heavy as ſo much Air equal to it in Bulk, then will *NO*, that Portion of the Surface which *D* inſiſts upon, have the ſame Preſſure upon it with *AN* and *OB*; and conſequently the Surface will retain its Horizontal Poſition, as having ſtill every where an equal Preſſure upon it.

COROLLARY II.

If the Body *D* (*Fig.* 2.) be ſpecifically lighter than Air, and if it be ſuppoſed not to fly away, then will that part of the Fluid it inſiſts upon, be leſs preſſed than *AN* and *OB*, and conſequently will riſe ſo high, till *K* and *D* together be equal in Weight to that Column of Air whoſe Room they poſſeſs; for then, and not till then, the Preſſure upon *ANOB* will be equal.



COROLLARY III.

If the Body *D* (*Fig.* 3.) be ſpecifically heavier than Air, but lighter than Water, it will then depreſs that part of the Fluid that is under it, and ſubſide ſo far into the Water (ſuppoſe to *G*) until the Gravity of that part of it which is above the Surface of the Water, *viz. I.* bears the ſame Proportion to as much Air as equals it in Bulk: As the Gravity of as much Water as is in Bulk equal to *K*, (*viz. I.*) bears to the Gravity of the immerſed part *G*. To illuſtrate which, put *G* for the Gravity of *I*, *g* for the Gravity of an equal Portion of Air, *M* for the Gravity of *K*, and *m* for the Gravity of *L*; then, before the parallel Surface *EF* can have an equal Preſſure upon it, *GM* muſt be equal to *gm*. (*i. e.*) *G* : *g* :: *m* : *M*.

COROLLARY IV.

If *D* or *H* (*Fig.* 1.) be, Bulk for Bulk, heavier than Water, then will *C* and *G*, the Parts they inſiſt upon, have a greater Preſſure upon them than the other Parts of the two Surfaces *AB* and *EF*; and this will be every where true, ſo that *D* or *H* muſt ſink to the Bottom of the Veſſel *KL*.

COROLLARY V.

If *D* (*Fig.* 1.) be preciſely as heavy as Air, then (by *Cor.* 1.) it will inſiſt upon the Surface without ſubſiding at all; for it will be the ſame thing as if ſo much Air preſt in the room of it: But if it be ſpecifically as heavy as the Fluid it is immerged in, then where ever it be placed within the Fluid, there it will remain; for as to Gravitation, there will be no Difference between the Fluid and it.

PROP. II.

If A be a Body ſpecifically lighter than B (Fig. 4.) *an equal Portion of the Fluid (in which it is immerged) then will it riſe with a Force proportionable to the Exceſs of Gravity of B + above A.*

Demonſtration.

For the Gravity of *A* put *x*; for that of *B*, *x* + *y* (*y* repreſenting the Exceſs of Gravity of *B* above *A*) then take a Body, as *D*, with the Gravity *y*, and let *D* + *A* be immerged in the Veſſel *ABCD*, and it will ſubſide ſo far, till *x* + *y* : *x* :: *y* : is to the Gravity of a Quantity of Air equal to *D*, (which, becauſe 'tis very inconſiderable, may be neglected) or till *B*, a Quantity of Water equal in Bulk to the immerſed part *A*, ſhall be equal in Gravity to the whole *D* + *A*: But a Quantity of Water, equal in Bulk to *A*, ſhall (by the Suppoſition) have its Gravity equal to the Gravity of *D* + *A*; therefore *A* is the part immerſed.

From this *Æquilibrium* it is evident, That the Force with which *A* preſſes upwards, is equal to the Gravity of *D* downwards; but the Gravity of *D* is equal to the Exceſs of Gravity of *B* above *A*; therefore

therefore *A* aſcends with a Force proportionable to the Exceſs of Gravity of *B* above *A*. *Q. E D.*

PROP. III.

If the Body A (Fig. 4.) *be ſuppoſed heavier than B, (an equal Portion of the Fluid in which it is immerged) it gravitates with the Exceſs only of its Gravity above that of B.*

Demonſtration.

Let the Gravity of *B* be $= x$, and that of $A = x + y$; then theſe two Forces being directly contrary, x and x deſtroy one another, ſo that *A* only gravitates with y, the Gravity by which *A* exceeds *B*. *Q. E. D.*

COROLLARY.

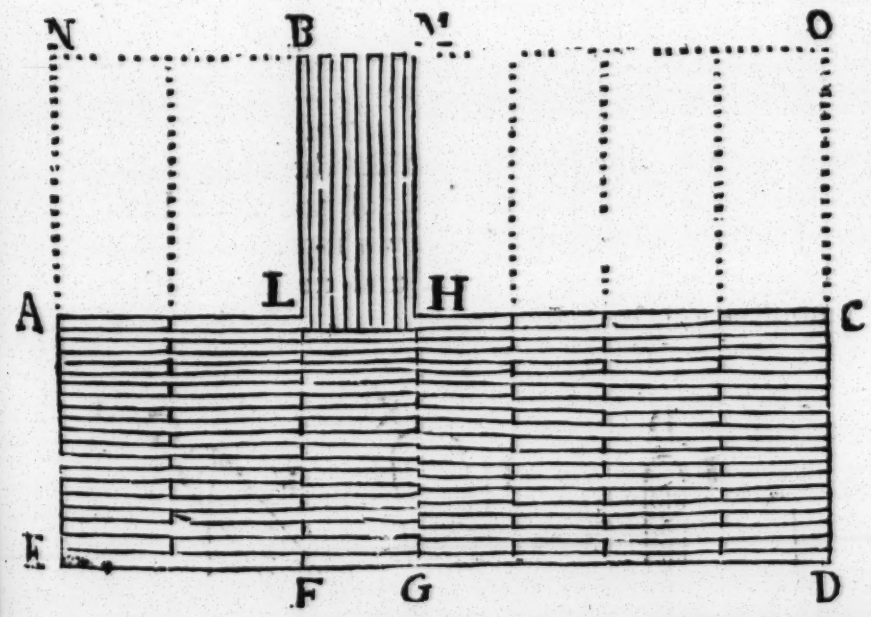
Hence it is manifeſt, That of Bodies immerſed in Water, or any other Fluid, we only perceive the Difference between the Weights of the immerſed Body, and of ſuch a Quantity of Water, or any other Fluid, in which the Body is immerſed, which is equal to the Bulk of that Body.

PROP. IV.

All Fluids preſs upon ſubjected Bodies according to their perpendicular Altitude, and not according to their Latitude.

Which is thus demonſtrated.

Let there be a Veſſel *ALB MHCDE* full of Water (*Fig.* 5.) then becauſe the Column *BF* is heavier (becauſe longer) than *HG*, 'tis certain, that if the Veſſel was open at *H*, *GH* would aſcend



till ſuch time as the Columns *BF* and *GH* were in an *Æquilibrium*; or of an equal Height; but ſeeing the Veſſel at *H* is ſhut, and conſequently hinders *GH* from aſcending, the Preſſure upwards upon *H* is equal to the Difference of the two Columns *BF* and *HG*, *i. e. BL*. And ſince all Preſſure is reciprocal, *i. e.* as much as *H* is preſſed upwards by the Liquor, ſo much it preſſes the Liquor downwards againſt the Bottom (Action and Re-action being always equal one to another:) If to this Preſſure be added the Gravity of *GH*, the Preſſure upon the Bottom G, will be the ſame as if it had the entire Column *BF* inſiſting upon it.

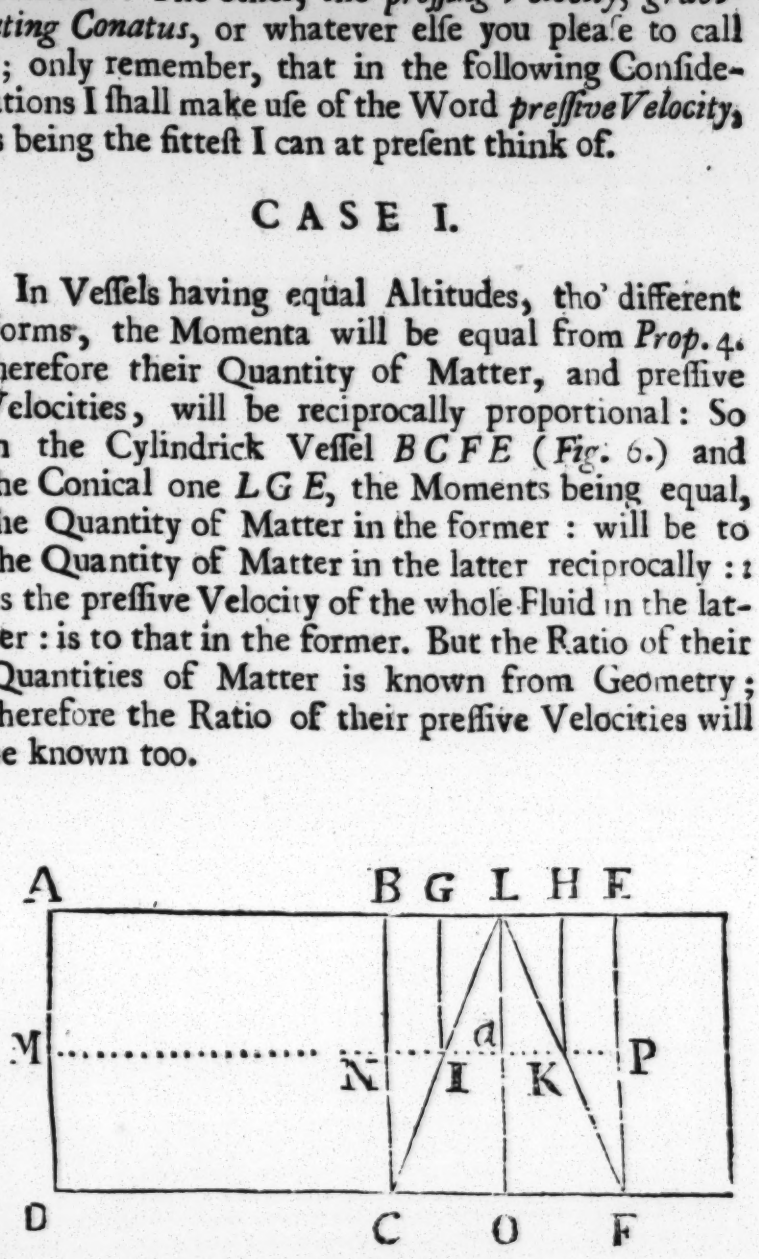
The ſame may be demonſtrated of all the reſt of the equal imaginary Columns; and conſequently 'tis evident, That the Bottom of the Veſſel *ED* ſuſtains as great a Preſſure, as if *NEOD* were full of Water. *Q. E. D.*

SCHOLIUM, by Mr. *Ditton*.

The Momenta of Fluids preſſing upon any Fund, may be look'd upon as Products; the Quantity of Matter being one of the Factors that compoſe theſe Momenta: The other, the *preſſing Velocity*, *gravitating Conatus*, or whatever elſe you pleaſe to call it; only remember, that in the following Conſiderations I ſhall make uſe of the Word *preſſive Velocity*, as being the fitteſt I can at preſent think of.

CASE I.

In Veſſels having equal Altitudes, tho' different Forms, the Momenta will be equal from *Prop.* 4. therefore their Quantity of Matter, and preſſive Velocities, will be reciprocally proportional: So in the Cylindrick Veſſel *BCFE* (*Fig.* 6.) and the Conical one *LGE*, the Moments being equal, the Quantity of Matter in the former: will be to the Quantity of Matter in the latter reciprocally:: as the preſſive Velocity of the whole Fluid in the latter: is to that in the former. But the Ratio of their Quantities of Matter is known from Geometry; therefore the Ratio of their preſſive Velocities will be known too.



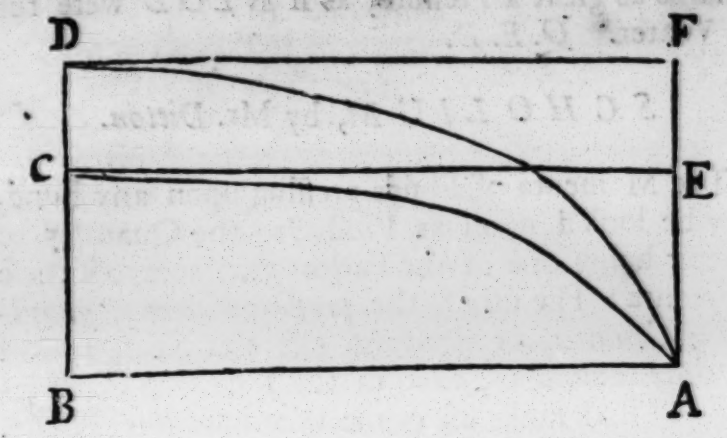
CASE II.

In the Veſſel *LCF*, 'twill be an eaſy thing to find the Momenta of the Fluid preſſing upon the ſeveral imaginary parallel Funds, as *CF*, *IK*, &c. for the Momentum of *LCF*: is to the Momentum of *LIK*:: as the Momentum of the Cylinder *BCFE*: to the Momentum of the Cylinder *GIKH*. But univerſally, the Momenta of Cylinders are as their Altitudes, by the laſt: Therefore let *LCF* be what Figure it will, the Preſſure upon a Fund, as *IK*: is to the Preſſure upon a Fund, as *CF* in the Veſſel continued ſo far:: as the Abſciſſe *La*: is to the Abſciſſe *LO*; that is, as *Ia*, to *CO*. And if you ſuppoſe it a parabolick Veſſel, as *Iaq*, to *COq*, &c.

N. B. We here conſider the Fund *IK*, as making a diſtinct Veſſel, and not meerly an imaginary one; ſo that *LIK* and *LCF* may be conſidered as two diſtinct Veſſels.

From what is ſaid may be found the Proportion of the preſſive Velocities in the Veſſels *LCF*, *LIK*; for we know the Ratio of their Momenta, and the Ratio of their Magnitudes; therefore that alſo of their preſſive Velocities, the other Factor of their Momenta, will be known too.

But



But the Momenta of Veſſels of different Heights, having the ſame common Fund, will be as thoſe Altitudes.

Suppoſe *AD* and *AC* two parabolick Veſſels, having the ſame common Abſciſſe *AB*; then will their Momenta upon the common Fund *AB*, be as their Ordinates *BC* and *BD*, *i.e.* as the Area's of the two Semi-parabola's *ADB* and *ACB*, or in a Sub-duplicate Ratio of their Parameters, as is evident from Conicks.

Likewiſe in Hyperbolical and Elliptical Veſſels, having the ſame Tranſverſe Diameter and Abſciſſa common to both, the Preſſure upon the common Abſciſſa, as a Fund, will be as the Area's *ACB* and *ACD* of the Semi-Ellipſis and Semi-Hyperbola.

CASE III.

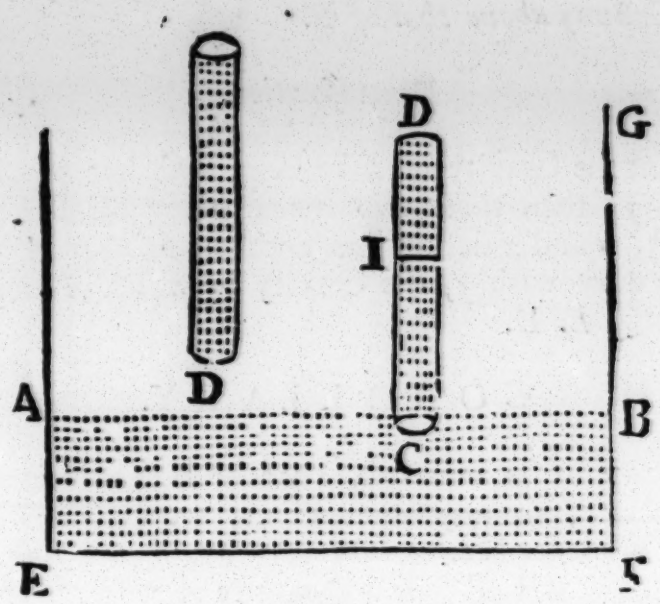
But now we come to conſider the Veſſels *LIK* and *LCF*, (Fig. 6.) as communicating with each other: And here the preſſive Velocities will be very different from what they were in the former Suppoſition: In order to expreſs the Proportions of which, we muſt conſider the Momenta of the ſeveral Portions of the Fluid taken from the Vertex, and imagin'd to be cut off by Plains parallel to the Baſe: And firſt, the Momentum of the Portion *LIK*, upon the Fund *CF*, is equal Momentum of *AMBN*, on the Fund *DC*; therefore the Momentum *LCF*: Is to the Momentum of *LIK*:: As the Momentum of the Cylinder *ABDC*: To the Momentum of the Cylinder *AMBN*; *i.e.* as *LO*, *La*. But having the Momenta's and Quantities of Matter, we can eaſily find the other Factors; that is, the preſſive Velocities of *LCF* and *LIK*, upon the Fund *CF*; which may be expreſſed thus:

The Ratio of the Momenta's is equal to $\frac{LO}{La}$ and the Ratio of the Magnitudes is equal to $\frac{LCF}{LIK}$; therefore the Ratio of the preſſive Velocities will be $\frac{LO \times LIK}{La \times LCF}$.

CASE IV.

To compare together the preſſive Velocities in both theſe diſtinct Caſes, (*viz.* 2, 3.) 'twill be only neceſſary to conſider, That in the Firſt Caſe, where we imagined a different Fund, as *IK*, the Momentum of the Portion *LIK*, is equal to that of the Cylinder *GHIK*; and in the Latter Caſe, where we ſuppoſe all one and the ſame Veſſel, and ſo the Fluid *LIK* preſſing on the Fund *CF*, that then the Momentum of that Portion *LIK*, will be equally the Momentum of the Cylinder *AMBN*; therefore the two Momenta's being as the Cylinders *AMBN*; and *GIKH*, (which have equal Altitudes) will be as *MN* to *IK*, *i.e.* as *NP*: *IK*.

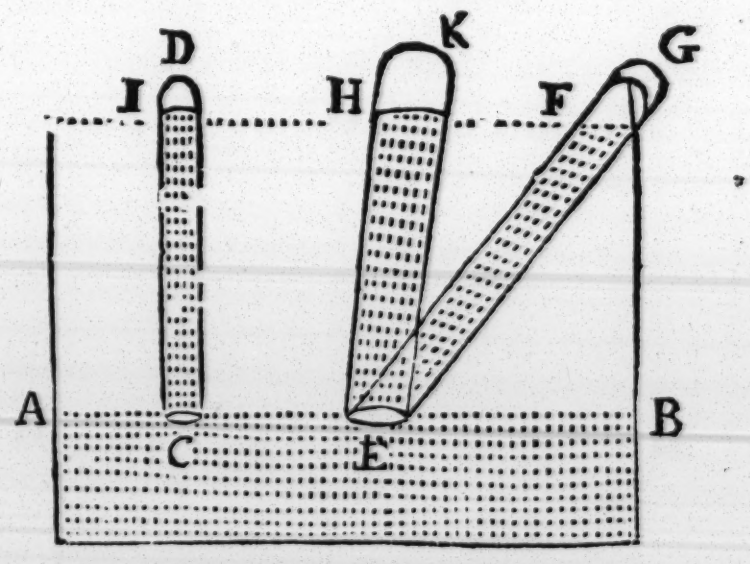
But having the Ratio of the Momenta's, we have alſo that of the preſſive Velocities of one and the ſame Quantity of the Fluid *LIK*, when conceived as preſſing upon the Fund *IK* in one Caſe, and on the Fund *CF* in the other.



CASE V.

Let *BE* (*Fig.* 8.) be a Veſſel fill'd with Mercury to the Altitude *AE*; then, as in the way of making the *Torricellian* Experiments, take a pretty long Glaſs Tube, ſhut at the End *D*, but open at *C*, which fill with Mercury; and ſtopping the open End *C*, invert the Tube, and put the ſaid End *C* into the Mercury *BE*: Tis evident from the firſt and general Propoſition, That if the Mercury contained in the Tube, preſs more upon *C*, than the Air upon the other Parts of the Mercury which are expoſed to it; 'tis evident, I ſay, That the Mercury in the Tube will deſcend ſo far, (ſuppoſe to *I*) till the Preſſure be equal on all the Parts of the Surface of the Stagnant Mercury in the Veſſel: But if the Mercury in the Tube preſs leſs upon *C*, than the external Air does on the Mercury without, then the Mercury within the Tube will aſcend ſo high, till the Preſſure of the Mercury within the Tube be equal to that of a Column of Air of the ſame Diameter in any Part of the Veſſel without.

This is clear from *Prop.* 1. and needs no other Demonſtration.



But here it may be enquired, Why, if the erect Tube *CI* (*Fig.* 9.) be put in an Oblique Poſition, as in *GE*, the Quickſilver ſhould notwithſtanding be found at the ſame perpendicular Height as before; ſince *GE* being longer than *CI*, 'tis certain there muſt be more Mercury contained in that, than in this.

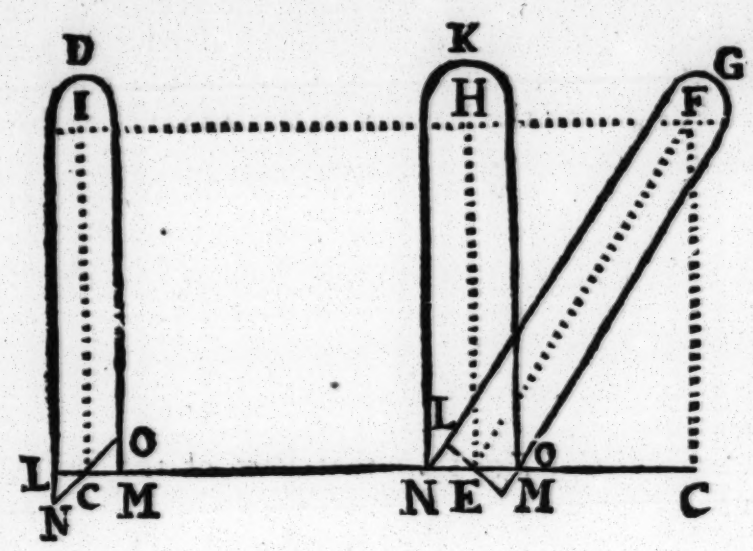
To

To this I Anſwer:

The Figure of the Surface of the Mercury in the Baſe *E* of the Tube *E G*, will become Elliptical, and conſequently enlarged by this Oblique Poſition; for tho' it will be of the ſame Breadth ſtill, yet it will be ſo much longer, as is the Ratio of the Diameter *E*, to the Diameter *C*: *i. e.* as the Tranſverſe Axe of that Ellipſis to its conjugate.

But I ſhall demonſtrate, That the Diameter of the Baſe *C*: Is to the Tranverſe of the Baſe *E* :: As the Length of the Tube *C I*: Is to the Length of the Tube *E F*.

For ſuppoſe *L C M* the Baſe of the erect Cylinder *C D*, which will be a Circle; and *N C O* the Baſe of it cut Obliquely, which will be an Ellipſis.



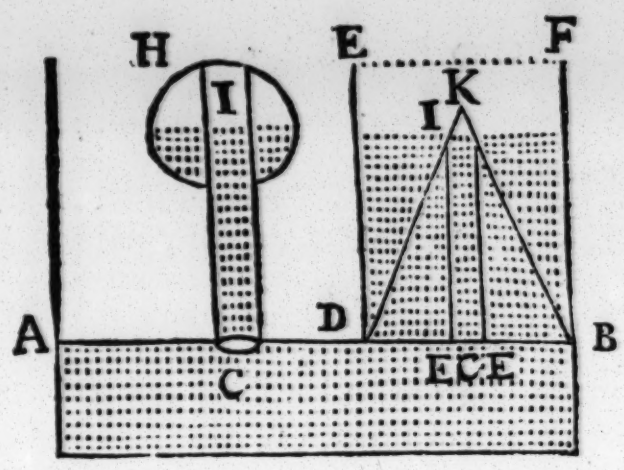
Then let the Cylinder *C D* be reclined into the Poſition *E G*, ſo that *N C O* may become *N E O*, *i. e.* in an Horizontal Poſition; the Cylinder *E F* will be equal to an erect Cylinder upon the ſame Elliptical Baſe *N E O*, and between the ſame Parallels *H F*, *N O*: From *F* therefore let fall *F C* perpendicular to *N E O* produced, and by this Means we ſhall have the Triangles *F E C* and *E N L* ſimilar; for the Angles at *C* and *L* are right, and the Angle *F E C* = *L N E*, ſeeing each of them, together with *L E N*, makes a Right Angle: Therefore *F E*: *F C* (is *C I*) :: *N E*: *E L* :: 2 *N E*: 2 *E L*; Or as the Baſe *E*: Is to the Baſe *C*. *Q. E. D.*

And now the Reaſon plainly appears, why more Mercury is kept ſuſpended in *E G* than in *C I*; (*Fig.* 9.) For the Baſe *E* of the Oblique Tube *E G*: Is as much greater than the Baſe *C* of the erect Tube *C D* :: As is the Length of the Former: Than the Length of the Latter.

But then it may be further enquired, Why, in the two equal Cylinders *E F* and *E H*, (*Fig.* 10.) the Mercury ſhould not riſe higher in the Former than in the Latter, ſince Dr. *Wallis* has demonſtrated, *Cap.* 2. *Prop.* 19. That equal Bodies gravitate in Proportion to their Declivities; and conſequently the Gravity of the Fluid within the Tube *E F*, being weaken'd by the Obliquity of the Tube, 'tis but reaſonable to ſuppoſe, That the Mercury ſhould be raiſed to a greater Height than in the erect Tube *E H*, whoſe Poſition does not at all weaken or hinder the Gravitation of the Fluid.

But here it ought to be conſider'd, That tho' the Gravity of the Fluid in the Tube *E F* be leſſened in proportion to the Obliquity of the Tube, yet at the ſame time the Preſſure upwards is weakened or hindered in the ſame proportion, the Angles *E F C* and *F E H* being equal; ſo that here is a ſort of Compenſation made, and the ſame Force [illegible]ch keeps the Mercury ſuſpended in *E H*, will be no more than ſufficient to buoy up that in *E F* of an equal Altitude with the Former.

Alſo, ſince Tubes and Veſſels, having the ſame or equal Baſes and Altitudes with Cylinders and Priſms, may, notwithſtanding, contain more or leſs Mercury than thoſe Cylinders and Priſms (as is apparent from *Fig.* 11.) it may very reaſonably be



aſk'd, Why the Mercury ſtands at the ſame Height in all? *Viz.* Why in the Tube *C H*, with a round Head, the Mercury ſhould ſtand at the ſame Height that it does in the Cylinder *C I*, upon the ſame or an equal Baſe? And why in the Veſſel *D K B*, it ſhould not riſe higher than it does in *E D B F*?

The Reaſon of theſe two Phænomena I take to be this:

Firſt, In the Tube *C H*, the Mercury contain'd in the Head, without the inſcribed Tube *C I*, is not ſupported by the Baſe *C*, but by the Sides of the Head of the Tube; and conſequently the Preſſure upon *C*, is the ſame in both Tubes *C H*, *C I*; therefore the Altitude of the Mercury in both of them muſt be the ſame.

Secondly, Although the Veſſel *D K B* be much leſs than the Circumſcribing one, yet it will be an eaſy Matter to account for the Mercury's riſing no higher in that than in this; for at thoſe Parts of the Baſe, as *C*, where the Mercury has a free Aſcent, it ariſes to a certain determinate Height, as *C I*, in the Veſſel *D K B*; but the Aſcent of the other Parts *D E* and *E B*, is impeded by the Sides of the Veſſel *D K* and *K B*, as much as if *E D I* preſt upon it; therefore it cannot riſe any higher than the Mercury in the Circumſcribing Veſſel *E D B F*.

PROP. V.

If the Mercury in the Tube C D (See Fig. 9.*) be kept ſuſpended at the Altitude C I, yet if the Aggregate of the Tube and Mercury be left to it ſelf to deſcend freely, it will ſink into the Stagnant Mercury ſo far, till the Gravity D I or D C (the Part above the Surface A B) bears the ſame Proportion to the Gravity of as much Air equal to it in Bulk :: As the Weight of a Quantity of Mercury equal in Bulk to that Part immerſed, bears to the Weight of the immerſed Part of the Tube, together with the Mercury included in C I.*

For the Air upon the Out-ſide *D*, of the Top of the Tube *D C*, is very nearly equal to the Preſſure of the Air upon the other Parts of the Surface of the Mercury *A B*; but this Preſſure upon the Top of the Tube being added to the Preſſure of the included Mercury, together with the Weight of the Tube, will make the Preſſure upon *C* more than double to the Preſſure upon any other Part,

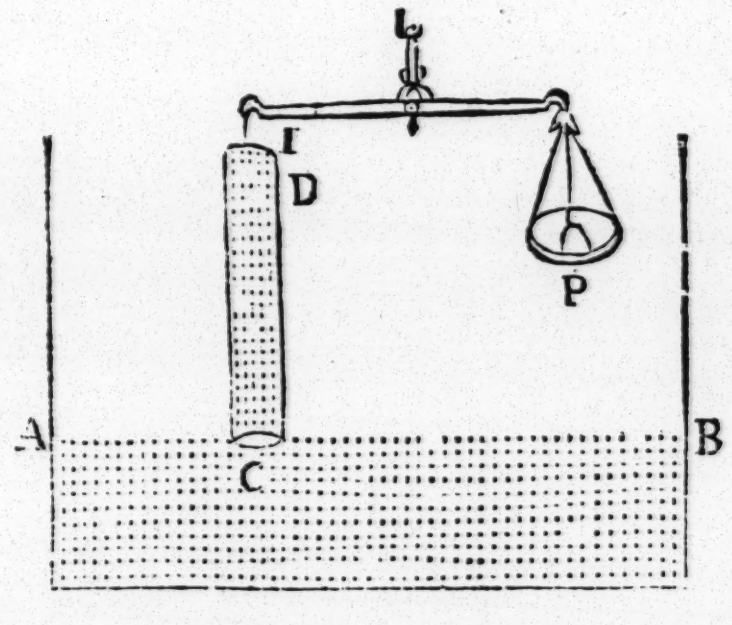
being the Effect of a double Column of Air of the Diameter of the Tube: and the Weight of the Tube and incumbent Air being not ſuſtained otherways, (by *Cor.* 3. *Prop.* 1.) the Tube will ſubſide ſo far, till the Part above the Surface bears the ſame Proportion to as much Air equal to it in Bulk, as a Quantity of Mercury equal in Bulk to the Part immerſed, bears to the immerſed Part. *Q. E. D.*

COROLLARY. I.

If the Tube *DI* be kept ſuſpended with its End *C* juſt under the Surface of the Mercury, the Weight or Tendency of the Tube downwards, is equal to the Gravity of a Column of Air, inſiſting upon the Top of the Tube *DI*, together with the Exceſs of the Gravity of the Tube above an equal Portion of Air; or, which is nearly the ſame Thing, equal to the Weight of the incloſed Mercury *DC*, together with the forementioned Exceſs.

COR. II.

But if *DC*, the Altitude of the inverted Tube, be leſs than *CI*, (where the Mercury, as in a common Barometer, would ſtand, were it not hinder'd) and conſequently, if the Air preſs more upon the other Parts, than the Mercury *DC* does upon *C*; then will ſo much of the Weight of the Tube and Mercury be abated, or ſo much Weight may be ſuppoſed to be taken out of the Scale *P*, (*Fig.* 12.) as is equal to the Exceſs of the Preſſure upon the other Parts above that upon *C*; for the Force upwards in *C* can ſuſtain ſo much Mercury, as is contained in a Tube whoſe Altitude is *CI*: Therefore



if the Altitude *CD* be leſs than *CI*, 'tis plain the Preſſure upwards at *C* will be able to buoy up as much more Weight than *DC*, as *DC* wants of *CI*; that is, ſo much Weight may be taken out of the Scale *P*, to bring it to an *Æquilibrium*.

For the Preſſure of the incumbent Air upon the Parts of the Surface *AB*, ſurrounding *C*, is ſufficient to ſuſtain either a Column of Air of an equal Weight with the former, or a mixt Column made up of 'em both, which does not exceed the Gravity of one of them, but cannot ſuſtain them both together, or any Thing more than what is equal to the Gravity of one.

Suppoſe the Part *C* of the Surface of the Mercury *AB* (*Fig.* 12.) expoſed to the open Air, then there will be ſuſtained a Column of the incumbent Air, equal to what is ſuſtained by every other equal Part of the Surface; but neither Mercury, nor any thing elſe more intenſively or ſpecifically heavier than Air, for that would deſtroy the *Æquilibrium*, by *Prop.* 1.

2. If, as in the *Torricellian* Experiment, which ſuppoſe made, the Preſſure of the incumbent Air be kept from acting upon *C* by *I*, the Top of the Tube *CI*, or any how elſe; the Preſſure at *C* upwards will then ſuſtain a Column of Mercury equal in Gravity to a Column of Air upon the ſame Baſe, but it can ſuſtain nothing elſe; ſo that the Tube, with the incumbent Column of Air upon the Top of it, muſt be ſuſtained ſome other way, either by the Hand, or by an equal Weight in the oppoſite Scale, *&c.*

3. If the Preſſure of the incumbent Air be kept off only in Part; that is, if the Pondus in the Scale *P*, be leſs than the Gravity of the Air reſting upon the Top of the Tube, and the Tube it ſelf; then *C* will ſuſtain a mixt Column, *i.e.* partly of Air, part of Mercury: And the Quantity of Air ſuſtained by *C*, is equal to the Exceſs of the Weight of the incumbent Air and Tube above the Pondus *P*; and the Mercury within the Tube wants juſt ſo much of the Weight of the Mercury in the laſt Caſe, as that Exceſs amounts to.

4. If the Pondus in the Scale *P*, be greater than the Weight of an incumbent Column upon the Top of the Tube, together with the Tube it ſelf, then it will elevate the Tube out of the Mercury.

This Matter will ſtill be more clear by the following Inſtances.

Suppoſe *C*, (*Fig.* 12.) that Part of the Surface *AB* upon which the Tube inſiſts, to be ſo large, as that being expoſed to the open Air, it can ſuſtain a Column of Air of 10 Ounces: Then if the *Torricellian* Experiment be made, and *C* be defended from the Gravitation of the Air upon it, then will, in its room, be ſuſpended a Column of Mercury, or any other Fluid which does not exceed 10 Ounces.

Let us imagine the Weight of the Tube to be two Ounces; then will the Weight of the Tube, together with the incumbent Air, be equal to 12 Ounces nearly, (I ſay nearly, for any one will perceive, from *Prop.* 5. that it wont be exactly ſo;) from which Preſſure *C* muſt be entirely freed, which may be done by the Hand, or by 12 Ounces in the Scale *P*.

Now let us ſuppoſe 4 Ounces taken out of the Scale *P*, then there will remain only 8, which cannot be a Balance for 12: Therefore the Tube *DC* will ſink down into the ſtagnant Mercury, (the Preſſure downwards upon *C* being greater by 4 Ounces, than the Preſſure any where elſe on the Surface of the ſtagnant Mercury) till the included Mercury weigh only 6 Ounces.

But here it may ſeem ſtrange, Why 8 Ounces in the Scale *P*, can buoy up the Tube equal to 2 Ounces, added to the Weight of the incumbent Air equal to 10 Ounces: But the Reaſon of this is evident; for the Preſſure upwards in *C*, is 4 Ounces greater than any where elſe; or, which is the ſame Thing, 4 of thoſe 12 Ounces (the Weight of the Tube and incumbent Air) will not be perceived, by reaſon of the contrary Tendency of the Mercury upwards at *C*; ſo that there will remain only 8 Ounces, equal to the Weight of the Pondus in *P*.

But if, inſtead of 4 Ounces, the whole Pondus had been taken out of the Scale *P*, *C* would then have a greater Preſſure upon it than it is able to bear, and conſequently will give way, and ſuffer the Tube and Mercury to ſink quite down to the Bottom of the Veſſel.

If

If, instead of 4 Ounces, 2 only had been taken out of the Scale *P*, there will remain 10 Ounces, which will take off 10 of the 12 Ounces, (the Weight of the Tube and Air together) and the remaining 2 Ounces will press upon *C*, which, with 8 Ounces of Mercury, will make 10; so that the Mercury in the Tube, in this Case, will weigh 8 Ounces, as before it weighed only 6; *i. e.* the Tube will ascend till the Mercury within it weigh 2 Ounces more than it did before.

If 2 Ounces more be added to *P*, the Tube will rise until the Mercury in it weigh 2 Ounces more than before, *i. e.* 10; but if any more Weight be added to *P*, the Tube will be elevated out of the Mercury.

From the foregoing Principles 'twill be no difficult Matter to account for that Experiment of Water rising higher in very narrow Tubes, than the Surface of the Water in which they are immers'd; for if you take a very slender Tube, open at both Ends, and put one End in a Vessel of Water, the Water within the Tube will be found something above the Level of the Water without, more and more proportionably to the Smallness of the Tube in which the Experiment is made.

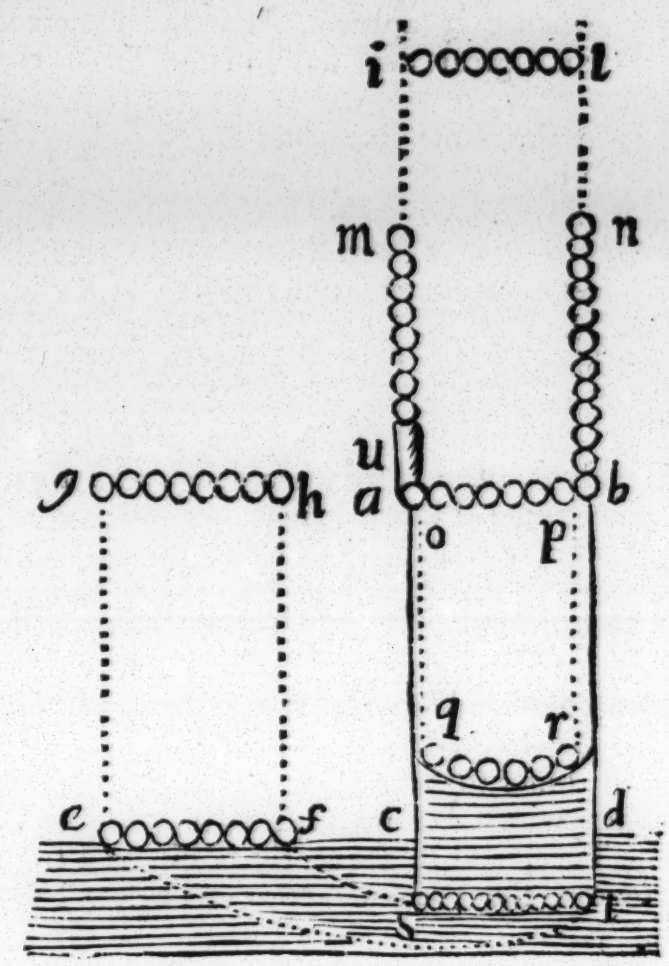
Rohault, in the First Part of his Physicks, *Cap.* 22. *Sect.* 85. tells us, That he thinks this Phænomenon may be thus accounted for: He fancies, That the Particles of Air cannot move so briskly in slender Pipes, as in larger; and consequently, are hinder'd from exercising a Force sufficient to suppress the Water.

Tho' had but this Gentleman made the same Experiment with Mercury, he would have found the quite contrary Effect, and that the Mercury in small Tubes is depress'd below the Mercury without.

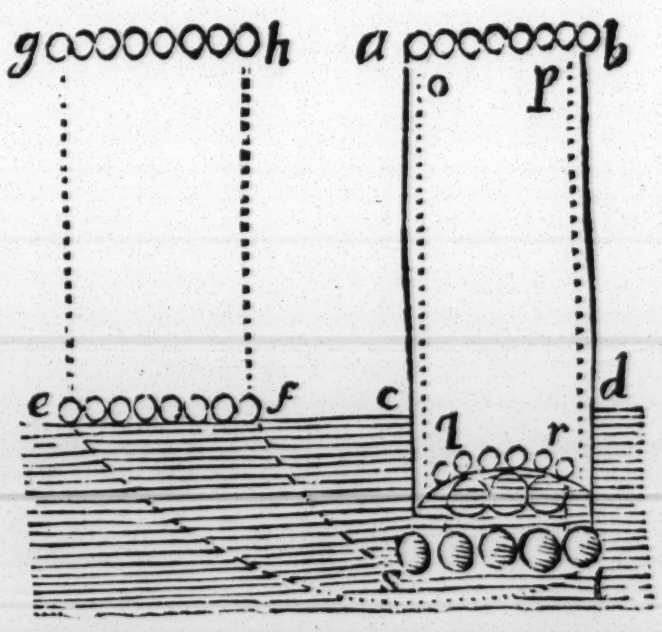
Besides, his Solution will appear precarious to any one that considers the Thing; for I wonder what a free Motion of the Particles of Air hath to do in depressing or elevating Liquors contain'd in Tubes: This is certainly the Effect of Gravity, whose Action is Rectilinear; but this Rectilinear Pressure is no more hinder'd in small Tubes than in larger.

And therefore the Reason why Water in small Tubes rises higher than the Level of the Surface without, according to Hydrostatical Principles, must be either because the Pressure without is increased, or the Pressure within the Tube diminished; but the Pressure without does not seem to be increased by barely putting the Tube into Water, and therefore it follows, the Pressure within is lessen'd: How this can be, is now to be accounted for.

Let there be a small Cylindrical Tube, *a b c d*, immersed in the Surface of the Water *e d*, upon which Surface let the Cylinder of Air *e f g h* likewise insist: Then let us suppose, that upon the Diameter of each Tube can stand a certain determinate Number of Particles of Air, *viz.* 8; or let 8 Particles of Air, placed in a Right-line, be equal to the Latitude of both Tubes: I say, it can seldom, nay, I believe, it can never happen, that the Eight can be intromitted in the Cavity of the Tube; for the upper Edges of the Tube will intercept the First and Eighth, so that only six can fall upon the Water: And the same will hold true of any other Series of Globules, whose two Extream Particles will always fall upon the Brinks of the Tube. Hence it is, that the whole Round of Globules insisting upon the Edges of the Tube, together with *a m* and *b n*, which they perpendicularly insist upon, gravitate only upon the Edges of the Tube, and never come to the Water *q r*, which is only gravitated upon by a Cylinder of Air, whose Diameter consists of six Globules: But 'tis quite another thing in the Aerial Cylinder *e f g h*, taken in any Part of the Surface without, where the Extream Globules are not in-



tercepted by the Sides of the Cylinder *g e* and *c h*, which are purely imaginary, but act freely upon the subjected Liquor: Consequently the Fluid without, is more acted upon than the Fluid within, by how much the Series of Globules insisting upon this, exceeds the Series of Globules insisting upon that; so that the Liquor without must subside a little, forcing that within the Tube to ascend, till such time as the Pressure be every where equal: But this is scarce perceivable in Tubes of larger Diameters; for the Air insisting upon the Brinks of a Tube, bears a greater Ratio to the Air without, whose Pressure is not hinder'd, in small Tubes than in larger, as the subsequent Calculation will make appear.



Let the Diameter of the Aerial Cylinder *e g h f* be 7 Globules, and that of the Cylinder *o p q r* be 6 Globules; then the Area of the Base of the former will be $38\frac{1}{2}$, and that of the latter $28\frac{1}{7}$, whose Difference is $10\frac{3}{14}$; so that *e f* is prest upon above $\frac{1}{4}$ more than the Base of the latter *c d*: But if the Diameter of the Base of the External Cylinder

be 14 Globules, and that of the Internal one a Globule leſs, *viz.* 13, the Area of the former will be 154, and that of the latter $132\frac{11}{14}$, whoſe Difference will be $21\frac{3}{14}$; ſo that the Preſſure of that is now ſcace $\frac{1}{7}$ part greater than the Preſſure of this: From whence it appears, That the Difference of Preſſure is a great deal leſs in large Tubes than in ſmall.

Upon the ſame Principles 'twill follow, That lighter Liquors will riſe higher in ſmall Tubes than heavier: And now we ſhall give an Account, why Mercury in a very ſmall Tube ſhould ſubſide below the Level of the external Mercury.

And here it may not be improper to obſerve, That ſome People, from the Aſcent of Liquors in ſmall Tubes, have vainly hoped for a perpetual Motion; for, ſay they, 'tis but making a Tube extreamly ſmall, and not too long, and then the Aſcent of the Liquor being proportional to the Smallneſs of the Tube, 'twill flow out at the Top, and that continually: But had thoſe People but throughly conſider'd the Matter, they could not have drawn any ſuch Concluſion; for though the Liquor contained in the Tube be forced to the Top of the Tube, by reaſon of a leſs Preſſure; yet when it comes to the Top, it meets there with the Globules which before acted only upon the Edges of the Tube, and conſequently is hinder'd from overflowing, the Preſſure above and below being equal.

But here it may very well be objected, That tho' the Aerial Cylinder *g h e f* preſs upon the ſubjected Liquor, yet this Preſſure is not wholly derived to the Tube, but partly broken: for the Globules of Water *s t*, cannot ſo exactly flow into the Tube, but the extream Globules *s* and *t*, muſt light on the Edges of the Bottom of the Tube, and conſequently their Preſſure be rendred ineffectual, as were *a* and *b* above; and this being true of the whole Round of Globules, they ſee no reaſon why the Water ſhould aſcend at all, being the Preſſure is equally debilitated both above and below.

To obviate which Objection, it may be conſidered, That the Particles of Water are more voluble and flexible; upon which account they eaſily glide into the Tube, without ſuffering any conſiderable Detriment; whilſt thoſe of Air, being more ſtiff and rigid, ſuffer much from the Sides of the Tube: Beſides, the Particles of Water are ſmaller than thoſe of Air, as Mr. *Boyle* has prov'd by ſeveral Experiments, and conſequently, though the extream Globules *s* and *t* do light upon the Edges of the Tube, yet ſtill the Preſſure upwards will be greater than the Preſſure downwards, and the Water forc'd to aſcend.

Theſe Things being conſidered, 'twill be no difficult Matter to account for the ſubſiding of Mercury in ſmall Tubes below the Level of the Mercury without; for by the Law of Contraries, the Particles of Mercury will be more groſs than thoſe of Air; and conſequently the Preſſure of the Particles of Mercury below, upwards will be leſs than the Preſſure of the Air down, and the Mercury forced to deſcend.

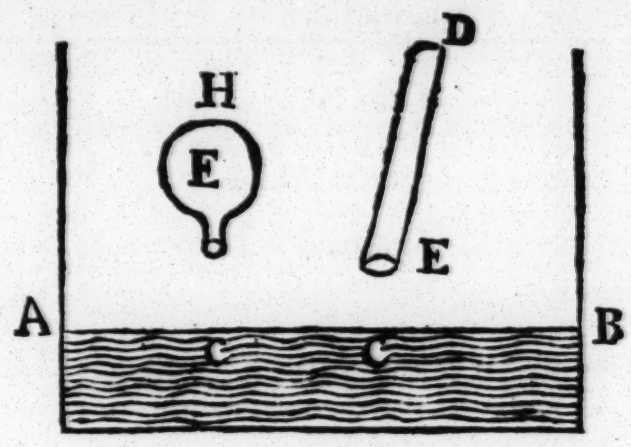
LEMMA.

Hitherto we have only taken notice of the Gravity of the Air, without any regard to that other remarkable Property of *it*; I mean its Elaſticity, which Mr. *Boyle* has prov'd by various Experiments. Now this Elaſticity is a Power that Air compreſſed, either by its own Gravity, or any other way, has of reſtoring it ſelf to its former State; and this Elaſtick Force acts indifferently every way, though in caſe any Part of the compreſſed Air be leſs preſs'd upon than the reſt, 'twill that way endeavour to free it ſelf from the Preſſure upon its other Parts, in order that the Preſſure may be equal every where; and this reſtitutive Force increaſes in proportion to the Compreſſive, and is always equal to it.

If any one deſire a fuller Account of this Matter, he may conſult Dr. *Wallis's Mechanical Philoſophy*, *P.* 1. *C.* 13. *Pr.* 1. and *L.* 14. *Pr.* 11. This being premiſed, I proceed to the following Propoſition.

PROP. VI.

The Elaſtick Force of Air contain'd in any Veſſel, and which is of the ſame Nature with the external Air, i. e. is neither more nor leſs compreſt, does the ſame thing as the whole Weight of the external Air.



Let there be a Tube, as *D*, or a Veſſel, as *H*, of any Form, whoſe Orifice at *E* is open, and conſequently the internal Air communicates with the external; then 'tis plain, that if the external Air be more compreſt than the internal, it will dilate it ſelf, compreſſing the internal till ſuch times as there be an *Æquilibrium*; but on the contrary, if the internal be more compreſt than the external, then will this dilate it ſelf, compreſſing the other till the *Æquilibrium* be again reſtor'd; *i. e.* till the Elaſticity of the included Air be equal to the compreſſive Force without; or, which is the ſame thing, to the whole Weight of the incumbent Air: And if *E* be cloſe, the Elaſticity of the included Air will ſtill be equal to the Weight of the external incumbent Air; for the Elaſticity won't be in the leaſt altered by the Orifice being ſtopp'd; therefore the Propoſition is clear.

PROP. VII.

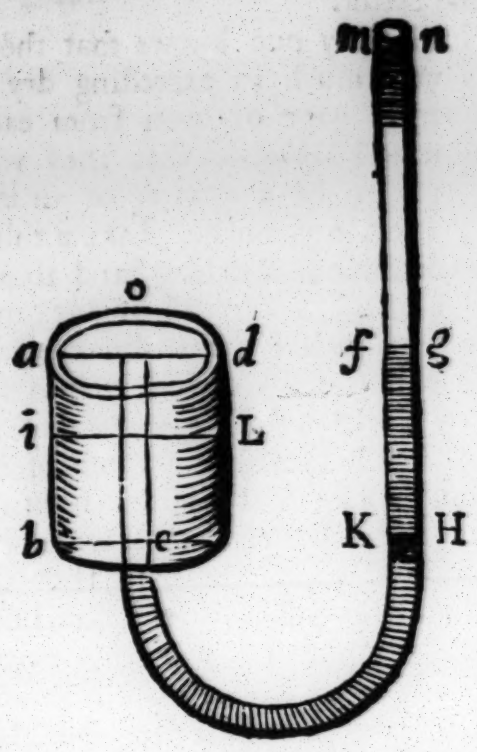
If the Orifice E, of the Tube D, or the Veſſel H, (fill'd with Air of the ſame Nature with the external Air) be put in the Surface AB of a Veſſel of Mercury, that Fluid will neither riſe nor be depreſt.

Demonſtration.

For *C*, that part of the Surface *A B* which the Orifice *E* inſiſts upon, is equally preſt with the other Parts of the Surface *AB*, ſeeing the Elaſticity of the Air in *D* and *H*, is equal by the laſt Propoſition, to the Weight of the external incumbent Air; (Here it muſt be obſerved, that we ſuppoſe the Veſſel to be ſuſtain'd ſome other way) and conſequently, by *Prop.* 1. the Mercury will neither aſcend nor deſcend. *Q. E. D.*

The

The Ingenious Mr. John Keil *thus Mathematically demonſtrates the Reaſon, why* Fluids *keep at the ſame Height in Canals, or Pipes of different Dimenſions.*



Let there be a larger Pipe or Cylinder, as *a b c d*, which is connected with the more ſlender one *m n K H c*, at *c*.

Water being put in at either Orifice, will keep the ſame Level in both Pipes, or will ſtand at the ſame Height in both Legs; ſo that the Surface of the Water, *a d* and *g f*, ſhall be in the ſame Plain.

For if by any Force the Water in the larger part *a d b c* ſhould be impelled down, ſuppoſe to *I L*, it muſt riſe ſo much higher in the leſſer Leg of the Siphon, ſuppoſe to *m n*, that the Cylinder of Water *m n f g* ſhall be equal to the empty part *a d i L*.

But when Cylinders are equal, and are of different Baſes and Heights, their Baſes and Heights muſt be reciprocally proportional; therefore here *f m* : *a i* :: As the Orifice *a d* : To the Orifice *m n* or *f g* : But *f m* : *a i* :: As the Velocity of Aſcent in one Tube : Is to the Velocity of Deſcent in the other; and the Orifice *a d* : Is to the Orifice *f g* :: As the Water in *a c* : Is to the Water in the part of the Pipe *f H*, (for Cylinders of equal Height are as their Baſes:) Wherefore the Velocity of the aſcending Water in the Pipe *f H* : Will be to the Velocity of the deſcending Water in the Pipe *a c* :: As the Water in the Pipe *a c* : Is to the Water in the Pipe *f H*; that is, the Velocities of the aſcending and deſcending Portions of Water are reciprocally proportional, and conſequently their Moments muſt be equal; and being contrary one to another, they will equi-balance each other, and conſequently make the Water ſtand in both Legs at one and the ſame Height.

The Phyſical Reaſon of which Phænomenon is, That no more Water preſſes on the Orifice *c*, than what is contained in the Cylinder *o c*, perpendicularly incumbent on the Orifice (the reſt being ſuſtained by the Bottom of the larger Pipe, which extends beyond the Orifice *c* all round it): Now the Cylinder *o c* being equal every way to *f g*, the Water in each will be of the ſame Height.

From hence alſo, by the by, may the Reaſon appear, Why Water, or any other Fluid, flowing out of a larger Pipe or Canal into a ſlenderer, moves there with a greater Celerity.

Hence alſo in an Animal Body, if the Ramifications of the Arteries (or the Capillary Arteries) have the Sum of all their Orifices, or rather of their Tranſverſe Sections, greater than the Area of the Tranſverſe Section of the Aorta, or great Artery, the Velocity of the Motion of the Blood in them will be leſs than in the Aorta; but if the Sum be leſs, the Motion of the Blood there will be ſwifter than in the Aorta.

HYDROTICKS, or Medicines that provoke Sweating, are thoſe which by fermenting and attenuating the ſmall Parts, penetrate into the cloſeſt Pores of the Blood, divide its Particles, rarify them, and turn them into a kind of Vapour, which, together with whatever they meet, and can carry with them, they drive out into the Surface of the Body, and there being condens'd into an inſenſible Liquor, they appear in the Form of Sweat. *Blanchard.*

HYEMAL-SOLSTICE: See *Solſtice.*

HYGIEA, is Health, which conſiſts in a good Temperature, and right Conformation of Parts.

Health is a Diſpoſition of the Parts of an Human Body, fit for the Performance of the Actions of that Body.

Signs of Health are Three, due Action, ſuitable Qualities, and when things taken in and let out are proportionable. *Blanchard.*

HYGIEINA, is that Part of Phyſick which teaches the way of preſerving Health: Some divide it into three Parts.

Prophylactick, which takes Notice of future imminent Diſeaſes.

Synteritick, which preſerves preſent Health: And,

Analeptick, which recovers the Sick. *Blanchard.*

HYGROCYRSOCELE, is a Branch of any winding Veins, ſwoln with ill Blood, accompanied with other Moiſture. *Blanchard.*

HYGROMETER, the ſame with *Hygroſcope*; which ſee.

HYGROSCOPE, is a Philoſophical Inſtrument, contrived to ſhew the Moiſture or Dryneſs of the Air, according as it abounds with watry or dry Steams; and to meaſure and eſtimate the Quantity of ſuch Moiſture or Dryneſs.

To make a Hygroſcope *with Oil of Vitriol.*

Procure a good nice pair of Scales, not too ſlight, that will turn with about $\frac{1}{10}$ part of a Grain, (or $\frac{1}{8}$ part of a Grain will do pretty well) into one of theſe in a flat Glaſs of about 3 or 4 Inches in Diameter (ſuch a kind of Glaſs as holds the ſtagnant Mercury in the Baroſcope) put 3 or 4 Drams of the Oil of Vitriol; hang up the Balance in a place free from the heat of the Sun's immediate Beams, or a Fire; and put Weights in the other Scale, to reduce it to an *Æquilibrium*, you will be ſurpriſed to find that this Liquor will, if it was good, and well dephlegmated, double, nay, perhaps treble the Weight in a Fortnight, by attracting and imbibing the Moiſture of the Air: But ſo it will certainly do more or leſs, according to the Seaſon of the Year, and the Temper of the Weather. You muſt let this Liquor hang till you find it hath gain'd its utmoſt Increaſe of Weight, which will be in leſs than a Fortnights time, unleſs it be exceeding dry and hot Weather.

And then you may begin to make uſe of it as an *Hygroſcope*: For as the Oil of Vitriol preponderates, the Air increaſes in Moiſture; and as the other

then Scale, where the Weights are, preponderates, its Drought increaſes in the ſame Proportion. The Degrees of Moiſture, or Dryneſs, may be computed either by ſmall Weights put into the lighter Scale, or elſe by having the Handle of the Scale very long, as alſo the Tongue; ſo that it ſhall with its Top mark the Diviſions on an Arch of Braſs, that may be applied for that purpoſe on the Top of the Handle, over the Tongue of the Balance.

The Hygroſcope *of Mr.* William Mollyneux, *Secretary of the Philoſophical Society at* Dublin, *is thus made:*

Faſten a Piece of Whip-cord, of about 4 Foot long, to an Hook or Staple, in ſome convenient Place of the Ceiling of a Room, and at the Bottom hang a Weight of about a Pound: Let thereon, or into the Bottom of the Weight, be faſtened an Index of about a Foot long, and under it, on a Table, or on a Piece of Board, place a Circle, divided into what Number of Degrees you pleaſe, and fit it ſo that the Center of the Index may hang juſt over the Center of the Circle.

After it has hung thus 2 or 3 Days to ſtretch the Cord, you may begin to meaſure by it the Degrees of Moiſture or Drought in the Air: For the Cord will twiſt one way, and contract it ſelf for Wet, and untwiſt it ſelf again on the contrary way for Dry. You will find this plain and ſimple Inſtrument the niceſt *Hygrometer* of any, for it will ſhew you very ſmall Alterations of the Temper of the Air, and is ſubject to fewer Inconveniencies than any other Inſtrument of this kind.

A very good Hygroſcope *may be thus eaſily made.*

Take a ſmall Deal-Box, and to the Bottom, or one of the Sides of it, faſten ſtrongly a pretty large Piece of Lute-ſtring or Cats-gut; and then bringing the other End thro' a Hole purpoſely made for it in the oppoſite Part or Side of the Box, and which muſt be ſo much bigger than the String, that the String may turn eaſily round in it any way: Faſten to the String (without) a light Index, made of a Piece of Cedar or Deal, *&c.* and round about the Hole where the String comes thro', draw a Circle on the Box, and divide it into Degrees; ſo that the String twiſting and untwiſting it ſelf, as it will do againſt wet or dry Weather, may turn the Index along with it, and that will ſhew in the graduated Limb of the Circle, the Meaſure of the Air's Moiſture or Dryneſs.

I have often tried this kind of Hygroſcope, and found it to do very well. But Dr. *Hook*, in his *Micrographia*, ſaith, Nothing will ſhew the Variations of Moiſture and Dryneſs in the Air like the Beard of a Wild Oat; which he there (*P.* 147.) ſhews you how to fit in a proper Box or Frame, and with an Index, *&c.* But I believe the Cats-gut one, tho' not ſo very tender as this, (and yet I have known one go twice round the ſame way) may retain its twiſting and untwiſting Property much longer.

I always found the Wind to have a peculiar effect upon this Inſtrument.

Another Hygroſcope *of two Plain Boards.*

Plain two pieces of Deal, or (which is better) of Poplar Boards, of about two Foot long, and a Foot and a half in breadth, and let them be ſhotten or joynted, ſo that their Edges will meet even together; let thoſe be ſet cloſe together like a Pannel of Wainſcot, with their Tops and Bottoms let into the Groove of a ſtrong Oaken-Ledge, and their four outward Corners pointed into the Groove; but there need be no Ledges on the Sides, that the Boards may play the better.

Then, ſince every one knows that theſe Boards will ſhrink very much in exceeding dry Weather, and conſequently gape or open from each other; ſuppoſe the utmoſt Diſtance that they will ſhrink from each other to be a quarter of an Inch, more or leſs, it matters not much. Take a thin piece of Braſs of two or three Inches long, and about a quarter of an Inch broad, and meaſuring at one end of it a quarter of an Inch (or that diſtance you ſuppoſe your Boards will ſhrink) divide it into five equal Parts, and then with a ſmall File cut thoſe Diviſions into ſo many ſmall Teeth, like thoſe of a Watch-wheel: Then drilling 2 or 3 Holes in this piece of Braſs towards the other end, with ſome ſmall Nails faſten it on one of your Boards, ſo that the firſt of the 5 Teeth may lie juſt over the Juncture of the Boards, and the reſt lie over the other Board. Next on the end of a piece of thick Iron-wire, make a Pinion of 3 Teeth to anſwer the 5 Notches in the Braſs-plate; and by means of a Bracket, let it be ſo faſten'd on the other Board, that its Axle playing in the Bracket, it may fit the Teeth of its Pinion to the Notches in the Braſs-plate; and then whenever the Boards ſhrink aſunder, the Braſs being drawn a little away, muſt needs turn this Axle more or leſs; and when the Boards have ſhrunk a quarter of an Inch from each other, the Axle will have made one entire Revolution. If then you faſten a long and light Index on the Extremity of this Axle, and make a Circle round it, divided into what number of parts you pleaſe, the Motion of the Point of the Index, backwards or forwards, will ſhew you the Degree of Moiſture or Drought in the Air.

You may eaſily have the Axle ſo long, as that its Index-end ſhall come thro' a round Plate of Wood or Metal, which may hide all Contrivances, and make it appear only like a Clock or Watch.

HYGROSCOPE STATICAL, was invented by that Noble Philoſopher Mr. *Boyle*. The beſt way to make it, is to take a Dram weight of fine Spunge, and having well cleaned it and dryed it, let it be put, when the Air is of a moderate Temperature, into one of the Scales of a very nice and tender Ballance, (that will turn, when ſo loaded, with half a quarter of a Grain) and in the other Scale put ſo much weight as will juſt equi-ponderate it. Then will the Spunge by its encreaſe and decreaſe of Weight, daily ſhew the Moiſture or Dryneſs of the neighbouring Air, and meaſure its Quantity by Weight; whence it hath its Name of the Statical *Hygroſcope*.

I have often tried this Inſtrument my ſelf, and have found it to anſwer very nicely, and to increaſe or decreaſe in Weight very conſpicuouſly, according as the Air hath been Moiſt or Dry.

If you think the taking out or putting in of ſuch ſmall Weights, as Grains, or their Subdiviſions, (of which there will be conſtant occaſion) to be troubleſome, you may eaſily ſo fit the Arch of a Semicircle well divided, as that againſt it the Tongue of the Ballance ſhall play, and by the Degree there cut, ſhew you the quantity of the encreaſe or decreaſe in weight of the Airs Moiſture: But the former way is more exact, and will be eaſy enough with a little Practice.

The

The above-mentioned Honourable Gentleman hath a little Tract about the Uſes and Advantages of *Hygroſcopes*; wherein he proves this *Statical one* to have many Advantages above the other Kinds. For,

1. It will laſt good longer than moſt of them.

2. As it is eaſily made at firſt, ſo 'tis as eaſily repaired or mended, if it come to any Injury.

3. The Quantity of the Drought or Moiſture of the Air it meaſures, is eaſily communicable to a Correſpondent by Letter, *&c.* becauſe it is eſtimable in the known Weights of Grains and their Parts; whereas in moſt other Hygroſcopes 'tis not ſo eaſy for another Perſon, beſides the Obſerver, to judge of the Quantity of the Alteration.

The Uſes and Advantages of theſe kind of Inſtruments when well made, and carefully obſerved, he judges may be ſuch as theſe:

1. To diſcover in what part of Day or Night the Air hath its greateſt degree of Moiſture; and how at ſuch times the Baroſcope ſtands affected; whether near the Sea-ſide, the Ebbing and Flowing of the Sea make any ſenſible Alteration as to the Moiſture or Drineſs of the Air; and whether at the Fall and New Moons the Atmoſphere be moſt damp and moiſt; and whether the Menſtrual or Annual Spring-Tides, have any ſenſible Operation on this Inſtrument.

2. To diſcover how much one Year and Seaſon is drier or moiſter than another; whether the multitude or fewneſs of Solar Spots occaſion (as ſome Aſtronomers have obſerved) any Alteration in the Temperature of the Air, as to Wet or Dry: And thoſe that are Aſtrologically given, may obſerve, whether the Aſpects of the Planets, their Eclipſes, Conjunctions, *&c.* have any Influence this way on our Atmoſphere.

3. To diſcover and compare the Changes of the Temperature of the Air made by Winds, ſtrong or weak; or by Froſty, Snowy, or other Weather.

4. To compare the Temperature of differing Houſes, and differing Rooms in the ſame Houſe; which may be of great Uſe to Tender and Sickly Perſons; and to keep a Chamber, if there be occaſion, conſtantly to the ſame, or any aſſigned degree of Drineſs.

HYMEN, is a circular Folding of the inner Membrane of the *Vagina:* and this being broke *(in primo Coitu)* its Fibres contract in three or four places, and ſo form the *Glandulæ Myrtiformes.*

HYOIDES, and by ſome *Os Upſiloides*, from its being in Figure like the Letter ϒ, is a Bone placed at the Baſis of the Tongue upon the Larynx: It hath 10 Muſcles which keep it in its place above by its upper *Cornua*; 'tis faſtened to the *Apophyſes Scyloides* of the Temple-Bone, and below to the Wings of the *Cartilago Theorides* of the *Larynx.*

HYOTHYROIDES, are two Muſcles of the *Larynx*, proceeding from the Inferior Part of the Bone *Hyoides*, laterally and oppoſite to the Origination of the *Ceratogloſſus.*

This pair of Muſcles deſcends directly to the lower part of the *Cartilago Scutiformis:* Its Uſe is to draw the *Larynx* upwards in an Acute Tone of the Voice; the Canal of the *Aſpera Arteria* being alſo ſtreightned by it.

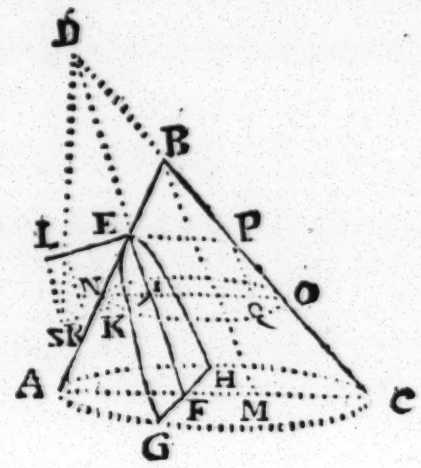
HYPÆTHRON, is an open Gallery or Building, the inſide whereof is uncover'd, and expoſed to the Weather. The Ancients gave this Name to all Temples which had no Roof; as that of *Jupiter Olympius* at *Athens*, having 10 Columns in Front, as alſo two Rows in its exterior Sides, and one in the Interior.

HYPALLAGE, or *Immutation*, a Grammatical Figure, when of different Expreſſions, which give the ſame Idea, we make choice of that which is leaſt uſed; or when there is a mutual Permutation or change of Caſes: As in this Inſtance, *Dare Claſſibus Auſtros*, inſtead of *Dare Claſſes Auſtris.*

HYPERBATON, a Grammatical Figure, where there is too bold and frequent a Tranſpoſition of Words.

HYPERBOLA, in Geometry, is a Section of a Cone made by a Plane, ſo that the Axis of the Section inclines to the oppoſite Leg of the Cone, which in the Parabola is parallel to it, and in the Ellipſis interſects it. The Axis of the Hyperbolical Section will meet alſo with the oppoſite ſide of the Cone, when produced above the Vertex.

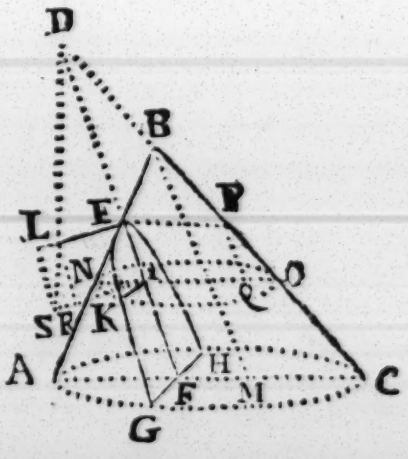
Thus, in the annexed Figure, the Curve *GEHF* is an *Hyperbola.*



Where the Line *E D*, being the Continuation of the Axis till it meet with the oppoſite Cone, or oppoſite ſide of the former Cone *CB* produced, is called by the Name of the *Latus Tranſverſum*; and the middle Point of that Line *E D*, is called the *Center of the Section*, or rather of *the oppoſite Sections.*

PROP. I.

In an Hyperbola GEHF, the Square of the Ordinate IK, is equal both to the Rectangle LI, made under the Parameter *LE, and the* Abſciſſa *EI; and alſo to the Rectangle LS, made under the* Abſciſſa *EI* (or *LR*) *and another Line SR, which is a fourth Proportional to DE the* Latus Tranſverſum, *EL the* Parameter (*or* Latus Rectum) *and EI the* Abſciſſa.



Let the ſide of the Cone *AB*, in which the Section is, be called *a*; and thro' *B* the Vertex of the Cone, draw *BM* parallel to the Axis of the Section, and which call *b*. Let the intercepted part of the

the Diameter of the Baſe AM be called c. Let $EI = eb$. Then by comparing the ſimilar Triangles ABM and EIN, IN, in this way of Notation, will be $= ec$. And if you put $MC = d$, and the Tranſverſe Diameter $DE = ob$; then will $DI = ob + eb$. And by reaſon of the ſimilarity of the Triangles BMC, DEP, and DIO, you will find that EP muſt be expreſſed by od, and IO by $od + ed$, and conſequently, $QO = ed$. *(The General Reaſon of all which way of Notation, and the way of working to obtain it, you will ſee in the Parabola.)*

This done, 'tis plain that KI Square muſt be $=$ to the Rectangle NIO; that is, in this Notation $= oecd + eecd$, as you will find by Multiplication. Wherefore, if $oecd + eecd$, the Square of IK, be divided by the *Abſciſſa* $EI = eb$, the Quotient muſt be ſuch a Line, which together with EI, can make a Rectangle equal to the Square of IK: Wherefore the Rectangle $ES = IK$ Square; which in this Notation will be $\frac{oecd + eecd}{eb}$, or contractedly, $\frac{ocd + ecd}{b}$. This done, proceed (as directed in *Cor.* 1. *Prop.* 1. of the *Parabola*, to find the *Latus Rectum*) by ſaying, As $b : c :: od : \frac{odc}{b}$; in Words, As the Parallel to the Section : is to the part of the Diameter of the Baſe intercepted :: So is the *Latus Primarium* : to a fourth Proportional; 'tis plain, the fourth Term will be one part of the Line IS, or in this Notation $\frac{odc}{b}$ = *Latus Rectum* RI (or LE.) And the other will be found thus: As $b : c :: ed : \frac{ced}{b}$.

Or, according to *Apollonius*'s way of Expreſſion in this Propoſition: As $ob : \frac{ocd}{b} :: eb : \frac{ecd}{b}$; for that will be found to be the fourth Proportional as before: Which is now found out according to the Terms of the Propoſition, between the *Latus Tranſverſum* ob, and the *Latus Rectum* $\frac{ocd}{b}$, and the Abſciſſa eb.

Wherefore $oecd + eecd$, the Square of the Ordinate IK, is manifeſtly equal to the Rectangle under the *Latus Rectum* and the *Abſciſſa*; and alſo to another under the *Abſciſſa*, and the fourth Proportional. *Q. E. D.*

COROLLARY I.

Hence the Reaſon of the Name Hyperbola, which *Apollonius* gave to this Section, is apparent, *viz.* Becauſe the Square of the Ordinate *exceeds* the Rectangle under the *Parameter* and *Abſciſſa*.

COROLLARY II.

If you multiply the *Latus Rectum* $\frac{ocd}{b}$ (which is noted here as in the *Parabola*) both above and below the Line by b, the Parallel to the Section, there will ariſe this Quantity $\frac{bocd}{bb}$.

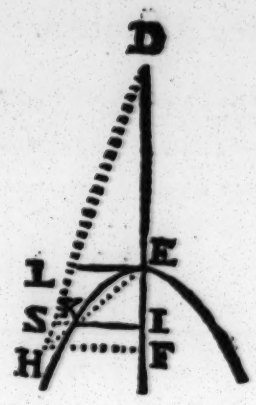
Which being reſolved into Proportionals thus:

As $bb : cd :: bo : \frac{bocd}{bb}$; gives exactly *Apollonius*'s Canon for finding the *Latus Rectum*, (in *Prop.* 12. *Lib.* 1.) *viz.*

As the Square of the Side of the Cone in which the Section is made: Is to the Rectangle between the Segments of the Baſe made by a Parallel to the Section, and drawn thro' the Vertex of the Cone :: So is the *Latus Tranſverſum*: to the *Latus Rectum*.

COROLLARY III.

The *Latus Rectum* may alſo here, as well as in the Parabola, be Geometrically found.



If you find firſt HF, a third Proportional to EI the Abſciſſa, and to KI (or EF) the Ordinate: (See *Praxis* 2. in the *Parabola*.) After which find a fourth Proportional EL to DI, the Sum of the *Latus Tranſverſum* and *Abſciſſa*, to HF, and to DE, the *Latus Tranſverſum*. For ſuppoſing $IS = HF$ (as it might eaſily have been made, by drawing it a little longer) at the end of which place S, and draw DS; as alſo LE parallel to HF: Then ſhall LE be the true *Latus Rectum*: For as $DI : IS$ (or HF;) :: ſo $DE : LE$.

COROLLARY IV.

From which 'tis plain, that having the *Latus Rectum* and *Tranſverſum*, the Ordinates in any *Hyperbola* may be drawn, and conſequently the Curve eaſily deſcribed.

For taking any part of the Axis (as EI) for the Abſciſſa, and making as DE : to EL :: So DI: to a fourth Proportional IS; and then finding a mean Proportional between IS and the Abſciſſa EI (ſuppoſe IK,) that Line IK rightly applied, ſhall be the Ordinate ſought, thro' whoſe Point K, the Hyperbola will paſs.

PROP. II.

In the Hyperbola the Squares of the Ordinates KI and GF, are as the Rectangles DIE and DFE, under the Lines lying between the Ordinates and the Vertices, or Extreams of the Latus Tranſverſum, *and their reſpective* Abſciſſæ. *See* Fig. Prop. 1.

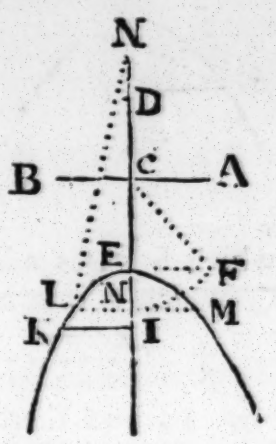
Let the Axis of the Section EF be called ib, as before EI was called eb: Then, by conſidering *Prop.* 1. 'tis plain, that the Square of GF will be $= oicd + iicd$; and the Rectangle DFE, will (by multiplying $DF = ob + ib$, by $FE = ib$) be found to be $oibb + iibb$.

Again, the Square of KI: will be to the Square of GF :: as $oecd + eecd$; (by Prop. 1. equal to it) : is to $oicd + iicd$ (now proved $=$ to the Square GF.) That is, taking away cd, which is common, as $oe + ee$, is to $oi + ii$. But in ſuch very Proportion are the Rectangles DIE and DFE: For $DIE = eobb + eebb$ (becauſe DE

$DE = ob$, and $EI = eb$) and $DFE = oibb + iibb$, as was proved just above. Now there is no doubt but $eobb + eebb : oibb + iibb :: ee + oi : ee + ii$; wherefore these Rectangles are as the Squares of the Ordinates. *Q E D.*

COROLLARY I.

If the *Latus Rectum* LM be applied so, as that N be the Focus, then will $LN = \frac{ocd}{2b}$, and its

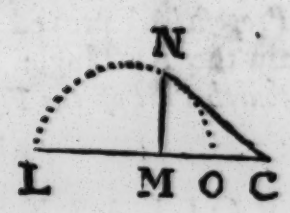


Square $= \frac{ooccdd}{4bb}$: But (by this Proposition) As the Square KI: Square LN :: So is the Rectangle DIE: Rectangle DNE; that is, as $eocd + eecd : \frac{ooccdd}{4bb} :: oebb + eebb :$ To $\frac{oocd}{4}$, which will be found to be the fourth Term by this way of Notation. Also this Rectangle DNE (being made out of the whole Line DE, with the Part added EN, multiplied by that Part added EN) together with the Square of CE, the Half of DE ($= \frac{1}{4}$ of $oobb$, i. e. $\frac{1}{4}$ of ob Square) is equal to $\frac{oocd + oobb}{4} = CN$ Square, the half Line with the Part added: Wherefore CN is the Distance from the *Focus* $= \sqrt{:} \frac{oocd + oobb}{4}$, of which the former Part $\frac{oocd}{4}$, is the fourth Part of the Rectangle under the *Latus Rectum* $\left(\frac{ocd}{b}\right)$ and *Transversum* (ob); or, as *Apollonius* calls it, the fourth Part of the Figure; and the other Part $\frac{oobb}{4}$ is $\frac{1}{4}$ of the Square of the *Latus Transversum*: So that from hence we may have a Canon to determine the Focus of any Hyperbola; thus,

Add the Fourth Part of the Figure (or of the Rectangle under the *Latus Rectum* and *Transversum*) to the Square of half the *Latus Transversum*; and extract the Square Root of the Sum, that Root shall be the Distance of the Focus from the Center $= CN$. And if from CN you take half the *Latus Transversum* CE, the Remainder EN is the Distance of the Focus from the Vertex.

Which Rule is very easie in Practice, for $\frac{oobb}{4}$ is nothing but the Square of CE, and $\frac{oocd}{4}$ is only $\frac{1}{4}$ of DE multiplied into LM.

Wherefore find a mean Proportional between $\frac{1}{4}$ of $DE = MO$, and LM, which let be MN (in this Figure.)



And then make $MC = CE$ of the Hyperbola; for then shall the Hypothenuse NC, be the Distance from the Center C to the Focus N required.

COROLLARY II.

Since the Rectangle DNE + Square CE = Square CN, therefore the Square CN — Square CE = Rectangle DNE: Put therefore, for Brevities sake, $m = CN$, and then will the Rectangle $DNE = mm - \frac{oobb}{4}$ in this Notation, of which more below.

PROP. III.

In the Hyperbola (See Fig. of Prop. 1.) *the* Latus Rectum : *is to the* Latus Transversum :: *as the Square of any Ordinate* IK : *is to the Rectangle* DIE, *contained under the Lines intercepted between it and the Vertexes of the* Latus Transversum *and the* Abscissæ.

For here (as above) $\frac{ocd}{b} =$ *Latus Rectum*, $ob =$ *Latus Transversum*, and $oecd + eecd$, will be $= KI$ Square; and the Rectangle DIE is $= eobb + eebb$; wherefore place those Terms according to the Condition of the Proposition; as

$$\frac{ocd}{b} : ob :: oecd + oecd : eobb + eebb.$$

And trying by multiplication of the Extreams and Means, you will find the same Quantity $eoocbd + eebocd$ arise from both, and therefore the Terms are truly proportional. *Q. E. D.*

COROLLARY I.

In the *Hyperbola* (see *Fig.* 1. of *Cor.* 1. of *Prop.* 2.) if AC Square, or its equal FE Square ($= \frac{oocd}{4}$, which is $\frac{1}{4}$ of DE multiplied into LM) be taken out of CF Square, or its equal CN Square (*i. e.* out of $\frac{oocd + oobb}{4}$, by *Cor.* 1. *Prop.* 2.) there will remain $\frac{oobb}{4}$ whose Square Root is $\frac{ob}{2} = CD =$ half the *Latus Transversum* DE.

Wherefore here, if the Axis be given, the *Foci* are so too: For draw thro' the Vertex E, EF perpendicular to ED, and equal to CA, and with the Distance CE, setting one Foot of the Compasses in C, cross the Axis at N and N; so shall these Points be the *Foci* required.

COROLLARY II.

Since (by *Cor.* 1. *Prop.* 2.) the Rectangle $DNE = \frac{ocd}{4}$; which Quantity $\frac{ocd}{4}$, is also (by *Cor.* 1. of this *Propoſition*) proved equal to AC Square; 'tis plain the Rectangle $DNE = AC$ Square, or to a *fourth Part of the Figure*, as *Apollonius* calls it.

COROLLARY III.

Hence 'tis plain, That the Square of CE, half the *Tranſverſe Diameter*: is to the Square of AC or EF, half the *Second Diameter*, as 'tis called:: as the *Latus Tranſverſum*: to the *Latus Rectum*.

For $\frac{obb}{4} : \frac{ocd}{4} :: obb : ocd :: obb : ocd :: ob : \frac{ocd}{b}$.

COROLLARY IV.

Again, Since CE Square : AC Square :: $ob : \frac{ocd}{b}$ (by *Cor.* 3.) that is, As the Rectangle DIE: IK Square (by this *Propoſition*) :: the Square of half the *Tranſverſe Diameter*: is to the Square of half the *Second Diameter*; (or, by *Cor.* 2. to the Rectangle $ENE = AC$ Square) :: as the Rectangle DIE: to the Square of the Ordinate IK.

COROLLARY V.

Hence the Square of the Ordinate KI (*Prop.* 3.) which hitherto in the Hyperbola hath been denoted by $oecd + eecd$, (ſee *Prop.* 1.) may receive a new and uſeful Notation, thus: ſince $CE = \frac{ob}{2}$ its Square will be $\frac{oobb}{4}$; ſay therefore, As CE Square: to the Rectangle DNE:: Rectangle DIE: to a fourth Term, which will be the Square of the Ordinate IK; and in this Notation it will ſtand thus;

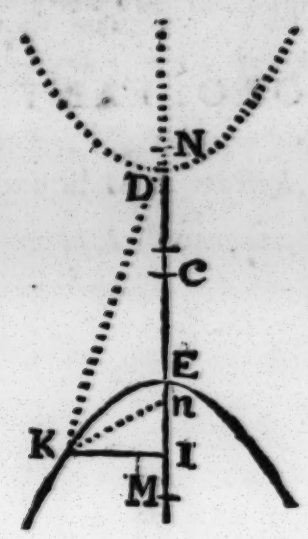
As $\frac{oobb}{4} : mm - \frac{oobb}{4}$ :: ſo is $oebb + eebb$: to $\frac{4emm}{o} + \frac{4eemm}{oo} - oebb - eebb$; ſo that the Square IK is equal to $\frac{4emm}{o} + \frac{4eemm}{oo} - oebb - eebb$. The Uſe of which will follow in the next Propoſition.

PROP. IV.

In the Hyperbola, the Difference between the Right Lines KN and Kn, drawn from the ſame Point in the Curve to both the Foci, is always equal to the Tranſverſe Diameter or Axis DE.

From the Point K in the Curve, let the Ordinate KI be applied; then will EI be the Abſciſſa, and noted eb. Let CN or Cn, the Diſtance from the Focus to the Center, be called m, as in *Cor.* 2. of *Prop.* 2. then will $IN = CI + CN = \frac{1}{2}ob + eb + m$; and $In = CI - Cn = \frac{1}{2}ob + eb - m$.

Square each, and IN Square $= \frac{1}{4}oobb + oebb + eebb + obm + 2ebm + mm$: And In Square $= \frac{1}{4}oobb + oebb + eebb - obm - 2ebm + mm$.



To each of which Squares add the Square of the Ordinate IK, which in this Notation will be found to be $\frac{4emm}{o} + \frac{4eemm}{oo} - oebb - eebb$, (ſee *Cor.* 5. of *Prop.* 3.) and there will ariſe the Square of the Hypothenuſes $KN =$ to $\frac{1}{4}oobb + obm + 2ebm + mm + \frac{4emm}{o} + \frac{4eemm}{oo}$, and of $Kn = \frac{1}{4}oobb - obm - 2ebm + mm + \frac{4emm}{o} + \frac{4eemm}{oo}$.

Out of which Quantities extract the Square Roots, as may eaſily be done, and there will be found,

$$KN = \tfrac{1}{2}ob + m + \frac{2em}{o};$$

And

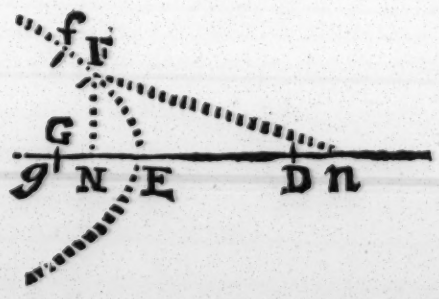
$$Kn = \tfrac{1}{2}ob - m - \frac{2em}{o}:$$

Whoſe Sum is juſt ob. *Q. E. D.*

N.B. Tho' the laſt, $Kn = \frac{1}{2}ob - m - 2em$, be an impoſſible Equation, yet 'tis no matter here, becauſe all the Parts, but $\frac{1}{2}ob$ are loſt in the Addition.

PROBLEM I.

To deſcribe an Hyperbola, having the Tranſverſe Diameter *DE, and the Foci N and n given.*



From N, at any convenient Diſtance, as NF, ſtrike an Arch, and keeping the Compaſſes at that Diſtance with one Foot in E, mark the Point G in the Axis continued; then with the Length GD, and one Foot in n, croſs the former Arch F, ſo ſhall you find a Point which is in the *Hyperbola*: and by this Method repeated, you may find another Point f further on, and ſo many as you pleaſe. The Reaſon of which is evident from this *Propoſition*.

PROP.

PROP. V.

Let the Second Axis *or* Conjugate Diameter *of the Hyperbola B A be brought down and placed at the* Vertex *parallel to the Ordinates, as O P; then if from the Center C, you draw thro' the Points O and P two Right Lines running on infinitely: And after this draw a Parallel to this Diameter within the Hyperbola, as Q R, I ſay,*

It will be plainly demonſtrable,

I. *That the Parts of the produced Ordinates G Q and H R, intercepted between the Curve and the Aſymptotes, will always be equal.*

For the Triangles *C E P* and *C F R*, being ſimilar, as alſo *C E O* and *C F Q*, it muſt be, As *C E*: *E O* (or *E P*) :: *C F*: *F Q* or *F R*: But *O E* and *E P* are equal; wherefore *Q F* and *F R* muſt be equal; from which taking the equal Ordinates, the Remainders *H R* and *D G* muſt be equal. *Q. E. D.*

II. *The Rectangle under Q G and G R (or R H and H Q) will ever be equal to the Square of E O* $\left(\frac{=aacd}{4}\right)$ *or to a fourth Part of the Figure.*

For the Triangles *C E O* and *C F Q* being ſimilar, *C E*: *E O* :: *C F*: *F Q*:: or as the Square *C E*: Square *E O*. That is, (by *Cor.* 3. *Prop.* 3.) as the *Latus Tranſverſum*, to the *Latus Rectum*. That is, by the ſame Propoſition, as the Rectangle *D F E*, is to *F G* Square. And *C E* Square *E O* Square :: *C F* Square : *F Q* Square. But if from *C F* Square, you take away the Rectangle *D F E*, there will remain *C E* Square (by 6. *E.* 2. *Euclid.*) And if from the Square of *F Q* you take the Square of *F G*, there will remain the Rectangle *Q G R*, (by 5. *E.* 2. *Euclid.*) and as will preſently appear, if you try it Algebraically, after the manner of the Demonſtrations in that Book. Wherefore theſe two Remainders muſt be to each other, as their Wholes, *i. e.* as the Square of *C F*, to the Square of *F Q*:: or as *C E* Square : *E O* Square; and then it will ſtand thus:

C E □ : *E O* □ :: *C E* □ : Rectangle *Q G R*.

Or Inverſely: As,

E O □ : *C E* □ :: Rectangle *Q G R*: *C E* □.

That is, the Square of *E O*, and the Rectangle *Q G R*, have the ſame Proportion to the ſame thing, and conſequently are equal one to another.

And this will be the Caſe every where, let the Aſymptotes run never ſo far. And ſince the farther you go from the Vertex of the Angle *C*, the longer muſt the Lines *G R*, *g r*, of neceſſity grow, ſince the Rectangle between *G R* and *Q G* is always the ſame, *viz.* = *O E* Square, the ſhorter muſt *G Q*, *g q*, continually grow; and conſequently decreaſe infinitely, as the others increaſe infinitely; *i. e. The Curve will infinitely approach to the Aſymptote.*

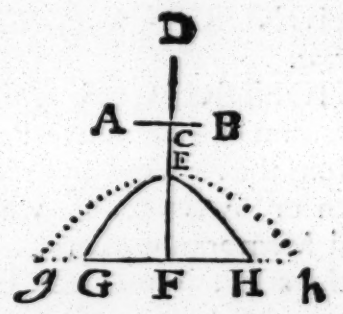
But yet they can never *coincide*, or meet with one another: For if the Points *G* and *Q*, or *g* and *q*, &c. ſhould ever come to be co-incident, it will be, As the Rectangle *D F E*: *F G* Square :: So will *G F* Square: be to *F G* Square (for *G F* Square and *F Q* Square, would then be the ſame thing); that is, Rectangle *D F E* would be = to *C F* Square, which is utterly impoſſible, as is plain from 6. *E.* 2. *Euclid.*

Wherefore theſe Lines are true *Aſymptotes*, as *Apollonius* named them from this Impoſſibility of Co-incidence with the Curve of the *Hyperbola*, when placed in this Poſition, *Vid. Apoll. Prop.* 1. *Lib.* 2.

HYPERBOLE (in Rhetorick) is a Figure which repreſents Things greater, leſſer, better, &c. than in reality they are; and is uſed in Diſcourſe, when our ordinary Terms are too weak or too ſtrong, and carry no Proportion with our Idea; and leſt we ſhould ſpeak too little, we fly out, and ſay too much, or the contrary: As to expreſs the Swiftneſs of a Horſe, one ſhould ſay, He was *ſwifter than the Wind*; if the Slowneſs of a Perſon, That *he moves ſlower than a Snail.*

HYPERBOLICK-SPACE, is the Area or Space contained between the Curve of an *Hyperbola* and the whole *Ordinate.*

Any *Hyperbolick Space G E H G*: is to any other Hyperbolick Figure of the ſame Height *g E h g*, (whoſe *Latus Rectum* and *Tranſverſum*, as in the Circle, are equal, and alſo both equal to *D E*, the *Latus Tranſverſum* of the former Space) :: As the Conjugate Axe *A B*: is to the *Latus Tranſverſum D E.*



For the Square of *g F* (the Ordinate) is = to the Rectangle *D F E*, (by the Hyperbola): Wherefore the Rectangle *D F E* (=Square *F G*): is to the Square *F G*: : as *Latus Tranſverſum*: is to *Latus Rectum* of the Hyperbola *G E H G*; *i. e.* as the Square *D E*: Square *A B*. Wherefore the Roots of theſe Squares will be alſo proportional, and conſequently *F g*: *F G* :: *D E*: *A B*; the former two Terms of which being each an Indiviſible of the two *Hyperbolick Spaces*, it will follow, that the whole Spaces are in the ſame Proportion.

Wherefore *g e h g*: *G E H G*:: *D E*: *A B*.
Or *G E H G*: *g e h g*:: *A B*: *D E*.
Q. E. D.

Hence, if you find the Quadrature of any Hyperbola, whoſe Parameter and *Latus Tranſverſum* are equal, you may ſquare any other Hyperbola.

In *Philoſoph. Tranſact. Numb.* 34. there is a Quadrature of the Hyperbola by an infinite Series of Rational Numbers.

In *Numb.* 53. there is a Method communicated by Sir *Chriſtopher Wren*, for grinding Glaſſes of an Hyperbolick Figure.

HYPERBOLICUM *Acutum*, is a Solid made by the Revolution of the infinite Area of the Space contained between the Curve and the Aſymptote, in the *Apollonian Hyperbola*, turning round that Aſymptote; this produces a *Solid* or *Body* infinitely long, and yet as *Torricellius* plainly demonſtrates,

(who gave it this Name) it is equal to a finite Solid, or Body.

HYPERCATALEPTICK *Verſe*: See *Depoſition*.

HYPERCATHARSIS, is a Purge that works too much.

HYPERCRISIS, is a Critical Excretion above meaſure.

HYPERDISYLLABLE, is a Word of more Syllables than two.

HYPEROON, are the two Holes in the Upper Part of the *Oſſa Palati*, which receive the pituitous Humours from the Mammillary Proceſſes, and after they are ſeparated, diſcharge them at the Mouth. Thro' thoſe a Branch of the Fifth Pair of Nerves paſſes to the Palate, Uvula, and Gums.

HYPEREPHIDROSIS, is too much Sweating.

HYPERSARCOSIS, is an Excreſcence of Fleſh in any part.

HYPERTHYRON, in Architecture, is a large Table, uſually placed over Gates or Doors of the Dorick Order, above the Chambranle, in form of a Frize.

HYPHEN, is an Accent in Grammar, that implies two Words are to be join'd, as *Male-Sanus*.

HYPNOTICKS, are thoſe Things, which by either fixing the Spirits, or by ſtraitning and ſhutting up the Pores, cauſe Sleep. *Blanchard*.

HYPOBIBASMUS: See *Equation*, N. 4.

HYPOBOLE, is a Figure in Rhetorick, whereby we anſwer what we prevented to be objected againſt by an Adverſary.

HYPOCHONDRIACA *Affectio*: See *Hypochondriacus Affectus*.

HYPOCHONDRIACUS *Affectus*, is (ſaith *Blanchard*) a kind of Convulſive Paſſion or Affection, ariſing from the flatulent and pungent Humours in the Spleen or Sweet-bread, which afflicts the Nervous and Membranous Parts.

Or, as others ſay, it proceeds from windy Humours bred in the *Hypochondres*, whence a black Phlegm ariſeth that infects the Animal Spirits, and they the Mind, and is what they call *Hypochondriack Melancholy*.

HYPOCHONDRIUM, or *Subcartilagineum*, is the Upper part or Region of the *Abdomen*, under the Cartilages of the Cheſt or ſhort Ribs: In the Right *Hypochondrium* lies the Liver, and a part of the Stomach; in the Left the Spleen, and a greater part of the Stomach.

HYPOCHYMA, is a depraved Sight, whereby Gnats, Cobwebs, little Clouds, or ſuch like, ſeem to ſwim before the Eyes. The Cauſe of it ſeems to conſiſt in turbid Humours, or ſometimes in the Optick Nerves, whoſe little Pores are obſtructed by the Matter that is thruſt into them. *Blanchard*.

HYPOCHYSIS, the ſame with *Hypochyma*.

HYPOCRATIS *Manica*, *Hippocrates* his Sleeve: See *Manica Hippocratis*.

HYPOGASTRICK-ARTERY, is by ſome ſaid to be a Branch of the internal *Iliaca*, and diſtributes it ſelf among the parts of the *Hypogaſtrium*, to the Bladder, *Rectum* (in Females to the outer and inner ſide of the *Matrix* and *Vagina*) *Veſiculæ Seminales*, *Proſtatæ Penis*, and to the *Os Sacrum*, and all Parts continued in the *Pelvis*: Then it gives two conſiderable Branches, which go out of the lower Belly; the firſt paſſes under the *Pyriformis*, and goes to the *Glutæi*; the ſecond goes to the *Obturatores* and the *Glutæus Major*.

HYPOGASTRIUM, is the lowermoſt Region of the *Abdomen*, reaching from three Inches below the Navel, to the *Abdomen*, *Os Pubis*, and Groins.

HYPOGLOSSIS, or *Ranula*, is an Inflammation or Exulceration under the Tongue: Alſo a Medicine that takes away the Aſperity of the Larynx. *Blanchard*.

HYPOMOCHLION, or *Prop*, in Mechanicks, ſignifies the Roller, which is uſually ſet under the Leaver, or under Stones or Pieces of Timber, to the end that they may be more eaſily lifted up or removed.

HYPOPHTHALMIA, is a Pain in the Eye under the Horney Tunick. *Blanchard*.

HYPOPHORÆ, are deep, gaping, and fiſtulous Ulcers. *Blanchard*.

HYPOPHYLLOSPERMOUS-PLANTS, are ſuch as bear their Seeds on the Backſides of their Leaves, as the *Capillaries*: See that Word.

HYPOPHYSIS, the ſame with *Hypochyma*.

HYPOPYON, is a gathering of Matter under the Horney Tunick of the Eye, which ſometimes covers the whole *Pupil*, hindering the Sight, and ſometimes incompaſſes the Circle of the *Iris*, like the paring of a Nail; whence 'tis called *Onyx* or *Unguis*.

HYPOSARCA, the ſame with *Anaſarca*.

HYPOSARCIDIUM, the ſame as *Anaſarca*.

HYPOSILOIDES: ſee *Hyoides*.

HYPOSPATHYSMUS, is an Inciſion in the Forehead, made by three Cuts or Diviſions, and where the Spatula is thruſt in under the Skin. *Blanchard*.

HYPOSPHAGMA, is a Blood-ſhot from a ſtroke upon the Eye.

HYPOSTASIS *Urinæ*, is that thick Subſtance which generally ſubſides at the Bottom of the Urine.

HYPOSTASTICAL *Principles*; *Paracelſus* and his Followers, called the three Chymical ones, *Salt*, *Sulphur*, and *Mercury*, ſo.

HYPOTENAR, is a Muſcle which helps to draw the Little-finger from the reſt.

HYPOTHENAR, is the Space from the Fore to the Little-finger. *Blanchard*.

HYPOTHENUSE, in a Right-angled Triangle, is that ſide which ſubtends the Right-angle, and conſequently the longeſt. The Square of this Line in a Right-angled and Right-lined Triangle, is always equal to the Sum of the Squares of the other two ſides, *Prop.* 47. *E.* 1. *Euclid*: ſee the Demonſtration under *Triangle*.

HYPOTHESIS, the ſame with *Suppoſition*: When for the Solution of any *Phænomena* in Natural Philoſophy, Aſtronomy, &c. ſome Principles are ſuppoſed as granted, that from thence an intelligible and plauſible Account of the Cauſes, the Effects of the propoſed *Phænomena* may be given, the laying down or ſuppoſing ſuch Principles to be granted, is called an *Hypotheſis*; and the thing ſaid to be accountable eaſily according to that *Hypotheſis*, if it give a clear and eaſie Solution of the *Phænomena*. Wherefore an *Hypotheſis is a Suppoſition of that which is not, for that which may be*; and it matters not whether what is ſuppoſed be true or not, but it muſt be poſſible, and ſhould always be probable.

An *Hypotheſis*, in ſome Senſe, falls in with a Syſtem: But this Word is uſually taken in reſpect to the Univerſe, and in Relation to the Diſpoſitions of the Heavens, and the Motion of the Stars: An elaborately contrived *Hypotheſis* about which, is called a *Syſtem*; as the *Ptolemaick*, *Copernican*, or *Tychonian Syſtem*.

HYPOTRACHELION, in Architecture, is the Top or Neck of a Pillar, or the moſt ſlender Part of it which toucheth the Capital.

It

It is taken by ſome for that part of the *Tuſcan* and *Dorick* Capitals which lies between the *Echinus* and the *Aſtragal*; and is otherwiſe called the *Collar*, *Gorge*, or *Frize of the Chapiter*.

HYPOTYPOSIS, is a lively and exact Deſcription of any Object made in Fancy.

HYPOZOMA, is a Membrane that parts two Cavities, as the *Mediaſtinum* in the Thorax. *Blanchard.*

HYPSILOGLOSSUS: ſee *Baſioglоſſus.*

HYSTERALGIA, is a Pain in the Womb, proceeding from an Inflammation, or otherwiſe. *Blanchard.*

HYSTERICA, are Medicines againſt the Diſeaſes of the Womb.

HYSTERICA-PASSIO, Fits of the Mother, is (according to ſome) a Convulſion of the Nerves of the *Par Vagum* and Intercoſtal in the *Abdomen*, proceeding from a pricking Irritation or Exploſion of the Spirits: This Diſtemper does not always, nor indeed uſually, depend upon the Womb, as is commonly thought: 'Tis ſeen ſometimes in Men, becauſe the Spleen, Pancreas, and other adjacent Bowels, are often the Cauſe of it. *Blanchard.*

Dr. *Purcell*, in his Book of Vapours, attempts to prove, and with Probability, That the Cauſe of Hyſterick Fits is neither the *Six Non-natural Things*, nor the ſolid Parts of the Body, nor the Blood, nor any of the Recrements, nor the Womb, nor Vapours thence ariſing, nor the irregular diſorderly Motion of the Animal Spirits; nor is it in the Chyle, or in the Ferment of the Stomach or Guts, *&c.* But he ſuppoſes the true Cauſe to be Crudities and Indigeſtions in the Aliments, which, by little and little, gather together in the Wrinkles and Folds of the Stomach and Guts; where they (as he ſuppoſes) lie for ſome time without much ſenſible Motion or Fermentation within themſelves, 'till at laſt by the Heat of the circumjacent Parts, their groſſer Salts are divided and put into Motion; which Fermentation is augmented by the various Juices which flow into the Guts from the many Glands which are placed in the Lower Belly; and by this means they are ſo diſſolved and liquified, as to enter in by the *Venæ Lacteæ* into the Blood, where they produce thoſe Accidents which cauſe the Symptoms of this various Diſeaſe.

HYSTEROMOTOCIA, or *Sectio Cæſarea*, is a cutting the Child out of the Womb; which is done thus: You make a *Semi-lunar Section* under the Navel along the *Linea Alba*, the Cavity whereof looks towards the ſaid Line; then according to the leading of the Fibres; the *Fœtus* being extracted after the Section, the Wound in the Womb contracts of it ſelf, ſo that the Blood ſcarce flows more plentifully than in a Natural Birth; but if the Mother be dead, chooſe the moſt convenient Place you can. *Blanchard.*

HYSTEROTOMIA, is an Anatomical Diſſection of the Womb.

JACOB'S-STAFF, a Mathematical Inſtrument for taking Heights and Diſtances; the ſame with *Croſs-ſtaff*; which ſee.

IAMBUS, is a Foot of a Latin Verſe, conſiſting of two Syllables, when the firſt is ſhort, and the other long, as *Tenax.*

JANITOR, the ſame with *Pylorus.*

JAUNDICE: ſee *Icterus.*

ICE: In *The Works of the Learned* for *July*, 1701, there is an Abridgment of a *French* Book, called *Nouvelle Conjecture pour expliquer la Natura de la Glace*; in which the Nameleſs Author modeſtly propoſes the following Conjectures about Freezing and Ice.

Water freezes only becauſe its Parts loſe their Natural Motion, and cleave cloſe to one another; but we muſt obſerve,

1. That the Water, whilſt it freezes, ſeems to dilate it ſelf, and that it becomes more light; whereas it ſhould ſeem that it ought to become more weighty.

2. That frozen Water is not quite ſo tranſparent, and that the Bodies tranſpire not ſo freely thro' it as formerly; tho' one would think the contrary ſhould happen, if it be true, that the Water dilates it ſelf as it freezes. Theſe are the ſeeming Contrarieties which are found in the Effects and Properties of *Ice*, that make the Nature of it obſcure and difficult to be explained.

'Tis the common Opinion of Philoſophers, That *Ice* is made by certain Spirits of Nitre, which in the Winter mix with the Parts of the Water, and being of themſelves improper for Motion, becauſe of their Figure and Inflexibility, infeeble and deſtroy gradually that of the Parts to which they are joined. This Opinion is ſupported by ſome Experiments, which prove, at leaſt, that on certain Occaſions the Spirits of Salt and Nitre contribute to form the *Ice.*

Our Author has no Deſign to controvert thoſe Experiments: He ſays only, That 'tis not certain that the Spirits of Nitre do always enter into the Compoſition of *Ice*; and that tho' they enter'd the ſame conſtantly, that alone would not be ſufficient to explain all the Effects.

For Inſtance; We cannot conceive how the Spirits of Nitre, which enter the Pores of the Water, and fix the Parts of it, can oblige the Water to dilate it ſelf, and make it more light; whereas Naturally they ought to augment the Weight of it. This Difficulty, and ſome others that might be inſiſted upon, ſhew the Neceſſity of a new Syſtem to explain the Nature of *Ice*: Therefore our Author gives this that follows, which he conceives explains all things with more Eaſe, and in a more ſimple manner, than the ordinary Syſtem.

He alledges, That Water freezes in the Winter, becauſe its Parts being more cloſely joined together, they mutually embarraſs one another, and loſe all the Motion they had; and he ſuppoſes the Air to be the ſole, or at leaſt the principal Cauſe, why the Parts of the Water join ſo cloſely together. He explains it thus:

There are an infinite Number of ſmall Parts of groſs Air mixt among the Parts of the Water, as every Man may plainly perceive; for if we put into a Pneumatick Machine an open Veſſel full of Water, in that ſame Proportion as you pump the Air out of the Machine, you will ſee the Water bubble up, and ſend forth a great Quantity of groſs Air.

Thoſe

Thoſe Parts of groſs Air being diſperſed among thoſe of the Water, they have each of them the Vertue of a Spring; which is now ſo well proved in Natural Philoſophy, that no Man will call it in queſtion.

If then it can be ſhewed, That the ſmall Springs of groſs Air, mixed with the Water, have more Force in the Winter, and that then they unbend themſelves a little; it would eaſily be conceiv'd, that on one ſide thoſe Springs unbending themſelves in that manner, and on the other the external Air continuing to preſs the Surface of the Water, the Parts of the Water ſhut up betwixt thoſe ſmall Springs which repulſe them on all ſides, muſt needs being locked up one againſt another, loſe their Moiſture, and form a hard Body, that is to ſay, *Ice*. All the Difficulty lies in this, How to know whether in reality the Springs of the Air, which are diſperſed in the Water, unbend a little in the Winter; which 'tis eaſie to prove they do.

The groſs Air, which we cannot perceive in the Water whilſt it is Liquid, is eaſily ſeen when 'tis Frozen; we ſee then very often a great Quantity of Bubbles of Air very ſenſibly; and when they are too ſmall to be obſerved every one apart, we may ſee them confuſedly and in groſs; for frozen Water is always a little whiter than 'twas before; and they that have ſtudied any thing of the Nature of Colours, know that this Whiteneſs proceeds only from the ſmall Bubbles of Air mix'd with the *Ice*. This is the Reaſon that all Scums are whitiſh, and that the Bubbles of Air mix'd with Glaſs or Chryſtal, appear whiter than the reſt.

Add to this, That the little Bubbles of groſs Air, which are abſolutely inſenſible in the Water, ſo long as 'tis liquid, cannot become ſenſible in frozen Water, but becauſe each of them becomes groſſer than they were: And they cannot become groſſer, but for one of theſe Reaſons: Either becauſe the Water, when it freezes, hath attracted new Air; or becauſe the Air already diſperſed in the Water, takes up a greater Space, and that its Springs are a little more unbended. We cannot conceive how the Water, as it freezes, could attract new Air, ſince the Pores of the *Ice* are certainly leſs than thoſe of the Water, thro' which the groſs Air cannot paſs but with Difficulty. It muſt be then, that the Air already diſperſed among the Parts of the Water, is dilated, and that the Springs are a little unbended.

But why, when 'tis cold, have the Springs of the Air more Strength to unbend themſelves, than at another Seaſon?

It is anſwered in the Firſt place, That to eſtabliſh this Syſtem here laid down, it is enough to prove that the Thing happens really ſo, without any Neceſſity of explaining the Cauſe of it.

Secondly, That this Cauſe is not very difficult to be found. Every one knows that Bodies with Springs have ſo much more Force as they are more ſtiff, and that they are ſo much the more ſtiff, as their Pores are leſs; but it is the Property of Cold to reſtrict the Pores: And during the Heat, the Pores are more open, becauſe the ſubtil Matter which paſſes always thro' them, being then in a more violent Motion, hath the more Force to extend them and keep them open; whereas in the Winter, their Motion being much ſlackened, all the Bodies ſhut themſelves up, and their Pores are ſtraightened. Hence it comes, that in the Winter the Bodies of Animals tranſpire much leſs than in another Seaſon. Since then the Cold locks up the leaſt Parts of the groſs Air, and makes them leſs pliable, and more ſtiff, becauſe it ſtraightens the Pores; we muſt ſay alſo, that it augments the Force of their Springs, the Springs becoming more violent, according as the Body becomes more ſtiff.

Thus, during the Winter, the Springs of Air which are diſperſed in the Water, having conſiderably more Force, they muſt unbend themſelves a little, and as they unbend, they preſs againſt one another the ſmall Parts of Water which they hold ſhut up.

This being ſuppoſed, there is nothing in *Ice* but what may be explained naturally enough.

1. That Water as it freezes, ought to make a hard Body, becauſe then its Parts being preſſed one againſt another, they embarraſs one another mutually, and ſo loſe all the Motion they had.

2. That Water as it freezes, ought to become more light; for tho' its Parts be more preſs'd than they were before, yet the Maſs being compoſed of the Parts of the Water thus preſs'd, and of Air dilated, ought to be more large, and by conſequence more light, than it was when the Water was liquid.

3. Frozen Water takes up a greater Space than when 'tis liquid, becauſe the Springs of Air diſperſed in the Water, by unbending themſelves, do oblige the Water to riſe in the Veſſel which contain'd it. It is true, that the external Air preſſes alſo the Surface of the Water, and makes an Effort to repel it; but this external Air being freer, and its little Springs leſs bended, becauſe they unbended themſelves according as the Cold lock'd up the neighbouring Bodies, it hath leſs Force than that which is ſhut up in the Water, whoſe Springs cannot unbend, but by making the Bulk of the Water larger.

4. If you ſhut up a Veſſel full of Water in the Pneumatick Machine, the Air diſperſed in the Water dilates it ſelf in an extraordinary manner when they pump the Air of the Machine; yet the Water freezes not, becauſe the external Surface of the Water being no more preſs'd, the Air which it contains may, by unbending it ſelf, eſcape freely, as in reality it does.

5. Frozen Water muſt always be leſs tranſparent than the ſame Water when it is liquid, becauſe the Bubbles of Air which are inſenſible in the Water, by reaſon of their Smallneſs, being more ſenſible and large in the *Ice*, muſt alſo make it appear to be more white, and by conſequence leſs tranſparent.

6. The Bodies muſt much leſs tranſpire through the *Ice*, than through the Water, becauſe the Parts of the frozen Water are, in effect, more preſs'd than they were before, and ſo leave a leſs free Paſſage to foreign Bodies.

7. The Water, from which there is abundance of Air drawn by means of the Pneumatick Engine, muſt alſo freeze with leſs Difficulty; of which an able Man told our Author he had made the Experiment.

8. The Spirit of Wine, Brandy, and other Liquors of the ſame ſort, cannot freeze at all, or at leaſt rarely; for their Parts being in a great Motion, as appears by the Evaporation made of them, it follows, that the Air diſperſed into the Parts of thoſe Liquors, is much more ſubtil, and by conſequence hath leſs of a Spring, than that which is diſperſed in the Parts of common Water, ſince the Spring of the Air is principally in its groſs Parts.

9. Oil, Fat, and other viſcous Liquors, muſt congeal more eaſily than Water freezes, becauſe their Parts being improper for Motion, do ſpeedily embarraſs one another; but thoſe Liquors, when they congeal, cannot become ſo hard as *Ice*, nor dilate themſelves in the ſame manner; for tho' they

contain among their Parts a greater Quantity of Air than Water does, yet that Air is more ſubtil, hath leſs Spring, and eaſily makes its way thro' the Pores of thoſe Liquors.

10. Quick-ſilver cannot freeze, becauſe it does not contain a great enough Quantity of groſs Air; its Parts alſo are much poliſh'd, and they can eaſily ſlide one againſt another, without embarraſſing or ſtopping one another.

11. According as the Cold grows more ſharp, the Springs of the Air, diſperſed in the *Ice*, ought to have more Force to repel the Parts of the frozen Water; and the Bulk compoſed of the Air and frozen Water, muſt needs grow larger and larger. This hath been proved in the following manner: They fill'd with Water an hollow Iron Bullet, which had a Hole of three or four Lines Diameter; the Water being frozen in that Bullet, and not being ſtrong enough to break it, the *Ice* iſſued at the Hole, and form'd a ſort of Stalk or Ice-ſickle, which lengthened according as the Cold increaſed, and grew to the Length of a Finger; this Stalk being broke, and the Bullet expoſed to the Air during a very cold Night, it made a new Stalk, but not ſo long as the former, the *Ice*'s pining it ſelf, if we may be allowed ſo to ſpeak, as it paſſed through the Hole of the Bullet; as Gold and other Minerals do, by paſſing through the Wire-drawer's Inſtruments.

12. In the Hypotheſis here laid down, the Spirits of Nitre may alſo contribute to form the *Ice*, in as much as by joining themſelves to the ſmall Parts of the Air diſperſed in the Water, they contribute towards rendring them more ſtiff and inflexible, and to augment the Force of its Springs.

ICHNOGRAPHY, in Perſpective, is the View of any thing cut off by a Plane parallel to the Horizon, juſt at the Baſe or Bottom of it: And in Architecture is taken for the Geometrical Plan or Platform of an Edifice, or the Ground-plot of a Houſe or Building delineated upon Paper, deſcribing the Form of the ſeveral Apartments, Rooms, Windows, Chimneys, *&c.* And this is properly the Work of the Maſter-Architect or Surveyor, being indeed the moſt abſtruſe and difficult of any.

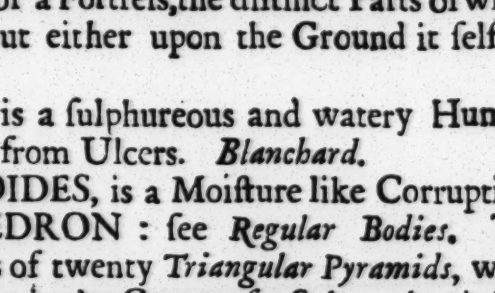
ICHNOGRAPHY, in Fortification, is in like manner the Plane or Repreſentation of the Length and Breadth of a Fortreſs, the diſtinct Parts of which are mark'd out either upon the Ground it ſelf, or upon Paper.

ICHOR, is a ſulphureous and watery Humour which flows from Ulcers. *Blanchard.*

ICHOROIDES, is a Moiſture like Corruption.

ICOSIHEDRON: ſee *Regular Bodies.* This Solid conſiſts of twenty *Triangular Pyramids*, whoſe Vertexes meet in the Center of a Sphere that is imagined to circumſcribe it, and therefore have their Height and Baſes equal: Wherefore the Solidity of one of thoſe Pyramids, multiplied by 20, the Number of Baſes, gives the ſolid Content of the *Icoſihedron.*

The following Figure being drawn on Paſteboard cut half thro', and then folded up neatly together, will repreſent an *Icoſihedron.*



ICTERUS, the Jaundice, is a changing of the Skin into a Yellow Colour, from an Obſtruction of the *Ductus Choledochus*, or the Glandules of the Liver, thro' Weakneſs, Obſtruction, or a *Schirrus* of the Liver; or becauſe the Gall abounds more than can be conveniently excerned, ſo that it ſtays in the Blood. The *Latins* call it, *Regius Morbus*, the Kingly Diſeaſe, becauſe it is eaſily cured in Courts with the Paſtimes and Divertiſements there which chear the Mind. It is alſo called a Suffuſion of the Gall. *Blanchard.*

IDEA, is whatſoever the Mind perceives in it ſelf, or ſtands there for the immediate Object of any Phantaſm, Notion, Species, Thought or Underſtanding.

IDENTITATE NOMINIS, is a Writ that lies for him, who upon a *Capias* or *Exigent*, is taken and committed to Priſon for another Man of the Name.

IDEOTA *inquirenda vel examinanda*, is a Writ to the Eſcheator or Sheriff of any County, where the King hath Notice that there is an *Ideot*, Naturally born ſo weak of Underſtanding, that he cannot govern or manage his Inheritance, to call before him the Party ſuſpected of the *Ideocy*, and examine him; and alſo by the Oath of Twelve Men, to inquire whether he be ſufficiently witted to diſpoſe of his own Lands with Diſcretion, or not, and to certify accordingly into the Chancery: For the King hath the Protection of his Subjects, and by his Prerogative, the Government of their Lands and Subſtance, that are naturally defective in their own Diſcretion.

IDES *of a Month*, among the *Romans*, were the Day after the *Nones* were out. They commonly fell out on the 13th of every Month, except in *March*, *May*, *July*, and *October* (which they called the *Full Months*, as all the others were called *Hollow*) for then they were on the 15th, becauſe in thoſe Months the *Nones* were on the 7th. The Etymology of the Word is variouſly given, and to be ſeen in moſt Dictionaries: See *Danet*'s *Greek* and *Roman Antiquities.*

IDIOCRASY, the proper Diſpoſition or Temperament of a Thing or Body.

IDIOPATHY, is a primary Diſeaſe, which neither depends on, nor proceeds from any other.

IDIOSYNCRASY, is a Temperament peculiar to any particular Animal Body; whereby it hath, either in Sickneſs or in Health, a peculiar Averſion againſt, or Inclination for ſome particular Things; or on which ſome Things will have no ſuch, or a more than uſual Operation, than they will have on other Bodies.

JECAR-CAPSTAN: ſee *Capſtan.*

JECUR, the ſame with *Hepar.*

JECUR *Uterinum*: ſee *Placenta Uteri.*

JEER, or *Jeer-Rope*, is a Piece of a Hawſer faſtened to the Main-yard and Fore-yard (in great Ships only) cloſe to the Ties; then 'tis reeved thro' a Block, which is ſeized cloſe to the Top, and ſo comes down again, and is reeved through another Block at the Bottom of the Maſt cloſe by the Deck; there are uſually two of theſe, one on each ſide the Ties: Its Uſe is to help hoiſe up the Yard, but more eſpecially to ſuccour the Ties, and to keep the Yard from falling, if they ſhould break.

JEJUNUM *Inteſtinum*, is the Second of the Small Guts, ſo called, becauſe it is moſt times found empty: 'Tis in Length about Eight Foot in Men; it begins on the Right Side under the *Colon*, where the *Duodenum* ends, and fills a good Part of the Umbilical Region, eſpecially on the Left Side;

'tis

'tis continued to the *Ileum*, but is eaſily known from it by its Emptineſs, by the great Number of its Veins and Arteries, which make it look a little Reddiſh, and alſo becauſe the Wrinkles in its Coats are more in number, and nearer to one another, than thoſe in the *Ileum*, and the Coats themſelves are much thicker.

JEOFAIL, in Common Law, ſignifies an Overſight in pleading, touching which you have a Statute, 32 *H.* 8. 30. whereby it is enacted, That if the Jury have once paſt upon the Iſſue, tho' afterward there be found a *Jeofail* in the Pleading, yet Judgment ſhall likewiſe be given, according to the Verdict of the Jury.

JESSANT, when in a Coat of Arms a Lion or other Beaſt is born *over* ſome Ordinary, as over a *Chief*, a *Bend*, a *Feſſe*, *&c.* that Lion or Beaſt is blazoned *Jeſſant* or *Jacent*, *i. e.* lying over all.

JET D'EAU, is the French Word for a Pipe of a Fountain, which caſts up the Water any conſiderable Height into the Air.

Mr. *Mariotte*, in his Treatiſe *du Mouvement des Eaux*, *&c.* ſaith, That a *Jet d' Eau* will never riſe ſo high as its Reſervatory, but always falls ſhort of it by a Space, which is in a ſubduplicate Ratio of that Height; and this he proves by ſeveral Experiments.

He ſaith alſo, That if a greater branches out in many ſmaller ones, diſtributed to different Jets, the Square of the Diameter of the main Pipe muſt be proportioned to the Sum of all the Expences of its Branches; and particularly ſaith, That if the Reſervatory be 52 Foot high, and the *Adjutage* half an Inch in Diameter, the Pipe ought to be 3 Inches in Diameter.

JETSON: ſee in *Flotſon*.

IGNIS-FATUUS, is a certain Meteor that appears chiefly in the Summer-Nights, for the moſt part frequenting Church-yards, Meadows and Bogs, as conſiſting of a ſomewhat viſcous Subſtance, or a fat Exhalation; which being kindled in the Air, reflects a kind of thin Flame in the Dark, yet without any ſenſible Heat, often flying about Rivers, Hedges, *&c.* becauſe it meets with a Flux of Air in thoſe Places. This Meteor is well known among the Common People, under the Name of *Will-of-the-Whiſp*, or *Jack-with-a-Lanthorn*.

IGNIS PERSICUS, the ſame that *Gangræna*: it is taken alſo for a Carbuncle.

IGNIS ROTÆ: ſee *Wheel-fire*.

IGNIS SACER, the ſame that *Eryſipelas*: Yet ſome take it for an *Herpes*.

IGNIS SYLVESTRIS, the ſame that *Phlyctena*.

IGNITION, is Calcination made by Fire.

IGNORAMUS, in Law, is a Word uſed by the Grand Inqueſt, impannelled in the Inquiſition of Cauſes Criminal and Publick, and written upon the Bill when they diſlike their Evidence, as defective or too weak to make good the Preſentment: The Effect of which Word ſo written is, That all farther Enquiry upon that Party, for that Fault, is thereby ſtopped, and he delivered without farther Anſwer.

ILE, is the Cavity from the *Thorax* to the Bones of the Thighs: *Pliny* obſerves, That all the Inteſtines in all Animals, except a Man and a Sheep, are called *Ile*. *Blanchard*.

ILEUM, is the Third of the ſmall Guts, ſo called ἀπὸ τῦ εἱλεῖσθαι, *à Circumvolvendo*, becauſe of its many Turnings, *&c.* It begins where the *Jejunum* ends, and ends it ſelf at the Gut called *Cæcum*, at the Beginning of the *Colon*: It is about 21 Hands Breadth in Length: There can be no ſuch thing as twiſting of the Guts, but ſometimes the Coats being doubled inward, the upper Part of an Inteſtine ſinks or falls with the lower, which makes the *Iliack Paſſion*, or *Volvulus*. The *Ileum* oft falls down into the *Scrotum*, and then the Rupture is called *Inteſtinalis*. The Paſſage of the *Ileum* is a little narrower than that of the *Jejunum*, and its Coats are ſomewhat thinner.

ILIA, the *Flanks* are the lateral Parts of the *Abdomen*, betwixt the laſt Rib and the Secret Parts.

ILIACK PASSION, the ſame with *Miſerere*, or the Twiſting of the Guts.

ILIACK VESSELS, are thoſe double-forked Veſſels of the Trunks of the great Artery, and the great Vein of the *Abdomen*, about the Place where the Bladder and the Womb are ſituate. *Blanchard*.

ILIACUS INTERNUS, is a Muſcle of the Thigh, which ariſes fleſhy from above half the Superior Region, and Internal Concave Part of the *Os Ilium*; and in its Deſcent over the Inferior Part of the laſt-named Bone, joins with the *Pſoas Magnus*, and is inſerted with it, partly under the Termination of the *Pectineus*: This, together with the *Pſoas Magnus*, move the Thigh forwards in Progreſſion.

ILINGUS: ſee *Scotomia*.

ILIUM OS, is the firſt and upper Part of the Bone called *Oſſa Innominata*, which are two large Bones ſituated on the ſides of the *Os Sacrum*. This Part of it, *Ilium*, is ſo named, becauſe it contains the Gut *Ilium*, which lies between it and its Fellow. Its Circumference is circular, being a little convex and uneven on its external ſide. 'Tis a large Bone, and is connected to the ſides of the three ſuperior *Vertebræ* of the *Os Sacrum*: The upper Part of it, of its Edge or Circumference, is called *Spina*, the Concave Internal Side *Coſta*, and the External Convex one *Dorſum*: It is joined to the *Os Sacrum* by a true *Suture*: It is larger in Women than Men.

ILLUMINATIVE-MONTH, is that Space of Time that the Moon is viſible to be ſeen betwixt one Conjunction and another.

IMAGE, in Opticks, is the Projection of an Object in the diſtinct Baſe of a Convex-glaſs.

To find the Diameter of an Image, *in the diſtinct Baſe of a Convex-Glaſs, Mr.* Molyneux *gives this Rule.*

As the Diſtance of the Object from the Glaſs:
To the Diſtance of the Image from the Glaſs::
So the Diameter of the Objects Magnitude:
To the Diameter of the Image.

Wherefore, if the Diameter of the Sun ſubtend an Arch of 32 Minutes of a Great Circle in the Heavens, the Diameter of the Sun's Image repreſented in the *diſtinct Baſe* of a *Convex Glaſs*, ſubtends an Arch of 32 Minutes alſo of ſuch a Circle as hath for its Radius the Diſtance of the diſtinct Baſe from the Glaſs.

IMAGINATION, is an Application of the Mind to the Phantaſm or Image of ſome *Corporeal Thing* impreſſed in the Brain.

IMBRICATED, is a Word uſed by Mr. *Tournefort*, and ſome other Botaniſts, to expreſs the Figure of the Leaves of ſome Plants, which are hollowed in like an *Imbrex*, or Gutter-Tile.

IMMENSE,

IMMENSE, is that whoſe Amplitude or Extenſion no Finite Meaſure whatſoever, or how oft ſoever repeated, can equal.

IMMERSION, the Plunging of any thing under Water: 'Tis alſo uſed by Aſtronomers, to ſignifie that any Planet is beginning to come within the Shadow of another, as in Eclipſes, whenever the Shadow of the Eclipſing Body begins to fall on the Body Eclipſed, we ſay, that is the time of *Immerſion*; and when it goes out of the Shadow, is the Time of *Emerſion*.

IMMERSUS: ſee *Subſcapularius*.

IMMUTATION: ſee *Hypallage*.

IMPALED, when the Coats of a Man and his Wife (who is not an Heireſs) are born in the ſame Eſcutcheon; they muſt be Marſhalled *in Pale*, the Husband's on the Right ſide, and the Wives on the Left; and this the Heralds call *Baron* and *Femme*, *two Coats Impaled*.

If a Man hath had two Wives, he may Impale his Coat in the middle between theirs; and if he hath had more than two, they are to be Marſhalled on each ſide of his, in their proper Order. See *Clifton*'s Coat in *Guillim*, p. 399. who had ſeven Wives.

IMPARLANCE, or *Emparlance*, is a Motion made in Court upon the Account of the Demandant by the Tenant, or Declaration of the Plaintiff by the Defendant, whereby he craveth Reſpite, or any other Day to put in his Anſwer.

This Imparlance is either *General* or *Special*.

The *Special* is with this Clauſe, *Salvis omnibus advantagiis tam ad juriſdictionem curiæ quam breve & narrationem.*

The *General* is made at large, without inſerting that or any other like Clauſe.

IMPENETRABILITY, is the Diſtinction of one extended Subſtance from another, by which the Extenſion of one thing is different from that of another; ſo that two things extended, cannot be in the ſame Place, but muſt of Neceſſity exclude each other.

IMPERATIVE-MOOD (in *Grammar*) implies a Command to ſuch a one to do ſuch a thing.

IMPERFECT CONCORDS: ſee *Concords*.

IMPERFECT *Flowers of Plants*, are ſuch as want the *Petala*, or thoſe finely coloured little Leaves which ſtand round and compoſe the Flower: And therefore they are ſometimes called *Apetalous*, and ſometimes *Stamineous*; becauſe they have only the *Stamina* and *Style* of a Flower.

IMPERFECT NUMBERS, are ſuch whoſe Aliquot Parts taken altogether, do either exceed, or fall ſhort of that Whole Number, of which they are Parts: And theſe are of two ſorts, either *Abundant* or *Deficient*; which ſee.

IMPERFECT PLANTS, are by the Botaniſts accounted ſuch as either really want Flower and Seed, or rather ſeem to want them; ſince no Flower or Seed hath yet been diſcovered to belong to much the greateſt part of them.

Theſe Mr. *Ray* diſtinguiſhes according to the Place of their Growth; into,

I. *Aquaticks*, or ſuch as grow in the Water; and that either in the Sea, and then they are called

- *Marine Plants*; and thoſe are either of an hard and ſtony Conſiſtence, as the *Corals*, *Corallines*, *Porus*;
  Or of a more Soft and Herbaceous one.

  Of theſe ſome are like Herbs, and are of two Kinds:

  - The Greater, which are *Cauliferous*, as the *Fucus*,
    The Leſſer, as the *Alga*.

  The others are more of the *Muſcus* or *Fungus* Appearance, as the *Spongia*.

- *Freſh-water Plants*, and thoſe have either no Leaves, but are *Capillaceous*, as the *Conferva*:
  Or their Leaves divided into three Parts; as the *Lens paluſtris*, *Lenticula*.

II. Such *Imperfect Plants*, as inhabit the dry Ground, he divides into,

- Firſt, Such as have a Subſtance, either Woody, or Fleſhy; and theſe have ſcarce any thing common to the Perfect Plants, neither the Green Herbaceous Colour, nor the Texture of Herbs, nor Flower, Seed, nor Leaf, properly ſpeaking, as all the *Fungi*; which are,

  1. Such as grow on Trees, and therefore called *Arboreous*; as the *Fungus Laricis*, called *Agarick*, and the *Fungus Sambuci*, which we call *Jews-Ear*, *Auricula Judæ* in *Latin*.

  2. *Terreſtrial*; and theſe are either *Cauliferous*, with Heads either Lamellated, or Poroſe underneath; or without Stalks, as the *Pezicæ* of *Pliny*, and *Fungus Pulverulentus*, *Crepitus Lupi*, or common Puff-Balls.

  3. *Subterraneous*; as the *Tuberæ Terræ*, or *Truffles*.

- Secondly, Such as have a more ſoft and dry Conſiſtence, and more like that of Herbs: Of which ſome are both *Cauliferous* and Branched, as the *Muſci* or *Moſſes*.

  Others are without Stalks, adhering like a Cruſt to the Surface of the Earth, Stones, Trees, or Wood; as the *Lichen Terreſtris* and *Arboreus*.

IMPERIAL-TABLE, is an Inſtrument made of Braſs, with Box and Needle, and Staff, uſed to meaſure Land: ſee *Vol.* II.

IMPERSONAL VERB, in Grammar, is ſuch an one as is only uſed in the Third Perſon Singular, as *Oportet*, *Licet*, &c.

IMPERVIOUS: Bodies are ſaid to be Impervious to others, when they will neither admit the Rays of Light, &c. nor the Effluvia of other Bodies to paſs thro' them.

IMPETIGO CELSI, the ſame with *Lepra Græcorum*. *Celſus* makes four ſorts of it:

The moſt harmleſs, ſays he, is that which is like a Scab, for it is red and hard, exulcerated and gnawed: But it differs from it, in that it is more exulcerated, and is accompanied with ſpeckled Pimples: And there ſeem to be in it certain Bubbles, from which after a certain time there fall, as it were little Scales, and it returns more certainly.

Another ſort is worſe, almoſt like a ſort of Meazles, or hot Pimples in the Skin, but more rugged, and redder, and of different Figures: In this Diſtemper little Scales too, fall from the Surface of the Skin, and it is called *Rubrica*.

The third ſort is yet worſe; for it is thicker and harder, and ſwells more, and is cleft on the top of the Skin, and gnaws more violently: It is Scaly too, but black, and ſpreads broad and ſlow: It is called *Nigra*.

The fourth ſort is altogether incurable, of a different Colour from the Red; for it is ſomething white, and like a freſh Scar, and has pale Scales; ſome whitiſh, ſome like the little Pulſe called *Lintel*, which being taken away, ſometimes the Blood follows: Otherwiſe the Humour that flows from it is white, the Skin hard and cleft, and ſpreads farther.

All theſe ſorts ariſe eſpecially in the Feet and Hands, and infeſt the Nails likewiſe.

Impetigo ſome reckon the ſame with *Lichen*. *Blanchard*.

IMPETIGO PLINII, *Pliny's Impetigo*, is the ſame with *Lichen Græcorum*. *Blanchard*.

IMPROPER FRACTIONS, are ſuch as have their Numerators equal to, or greater than their Denominators, as $\frac{6}{4}$, $\frac{18}{12}$, &c. which are not Fractions properly ſpeaking, but either Whole or Mixt Numbers; and are only put into the Form of Fractions, in order to be added, ſubtracted, multiplied, or divided, &c.

INACCESSIBLE HEIGHT or *Diſtance*, is that which cannot be Meaſured, by reaſon of ſome Impediment in the Way; as Water, &c.

INADEQUATE IDEA'S, are ſuch, which are but a partial, or incomplete Repreſentation of thoſe Archetypes or Images to which the Mind refers them.

INANITY, is the School-Term for Emptineſs or abſolute Vacuity, and implies the Abſence of all Body and Matter whatſoever; ſo that nothing remains but bare Space.

INCALESCENCE, is a Thing growing hot by ſome Internal Motion, or Fermentation; as when Quick-lime grows hot by pouring Water upon it.

INCALESCENT MERCURY, ſo Mr. *Boyle* calls ſome Mercuries of an uncommon Preparation, which by being mingled with a due Proportion of Gold Leaves, or ſmall Filings, would Amalgamate and grow hot with the Gold, even in the Palm of our Hand.

IN CASU CONSIMILI, is a Writ: ſee *Caſu Proviſo*.

IN CASU PROVISO, is a Writ: ſee *Caſu Proviſo*.

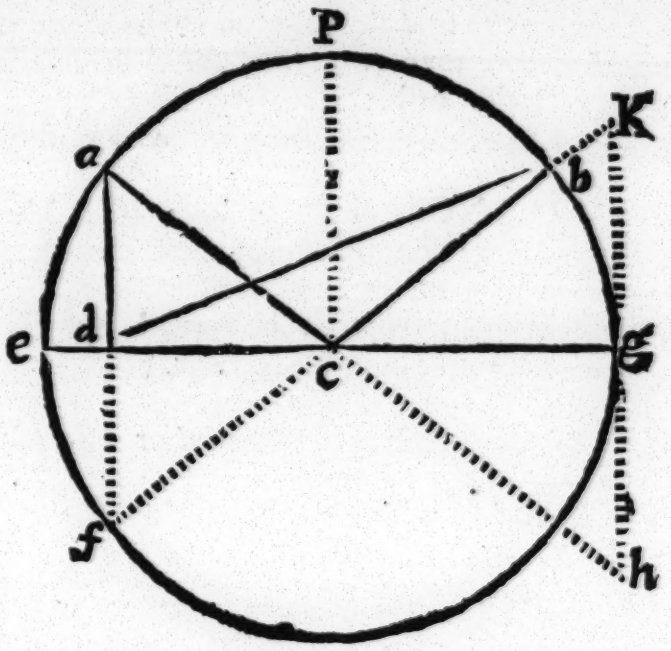
INCEPTIVE *of Magnitude*, is a Word uſed by Dr. *Wallis*, expreſſing ſuch Moments or firſt Principles, as tho' of no Magnitude themſelves, are yet capable of producing ſuch. Thus a point hath no Magnitude it ſelf, but is Inceptive of a Line, which it produces by its Motion: A Line conſidered one way, hath no Magnitude as to Breadth, but is capable by its Motion of producing a Surface which hath Breadth, &c.

INCERATION, is a mixture of Moiſture with ſomething that is dry, by a gentle ſoaking, till the Subſtance be brought to the Conſiſtence of Soft Wax. *Blanchard*.

INCIDENCE. In Opticks, the Angle *a c P*, made by the Ray *a c*, and the Perpendicular *P c*, is called the *Angle of Incidence*; but Dr. *Barrow*, and ſome others, call it the *Angle of Inclination*; and by the *Angle of Incidence*, they underſtand its Complement *e c a*.

Mr. *Molyneux*, in his Dioptricks uſes the Words *Inclination* and *Incidence* promiſcuouſly, and by the *Angle of Incidence* or *Inclination*, always intends the firſt named Angles *a c P*.

The Angle *P c b*, is called, *The Angle of Reflexion*, and is always = to the Angle of *Incidence a c P*: Which is thus proved by *Leibnitzius*.



Every Ray of Light goes the ſhorteſt way that poſſibly it can: But if you ſuppoſe the Ray *a c* to fall on the Plane-Glaſs, or Surface *e g*, and thence to be reflected to *b*, ſo that the Angle *a c e* be = *b e g*, then will the two Lines *a c* and *c b* be the two ſhorteſt Lines that can poſſibly be drawn from the Points *a* and *b*, to the Plane *e g*: For Inſtance, they will be ſhorter than *a d* + *d b*, or any others.

Produce *c b* to *f*, and draw *d f*, becauſe the oppoſite Angles at *c* are =; the Arch *e f* (= *b g*) = *a e* by the Suppoſition; but 'tis plain that *f c* = *a c*, and *c f* = *c b*. Wherefore *f b* (= *a c* + *c b*) will be leſs than *d f* (i. e. *a d*) + *d b*: and ſo it will be every-where elſe. Wherefore ſince the Ray muſt go the neareſt way, the Angle of Incidence will always be = to that of Reflexion: For the two Angles *e c a* and *b c g*, being thus equal, their Complements *a c P* and *P c b* muſt be ſo too.

That the *Angle of Incidence a c P*, is = to that of *Reflexion P c b*, may very briefly be thus proved.

Produce the Ray *a c* directly till it meet with the Perpendicular *g h* in the Point *b*: Then make *g R* = *g h*, and draw *c K*: I ſay *c K* is the Reflected Ray, and that the Angle *P c k* = *r c P*: For *P* being drawn perpendicular to the Plane *e g*, the Angle *e c a* + *a c P* = *K c g* + *P c K*; becauſe both are = *L*: But *e c a* = *g c h*, becauſe Vertical and *c g h* = *g c K* by Conſtruction. Wherefore *e c a* = *b e g*: And conſequently their Complements *a c P* and *P c b* are equal. *Q. E. D.*

In *Dioptricks*, the Sines of the *Angles of Incidence*, and *Refracted Angles*, are to each other reciprocally, as the Reſiſtances of the Mediums, as is demonſtrated

ſtrated by *Leibnitz* in *Acta Erud. Lipſiæ Anno* 1682. *p.* 185. And in Mr. *Molineux's Dioptrica Nova*, Part II. Chap. I.

Sir *Iſaac Newton* diſcover'd, That from Air to Glaſs, the Sine of the Angle of Incidence: is to the Sine of the Refracted Angle :: as 300: to 193, or nearly, as 14 to 9.

And on the contrary, That from Glaſs to Air, the Sine of the Incidence: is to the Sine of the Refracted Angles:: as 193: to 300, or as 9 to 14.

But in his Diſſertations concerning *Light* and *Colours*, he has demonſtrated, that the Rays of Light are not all *Homogeneous*, or of the ſame ſort, but of different Forms and Figures; ſo that ſome are more Refracted than others, tho' they have the ſame or equal Inclinations on the Glaſs: And therefore there can be no conſtant Proportion ſet between the Sines of the *Incident*, and *Refracted Angles*.

But the Proportion that comes neareſt the Truth, for the middle and ſtrong Rays of Light, is nearly as 300 to 193, 14 to 9.

INCIDENCE-POINT, (in Opticks) is that Point in which a Ray of Light is ſuppoſed to fall on a Piece of Glaſs.

INCIDENT-RAY, in *Catoptricks* and *Dioptricks*: ſee *Ray of Incidence*.

INCINERATION, is the Reducing the Bodies of Vegetables and Animals into Aſhes by a violent Fire.

INCISIVUS, is a Muſcle which pulleth the Upper Lip upwards.

INCISORES DENTES, the ſame with *Primores*.

INCISIVI, the ſame with *Primores*.

INCLINATION, is a Word frequently uſed by Mathematicians, and ſignifies the mutual Approach, Tendency or Leaning of two Lines or two Planes towards each other, ſo as to make an Angle.

What the *Angle of Inclination* ſignifies in Opticks, ſee in *Incidence*.

The *Inclination* of two Planes, is the acute Angle made by two Lines, drawn one in each Plane, and perpendicular to their *Common Section*.

INCLINATION *of the Axis of the Earth*, is the Angle which it makes with the Angle of the Ecliptick; or the Angle between the Planes of the Equator and Ecliptick.

INCLINATION *of a Planet*, is an Arch of the Circle of Inclination, comprehended between the Ecliptick and the Place of a Planet in his Orbit.

INCLINATION *of a Plane*, in Dialling, is the Arch of a Vertical Circle, perpendicular to both the *Plane* and the *Horizon*, and intercepted between them.

To find the Inclination of a Plane,

Take a Quadrant, and apply its Side to the Side of a Square, and apply the other Side of your Square to your *Plane*; if the Plummet fall parallel to the Side of the Square, then the lower Side of the Square ſtands level; by which draw an Horizontal Line, whereon erect a Perpendicular, and apply your Square to that Perpendicular, and if the Plummet falls parallel to the Side of the Square, then that is alſo a level Line, and your Plane ſtands Horizontally: If the Plummet falls not parallel to the Side of the Square, then turn your Square until it does, and draw an Horizontal Line, on which erect a Perpendicular, to which apply your Square, and obſerve what Angle your Plummet makes on the Quadrant, with the Side of the Square; that is, the Angle of the *Inclination of the Plane*.

INCLINATION *of a Ray*, in Dioptricks, is the Angle which this Ray makes with the *Axis of Incidence* in the firſt *Medium*, at the Point where it meets the ſecond *Medium*.

INCLINATION *of a Right Line to a Plane*, is the acute Angle which this Right Line makes with another Right Line drawn in the Plane, through the Point where the inclined Line interſects it, and thro' the Point where it is alſo cut by a Perpendicular drawn from any Point of the *inclined Lines*.

INCLINATIONS of the Planes of the Orbits of the Planets, to the Plane of the Ecliptick, are thus: *Saturn's* Orbit makes an Angle of 2 Degrees 30 Minutes; *Jupiter's* 1 Degree, and $\frac{1}{3}$; *Mars's* little leſs than 2 Degrees; *Venus's* is 3 Degr. and $\frac{1}{4}$; *Mercury's* is almoſt 7 Degrees.

INCLINING *Direct South or North Dials*: ſee *Direct South or North Inclining Dials*.

INCLINING *Declining Dials*: ſee *Declining Inclining Dials*.

INCLINING *Planes*, are thoſe which lean or incline to the Horizon.

INCOMMENSURABLE *Numbers*, are ſuch as have no Common Diviſor that will divide them both equally.

INCOMMENSURABLE *Quantities*, are thoſe which have no Aliquot Parts, or any Common Meaſure that may meaſure them; as the *Diagonal* and Side of a Square: for altho' that each of thoſe Lines have infinite Aliquot Parts, as the Half, the Third, &c. yet not any Part of the one, be it never ſo little, can poſſibly meaſure the other, as is demonſtrated in 117. *El.* 10. *Eucl.*

INCOMPLEX *Terms* in Logick: ſee *Complex*.

INCONGRUITY: ſee *Congruity*.

INCORPORATE: To *Incorporate*, in Chymiſtry or Natural Philoſophy, ſignifies accurately to mix the Particles of one Body with another.

INCRASSATING, or thickening things, are thoſe which being endued with thick ropy Parts, and mixed with thin liquid Juices, bring them to a thicker Conſiſtence, by joining and knitting their Parts together. *Blanchard*.

INCUBUS: ſee *Ephialtes*.

INCUMBENT, in Common Law, is a Clerk reſident on his Benefice with Cure; and called *Incumbent* of that Church, becauſe he doth, or ought to bend his whole Study to diſcharge his Cure.

INCURVATION *of the Rays of Light*: ſee *Light* and *Refraction*.

INCUS, the Anvil, is a Bone of the inner Part of the Ear: It is like a Grinder-tooth, and lies under the Bone called *Malleus*. It has two Legs, the ſhorter of which is tied to the Side of that Conduit or Paſſage which goes to the *Proceſſus Mammillaris*; and the longer Leg to the Head of the third Bone, called the *Stapes*.

INDAGATOR, a Searcher or Inquirer into Nature.

INDEFINITE, is what hath no Bounds or Limits determined; or what is conſidered as not having any.

INDENTED, a Term in Heraldry, when the Out-line of a Bordure, Ordinary, &c. is in the Form of the Teeth of a Saw: Thus,

INDENTURE, is a Writing comprising ſome Contract between two, and being *indented* in the Top anſwerable to another, that likewiſe containeth the ſame Contract.

INDETERMINED *Problem in Geometry*: ſee *Local*.

INDEX, is the ſame with what is ſometimes called the *Characteriſtick* or Exponent of a Logarithm; and ſheweth always of how many Places the Abſolute Number belonging to the Logarithm doth conſiſt, and of what Nature it is; *i. e.* whether an Integer, or a Fraction: Thus; In this Logarithm 2.562293, the Number ſtanding on the Left-hand of the Point, is called the *Index*; and becauſe it is 2, ſhews you that the abſolute Number anſwering to it, conſiſts of 3 Places; for 'tis always one more than the Index, becauſe the Index of 1 is 0; of 10 is 1; of 100 is 2, *&c.*

As in this Example;

0 1 2 3 4 5 6 7 8 9

1 2 3 4 5 6 7 8 9

Where the upper Numbers are Indices to the lower. And therefore in thoſe ſmall Tables of *Briggs*'s Logarithms, where the Index is omitted, it muſt always be ſupplied before you can work by them. If the abſolute Number be a Fraction, then the Index of the Logarithm hath a negative Sign, and is marked thus, $\overline{2}.562293$; which ſhews the correſponding Number to be a Decimal Fraction of 3 Places, *viz.* 1.365.

Mr. *Townly* hath a peculiar way of noting theſe Indices, when they expreſs Fractions, and 'tis now much in Uſe, *viz.* by taking inſtead of the true Index, its Arithmetical Compliment to 10; and therefore he would write the Logarithm now mention'd thus, $\overline{8}.562293$. How they are added and ſubtracted, ſee in *Addition* and *Subtraction*.

INDICATION, a Word uſed by Phyſicians and Surgeons, and ſignifies a Diſcovery of what is to be done, and what Courſe is to be taken for the Recovery of the Patient's Health; as if on Examination Bleeding be found neceſſary, they ſay, Bleeding is indicated.

INDICATIONS are uſually accounted Threefold:

1. *Preſervatory*, which ſhew what is to be done for the Continuation and Preſervation of Health.

2. *Curative*, which ſhew how the Diſeaſe is to be removed, that the Patient at preſent labours under. And,

3. *Vital*, which reſpect the Patient's Life, Strength and way of Living.

INDICATIVE-MOOD, in Grammar, demonſtrates ſimply what we affirm.

INDICATOR; ſee *Extenſor Indicis*.

INDICAVIT, is a Writ or Prohibition, that lieth for a Patron of a Church, whoſe Clerk is Defendant in Court-Chriſtian, in an Action of Tythes commenced by another Clerk, and extending to the fourth part of the Church, or of the Tythes belonging to it; for in this Caſe the Suit belongeth to the King's Court; wherefore the Patron of the Defendant being like to be prejudiced in his Church and Advowſon, if the Plaintiff obtain in the Court-Chriſtian, hath this Means to remove it to the King's Court.

INDICTION: ſee *Cycle of Indiction*.

INDICTMENT: ſee *Enditement*.

INDIGNATORIUS, an Epithet attributed to the fourth ſtreight Muſcle of the Eye, becauſe that Motion or Caſt of the Eye is peculiar to Men in the Paſſion of Anger. For this Muſcle being one of the *Abducent*, ſerves to draw the Eye outward from the inner Corner to the outer.

INDIVIDUUM, in *Logick*, is that which ſignifies but one only thing: Of which they make a fourfold Diviſion.

1. *Individuum Vagum*, is that which tho' it ſignifies but one Thing, yet may be any of that kind; as when we ſay, *A Man*, *A certain Perſon*, or *One* ſaid ſo or ſo; tho' but one Perſon is meant, yet that one Perſon, for ought appears to the contrary, may be any Body.

2. *Individuum Determinatum*, is when the Thing is nam'd or determin'd; as *Alexander*, the River *Nile*, or Mount *Athos*: This alſo is called *Signatum*.

3. *Individuum Demonſtrativum*, is when ſome Demonſtrative Pronoun is uſed in the Expreſſion; as *This Man*, *That Woman*.

4. *Individuum ex Hypotheſi*, or by Suppoſition; when an univerſal Name or Term is reſtrained by the Suppoſition to a particular Thing; as when we ſay, the *Son* of ſuch an one, and it be known that he had but one Son.

INDIVISIBLES, in Geometry, are ſuch Elements or Principles as any Body or Figure may ultimately be reſolved into. And theſe *Elements* or *Indiviſibles*, are in each peculiar Figure ſuppoſed to be infinitely ſmall.

With regard to which Notion, a Line may be ſaid to conſiſt of Points; a Surface of Parallel-Lines, and a Solid of Parallel and Similar Surfaces: And then, becauſe each of theſe Elements is ſuppoſed Indiviſible, if in any Figure, a Line be drawn thro' the Elements perpendicularly, the Number of Points in that Line, will be the ſame as the Number of the Elements.

Whence we may ſee, that a Parallelogram, Priſm or Cylinder, is reſolvable into Elements, or Indiviſibles, all equal to each other, parallel, and like to the Baſe. A Triangle into Lines parallel to the Baſe, but decreaſing in Arithmetical Proportion, and ſo are the Circles which conſtitute the *Parabolick Conoid*, and thoſe which conſtitute the Plane of a Circle, or the Surface of an Iſoceles Cone.

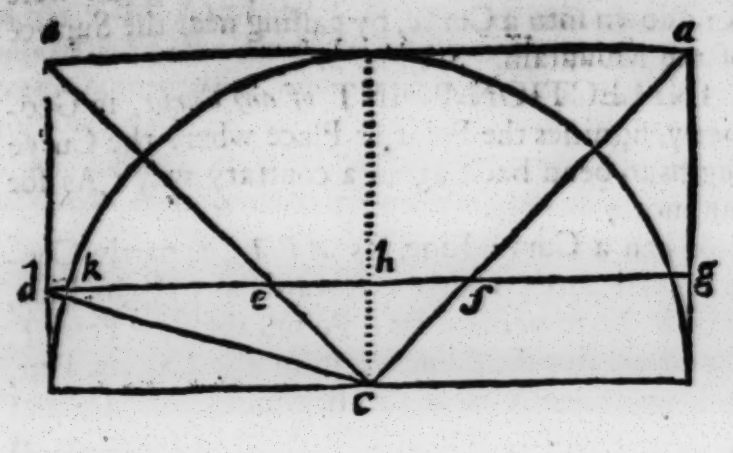
A Cylinder may be reſolved into Cylindrical Curve Surfaces, having all the ſame Height, and continually decreaſing inwards, as the Circles of the Baſe do, on which they inſiſt.

This *Method of Indiviſibles*, is only the Ancient *Method of Exhauſtions* a little diſguiſed and contracted: It was firſt introduced by *Cavallerius* in his *Geometria Indiviſibilium*, *Anno Dom.* 1635. purſued after by *Torricellius* in his Works, printed 1644. and again by *Cavallerius* himſelf in another Treatiſe, publiſhed 1647. And is now allowed to be of excellent Uſe in the ſhortening of Mathematical Demonſtrations: Of which take the following Inſtance in that famous Propoſition of *Archimedes*;

That *A Sphere is two thirds of a Cylinder circumſcribing it.*

For ſuppoſe (as in the Figure) a Cylinder, Hemiſphere, and an Inverted Cone, to have the ſame Baſe and Altitude, and to be cut by Infinite Planes all parallel to the Baſe, of which dg is one: 'Tis plain, the Square of dh will every where be equal to the Square of KC (the Radius of the Sphere) the Square $bc = eb$ Square; and conſequently, ſince Circles are to one another, as the Squares of the Radii,

Radii, all the Circles of the Hemiſphere will be equal to all thoſe of the Cylinder, deducting thence



all thoſe of the Cone: Wherefore the Cylinder, deducting the Cone, is equal to the Hemiſphere; but 'tis known, the Cone is one third of the Cylinder, and conſequently the Sphere muſt be two thirds of it. *Q. E. D.*

INDUCTION, is commonly taken for the giving Poſſeſſion to an Incumbent of his Church, by leading him into it, and delivering him the Keys, by the Commiſſary or Biſhop's Deputy, and by his ringing one of the Bells.

INDURANTIA: ſee *Sclerotica.*

INDUSIUM: ſee *Amnios.*

INEDIA, is abſtaining from Meat, when one eats leſs than formerly.

INEFFABLE-NUMBERS, the ſame with *Surd-Numbers.*

INEQUALITY of Natural Days. Tho' the Sun is ſuppoſed vulgarly to meaſure our Time equally, yet he is very far from doing ſo: And as 'tis impoſſible for a good Clock, or Movement, to keep Time with the Sun; ſo one that is truly ſuch, will meaſure Time much more truly, and go exacter than any Sun-Dial.

The uſual Reaſon, and one good one it is, of the Inequality of Natural Days, you have under the Word *Equation of Time*: But the Truth is, there is alſo another; and that is, That the Motion of the Earth it ſelf round its Axis, is not exactly Equable or Regular, but is ſometimes ſwifter, and ſometimes ſlower.

INERGETICAL Bodies or Particles, are ſuch as are ſluggiſh and unactive.

INESCUTCHEON, in Heraldry, ſignifies all the Eſcutcheons, containing $\frac{1}{7}$ of the Field, and is born within it as an Ordinary, thus:

He beareth *Ermin*, an *Ineſcutcheon Gules.*

This is alſo ſometimes called, An *Eſcutcheon of Pretence*; which is born when a Man marries an Heireſs: For then he bears her Coat of Arms on an *Ineſcutcheon*, or *Eſcutcheon of Pretence*, in the Middle of his own Coat.

INFERNAL-STONE, or *Perpetual Cauſtick*, is a Chymical Operation, whereby Silver is rendred *Cauſtick* by the Salts of Spirit of Nitre.

'Tis thus made;

Diſſolve in a Vial any Quantity of Silver in thrice its Weight of Spirit of Nitre; and then in a Sand-heat evaporate $\frac{2}{3}$ of the Moiſture: The Remainder put into a good large *German* Crucible, which place over a gentle Fire; let the Matter alone, and heaving 'till at laſt it ſinks quietly to the Bottom: Then increaſing the Fire a little, 'twill turn into an Oil; and as ſoon as you perceive it to be ſo, it muſt immediately be poured into an Iron-mold, purpoſely made for it, that is a little oil'd and greas'd, where it will preſently coagulate and harden. After 'tis taken out, it muſt be kept in a Vial well ſtopt; 'tis a great *Cauſtick*, and will laſt for ever, if it be kept from the Air. Some make them of Copper, but thoſe are not ſo good as theſe.

INFIMUS VENTER: ſee *Abdomen.*

INFINITE, is that which has no Bounds, Terms, nor Limits.

INFINITE QUANTITY. *Of the ſeveral Species of* Infinite Quantity, *and of the Proportions they bear one to the other, the learned Mathematician Capt.* Halley, *in* Philoſoph. Tranſactions, N. 193. *gives the following Account:*

That all Magnitudes infinitely great, or ſuch as exceed any aſſignable Quantity, are equal among themſelves, though it be vulgarly received for a Maxim, is not yet ſo common as it is erroneous; and the Reaſon of the Miſtake ſeems to be, That the Mind of Man coming to contemplate the Extenſions of what exceeds the Bounds of its Capacity, and of which the very Idea does include a Negation of Limits; it comes to paſs, that we acquieſce generally, and it ſuffices to ſay, ſuch a Quantity is *Infinite.*

But if we come more nearly to examine this Notion, we ſhall find, that there are really beſides *Infinite Length*, and *Infinite Area*, no leſs than three ſeveral ſorts of *Infinite Solidity*: All of which are *Quantitates ſui generis*, having no more Relation or Proportion the one to the other, than a Line to a Plane, or a Plane to a Solid, or a Finite to an Infinite; but that among themſelves each of theſe Species of *Infinites*, are in given Proportions, is that which is to be made plain.

But firſt, *Infinite Length*, or a Line infinitely long, is to be conſidered, either as beginning at a Point, and ſo infinitely extended one way, or elſe both ways from the ſame Point; in which caſe the one, which is a beginning *Infinity*, is the one half of the whole, which is the Sum of the beginning and ceaſing *Infinity*, or of *Infinity a parte ante*, and *a parte poſt*, which is analogous to Eternity in Time or Duration, in which there is always as much to follow as is paſt from any Point or Moment of Time: Nor doth the Addition or Subduction of finite Length or Space of Time alter the Caſe, either in Infinity or Eternity, ſince both the one and the other cannot be any Part of the Whole.

As to *Infinite Surface* or *Area*, any Right Line infinitely extended both ways on an infinite Plane, does divide that infinite Plane into equal Parts, the one to the Right, and the other to the Left of the ſaid Line: But if from any Point in ſuch a Plane, two Right Lines be infinitely extended, ſo as to make an Angle, the infinite Area, intercepted between thoſe infinite Right Lines: is to the whole infinite Plane:: as the Arch of a Circle, on the Point of Concourſe of thoſe Lines as a Centre, intercepted between the ſaid Lines: is to the Circumference of the Circle; or as the Degrees of the Angle, to the 360 Degrees of the Circle.

For Example,

Two Right Lines meeting at a Right Angle, do include, on an infinite Plane, a quarter Part of the whole infinite Area of ſuch a Plane.

But

But if ſo be two parallel infinite Lines be ſuppoſed drawn on ſuch an infinite Plane, the Area intercepted between them will be likewiſe infinite; but at the ſame time will be infinitely leſs than that Space which is intercepted between two infinite Lines that are inclined, tho' with never ſo ſmall an Angle; for that in the one Caſe, the given finite Diſtance of the Parallel Lines, diminiſhes the Infinity in one Degree of Dimenſion; whereas in a Sector, there is Infinity in both Dimenſions; and conſequently the Quantities are the one infinitely greater than the other, and there is no Proportion between them.

From the ſame Conſideration ariſe the three ſeveral Species of infinite Space or Solidity, as has been ſaid; for a Parallelopipid or a Cylinder infinitely long, is greater than any finite Magnitude, how great ſoever; and all ſuch Solids ſuppoſed to be formed on given Baſes, are as thoſe Baſes, in proportion to one another: But of theſe, three Dimenſions are wanting, as in the Space intercepted between two parallel Planes infinitely extended, and at a finite Diſtance; or with infinite Length and Breadth with a finite Thickneſs; all ſuch Solids ſhall be as the given finite Diſtances one to another; but theſe Quantities, tho' infinitely greater than the other, are yet infinitely leſs than any of thoſe wherein all the three Dimenſions are infinite. Such are the Spaces intercepted between two inclined Planes infinitely extended; the Space intercepted by the Surface of a Cone, or the ſide of a Pyramid likewiſe infinitely continued, *&c.* of all which, notwithſtanding the Proportions one to another, and to the vaſt Abyſs of infinite Space, (wherein is the Locus of all things that are or can be; or to the Solid of infinite Length, Breadth and Thickneſs taken all manner of ways) are eaſily aſſignable. For the Space between two Planes: is to the whole: : as the Angle of thoſe Planes: to the 360 Degrees of the Circle.

As for Cones and Pyramids, they are as the Spherical Surface intercepted by them, is to the Surface of the Sphere; and therefore Cones are as the Verſed Sines of half their Angles to the Diameter of the Circle. Theſe three ſorts of *Infinite Quantity*, are analogous to a Line, Surface, and Solid, and after the ſame manner cannot be compared, or have no proportion the one to the other.

Beſides theſe, there are alſo ſeveral other Species of *Infinite Quantity*, ariſing from the Contemplation of Curves, and their Aſymptotes, which he leaves to the Speculation of the learned Mathematicians.

INFINITE SERIES: ſee *Series*.

INFINITIVE-MOOD, in Grammar, is when a Verb is uſed ſo as to determine neither any particular Perſon, or Number.

INFLAMMATIO: ſee *Phlegmone*.

INFLATION, is the Diſtention of a Part from flatulent Matter.

INFLECTION (in Opticks) is a Multiplicate Refraction of the Rays of Light, cauſed by the unequal Denſity of any Medium, whereby the Motion or Progreſs of the Ray is hindred from going on in a Right Line, and is Inflected or Deflected by a Curve, ſaith the ingenious Dr. *Hook*, who firſt took notice of this Property in his *Micrography*, p. 217. And this he ſaith, differs both from Reflection and Refraction, which are both made at the Superficies of the Body, but this in the middle of it within.

Sir *Iſaac Newton*, as you will find under the Word *Light*, diſcovered alſo by plain Experiment this Inflection of the Rays of Light; and Mr. *de la Hire* ſaith he found, That the Beams of the Stars being obſerved in a deep Valley, to paſs near the Brow of an Hill, are always more refracted than if there were no ſuch Hill, or the Obſervations were made on the Top thereof; as if the Rays of Light were bent down into a Curve, by paſſing near the Surface of the Mountain. *See Vol.* 2.

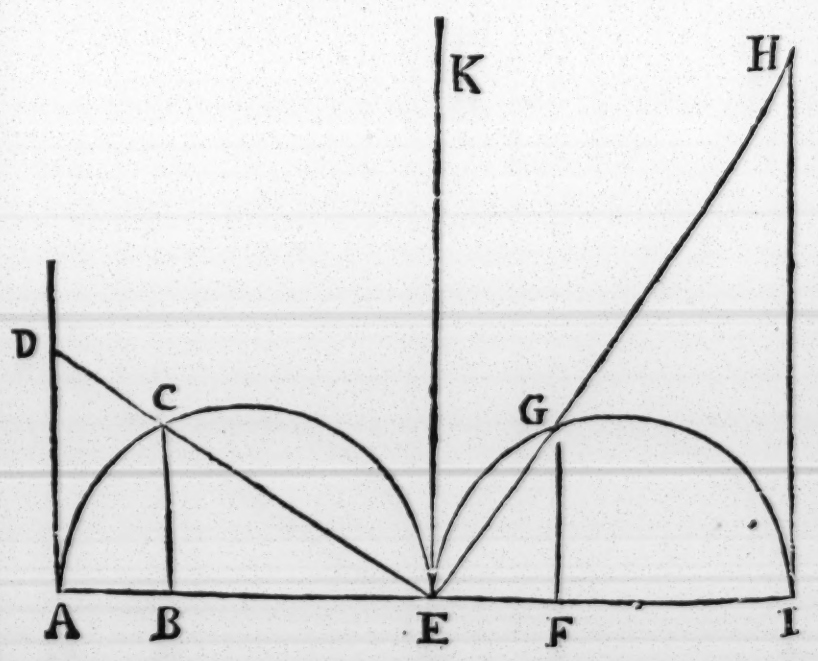
INFLECTION-POINT *of any Curve*, in Geometry, ſignifies the Point or Place where the Curve begins to bend back again a contrary way: As for Inſtance;

When a Curve Line, as *A F K*, is partly Concave and partly Convex towards any Right-Line, as *A B*, or towards a fix'd Point, then the Point *F*, which divides the Concave from the Convex Part, and conſequently is at the Beginning of one, and End of the other, is called the Point of *Inflection*, as long as the Curve, being continued in *F*, keeps its Courſe the ſame; but 'tis called the Point of *Retrogreſſion*, when it inflects back again towards that Part or Side from whence it took its Original: *See the next Figure ſave one.*

Before the Theory of this Inflection *and* Retrogreſſion of Curves *can be underſtood, a certain Principle muſt be explain'd, which is this, as communicated by Mr.* Ditton.

Whatſoever finite Quantity (or if it be a Fluxion 'tis all one) goes on continually increaſing or decreaſing, it cannot change from a Poſitive to a Negative Expreſſion, or from a Negative to a Poſitive one, without firſt becoming equal to an Infinite, or to Nothing: It is equal to Nothing, if it does continually decreaſe, and equal to an Infinite, if it does continually increaſe.

To illuſtrate this, Let there be two Circles touching one another in the Point *E*, their Diameters *A E* and *E I*, lying in one and the ſame Right-Line. Let *A E* or *E I* be $= d$. Let the Diſtance between the Extremity *A*, and any Ordinate in either of the Circles be $=$ to x perpetually. I conſider now, what will be the Expreſſions of the Lines intercepted between *E* the Point of Contact of the Circles; ſuch as are the Lines *E B* and *E F* intercepted between *E* and the Ordinates *C B* and *G F*. 'Tis certain therefore, That taking a Point, as *B*, any where between *A* and *E*, that then the Expreſſion of the intercepted *B E* is $d - x$; but taking a Point, as *F*, between *E* and *I*, the Expreſſion of the intercepted *E F*, ſhall be $x - d$. For *A B*, or



A F being taken for x indifferently, the Values of the intercepted Lines will appear with this Change of Signs.

In

In one Case therefore the Expression is Positive, in the other Negative. But as the points *B* or *F* approach to *E*, the Quantities *B E* and *E F* decrease continually, and at the point *E* are equal to nothing.

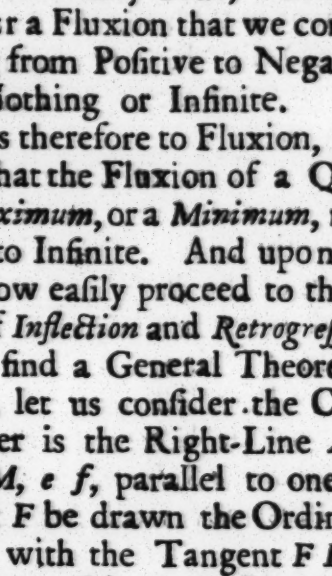
So that it is plain, That there is no passing from a Positive to a Negative Expression, in this Case of a Quantity continually decreasing, without passing thro' nothing. For the other part,

Let us consider the Tangents (as *D A* or *H I*) cut off by Lines continually drawn from *E* the point of the Circles contact. If *C B*, or *G F*, be put equal to *y*, the Expression of any such Tangent will be $\frac{y\,d}{d-x}$, or $\frac{y\,d}{x-d}$, according as we take it on the one or the other side of the point *E*; in one Case therefore 'tis Positive, in the other Negative. But as the Points *B* or *F* approach to *E*, the Tangents *D A* and *H I* encrease continually, and at the Point *E* they become infinite: Therefore a Quantity that continually encreaseth, cannot pass from a Positive to a Negative Expression, without being infinite.

All this is Universally True, whether it be a Finite Quantity or a Fluxion that we consider. There is no changing from Positive to Negative, without passing thro' Nothing or Infinite.

Applying this therefore to Fluxion, it will follow from hence, That the Fluxion of a Quantity, that expresses a *Maximum*, or a *Minimum*, must be equal to Nothing or to Infinite. And upon this Foundation we may now easily proceed to the Speculation of the Points of *Inflection* and *Retrogression*.

In order to find a General Theorem to assist us in this Matter, let us consider the Curve *A F K*, whose Diameter is the Right-Line *A B*; and its Ordinates *P M*, *e f*, parallel to one another. If thro' the Point *F* be drawn the Ordinate Applicate *E F*, together with the Tangent *F L*; and from any other Point as *M*, on the same side with *A F*, he draws the Ordinate Applicate *M P*, as likewise the Tangent *M T*: It is evident,

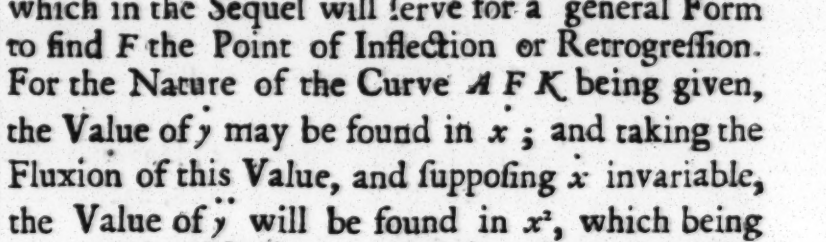


1. In these Curves that have a Point of *Inflection*, that the Abscissa *A P* encreaseth continually, and that the Part *A T* of the Diameter, intercepted between *A* the Original of *X*, and *T* the Concourse of the Tangent and the Axe, encreaseth such time as the Point P fall upon *E*, and after it again begins to diminish: From whence it is apparent, that *A T* must become the *Maximum A L*, when the point *P* falls upon the point *E* required.

2. In those Curves that have a Point of *Retrogression*, 'tis evident, that the part *A T* encreaseth continually, and that the Abscissa encreaseth so long, till the point *T* fall upon *L*, after which it again diminisheth: From whence it is clear, That *A P* must become a *Maximum*, when the point *T* falls upon *L*.

Now if *A E* be put $= x$, *E F* $= y$, then will *A L* be $= \frac{y\,\dot{x}}{\dot{y}} - x$, whose Fluxion, which is $\frac{\dot{y}^2\,\dot{x} - y\,\dot{x}\,\ddot{y}}{\dot{y}^2} - \dot{x}$ (supposing $\dot{x}$ invariable) being divided by $\dot{x}$; the Fluxion of *A E* must become Nothing or Infinite; that is $-\frac{y\,\ddot{y}}{\dot{y}^2}$ = Nothing or Infinite: So that the multiplying by $\dot{y}^2$, and dividing by $-y$, $\ddot{y}$ will be $=$ to Nothing or Infinite, which in the Sequel will serve for a general Form to find *F* the Point of Inflection or Retrogression. For the Nature of the Curve *A F K* being given, the Value of $\dot{y}$ may be found in $\dot{x}$; and taking the Fluxion of this Value, and supposing $\dot{x}$ invariable, the Value of $\ddot{y}$ will be found in $\dot{x}^2$, which being put equal to Nothing, or Infinity, serves in either of these Suppositions to find such a Value of *A E*, as that the Ordinate *E F* shall intersect the Curve *A F K* in *F* the point of Inflection or Retrogression. Of this I shall only now, from the *Analyse des Infiniment Petits*, give one

EXAMPLE.



Let *A F K*, be a protracted Semi-cycloid, whose Base is longer than the Circumference of the generating Circle *A D B*, whose Center is *C*. 'Tis required to find *E* in the Diameter *A B*, so that the Ordinate Applicate *E F* shall cut the Semi-cycloid in *F*, the Point of contrary Flexion.

Sup-

Suppoſe the known Quantities $AD\,B = a$; $BK = b$; $AB = 2c$, and the unknown Quantities $AE = x$, $ED = z$, the Ark $AD = u$, $EF = y$; then by the Property of the Cycloid $y = z + \frac{b\,u}{a}$; and therefore $\dot{y} = \dot{z} + \frac{b\,\dot{u}}{a}$: But by the Property of the Circle $z = \sqrt{2cx - xx}$, and conſequently $\dot{z} = \frac{c\,\dot{x} - x\,\dot{x}}{\sqrt{2cx - xx}}$, and $\dot{u}\left(\sqrt{\dot{x}^2 + \dot{z}^2}\right) = \frac{b\,\dot{x}}{\sqrt{2cx - xx}}$: Therefore ſubſtituting for $\dot{z}$ and $\dot{u}$ their reſpective Values, we have $\dot{y} = \frac{ac\,\dot{x} - a\,x\,\dot{x} + b\,c\,\dot{x}}{a\sqrt{acx - xx}}$, and the Fluxion thereof, (ſuppoſing $\dot{x}$ invariable) is, $\frac{bcx - acx}{2cx - xx \times \sqrt{2cx - xx}} - \frac{bcc \times \dot{x}}{} = 0$; that is, $AE\,(x) = c + \frac{ac}{b}$, and $CE = \frac{ac}{b}$.

Hence it is evident, That to have F, a Point of contrary Fluxion, b muſt be greater than a; for if it be leſs, then CE would exceed CB.

INFLUENCES of the Planets, or Heavenly Bodies, are ſuch Phyſical Powers or Forces, as they are ſuppoſed to have on Sublunary Things.

Mr. *Boyle* is inclined to believe (tho' he had no Opinion of Judicial Aſtrology in other reſpects) that the Planets may have ſome Phyſical Influence or Operation on Bodies belonging to our Globe, from theſe Conſiderations.

1. That it cannot be denied, that all the Affections and Diſpoſitions of Moiſture, Heat, Cold, Drought, the Courſe of all Winds, Showers, Thunder, &c. and whatever elſe helps to produce the great and univerſal Effects of Rarefaction and Condenſation in our Atmoſphere, do in a great Meaſure, if not entirely, depend on the Motion, Poſition, Situation, and Aſpects of the Superior Celeſtial Bodies or Planets. That every Planet hath its own proper Light diſtinct from every other, which Light not being a bare Quality, but deſigned for a further uſe than meer Illumination, muſt be accompanied with ſome peculiar Tincture, Virtue, or Power.

2. That this Light of each particular Celeſtial Body, not being at all Refracted in the Ætherial Spaces, it is tranſmitted thro', deſcends entirely and unchanged into our Atmoſphere.

3. That whatever is received into our Atmoſphere, is alſo received by the Thin and Subtile Air, which is contiguous to the Atmoſphere; which cannot but be capable of being moved, ſtirred, altered, and influenced by theſe differently diſpoſed Lights which penetrate each part of it.

4. And ſince the Thin and Subtile Air is capable of being thus affected, moved and altered by theſe Planetary Virtues, it muſt needs variouſly impreſs, move, agitate and infect the Spirits or Subtiler parts of all Bodies within its reach; and conſequently muſt have a conſiderable influence upon the Bodies wherein ſuch Spirits reſide, and whom they actuate.

5. This is alſo farther confirmed, as true in Fact, by thoſe ſudden ſtrokes of Cramps, Convulſions, Blites, Colds, Peſtilential Invaſions, &c. which do not only often, as it were in an Inſtant, ſeize on our Bodies, but which do alſo continue for a long time, &c.

IN FORMA PAUPERIS, in Law, is when any Man that hath a juſt Cauſe of Suit, either in the Chancery, or any other of the Courts of Common Law, will come either before the Lord Keeper, Maſter of the Rolls, either of the Chief Juſtices, or Chief Baron, and make Oath that he is not worth five Pounds, his Debts paid, either of the ſaid Judges will in his own proper Court, admit him to ſue in *forma Pauperis*, and he ſhall have Council, Clerk or Attorney aſſigned to do his Buſineſs, without paying any Fees.

INFORMATUS NON SUM, or rather *non ſum Informatus*, in Law, is a formal Anſwer made of Courſe by an Attorney, that is commanded by the Court to ſay what he thinketh good in defence of his Client; who being not inſtructed to ſay any thing material, ſays, He is *not informed*, by which he is deemed to leave his Client undefended, and ſo Judgment paſſeth for the Adverſe Party.

INFORMED STARS, are ſuch of the *Fixed-Stars*, as are not caſt into, or ranged under any Form: ſee *Sporades*.

INFRASPINATUS, or *ſupra Scapularis inferior*, is a Muſcle of the Arm, ſo called, becauſe it is placed below the Spine. This ariſes Fleſhly from the inferior part of the *Baſis Scapulæ*, as alſo from its Spine, and Inferior *Coſta* and *Dorſum*; from hence paſſing in a Triangular Form, according to the Figure of the Part, leſſening it ſelf as it marches over the Juncture it becomes Tendinous, and is inſerted like the *Supra Spinatus* to the Head of the *Os Humeri*. This moves the Arm directly backward.

INFUNDIBULUM CEREBRI, the ſame that *Choana*.

INFUNDIBULUM RENUM, is the Pelvis or Baſin thro' which the Urine paſſes to the Ureters and the Bladder.

INFUSION, is an Extraction of the Vertue of Medicines with a convenient Liquour, which if it be Purgative, it is uſually taken at one Doſe; and to this the Name properly agrees.

INGREDIENTS, are the ſeveral Parts or Simples that go to the making of any Compound Medicine; and in general it ſignifies the Conſtitutent Parts or Principles of a mixt Body.

INGRESS, in Aſtronomy, ſignifies the Sun's entring the firſt Scruple of one of the four *Cardinal Signs*, eſpecially *Aries*.

INGRESSU, is a Writ of Entry, whereby a Man ſeeketh Entry into Lands and Tenements: It lies in many Caſes, and hath many ſeveral Forms: ſee *Entry*.

This Writ is alſo called in particular, *Præcipe quod reddat*, becauſe thoſe be formal Words in Writs of Entry.

The Writs, as they lie down in divers Caſes, are theſe, ſet down in the *Old Nat. Brev. viz.*

INGRESSU *ad communem Legem*, is a Writ which lieth where a Tenant for Term of Life, or of another Life, Tenant by Courteſie, or Tenant in Dower, maketh a Feoffment in Fee, and dieth: He in Reverſion ſhall have the aforeſaid Writ againſt whomſoever that is in the Land after ſuch Feoffment made.

INGRESSU *ad Terminum qui præterit*, a Writ which lieth where the Lands or Tenements are Let

to a Man for Term of Years, and the Tenant holdeth over his Term.

INGRESSU *Cauſa Matrimonii prælocuti* : ſee *Cauſa Matrimonii prælocuti.*

INGRESSU *cui ante divortium* : ſee *Cui ante divortium.*

INGRESSU *dum fuit infra ætatem*, is a Writ which lies where one under Age ſells his Lands, *&c.*

INGRESSU *dum non fuit compos mentis*, is a Writ which lies when a Man ſelleth Lands or Tenements, being out of his Wits, *&c.*

INGRESSU *in Caſu conſimili* : ſee *Caſu conſimili.*

INGRESSU *in Caſu proviſo* : ſee *Caſu proviſo.*

INGRESSU *in le per*, is a Writ which lies where one demandeth Lands or Tenements, lett by another after the Term is expired.

INGRESSU *ſine aſſenſu capituli*, is a Writ given by the Common Law, to the Succeſſor of him that alienated, *ſine aſſenſu capituli*, *&c.* and ſo called from thoſe Words contained in the Writ.

INGRESSU *ſuper diſſeiſina in ſe quibus*, is a Writ which lies where a Man is diſſeiſed, and dieth, for his Heir againſt the Diſſeiſor.

INGRESSU *ſur cui in vita*, is a Writ that lies where one demandeth Lands or Tenements of that Tenant that had *Entry* by one, to whom ſome Anceſtor of the Plaintiff did lett it for a Term now expired.

INGROSSATOR *magni Rotuli* : ſee *Clerk of the Pipe.*

INGROSSER, in Common Law, is one that buys Corn growing, or dead Victuals, to ſell again.

Alſo a Clerk that writes Records or Inſtruments of Law in Skins of Parchment.

INGROSSING *of a Fine*, is making the Indentures by the *Chirographer*, and the Delivery of them to the Party unto whom the Cognizance is made.

INGUEN, is that Place from the Bending of the Thigh to the Secret Parts.

INHARMONICAL *Relation*, a Term in Muſick : ſee *Relation Inharmonical.*

INHERITANCE, is a Perpetuity in Lands or Tenements to a Man and his Heirs : For *Littleton lib.* 1. *cap.* 1. ſays, This Word *Inheritance* is not only underſtood where a Man hath *Inheritance* of Lands and Tenements by Deſcent of Heritage, but alſo every Fee-ſimple or Fee-tail that a Man hath by his Purchaſe, may be ſaid by *Inheritance*, for that his Heirs may inherit after him.

INHIBITION, is a Writ to *inhibit* or forbid a Judge from farther proceeding in the Cauſe depending before him : ſee *F. N. B. Fol.* 39. where *Prohibition* and *Inhibition* are put together. But *Inhibition* is moſt commonly a Writ iſſuing out of a higher Court-Chriſtian to a lower and inferior ; and *Prohibition* out of the King's Court to a Court-Chriſtian, or to an inferior Temporal Court.

INJECTION, is the caſting (by a Syringe, *&c.*) ſome liquid Medicine into Wounds or Cavities of the Body, or of the Veſſels ; Clyſters are hence by ſome called *Injections.*

Several Experiments have been made about

INJECTION *of Liquors*, into the Veins of Animals, from whence probably ſome good Hints may be taken ; I ſhall therefore mention ſome of them.

Sir *Fraxaſtati*, Profeſſor of Anatomy at *Piſa* in *Italy*, injected a little *Aqua Fortis* diluted into the Crural and Jugular Vein of a Dog, and he died preſently ; and had (on opening him) all his Blood found fixed, except about the Guts : ſome of the great Veſſels were burſt.

Some *Spirit of Vitriol* being *injected* into the Veins of another Dog, he died not ſo ſoon, but fetched his Breath thick and difficultly, and foamed like an Epileptick ; but dying at laſt, he opened him, and found his Blood fix'd in his Veins Grumous and like Soot.

Oil of Tartar injected, did not kill the Dog, tho' tried upon him ſeveral times ; but he grew more eager for Meat than before, and getting ſome Bones, he gnawed them moſt greedily.

Oil of Sulphur injected, ſwelled the Dog and killed him ; his Blood was found not coagulated, but more thin and florid than ordinary ; which Conſtitution, perhaps, may be as fatal in the Blood, as its being curdled and fixed.

INJUNCTION, is a Writ grounded upon an Interloqutory Order in Chancery ; ſometimes to give Poſſeſſion to the Plaintiff, for want of the Defendant's Appearance ; ſometimes to the King's Ordinary Court, and ſometimes to the Court-Chriſtian, to ſtay Proceedings in a Cauſe upon Suggeſtion made, That the Rigour of the Law, if it take place, is againſt Equity and Conſcience in that Caſe.

INIUM, is the Beginning of the oblongated Marrow, which is the common Senſory, becauſe the Species which are received from the external Organs are conveyed thither by the Nerves. *Blanchard.*

INLAGARY, a Term in Law, ſignifying a Reſtitution of one Outlaw'd to the King's Protection, and to the Benefit or Eſtate of a Subject.

INNATE *Principles*, according to ſome Philoſophers, are primary Notions or Characters which they will have to be ſtamp'd upon the Mind of Man when it firſt receives its Being, and which it brings into the World with it.

INNOMINATA *Tunica Oculi*, the Tunick of the Eye that wants a Name, is a certain ſubtile Expanſion of the Tendons, from the Muſcles which move the Eye to the Circumference of the *Iris* or Horney Membrane.

INNOMINATA *Oſſa*, are two large Bones ſituated on the ſides of the *Os Sacrum*, and in a *Fœtus* may each be ſeparated into three Bones, *Ilium*, *Os Pubis*, and *Iſchium*, joined by Cartilages, and appear diſtinct by three Lines 'till ſeven Years old, but grow all into one Bone at riper Years : they are by ſome called *Cuneiformia.*

INNOMINATUS *Humor*, or *Inſitus*, is a Secondary Humour, as the Ancients call it, wherewith they thought the Body was nouriſhed : For thoſe Nutritious Humours they talked of are four, *Innominatus*, *Ros*, *Gluten*, *Cambium.* *Blanchard.*

INNOTESCIMUS, in Law, are Letters Patents which are always of a Charter of Feoffment, or ſome other Inſtrument not of Record, and ſo ſtyled in the Words of the Concluſion, *Innoteſcimus per præſentes.*

INNS-OF-COURT, are ſo called, becauſe the Students there ſtudy the Laws, to enable them to practiſe in the *Courts of Weſtminſter*, or elſewhere. Theſe are the *Middle* and *Inner Temple*, *Lincolns-Inn*, and *Grays-Inn.* There are alſo two Serjeants-Inns, and eight Inns of Chancery.

INNUENDO, is a Word frequently uſed in Writs, Declarations and Pleadings ; and its Uſe is only to declare and aſcertain the Perſon or Thing which was named or left doubtful before.

INOCULATION, is a kind of Grafting by the Inſertion of the Bud of one kind of Fruit-Tree

into the Bark of another, ſo as to make different Kinds of Fruit grow on the ſame Tree, and the ſame common Sap ſupply them all.

INOSCULATION: ſee *Anaſtomoſis.*

INQUIRENDO, is an Authority given to a Perſon or Perſons, to enquire into ſomething for the King's Advantage.

INQUISITION, in Law, is a manner of proceeding in Matters Criminal, by the Office of the Judge, or by the great *Inqueſt* before Juſtices in *Eyre.*

INQUISITORS, are Sheriffs, Coroners, *ſuper viſum corporis*, or the like, who have Power to enquire into certain Caſes.

INROLMENT, in Law, is the Regiſtring, Recording, or Entring of any Lawful Act in the Rolls of the Chancery, as a Recogniſance acknowledged, or a Statute, or a Fine levied; or in the Rolls of the Exchequer, King's-Bench, or Common Pleas; or in the Huſtings of *London*, or by the Clerk of the Peace in any County.

INSANIA, or *Amentia*, Madneſs, is an Abolition or Depravation of Imagination and Judgment.

INSCONCED, a Term in the Art Military, implying that a Part of an Army hath fortified themſelves with a Sconce or ſmall Fort, in order to defend ſome Paſs, *&c.* See *Sconces.*

INSCRIBED, in Geometry, a Figure is ſaid to be *inſcribed* in another, when all the Angles of the Figure *inſcribed* touch either the Angles, Sides, or Planes of the other Figure.

INSCRIBED *Bodies*: ſee *Regular Bodies.*

INSESSUS, is a Bath for the Belly, proper for the Lower Parts, wherein the Patient ſits down to the Navel. They are for ſeveral Uſes, as for eaſing of Pain, ſoftning of Parts, diſpelling of flatulent Matter, and frequently for exciting the Courſes. *Blanchard.*

INSIMUL *Tenuit*, is one of the Species of the Writ called *Formedon*; which ſee.

INSISTING, the Angles in any Segment, in Geometry, are ſaid to be *inſiſting* upon the Arch of the other Segment below.

INSITIO, the Botanick Word for *Grafting*; it ſignifies in general, the Inſertion and Uniting of any Cyon, Bud, *&c.* into the Subſtance of the Stock, and is of divers Kinds.

INSOLATION, is expoſing of any Body to be warmed or heated by the Beams of the Sun.

INSPEXIMUS, are Letters Patent, ſo called becauſe they begin, after the King's Title, with this Word *Inſpeximus*; and is the ſame with *Exemplification.*

INSPIRATIO, is an alternate Dilatation of the Cheſt, whereby the Nitrous Air is communicated to the Blood, to accend it by the Wind-pipe and its *Veſicular* Parts.

The Cauſe of *Inſpiration* doth not ſeem to conſiſt only in the Dilatation of the Thorax, as is commonly thought, but alſo in the Contraction of the Tunick, which covers the upper part of the *Oeſophagus*, and the moſt cloſe Receſſes of the *Aſpera Arteria. Blanchard.*

INSTANT, is ſuch a Part of Duration wherein we perceive no Succeſſion; or is that which takes up the Time of only one *Idea* in our Minds, without the Succeſſion of another, wherein we perceive no Succeſſion at all.

INSTITUTIONS, or *Inſtitutes*, Part of the Firſt of the Four Tomes or Volumes of the Civil Law, and is a Compendium of the Digeſt drawn into Four Books, compoſed on purpoſe by the Emperor for the Uſe of young Students, that ſo having the firſt Elements of the whole Profeſſion in this little Treatiſe, they might the ſooner gain a competent Knowledge of it, without being diſcouraged by the Largeneſs of the former Books.

INTACTÆ, are Right Lines, to which Curves do continually approach, and yet can never meet with them: Theſe are uſually called *Aſymptotes*; which ſee.

INTEGERS, from the Latin *Integrum*, ſignifies in Arithmetick whole Numbers, in Contradiction to Fractions.

INTENSION, is a Writ that lies againſt him that enters after the Death of a Tenant in Dower, or other Tenant for Life, and holds him out in the Reverſion or Remainder: And every Entry upon the Poſſeſſion of the King, is called an *Intenſion*; as where the Heir of the King's Tenant enters after Office, and before Livery, this is called an *Intenſion upon the King.*

Intenſion, in Natural Philoſophy, ſignifies the Increaſe of the Power or Energy of any Quality, ſuch as *Heat*, *Cold*, *&c.* for of all Qualities, they ſay, they are *Intended* and *Remitted*; that is, capable of Increaſe and Diminution. Under the Word *Quality* you will find it demonſtrated, That the *Intenſion* of all Qualities increaſes reciprocally, as the Squares of the Diſtances from the Center of the Radiating Quality decreaſes.

INTENTION, or *Study*, is when the Mind with great Earneſtneſs, and of Choice, fixes its View on any *Idea*, conſiders it on all ſides, and will not be called off by the ordinary Sollicitation of other *Ideas.*

INTERCALARY-DAY, is the odd Day put in or inſerted in the *Leap-Year.*

INTERCEPTED-AXE, a Term in Conick Sections, ſignifying the ſame with *Abſciſſa*; which ſee.

INTERCOLUMNIATION, is the Space or Diſtance between the Pillars of any Building.

INTERCOLUMNS, or *Intercolumniation*, in Architecture, are the Spaces between Column and Column in any Portico or great Piazza, *&c.*

INTERCOSTAL-ARTERIES, are Arteries, according to ſome, ſo called, becauſe they go to the Regions about the Ribs: The upper beſtows it ſelf among the Muſcles that are between the four higheſt Ribs; and the under one goes to every Muſcle that is between the reſt of the Ribs.

INTERCOSTAL-VESSELS, are the Veins and Arteries that run along the Intervals or Spaces of the lower and upper Ribs; on which account they are diſtinguiſhed into Superior and Inferior.

INTERCOSTALES *Externi & Interni*, are Muſcles placed in the Intervals of the Ribs, as their Names declare. Their Number on each ſide is twice eleven, equal to the Interſtices in which they are lodged. Their Originations are differently aſſigned by Anatomiſts; but 'tis moſt probable that they do ariſe from the lower Edge of each ſuperior Rib, and are inſerted to the upper Edge of each inferior one. Theſe are thin and fleſhy; the Fibres of the External paſs from above obliquely downwards to the Fore-part, or *Oſſa Pubis*: Thoſe of the Internal deſcend in like manner obliquely towards the Back-part, or *Os Sacrum*, their Fibres decuſſating each other like the Letter X.

INTERCUS; ſee *Anaſarca.*

INTEREST, is the Sum reckoned for the Loan or Forbearance of ſome principal Sum lent for (or due at) a certain Time, according to ſome certain Rate, and therefore called *Principal*, becauſe it is the Sum that procreates the *Intereſt*, or from which

the *Intereſt* is reckoned; and is either *Simple* or *Compound*.

I. *Simple Intereſt*, is counted from the *Principal* only, and is eaſily compured by the *Simple* or *Compound Golden Rule*, thus:

Let that which is the principal Cauſe of the *Intereſt* be put into the firſt place; and that which betokeneth Time, be in the ſecond place; and the remaining in the third: Under this Conditional part place the two other Terms, each under its like, and there will be a Blank to ſupply under one of thoſe above, either under the firſt, ſecond, or third:

EXAMPLE.

If 100 l. *in* 12 *Months gain* 6 l. *(this is the Conditional part;) What ſhall* 50 l, *get in* 3 *Months?*

Place them down as in the Rule:

L.	*m.*	*l.*
100	12	6
50	3	

Here the Blank will be under the third place, and by this

RULE I.

Multiply the three laſt for a Dividend, and the two firſt for a Diviſor, the Quotient of theſe gives the ſixth.

That is, $6 \times 50 \times 3 = 900$, and $100 \times 12 = 1200$.
Now 1200) 900.0 (.73 = 15 *s.* required.

But if the Demand had been, In how many Months would 50 *l.* have gained 15 *s.* Or if 100 *l.* in 12 Months gain 6 *l.* What ſhall the Principal be, that in 3 Months would gain 15 *s.* In theſe two Caſes the Blank would have been under the firſt or ſecond Terms: Then by this

RULE II.

Multiply the firſt, ſecond, and laſt for a Dividend, and the third and fourth for a Diviſor; the Quotient is the Anſwer.

l.	*m.*	*l.*	
103	12	6	
	3	.75	= 15 *s.*

Then by the Rule, $100 \times 12 \times .75 = 900.00$.
And $6 \times 3 = 18$) 900. (50 *l.* required.

This Rule ſhews *Simple Intereſt* and all that belongs to it with eaſe, and was thus found;

Put P for the Principal, T for the Time, and G for the Gain in the Conditions; and p, t, g anſwering, it will be, $P : G :: t : p : \frac{Gp}{P}$.

And $T : Gp :: t : \frac{Gpt}{TP} = g$, which is the firſt Rule, that is, multiply the three laſt for a Dividend, and the two firſt for a Diviſor.

And becauſe $\frac{Gpt}{TP} = g$, therefore $Gpt = TPg$; and conſequently $t = \frac{TPg}{Gp}$, and $p = \frac{TPg}{Gt}$, which is the ſecond Rule.

II. *Intereſt Compound*, is that which is counted from the *Principal*; and *Simple Intereſt* forborn, called alſo *Intereſt upon Intereſt*.

And for the reſolving of Propoſitions relating to *Compound Intereſt*, firſt ſtate the Queſtion propos'd, as tho' the Demand lay upon one Pound only; and having found a fit Anſwer (according to the Import of the Queſtion) for one Pound, to a convenient Number of Decimal parts, multiply the Sum or Number of Pounds, &c. propos'd in the Queſtion, into that Anſwer agreeing to one Pound, the Product ariſing from thence will be the Anſwer required.

Mr. *Ward* hath done this very well at the End of his Algebra, thus:

For the eaſier expreſſing of the ſeveral parts given or ſought, they may be repreſented by the following Letters;

Let P = the *Principal* { given or ſought in any Queſtion.
t = the *Time*, { or Number of Years or Days, &c. given or ſought.
a = the *Amount* { of one Pound, for one Year, or Day, &c. according to any Rate propoſed.
z = the *Sum* { or amount of *Principal* and *Intereſt* given or ſought.

Note, That in the Caſes of *Compound Intereſt*, (t) is the Index of the Power of (a).

Now, by conſidering the two following Proportions, a General Theorem may be raiſed, by which all Queſtions in *Compound Intereſt* may be reſolved.

Firſt, 1 l. : a :: a : aa :: aa : a^3 :: a^3 : a^4 :: a^4 : a^5, &c. in $\div$.

That is, *As one Pound: Is to its Amount (or one Pound with its Intereſt) at one Years End:: So is that Amount: To the Amount of one Pound at two Years; and ſo on.*

Whence 'tis plain, That *Compound Intereſt* is grounded upon a Rank of Geometrical Proportionals continued, the laſt of which is known by the Number ſignified by (t) and is a^t.

Secondly, 1 l. : a^t :: P : z; *Ergo* $P\,a^t = z$.

That is, *As one Pound: Is to the Amount of one Pound for any Time propoſed:: So is* 10, 100, 1000, *or any Sum propoſed: To its Amount for the ſame Time.*

From theſe two Proportions the General Theorem $P\,a^t = z$ is ſufficiently demonſtrated, and may be clearly underſtood.

Queſt. 1 *Suppoſe* 250 l. *hath been at Intereſt ſeven Years; What doth it amount to at* 6 per Cent. per Annum, Compound Intereſt?

Here is given $P = 250$ *l.* $t = 7$, and $a = 1.06$.

For $100 : 6 :: 1 : 1.06 = a$, the firſt Year.

Then if a be involved ſo often, until its Index $= t$, *viz.* $a^7 = a^t$, and then multiplied into P, it will produce z, as appears by the Theorem $P a^t = z$.

But $a = 106$, involved 7 times $= 1.50363$.

And $250 \times 1.50363 = 375.9075 = z$.

That is, 375 *l.* 18 *s.* 2 *d.* is the Sum produced from 250 *l.* having been at *Compound Intereſt* ſeven Years (as above propoſed.)

Queſt. 2. *Suppoſe* 375 l 18 s. 2 d. *were to be paid ſeven Years hence; What is it worth in ready Money, abating* 6 per Cent, per Annum, Compound Intereſt?

Here is given $z = 375.9075$, $t = 7$, and $a = 1.06$; to find P.

General Theorem is $P a^t = z$, therefore $\frac{z}{a^t} = P$.

But $a = 1.06$, and involved 7 times $= 1.50363$.

And $\frac{375.9075}{1.50363}$ $\left(\begin{array}{l} = 250 = P; \text{ that is, worth} \\ 250\ l. \text{ ready Money.} \end{array}\right.$

Queſt. 3. *Suppoſe* 250 l. *hath been at Intereſt, and the Amount is* 375 l. 18 s. 2 d. *at* 6 per Cent. Compound Intereſt; *How long hath it been forborn?*

Here is given $P = 250$, $z = 375.9075$, and $a = 1.06$, for one Year; thence to find t, the Index of the Power of a.

General Theorem, $P a^t = z$; *ergo*, $\frac{z}{P} = a^t$.

Conſequently, if a^t be continually divided by a, until it become $\frac{a}{a} = 1$, the Number of ſuch Diviſions will be t: For ſuch Number of Diviſions diſcovers how oft a was involved.

But $\frac{375.9075}{250}$ $\left(= 1.50363 = a^t.\right.$

And $\frac{1.50363}{1.06}$ $\left(= 1.418518.\right.$

Alſo $\frac{1418518}{1.06}$ $\left(= 1.338225\right.$

And ſo on till it become $\frac{1.06}{1.06}$ $(= 1$, which will be at the ſeventh Operation.

Then will $t = 7$, the Number of Years required.

Queſt. 4. *Suppoſe* 250 l. *had been forborn ſeven Years, and the Debtor is willing to give up both Principal and Intereſt, proffering* 375 l. 18 s. 2 d. *to be cleared; What Rate of Intereſt,* per Cent. *(allowing Compound Intereſt) doth he hereby offer to the Creditor?*

Here you have given $P = 250$, $z = 375.9075$, and $t = 7$, to find a.

General Theorem, $P a^t = z$, *ergo* $\frac{z}{P} = a^t$.

That is, $a^t = a^7$, conſequently $\sqrt[7]{\frac{z}{P}} = a$.

But $\frac{z}{P}$ $(= 1.50363 = G.$

Let $a = r + e$.

Then $r^7 + 7 r^6 e + 21 r^5 ee = a^7 = G.$

$\frac{1}{7} r^7 + r^6 e + 3 r^5 ee = \frac{1}{7} G.$

$\frac{1}{7} rr + re + 3 ee = \frac{\frac{1}{7} G}{r^5}.$

$re + 3ee = \frac{\frac{1}{7} G}{r^5} - \frac{1}{7} rr = D.$

Hence this *Theorem*, $\frac{D}{r + 3e} = e$.

Let $r = 1$	$1.50363 = G.$
	$.214804 = \frac{1}{7} G \div 1^5.$
	$-.142857 = \frac{1}{7} rr.$
	. . .
$r = 1$	$.071947 = D$ $(.06 = e.$
$+ 3e = .18$	708
Diviſ. $= 1.18$	$.21480428 = \frac{1}{7} G.$
	$.16051432 = \frac{1}{7} G. \div r^5.$
Firſt $r = 1$	$- .16051428$
$+ e = .06$	$.00000004$
New $r = 1.06 = a$	

Then $1 : 1.06 :: 100 : 6 =$ the Rate of the Intereſt required.

But if in any Queſtions, either of *Intereſt* or *Annuities*, the Time given or ſought be not terminated by whole Years, but by Weeks, Months, Quarters, Half-Years, Three Quarters, &c. for reſolving ſuch Queſtions, firſt reduce ſuch broken or Fractional parts of the Year into Days, *viz.* $\frac{1}{52} = 7$ Days, $\frac{1}{12} = 30.4$ Days, $\frac{1}{4} = 91.25$ Days, $\frac{1}{2} = 182.5$ Days, $\frac{3}{4} = 273.75$ Days; and ſo for any odd Number of Days that falls betwixt ſuch even parts of the Year.

This done, find an Anſwer according to the Demand of the Queſtion, (and agreeing to one Pound as before) for the Number of the Days propoſed.

To perform which, it will be requiſite to reſolve this following Queſtion.

Queſt. 5. *What is the Amount (or Intereſt) of one Pound for one Day, at* 6 per Cent. per Annum, Compound Intereſt?

Put a for the Amount ſought, then 'twill be,

$1 : a :: a : a^2 :: a^3 : a^3 : a^3 :: a^4 : a^5 :: a^6$, &c. $\div$.

That is, *As one Pound: Is to its Amount for one Day:: So is that Amount: To the Amount for two Days:: And ſo is that of two Days: To that of three Days; and ſo on to* 365 *Days.*

The

The laſt of which will be $a^{365} = 1.06$.

Let $a = r + e$.

Then $r^{365} + 365re^{364} + 66430r^{363}ee = 1.06 = G$.

$\frac{1}{365}r^{365} + r^{364}e + 182r^{363}ee = \frac{1}{365}G$.

$\frac{1}{365}rr + re + 182ee \frac{\frac{1}{365}G}{r^{363}}$.

$re + 182ee = \frac{\frac{1}{365}G}{r^{363}} - \frac{1}{365}rr = D$:

Whence this *Theorem*, $\frac{D}{r + 182e} = e$.

Let r = 1.	.00290410 = $\frac{\frac{1}{365}G}{r^{363}}$.	
+ 182 e = .0182	—.00273972 = $\frac{1}{365}rr$.	
Diviſor = 1.0182	.00016438 = D(.00016 = e	
	10182	
New r = 1.0001	625600	
+ 182 e = .01092	606612	
Diviſor = 1.01102		

New r = 1.00016, for a ſecond Operation.

Then is, .00274025636372 = $\frac{\frac{1}{365}G}{r^{363}}$.

—.00274050280986 = $\frac{1}{365}rr$.

Here the Exceſs lieth upon $\frac{1}{365}rr$, and therefore the Difference or new Reſolvend will have the Sign —, and conſequently muſt be — e.

Then	—.0000003464644	= D(-.0000003 = e
r = 1.00016	30003162	
+ 182 e = 1.0000546		
	46414520	(-464 = z.
Diviſor 1.0001054	40004216	
Laſt r = 1.00016	6413004	
— e = .0000003464	6000530	
a = 1.0001596536	409674	
	400040	

This Value of a, is the Amount of 1 *l.* for one Day; from which, if 1 *l.* be ſubſtracted, the Remainder will be the *Intereſt* of 1 a for one Day; *i. e.* .0001596536: Conſequently, if any propoſed Sum be multiplied into either of theſe, the reſpective Product will be the Amount or Intereſt of that Sum for one Day.

Hence, if a Table of the ſeveral Powers of a was calculated, it would be,

$a : a^2 : a^3 : a^4 : a^5 : a^6 : a^7$ = the Amounts.
1, 2, 3, 4, 5, 6, 7, = the Days.
And ſo on to $a^{65} = 1.06$, the Amount for 365 Days.

Such a Table would be very uſeful for the ſpeedy reſolving of all Queſtions relating to *Compound Intereſt*, &c. for any Number of Days leſs than one Year.

III. *Annuities, Penſions, Leaſes in Reverſion*, &c. differ from *Compound Intereſt* in this; that *Compound Intereſt* is grounded upon a Rank of Geometrical Proportionals continually increaſing; but *Annuities*, &c. upon a Rank of Geometrical Proportionals continually decreaſing; and may be thus repreſented,

Let p = the { *Penſion* or *Annuity*; and is the firſt or greateſt Term in the Progreſſion.

t = the { *Time* of Continuance (as in Intereſt) and is the Number of all the Terms except the firſt.

a = the { Rate of Intereſt for one Pound (as before) and is the Common Ratio of all the Terms.

z = the { Sum of all the Terms, except the firſt, and is the Price, or preſent Worth of any Annuity or Penſion, &c.

Hence the Progreſſion will be,

$$p : \frac{P}{a} :: \frac{P}{a} : \frac{P}{aa} :: \frac{P}{aa} : \frac{P}{aaa} :: \frac{P}{aaa} : \frac{P}{aaaa}, \&c. ::.$$

Until it become $\frac{P}{a^t}$; that is, until the Index of the Power of a, be equal to the Time of Continuance of the Annuity.

In this Progreſſion $\frac{P}{a^t}$ is the laſt Term;

Then $z - \frac{P}{a^t}$ is the Sum of all the Antecedents,

And $z - \frac{P}{a}$ the Sum of all the Conſequents.

But, *As one of the Antecedents : Is to its Conſequents :: So is the Sum of the Antecedents : To the Sum of the Conſequents.*

That is, $P : \frac{P}{a} :: z - \frac{P}{a} : z - \frac{P}{a}$.

Therefore $zP - \frac{PP}{a} = \frac{zP}{a} - \frac{PP}{a^t \times a}$.

That is, $za - p = z - \frac{P}{a}$.

Or, $za - z = p - \frac{P}{a}$.

By this Equation may all the Caſes in Annuities or Penſions, &c. (that are bounded by Time) be reſolved, by tranſpoſing the ſeveral Parts thereof, as the Nature of the Queſtion requires.

For Inſtance, *Suppoſe the Yearly Penſion or Leaſe, Years of Continuance, and Rate of Intereſt, were each given; Thence to find the Worth thereof in preſent Money.*

You have given P, t, and a, thence to find z.

The Equation is $za - z = p - \frac{P}{a^t}$.

Therefore $z = \frac{P - \frac{P}{a^t}}{a - 1} = P - \frac{P}{a^t} \div a - 1$.

The like for any other Part, *viz.* P, t, or a.

The

The very Ingenious and Learned Capt. *Halley* hath, in his Obſervations on the *Breſlaw* Bills of Mortality, (in *Philoſ. Tranſ.* N. 196,) ſhewed ſeveral ways of eſtimating the Values of Annuities and Lives, and computing the different Degrees of Mortality, or rather, as he calls it, Vitality; where he proves, That 'tis 80 to 1, that a Perſon of 25 Years old doth not die in a Year: That 'tis 5 and a half to one, a Man of 40 lives 7 Years: That a Man of 30 may reaſonably expect to live between 27 and 28 Years, &c. And he gives Rules for the Valuation of 2 or 3 more Lives, and what an Annuity is worth during the Continuance of any of them, &c.

INTERFORAMINEUM, or *Interfemineum*, the ſame with *Perineum*.

INTERJECTION, in Grammar, is an indeclinable Word uſed in a Sentence, to declare the Affections or Paſſions of the Mind, and to compleat the Senſe of it.

INTERIOR *Polygon*: ſee *Polygon Interior*.

INTERIOR *Talus*: ſee *Talus*.

INTERLOCUTORY *Order*, is that which decides not the Cauſe, but only ſettles ſome intervening Matter relating to the Cauſe; as where an Order is made by Motion in *Chancery*, for the Plaintiff to have an Injunction, to quit his Poſſeſſion till the hearing of the Cauſe; this, or any other ſuch Order not being final, is *Interlocutory*.

INTERMISSIO *Febrium*: ſee *Apyrexia*.

INTERMITTENS *Morbus*, is a Diſeaſe which comes at certain times, and then remits a little.

INTERNAL *Angles*: ſee *Angles Internal*.

INTERNODIUM, in Botany, is the Space contained between any two Knots or Joints of the Stalk of a Plant.

INTERNUS *Auris*, is a Muſcle which lies in a Bony Channel evacuated in the *Os Petroſum*, which makes one of the *Parietes Tympani*: One part of this Channel is without the *Tympanum*, and lies in the upper part of the Bony Paſſage which goes from the Ear to the Palate; the other part, which is within the *Tympanum*, advancing as far as the *Feneſtra Ovalis*, makes in that place a riſing, upon which, as on a Pulley, the Tendon of this Muſcle paſſes to the other Side of the *Tympanum*, and inſerts it ſelf at the poſterior part of the Handle of the *Malleus*, a little below the Inſertion of the External Muſcle, by which means it draws towards the *Os Petroſum*. When this Muſcle acts it pulls the *Manubrium* of the *Malleus* towards the *Os Petroſum*, whereby the *Membrana Tympani* becomes ſomewhat concave outwardly.

INTEROSSEI *Manus*, are the Muſcles of the Fingers, which are diſtinguiſhed into External and Internal; they are aptly ſo named from their Situations. Authors diſagree in their Number, ſome reckoning ſix, others eight, amongſt which they eſteem the *Abductor Minimi Digiti*, and *Indicis*; but Mr. *Cowper* inclines to the firſt Opinion, conceiving the two latter named Muſcles do not deſerve theſe Denominations. They ariſe Fleſhy internally in the Palm from the ſuperior parts of the Metacarpal Bones next the *Carpus*, whence deſcending, they become Tendinous at the firſt Internode of each Finger laterally, and paſs to their Inſertions with the *Extenſor Digitorum Communis*; each Interſtice of the Metacarpal Bones entertaining two Muſcles inſerted to the Sides of the Fingers. When all theſe *Interoſſei* act together, they draw the Fingers near each other, and aſſiſt in their Extenſion, as *Galen* takes notice; at which time they, together with the *Abductor Indicis*, and *Minimi Digiti*, are capable of divaricating the Fingers, which Action cannot be performed without ſome Difficulty by them when they are bended; which Contrivance of the moſt Wiſe Architect is alſo obſerved by *Galen*.

INTEROSSEI *Pedis*, are Muſcles of the Foot; they are reckoned to be ſeven in Number. They derive their Names from their Situation, and may each deſerve a proper Appellation from their Uſe.

The Firſt may be called *Abductor Minimi Digiti*.

The Second, which is the largeſt, draws the next Toe towards the leſſer, and may be called, *Abductor Auricularius*.

The Third antagonizes the former, and is an *Abductor* of the Toe.

The Fourth may be called *Abductor Medii Digiti*.

The Fifth is an *Abductor* of the ſame.

The Sixth is an *Abductor*; and Seventh, *Abductor Indicis Pedis*.

All theſe ariſe Fleſhy from the ſuperior part of the *Oſſa Metatarſi* of the leſſer Toes, and becoming bellied, grow Tendinous at their Inſertions to the firſt Internode of each leſſer Toe laterally.

INTERROGATION, is a Figure in Rhetorick, in which the Paſſion of the Speaker introduces a thing by way of Queſtion, to make its Truth the more conſpicuouſly appear.

INTERRUPTION, as ſome call it, is the ſame with Disjunction of Proportion in Geometry, and is noted thus, (::) and ſignifieth the breaking off of the Ratio in the middle of four disjunct or diſcrete Proportionals, As A : B :: C : D; that is, As A is to B :: So is C to D.

INTERSCAPULARIA, are the Cavities betwixt the Shoulder-blades and the Vertebres.

INTERSECTION, in Mathematicks, ſignifies the cutting of one *Line* or *Plane* by another: Thus we ſay, that the mutual *Interſection* of two Planes, is a Right Line.

INTERSPERSUM *Vacuum*: ſee *Vacuum*.

INTERSPINALES *Colli*; theſe are ſmall fleſhy Muſcles of the Neck, ariſing from the ſuperior parts of each double ſpinal Proceſs of the Neck, except of the ſecond *Vertebra*; and are inſerted to the inferior Parts of all the ſaid double Spines. When theſe Muſcles act, they draw the Spines of the *Vertebræ* of the Neck nearer each other.' Theſe were firſt diſcovered in the Year 1690.

INTERSTELLAR, a Word uſed by ſome Authors, to expreſs thoſe parts of the Univerſe that are without and beyond our Solar Syſtem; and which are ſuppoſed as Planetary Syſtems moving round each fix'd Star as the Center of their Motion, as the Sun is of ours: And if it be true, as 'tis not improbable, That each fix'd Star may thus be a Sun to ſome habitable Orbs that may move round it, the *Interſtellar* World will be infinitely the greater part of the Univerſe.

INTERTRIGO, or *Attritus*, is cutting or fretting the *Cuticula* off of the parts near the Fundament, or betwixt the Thighs.

INTERVAL, in Muſik, is the Diſtance or Difference between any two Sounds, whereof one is more Grave, and the other more Acute. They make ſeveral Diviſions of an *Interval*, as firſt into *Simple* and *Compound*: The *Simple Intervals* are the *Octave*, and all that are within it, as the *Second*, *Third*, *Fourth*, *Fifth*, *Sixth*, and *Seventh*, with their Varieties: The *Compound* ones are all thoſe that are greater than an *Octave*, as the *Ninth*, *Tenth*, *Eleventh*, &c. with their Varieties.

An *Interval* is alſo divided into *Juſt* or *True*, and into *Falſe*: All the above-mention'd *Intervals*, with their

their Varieties, whether *Major* or *Minor* are *Juſt*; but the diminutive or ſuperfluous ones are all *Falſe*: See *Ozanam's Dict. Matth. p.* 653. An *Interval* is alſo divided into a *Conſonance* and a *Diſſonance*; which ſee.

INTESTATES, in Law, there are two kinds of *Inteſtates*, one that makes no Will at all; another that makes a Will, and nominates Executors, but they refuſe; in which he dies as an *Inteſtate*, and the Ordinary commits Adminiſtration.

INTESTINES, the *Entrails*, *Guts*, or *Bowels*.

INTRUSION, is when the Anceſtor dies ſeized of any Eſtate of Inheritance, expectant upon an Eſtate for Life; and then the Tenant for Life dies, between whoſe Death, and the Entry of the Heir, a Stranger does interpoſe and *intrude*.

INTRUSIONE, is a Writ that lies againſt the *Intruder*.

INTUITION, according to Mr. *Lock*, is the Perception of the certain Agreement or Diſagreement of any two Idea's immediately compared together.

INVIDIATUS, in Law, is when one has been accuſed of ſome Crime, which being not fully proved, he is put *ſub debita fidei juſſione*; i. e. *Suretiſhip*.

INVECTED, a Term in Heraldry, ſignifying directly contrary to *Engrailed*; which ſee.

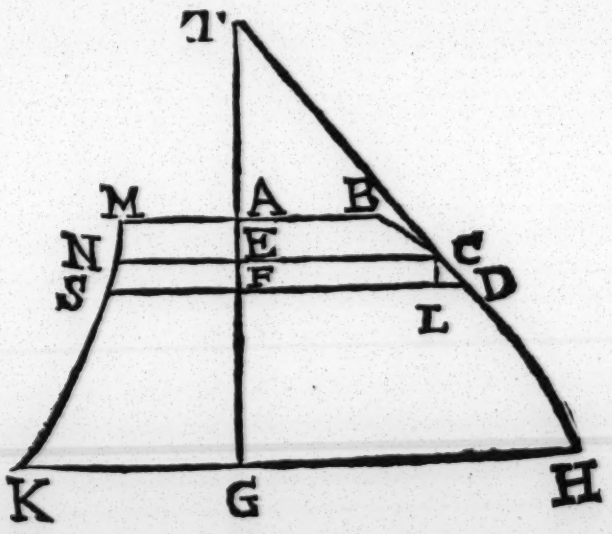
INVENTORY, is the Deſcription or Repertory orderly made of all dead Mens Goods and Chattels, prized by four or more Credible Men, which every Executor or Adminiſtrator is bound to exhibit to the Ordinary at ſuch times as he ſhall appoint.

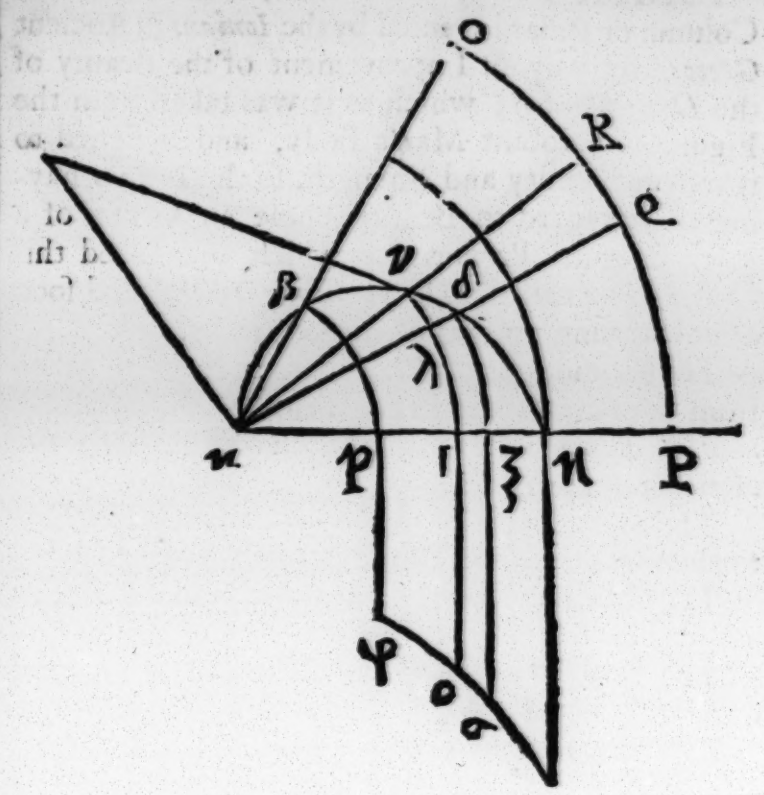
INVERSE *Proportion*, or *Proportion by Inverſion*: ſee the Word *Proportion*, N. 7.

INVOICE, is a Particular of the Value, Cuſtom, and Charges of any Goods ſent by a Merchant in another Man's Ship, and conſigned to a Factor.

INVOLUCRUM *Cordis*: ſee *Pericardium*.

INVOLUTE and *Evolute Figures*, in Mathematicks, are ſuch as theſe:





Let the Space *A B H G* be divided into an infinite Number of Trapezia; and imagine the Portions of the Curve *C D*; and their Sines *C L*, to be flexible like ſo many Threads; and the Ordinates *A B*, *E C*, *F D*, *G H*, to be rigid and inflexible: Then the Trapezia *C E F D*, may be changed into the Trilineal Figures *x γ δ*; *viz.* if the Points *E* and *F* be ſuppos'd to co-incide; and if this be done in all the other Trapezia's, and if all the Points of the Diviſions in the Axis be ſuppos'd to be contracted or meet in *G*, there will be produced a new Figure *x β n*; and the Point *x* will repreſent the Point of Concourſe, wherein all the Points of the Axis *E*, *E*, *F*, *G*, *&c.* meet; and the Figure *x β n* is call'd the *Involuta* of the Figure *A B H G*, and this is call'd the *Evoluta* of that. Now the Properties of theſe Figures are,

1. Becauſe the Rectangle *C L F E* is ſuppos'd to be chang'd into the infinitely little Sector of a Circle *γ x λ*, this Sector is equal to half that Parallelogram, the Angles at *γ* and *λ* being Right Angles, and *λ γ* being = *C L*; and if this be obſerved in all the reſt, all the Rectangles *C E F L*, or the Figure *A B H G*, is equal to twice the Sum of all the Triangles *x γ λ*, or the *Involuta x β n*.

2. Becauſe, by Suppoſition, *C L* = *γ λ*, and *C D* = *γ δ*, and the Angles *L* and *λ* Right Angles; therefore the Triangles *C L D* and *γ λ δ* are ſimilar and equal: Whence, if we ſuppoſe the Angle *T x γ* = *γ λ δ*, then the Triangles *T x γ* and *T E C* will be (becauſe *γ x* = *E C*) ſimilar and equal.

3. The Arch *β p* deſcrib'd with the Radius *x β*, is leſs than the Axis *A G*, and the Axis *ν μ* deſcribed with the Radius *x n*, is greater than the ſaid Axis *A G*, as is evident from the Geneſis of theſe Figures: ſee *Hayes's Fluxions, p.* 109.

INVOLUTION, in *Algebra*, is the raiſing up any Quantity from its Root to any Power aſſign'd; as ſuppoſe *a* + *b* were to be ſquared, or raiſed up to its ſecond Power, they ſay, *involve a* + *b*; that is, multiply it into its ſelf, and it will produce *a a* + 2 *a b* + *b b*, which is the Square or ſecond Power of that Quantity; and if it be involved again, or if that Square be multiplied by the Root, the Cube or third Power will be produced, which is *a a a* + 3 *a a b* + 3 *b b a* + *b b b*.

INWARD *Flanking Angle*, in Fortification, is made by the Courtine and the *Razant Flanking Line of Defence*.

IONICK

IONICK *Order of Architecture*, is the Form of a Column or Pillar invented by the *Ionians* in Ancient *Greece*, by way of Improvement of the Beauty of the *Dorick Order*; which as it was taken from the Figure of a robuſt Man's Body, and deſigned to repreſent Solidity and Strength, ſo the *Ionians* having more regard to Beauty, choſe an Order of a more Elegant Proportion, which occaſioned this Order to be called, *The Feminine Order*; and ſoon after it ſprung up that of the *Caryatides*.

The Promotions of this Pillar, as they are taken from the famous one in the Temple of *Fortuna Virilis* at *Rome*, now the Church of St. *Mary* the *Ægyptian*, are theſe;

The intire Order from the Superficies of the *Area* to the *Cornice*, are 22 Modules or 11 Diameters.

The Column with its Baſe and Capital, contains 18 Modules.

The *Entablature* (*i. e.* the *Architrave*, *Frieſe*, and *Cornice*) contain 4 Modules.

The *Voluta* of the Capital, is of an Oval Form.

The Columns in this Order are often hollow'd and furrow'd with 24 Gutters; and ſometimes 'tis done only to the third part of the Column, reckoning from the Bottom; and then that third part hath its Gutter filled with little Rods or Battoons, all the part of the Hollow above being left empty.

JONTHUS, or *Varus*, is a little hard, callous Swelling in the Skin of the Face. *Blanchard.*

JOURNEYS *Accounts*, is a Term in Law, to be thus underſtood: If a Writ be abated without the Default of the Plaintiff or Demandant, he may purchaſe a new Writ, which if it be purchaſed by *Journeys Accounts*; (that is, within as little Time as he poſſibly can after the Abatement of the firſt Writ) then this ſecond Writ ſhall be as a Continuance of the firſt, and ſo ſhall ought the Tenant or Defendant of his Voucher, Plea, or Non-tenure, Joint-tenancy fully adminiſtred, *&c.* or any other Plea which ariſes upon Matter happening after the Date of the firſt Writ; and 15 Days have been held a convenient Time for the Purchaſe of the new Writ.

JOY, is a Delight of the Mind, from the Conſideration of the preſent, or aſſured approaching Poſſeſſion of a Good; and we are then poſſeſſed of any Good, when we have it ſo in our Power that we can uſe it when we pleaſe.

JOYNTURE, is a Covenant, whereby the Husband, or ſome other Friend in his Behalf, aſſureth unto his Wife, in reſpect of Marriage, Lands or Tenements for a Term of Life: Or otherwiſe

It is ſo called, either becauſe granted *Ratione Juncturæ in Matrimonio*; or becauſe the Land in *Frank-marriage* is given jointly to the Husband and Wife, and after to the Heirs of their Bodies, whereby the Husband and Wife be made Joint-Tenants during the Coverture.

IRIS, is that fibrous Circle next to the Pupil of the Eye, diſtinguiſhed with Variety of Colours: ſee *Uvea Membrana*. 'Tis ſo called from its Similitude to a Rainbow, (in Latin *Iris*.)

Alſo thoſe changeable Colours which ſometimes appear in the Glaſſes of Teleſcopes, Microſcopes, *&c.* are called *Iris* for the ſame Reaſon; as is that coloured *Spectrum*, which a Triangular Priſmatick Glaſs, will project on a Wall, when placed (at a due Angle) in the Sun-beams: ſee *Rain-bow*.

IRONY, is a Trope in Rhetorick, by which we ſpeak contrary to our Thoughts; as to ſay, *Such a one is a very honeſt Man*, when we know he is notoriouſly Corrupt.

IRON-SICK, a Ship or a Boat is ſaid to be *Iron-ſick*, when her Spikes are ſo eaten with Ruſt or Nails, and ſo worn away, that they make Hollows in the Planks, whereby the Ship leaks.

IRRADIATION, is a Word uſed by *Van Helmont*, and ſome other Chymiſts, to expreſs the Operation of ſome Mineral Medicines, which they will have to impart their Virtue, without emitting any thing Material or Subſtantial out of them, or without the Emanation of any Corporeal Effluvia.

Thus, for Inſtance, They tell you, That ſome Antimonial Preparations, as is *Glaſs* and *Crocus Metallorum*, will give an Emetick Quality to Wine, *&c.* without any manner of Diminution of its Weight: But it doth not appear that they were well enough exerciſed in Statical Experiments, either to have nice Scales, or to know how to uſe them, and therefore, doubtleſs, do too boldly call that Diminution, which was only not ſo ſenſibly ſo to them: But how a Body ſhould communicate its Vomitive Quality to a Liquor, without impregnating it with ſome of its fine and ſubtile Emetick Particles, is hardly poſſible to conceive.

IRRATIONAL *Numbers*: ſee *Surd Numbers*.

IRRATIONAL *Quantities*: ſee *Rational Quantities*.

IRREGULAR *Bodies*, are Solids which are not terminated by equal and like Surfaces.

IRREGULAR *Fortification*: ſee *Fortification*.

IRREGULAR *Lines* or *Curves*: ſee *Regular*.

ISAGON, in Geometry, is ſometimes uſed for a Figure conſiſting of equal Angles.

ISCHÆMA, are Medicines that ſtop the Blood, which, with a binding, cooling, or drying Virtue, cloſe up the Openings of the Veſſels, or diminiſh and ſtop the Fluidity or violent Motion of the Blood. *Blanchard.*

ISCHIAS, the Gout in the Hip.

ISCHIAS *Major*, is a Branch of the *Crural Vein* which goes to the Muſcles and Fat of the Leg, and is divided afterwards into ſeveral Branches, which are diſtributed to the Toes.

ISCHIAS *Minor*, a Branch alſo of the *Crural Vein*, being but a little one, and is wholly ſpent on the Muſcles and Skin, which are about the upper Joint of the *Femur*.

ISCHIUM, is the Hip or Huckle-Bone.

ISCHURETICA, are Medicines which force Urine, in the Caſe of a Suppreſſion of it.

ISCHURIA, is ſuch a Suppreſſion of Urine in the Bladder, that little or nothing of it can be diſcharged.

ISLES, in Architecture, are Sides or Wings of a Building.

ISOCHRONE, Vibrations of a Pendulum, are ſuch as are made in the ſame ſpace of Time, as all the Vibrations or Springs of the ſame Pendulum are, whether the Arks it deſcribes be longer or ſhorter; for when it deſcribes a ſhorter Ark, it moves ſo much the ſlower; and when a long one, proportionably faſter.

ISOMERIA, in Algebra, is the ſame with *Converſion of Equations*, (ſee *Equations*, N. 1.) or of clearing any Equation from Fractions.

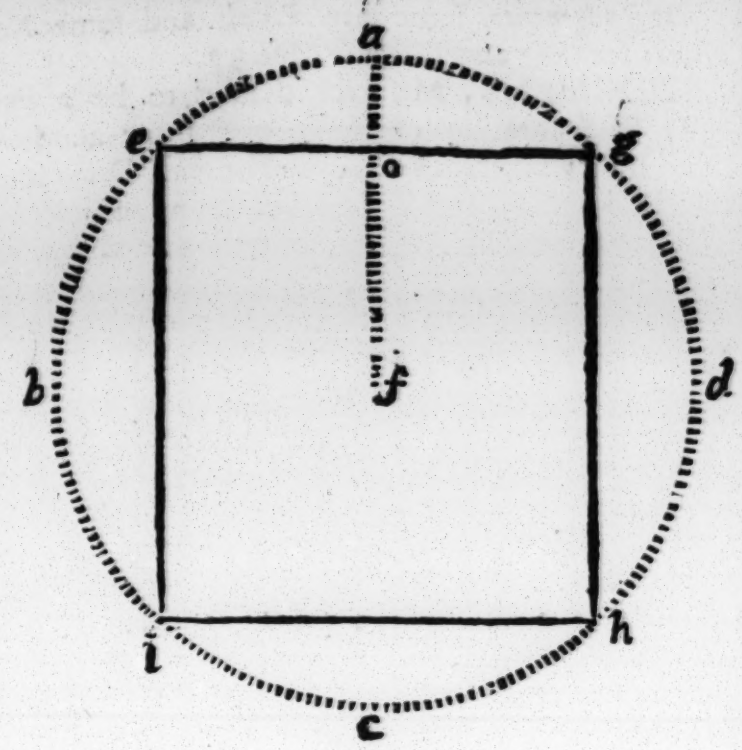
ISOPERIMETRICAL *Figures*, in Geometry, are ſuch as have equal *Perimeters* or *Circumferences*.

Of all *Iſoperimetrical Figures*, the *Circle* is the greateſt.

For if a Right Line could be diſpoſed into the Form of the Circumference of a *Circle*, it would contain more Space than any other Figure or *Regular Polygon* whatſoever.

As

As ſuppoſe the Circumference of the *Circle a b c d*, to be diſpoſed into the Form of a Square, or any other *Regular Polygon*: ſo that all the Sides *e g*, *g h*, *h i*, and *i e* together, may be equal to the



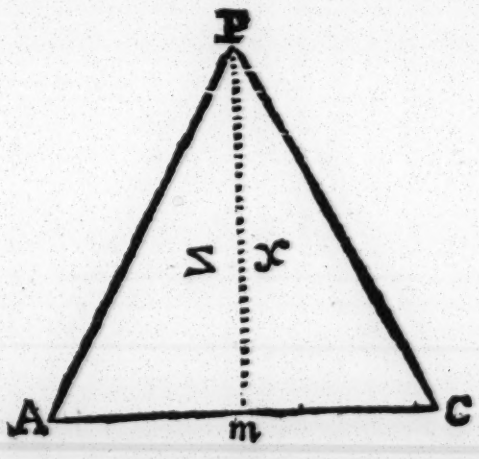
Circumference of the Circle *a b c d*; I ſay the *Circle* is greater than that *Square*.

For the *Circle* is equal to a Rectangle-Triangle, one of whoſe Legs is the Radius *f a*, and the other the Circumference. And the *Polygon* is equal alſo to ſuch a Triangle, one of whoſe Legs is the ſame Circumference *a b c d*, or the Sum of the Sides *g e i h*: And the other Leg is the Line *f o*, but as *f o* is leſs than the Radius *f a*, ſo the Triangle, which is equal to the *Polygon*, muſt be leſs than that which is equal to the *Circle*: Therefore the *Square* or *Polygon* muſt be leſs than the *Circle*. W. W. D.

ISOSCELES-TRIANGLE: ſee *Triangle*.

PROP. I.

The Angles oppoſite to the equal Sides of an *Iſoſceles-Triangle* are equal; and a Line drawn from the Top (or Vertex) cutting the Baſe into two equal Parts, is perpendicular to the Baſe.



Let the *Iſoſceles-Triangle* be *A P C*, and let its Baſe *A C* be ſuppoſed to be divided into two equal Parts in *m*.

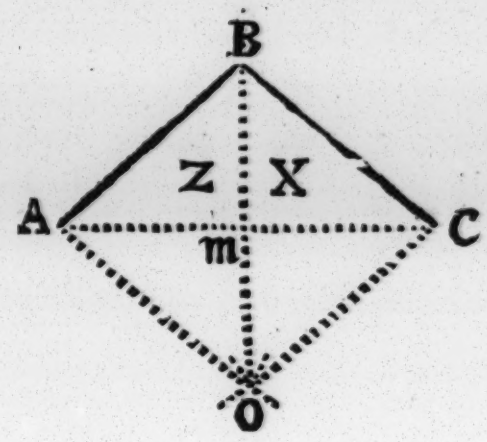
I ſay *P m* is perpendicular to *A C*; and the Angle *P C A*, is equal to the Angle *P A C*.

Demonſtration.

For the Triangle *Z* hath all its Sides equal to thoſe of *X*, and therefore muſt have all its Angles alſo reſpectively equal to thoſe in *X*: And then the Angle *P m A* = *P m C*, becauſe they are both right; therefore *P m* is perpendicular to *A C*, and the Angle *P A m* = *P C m*. Q. E. D.

PROBLEM I.

To Divide a Right Line into Two equal Parts.



Let the Line given be *A C*, opening the Compaſs to any Diſtance more than half the Line *A C*, and ſetting one Foot in *C*, ſtrike an Ark both above and below the middle of the Line; then keeping them at the ſame Diſtance, ſet one Foot in *A*, and croſs the former Arks in *O* and *B*; a Ruler laid from *O* to *B*, ſhall cut the Middle of the *A C*, or divide it into two equal Parts.

Demonſtration.

Draw the Lines *A B*, *B C*, *B O*, *A O*, and *C O*.

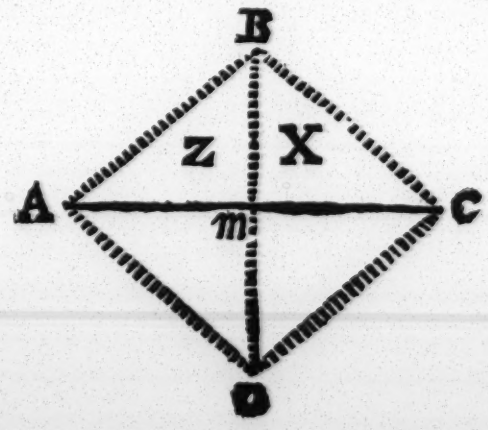
1. Then will the Triangles *B A O*, and *B C O*, have all their three Sides reſpectively equal, and conſequently be equal to one another; and therefore the Angle *C B O* = Angle *A B O*.

2. The Triangles *Z* and *X*, have the ſame two Angles *A B m*, and *C P m* equal, and the Side *A B* equal to the Side *B C*, and *B m* common to both: Therefore all are equal, and conſequently *A m* = *C m*. Q. E. D.

N. B. By this Problem alſo, a Perpendicular may be let fall to the middle of any given Line; for here 'tis plain, *B m* is perpendicular.

PROBLEM II.

To Divide an Angle given into Two equal Parts.
Let the given Angle be A B C.



Open your Compaſs to any convenient Diſtance, and ſetting one Foot in *B*, croſs the Legs of the Angle in *A O*, ſtrike an Ark below as at *O*, and removing the Compaſs to *A*, croſs the former Ark in the Point *O*, ſo a Line drawn from *B* to *O* ſhall Biſſect the Angle.

The Demonſtration is the ſame with that of the laſt Problem.

ISSUANT, a Term in Heraldry, when a Lion, or other Beaſt, is drawn in a Coat of Arms juſt iſſuing out of the Bottom Line of any *Chief*, *Feſſe*, &c. but if it come out of the Middle of any Ordinary, they call it *Naiſſant*; that is, *Naſcent*, juſt coming out as it were from the Womb.

ISSUE, a Term in Common Law, having divers Applications; ſometimes 'tis taken for the Children begotten between a Man and his Wife; ſometimes for Profits growing from Amerciaments or Fines; and ſometimes from Profits of Lands or Tenements; ſometimes for that Point of Matter depending in Suit, whereupon the Parties join, and put their Cauſe to the Trial of the Jury: And yet in all theſe it hath but one Signication, which is an Effect of a Cauſe proceeding, as the Children be the Effect of the Marriage between the Parents: The Profits growing to the King or Lord, from the Puniſhment of any Man's Offence, is the Effect of his Tranſgreſſion: The Point referred to the Trial of Twelve Men, is the Effect of Pleading or Proceſs.

Iſſue in this laſt Signification, is either *General* or *Special*.

General Iſſue, ſeemeth to be that whereby it is referred to the *Jury* to bring in their Verdict, whether the Defendant hath done any ſuch thing as the Plaintiff layeth to his Charge.

For Example:

If it be an Offence againſt any Statute, and the Defendant plead, *Not Guilty*; this being put to the Jury, is called, *The General Iſſue*.

And if a Man complain of a private Wrong, which the Defendant denieth, and pleads no Wrong nor Diſſeiſin, and if this be referred to the Jury, it is likewiſe the *General Iſſue*.

The *Special Iſſue* then muſt be that, when Special Matters being alledged by the Defendant in his Defence, both Parties joyn thereupon, and ſo grow rather to a Demurrer, if it be *Quæſtio Juris*, or to Trial by the Jury, if it be *Quæſtio Facti*.

ISTHMUS, in Geography, is a little Neck or Part of Land joining a *Peninſula* to the *Continent*.

ISTHMUS, in Anatomy, according to ſome, is that Part which lies betwixt the Mouth and the Gullet, like a Neck of Land; alſo the Ridge that ſeparates the Noſtrils.

ITINERARIUM, is a Chyrurgeon's Inſtrument, which being fixed in the Urinary Paſſage, ſhews the Neck or Sphincter of the Bladder, that an Inciſion may be more ſurely made to find out the Stone: 'Tis uſually thruſt up thro' the Cavity of a Fiſtulous Catheter, which ſaves it from wounding the *Urethra* as it goes.

ITHMOIDEA *Oſſa*: ſee *Ethmoides*.

JUBA, a Botanick Word, ſignifying a ſoft looſe Beard, which hangs at the Ends of the Husks of ſome Plants of the *Frumentaceous Kind*; as particularly in *Millet*.

JUDGE and *Judges*, have all their Commiſſions bounded with this Limitation, *Facturi quod ad juſtitiam pertinet ſecundum legem & conſuetudinem Angliæ*.

The *Judge* at his Creation takes this Oath, "That he ſhall indifferently miniſter Juſtice to all "them that ſhall have any Suit or Plea before "him; and this he ſhall not forbear to do, tho' "the King by his Letters, or by expreſs Word of "Mouth, ſhould command the contrary, &c.

JUDGMENT, in Law, is the Cenſure of the Judges ſo called, and is the very Voice and Final Doom of the Law, and therefore is always taken for unqueſtionable Truth.

Of *Judgments*, ſome are *Final*, and ſome *Not Final*: ſee *Coke* and *Littleton*, *Fol.* 39.

JUDGMENT, Mr. *Lock* defines to be a Faculty of ſeparating carefully one from another, thoſe Idea's wherein any, even the leaſt Difference can be found, thereby to avoid being miſled by Similitude and by Affinity, to take one thing for another.

Others define it to be that Action of the Mind, by which aſſembling together ſeveral Idea's, we either deny or affirm *This* to be *That*.

Thus, conſidering the Idea of the Earth, and the Idea of Roundneſs, we affirm or deny the *Earth to be Round*.

JUGALE *Os*, the ſame that *Zygoma*.

JUGULAR-VEINS, are thoſe Veins which go towards the Skull by the Neck; and are of two ſorts, *viz.* External and Internal.

The *External Jugulars* aſcend on the Outſide of the Neck, and are uſually open'd where one is let Blood in that Part for any Diſtemper in the Head, *Quinſey*, &c.

The *Internal Jugulars* ariſe from the *Subclavian*, by the ſides of the Wind-pipe, and paſſing along the Skull in two Branches, are diſperſed thro' the *Dura Mater*, &c.

JUGULUM, the ſame that *Furcula*.

JULAP, from the Greek ζυλάπα, or, as ſome ſay, from the Perſick Word *Juleb*, which ſignifies a *ſweet Potion*; is a grateful Medicine compoſed of Diſtilled Waters, Spirits, &c. and ſweetened to the Patient's Palate with Sugar, or ſome agreeable Syrup.

JULIAN-YEAR, is the *Old Account* of the Year, inſtituted by *Julius Cæſar*, which to this Day we uſe in *England*, and call it the *Old Style*, in Contradiſtinction to the *New Account*, framed by Pope *Gregory*, which is Eleven Days before ours, and is called the *New Style*.

JULIAN-PERIOD, is a Cycle of 7980 Conſecutive Years, produced by the continual Multiplication of the three Cycles, *viz.* That of the *Sun* of 28 Years, that of the *Moon* of 19 Years, and that of the *Indiction* of 15 Years; ſo that this *Epocha*, although but Artificial or feign'd, (and which was the Invention of the famous *Julius Scaliger*) is yet of very good Uſe; in that every Year within the Period, is diſtinguiſhable by a certain peculiar Character; for the Year of the *Sun*, *Moon*, and *Indiction* will not be the ſame again, 'till the whole 7980 Years be revolved: *Scaliger* fix'd the Beginning of this Period 764 Years before the Creation.

For the finding the Year of the Julian Period, *you have this Rule*,

Multiply the *Solar Cycle* by 4845, the *Lunar* by 4200, and the *Indiction* by 6916;

Then divide the Sum of Products by 7980, and the Remainder of the Diviſion (without having Regard to the Quotient) ſhall be the Year enquired after.

Example.

Let the Cycle of the *Sun* be 3, of the *Moon* 4, and of the *Indiction* 5.

Multiply

Multiply 8485 by 3, 'twill be 14535; and 4200 by 4 = 16800; and 6916 by 5, gives 35580.

The Sum of the Products is 65915, which divided by 7896, gives 8 in the Quote, and leaves 2075 for a Remainder, which is the Year of the *Julian Period*.

JULUS, is a Botanick Word for thoſe *Catalins*, as ſome call them, or long Wormlike Tufts, or *Palms*, as they are called in Willows, which at the Beginning of the Year grow out of, and hang pendulous down from Hazels, Wallnut-Trees, &c.

The Accurate Mr. *Ray* thinks them to be a kind of Collection of the *Stamina* of the Flowers of the Tree; becauſe in Fertile Trees and Plants they have abundance of Seminal Veſſels or Seed-Pods.

JUPITER: The Proportion of *Jupiter* to our Earth, is about 60 to 1.

The Periodical Time of *Jupiter*'s Revolution about the *Sun*, is in the Space of 12 Years, or 4380 Days; and he revolves round his Axis in the Space of 10 Hours; which very ſwift Motion may cauſe that Exceſs of his Equatorial Diameter above his Polar, which you will find below; whereas in the Sun and Moon, which take, the one 27, the other 28 Days in their Revolution round their Axis, there is no ſuch Inequality between their Polar and Equatorial Diameters obſerved.

The Mean Diſtance of *Jupiter* from the Sun, according to *Kepler* 519650; to *Bullialdus* 522520; according to the Periodical Time of its Revolution 520116: Such Parts of which the Mean Diſtance between the Earth and Sun is 100000; that is, about 280862640 Engliſh Miles.

According to Mr. *Caſſini*, *Jupiter*'s greateſt Diſtance from the Earth is 142919; his mean Diſtance 115000; and leaſt Diſtance 87081 Semi-diameters of the Earth.

And the Diameter of *Jupiter* is equal to 27 and a Half Semi-diameters of the Earth.

Wherefore the Globe of *Jupiter* muſt be greater than that of the Earth by 2460 times.

The Semi-diameter of *Jupiter*, ſeen from the Sun, is but 19 Seconds, $\frac{1}{4}$.

In the Year 1664, *Campani* by the help of an excellent Teleſcope) obſerved certain Protuberances and Inequalities in the Surface of this Planet.

He ſaw alſo in his Body the Shadows of his *Satellites*, and followed them with his Eye till he ſaw them go off the Disk.

In the ſame Year, *May* the 9th, 2 Hours, *P. M.* Mr. *Hook*, with a Teleſcope of 12 Foot, obſerved a ſmall Spot in the biggeſt of the three obſcurer Belts of *Jupiter*; and within two Hours after he found that the ſaid Spot had moved from Eaſt to Weſt about half the Length of the Diameter of *Jupiter*.

Mr. *Caſſini* obſerved alſo, near the ſame Time, a permanent Spot in the Disk of *Jupiter*; by whoſe help he not only found that *Jupiter* turns about upon his own Axis, but alſo the Time of ſuch Converſion, which he eſtimates to be 9 Hours, and 56 Minutes.

Which was alſo confirmed by better Obſervations of a Spot in the Year 1691.

The Equatorial Diameter of *Jupiter* to his Polar one, Sir *Iſ. Newton* computes to be as 40 $\frac{3}{5}$ to 39 $\frac{2}{5}$.

Captain *Halley*, in his Preface to his Catalogue of the Southern Stars, ſaith, That he found *Jupiter* to move ſwifter than he is ſuppoſed to do by the Aſtronomical Tables.

The ſame Learned Perſon thinks, That the Reaſon of the Error (of about 3 or 4 Minutes in Time) of the Tables in calculating the Eclipſes of the *Satellites*, ariſes from ſome ſmall Excentricity in the Motion of the Planet, and from the Oval Figure of his Body newly mentioned, whoſe quick Rotation round his Axis by the *Vis Centifuga*, dilates his Equinoctial Parts, and makes his Meridians much Elliptical, ſo as to be diſcernable by the Teleſcope.

The Sun's Heat in *Jupiter*, is at moſt not above one twenty fifth part of what it is with us; and conſequently 'twould be very uncomfortable living there (if at all poſſible) for Men of our Conſtitution; and yet ſome are very fond of thinking *Jupiter* an excellent Place to live in.

The Diſtance of *Jupiter* from the Sun, is above five times as great as that of the Earth from the Sun, (ſee *Gregory*'s *Aſtron.*) and conſequently the Diameter of the Sun to any Eye in *Jupiter*, will be not a fifth part of what it appears to us, and therefore his Disk will be above 25 times leſs, and in the ſame Proportion will his Light and Heat be.

The Artificial Day and Night (each of 5 Hours) is of the ſame length in *Jupiter* all over his Surface; becauſe the Axis of his Diurnal Revolution, is nearly at Right Angles to the Plane of his Annual Orbit round the Sun.

Although *Jupiter* hath four Primary Planets below him; yet an Eye placed there, and of no ſharper Sight than one of ours, could never behold any one of them, unleſs as Spots tranſiting over the Sun's Disk, when they happen to be between the Jovial Eye and the Sun: For *Mars*, which goes furtheſt of all from the Sun, will not in *Jupiter* be ſeen above 18 Degrees from him; and ſince that Planet is but ſmall, and reflects but a weak Light, ſo near the Sun it cannot be viſible: So that *Saturn* is the only Planet that can be ſeen in *Jupiter*, except his own four Moons or Satellites.

The Sun's Parallax ſeen from *Jupiter*, will ſcarce be ſenſible any more than *Saturn*'s; neither being much above 20 Seconds; ſo that the Sun's apparent Diameter in *Jupiter* will not be above 6 Minutes: But the outermoſt of his Satellites will appear almoſt as great as the Moon doth to us; *viz.* of five times the Diameter, and 25 times the Disk of the Sun, ſeen from the ſame Planet; and if the other Satellites are not leſs than the outermoſt, they will yet appear much greater, (and the Learned Mr. *Hugens* conceives them not much leſs than our Earth) and gives the Planet a good Light in the Nights, which alſo can never there be very long.

Dr. *Gregory*, (from whence this comparative Aſtronomy is collected) ſaith alſo, That an Aſtronomer placed in *Jupiter*, would eaſily compare the Diſtances of the four inferior Planets with the Diameters of *Jupiter*, as we do the Diſtances of us from the Planets, by comparing them with the Diameter of the Earth: And this would be done as to the four neareſt ones, eaſier than we compute the Diſtance of the Moon by the Earth's Diameter; for the Horizontal Parallax of the remoteſt of the Planets ſeen from *Jupiter*, is above twice as great as the Horizontal Parallax of the Moon ſeen from the Earth, and therefore muſt be very ſenſible and conſiderable. And tho' the Globe of *Jupiter* be vaſtly large, in compariſon of our Earth; yet the Sun's Parallax, when he's beheld from *Jupiter*, will not be quite 20 Seconds, and conſequently ſcarce ſenſible: Nor will the Parallax of *Saturn*, (though when in Oppoſition to the Sun, and next to *Jupiter*) be much greater; and therefore 'twill be very difficult for the *Jovial Aſtronomer* to eſtimate the Diſtance of *Saturn*, or of the Sun, from that Planet.

Indeed, if he can discover that *Jupiter* moves round the *Sun*, he may be able (as the Doctor shews, *Prop.* 3.) to determine the Ratio of the Distance of *Jupiter* and *Saturn* from the *Sun*, otherwise not.

Our *Jovial Astronomer* therefore, by the Help of his Senses, would distinguish two kinds of Planets; four nearer to him, which are the Satellites, and two (as the *Sun* and *Saturn*) more remote; and these latter would appear with a lesser Diameter, the former with a greater: Of the remotest, the Sun would appear in a Diameter about six Minutes, but the Diameter of *Saturn* would scarce be $\frac{1}{2}$ of a Minute.

Of the four nearer Planets or Satellites, the Fourth would appear to an Eye in *Jupiter* of the Bigness the Moon doth to us; that is, with a Diameter five times greater, and a Disk twenty five times greater than the *Sun* doth there: Besides, the four nearer, and apparently greater ones, will be distinguished from the more remote and lesser ones, in this, That in the nearer Planets, the Squares of the Periodick Times, are as the Cubes of their Distances from the Center of *Jupiter*; which would by no means be true, if any one of the greater were compared with any one of the lesser. And although the nearer these Planets are, they appear the greater; yet the Sun will be immensely more bright than they; for from their Faces, which depend upon their Situation, with respect to the Sun, they will appear like so many Moons: From whence a Spectator in *Jupiter* will have four kinds of Months, according to the Number of Moons. There will be contained above 2407 of the least Months in a Year, and about half the Number of Months next to these: The Number of the Months of the third Satellite contain'd in a Year, will be nearly subduple of the second, or subquadruple of the first; and the Months of the greatest will be about 254: So that although the Notation of Time be much more intricate in *Jupiter*, by reason of the great Number of Days which their Year contains; yet it is much facilitated by these four kinds of Months; for in the least Month there are only 4 Days and a Quarter, but in the greatest something more than 40.

Besides, these Moons suffer an Eclipse when they, being in Opposition to the Sun, happen to fall into the Shadow of *Jupiter*; and again, when they, (being in Conjunction with the Sun, project their Shadows to *Jupiter*, they make an Eclipse of the Sun to an Eye placed in that Region of *Jupiter*, where the Shadow falls (which Region is a very small part of *Jupiter*'s Surface) just as our Moon does: But because the Orbits of those Moons about *Jupiter*, are in a Plane which is inclined to, or makes an Angle with *Jupiter*'s Orbit about the Sun, and are all of them nearly in the same Plane, excepting the second, which deviates a little; upon this Account, I say, their Eclipses are Central, and consequently most lasting, when the Sun is in one of the Nodes of those Moons: But when the Sun is out of this Position, the Eclipses may be Total, though not Central, because the Breadth of *Jupiter*'s Shadow, is nearly decuple the Breadth of any of the Satellites; and the apparent Diameter of any of those Moons, is nearly quintuple the apparent Diameter of the Sun. And this remarkable Inequality of the Diameters, and the small Inclination the Plane of the Orbits of the Satellites has to the Plane of *Jupiter*'s Orbit round the Sun, is the Reason why in each Revolution there happens Eclipses both of the Satellites and of the Sun, though the Sun be at a considerable Distance from the Nodes: And the inferior of these Satellites, though the Sun to a Spectator in *Jupiter*, be at his greatest Distance from their Nodes, are nevertheless Eclipsed, and Eclipse the Sun; but the remotest of them in this Case, for two Years together, escapes falling into *Jupiter*'s Shadow, and *Jupiter* into its Shadow; and the Phænomena of partial Eclipses in the intermediate Times and Places, will be apparent to a Spectator in *Jupiter*. Farther, it sometimes happens here, that one Moon Eclipses another, whose Phasis is sometimes very different, nay, contrary to the Eclipse of a Moon, falling into the Shadow of *Jupiter*, which was described above; for in this the Oriental Limb is first darkened, and the Occidental Limb emerges last; but in others of them the Occidental Limb is first darkened, and the Oriental Limb emerges last; and in others contrarily.

The Shadow of *Jupiter*, though it go far beyond its Satellites, yet does not reach any other Planet, as the Shadow of all other primary Planets do; for no other Planet, except *Saturn*, could be immerged in it, tho' it was infinite; but the Shadow of *Jupiter* cannot reach *Saturn*, except the Diameter of *Jupiter* were half the Diameter of the Sun, and it is scarce $\frac{1}{3}$ of it.

If the Surface of *Jupiter* were chiefly Water, and we suppose the Seas there to be Navigable, the Sailors would have great Advantages, as well because the Nights are very short, and very light from the Numbers of their Moons; as because these Moons would be of singular use to 'em in directing their Courses.

For from those manifold Eclipses, the Longitude of a Place would be easily determined, and Hydrographical Tables accurately constructed, which is very Advantageous in so vast a Globe as that of *Jupiter*; whose Surface being Centuple, (nay, according to *Hugens*, 400 times as much) the Surface of the Earth would render its Mensuration very laborious: But the Flux and Reflux of the Sea, occasion'd by these four Moons, (for the Force of the Sun would be very little there) would be very different, and besides, would be very difficultly brought to a Calculation.

JURATS, are in the Nature of Aldermen, for Government of their several Corporations: As the *Mayor* and *Jurats* of *Maidstone*, *Rye*, *Winchelsea*, *&c.* So *Jersey* hath a Bayliff and Twelve *Jurats*, or sworn Assistants, to Govern the Island.

JURISDICTION, is a Dignity which a Man hath conferred on him to do Justice in Cases of Complaint.

JURIS *Utrum*, is a Writ that lieth for the Incumbent, whose Predecessor hath alienated his Lands or Tenements.

JUROR, is one of those twenty four or twelve Men, which are sworn to deliver a Truth upon such Evidence as shall be given them touching the Matter in question.

JURY, in Common Law, signifies either twenty four or twelve-Men sworn to enquire of the Matter of Fact, and declare the Truth upon such Evidence as shall be delivered them touching the Matter in Question: Of which *Jury* some may, and some may not be impannel'd: See *F. N. B. Fol.* 165.

In *England* there are three sorts of Trials, *viz.* one by Parliament, another by Battle, and the third by Assize or Jury.

The Trial by *Assize*, (be the Action Civil or Criminal, Publick or Private, Personal or Real) is referred

ferred for the Fact to a Jury, and as they find it, ſo paſſeth the Judgment.

This *Jury* is not only uſed in Circuits of Juſtices Errant, but alſo in other Courts and Matters of Office: And though it appertains to moſt Courts of the Common Law; yet it is moſt notoriouſly in the Half-year Courts of the Juſtices Errants, commonly called, the *Great Aſſizes*; and in the Quarter-Seſſions, and in them it is moſt ordinarily called a *Jury*, and that in a Civil Cauſe; whereas in other Courts 'tis uſually called an *Inqueſt*, and in the Court-Baron, a *Jury of the Homage*.

In the *General Aſſize* there are uſually many *Juries*, becauſe there be ſtore of Cauſes both Civil and Criminal commonly to be tried; whereof one is called, *The Grand Jury*, and the reſt *Petit Juries*; whereof it ſeemeth there ſhould be one in every Hundred.

The *Grand Jury* conſiſts of Twenty four Grave and Subſtantial Gentlemen, or ſome of the better ſort of Yeomen, choſen indifferently by the Sheriff out of the whole Shire, to conſider of all Bills of Indictment preferred to the Court; which they do either approve, by writing upon them, *Billa Vera*; or diſallow, by indorſing *Ignoramus*. Such as they do approve, if they touch Life and Death, are further referred to another *Jury* to be conſidered of, becauſe the Caſe is of ſuch Importance; but others of lighter Moment, are upon their Allowance, without more Work, fined by the Bench; except the Party traverſe the Indictment, or challenge it for Inſufficiency, or remove the Cauſe to a higher Court by *Certiorari*; in which two former Caſes it is referred to another *Jury*; and in the latter, tranſmitted to a higher: And preſently upon the Allowance of this Bill by the Grand Inqueſt, a Man is ſaid to be indicted: Such as they diſallow are delivered to the Bench, by whom they are forthwith cancelled or torn.

The *Petit Jury* conſiſts of Twelve Men at the leaſt, and are empannelled as well upon Criminal, as upon Civil Cauſes: Thoſe that paſs upon Offences of Life and Death, do bring in their Verdict, either Guilty, or not Guilty; whereupon the Priſoner, if he be found Guilty, is ſaid to be Convicted, and ſo afterwards receiveth Judgment and Condemnation; or otherwiſe is acquitted and ſet free. Thoſe that paſs upon Civil Cauſes Real, are all, or ſo many as can conveniently be had, of the ſame Hundred where the Land or Tenement in Queſtion doth lie, being four at the leaſt; and they, upon due Examination, bring in their Verdict either for the Demandant or Tenant.

JURY-MAST, ſo the Seamen call whatever they ſet up in the room of a Maſt loſt in a Fight, or by a Storm; which, if they can ſave it, ſome great Yard, which they put down into the Step of that loſt Maſt, faſtening it into the Partners, and fitting to it the Miſſen, or ſome leſſer Yard, with Sails and Ropes, as they can, they make a hard ſhift to ſail with it inſtead of the Maſt which they have loſt.

JUSTICE, ſignifies him that is deputed by the King to do Right by way of Judgment. Of theſe *Juſtices* there are divers ſorts in *England*; of the manner of whoſe Creation, with other Appurtenances, read *Forteſcue, Cap. 51.*

JUSTICE *of the Common-Pleas*, is a Lord by his Office, and with his Aſſiſtants originally did hear and determine all Cauſes at the Common Law; that is, all Civil Cauſes between Common Perſons, as well Perſonal as Real; for which Cauſe it is called, *The Court of Common-Pleas*, as diſtinguiſhing it from *The Pleas of the Crown*, or the *King's Pleas*, which are Special, and appertaining to him only.

JUSTICE *of the Foreſt*, or *Juſtice in Eyre of the Foreſt*, is a Lord by his Office, and hears and determines all Offences within the Foreſt, committed againſt Veniſon or Vert: Of theſe there be two, whereof one hath Juriſdiction over all Foreſts on this Side *Trent*, the other of all beyond.

JUSTICE *of the King's-Bench*, is a Lord by his Office while he enjoys it, and the Chief of the reſt: His Office (eſpecially) is to hear and determine all Pleas of the Crown, *viz.* ſuch as concern Offences committed againſt the Crown, Dignity, and Peace of the King; as Treaſons, Felonies, Mayhems, and ſuch-like: He alſo, with his Aſſiſtants, heareth all Perſonal Actions, and Real alſo, if they be incident to his Juriſdiction.

JUSTICES *of Aſſize*, are ſuch as were wont by Special Commiſſion to be ſent into this or that County, to take Aſſizes for the Eaſe of the Subjects; for whereas theſe Actions paſs always by Jury, ſo many Men might not, without great Damage and Charge, be brought up to *London*, and therefore Juſtices for this Purpoſe, by Commiſſion particularly authoriſed, were ſent down to them: And twice every Year they go the Circuit, by two and two, through all *England*, diſpatch their ſeveral Buſineſſes by ſeveral Commiſſions; for they have one Commiſſion to take *Aſſizes*, another to deliver Gaols, and another of *Oyer* and *Terminer*, *&c.*

JUSTICES *in Eyre*, are thoſe who were ſent with Commiſſion into divers Counties to hear Cauſes, eſpecially thoſe that were termed *Pleas of the Crown*: And this was done for the Eaſe of the People, who would elſe have been hurried to the *King's-Bench*, if the Cauſe were too high for the County-Court.

JUSTICES *of Gaol-Delivery*, are ſuch as are ſent with Commiſſion to hear and determine all Cauſes appertaining to ſuch, as for any Offence are caſt into the Gaol.

JUSTICES *of Niſi Prius*, are now all one with *Juſtice of Aſſize*; for it is a common Adjournment of a Cauſe in the *Common-Pleas*, to put it off to ſuch a Day, *Niſi prius juſticiarii venerint ad eas partes ad capiendas Aſſiſas*: And upon this Clauſe of Adjournment, they are called *Juſtices of Niſi Prius*, as well as *Juſtices of Aſſize*, by reaſon of the Writ or Action they have to deal in.

JUSTICIES *of Oyer and Terminer*, were Juſtices deputed upon ſome ſpecial or extraordinary Occaſion, to hear and determine ſome peculiar Cauſes.

JUSTICES, is a Writ directed to the Sheriff, for the diſpatch of Juſtice in ſome Special Cauſe, of which he cannot by his ordinary Power hold Plea in his County-Court.

By this Writ *Juſticies*, the Sheriff may hold Plea of a great Sum; whereas of his ordinary Authority he can hold no Pleas, but of Sums under forty Shillings.

JUXTA-POSITION, is the ranging the Particles or Corpuſcles of any mix'd Body into ſuch an Order, Poſition, or Situation, that the Particles being contiguous to one another, ſhall determine or denominate a Body to be of ſuch a Figure or Nature, or to be indued with ſuch Properties as are the proper Reſult of ſuch a Configuration and Diſpoſition of Parts.

KALENDAR : See *Calendar.*

KALENDS : See *Calends.*

KECKLE ; when the Cables of a Ship gaul in the Hawſe, or the Bolt-ropes do ſo againſt the Ship's Quarter, the Seamen wind ſome ſmall Ropes about them ; and this ſerving of theſe Ropes is called *Keckling.*

KEDGING, at Sea, is when a Ship is brought up or down in a narrow River, the Wind being contrary to the Tide, and yet ſhe is to go with the Tide ; then they uſe to ſet their Fore-ſail, or Fore-top-ſail and the Miſſen, and ſo let the Ship drive with the Tide, that ſo they may ſtat her about ; and if ſhe happen to come over too near the Shoar, they have a ſmall Anchor in the Head of their Boat with a Hawſer faſtened to it from the Ship, which Anchor they then let fall in the Middle of Stream, and ſo wind or turn her Head about, lifting the Anchor up again when ſhe is come fully about : This Work is called *Kedging*, or to *kedge* up a River, and the Anchor made uſe of is called the

KEDGER, or *Kedge-Anchor.*

KEEL, is the loweſt Piece of Timber in a Ship, in the Bottom of her Hull ; one End whereof is at the *Stern*, the other at the *Stem* : Into this are all the Ground-Timbers and Hooks faſtened, and bolted fore and aft. When a Ship hath a deep Keel, ſhe is ſaid to have a *Rank Keel* ; and this ſerves well to keep her from rowling ; but if ſhe is over-floaty and rowls too much, a new *Keel* is ſometimes put on, called a *Falſe Keel.*

KEEL-ROPE, a Hair-Rope running between the *Keelſon* and the *Keel* of a Ship, to clear and *Limber-Holes* when they are choaked up with Balaſt, *&c.*

KEELSON, the next Piece of Timber in a Ship to her Keel, lying right over it next above the Floor-Timber.

KEEPER *of the Great Seal*, is a Lord by his Office, and ſtiled *Lord-Keeper of the Great Seal of* England : He is one of the King's Privy-Council ; through whoſe Hands paſs all Charters, Commiſſions, and Grants of the King under the *Great Seal* ; without which *Seal* all ſuch Inſtruments by Law are of no force : For the King is, in the Interpretation of Law, a Corporation, and paſſeth nothing firmly but under the ſaid Seal, which is as the publick Faith of the Kingdom, in the high Eſteem and Reputation juſtly attributed thereto.

This *Lord-Keeper* hath the ſame Place, Authority, Preheminence, Juriſdiction, Execution of Laws, and all other Cuſtoms, Commodities, and Advantages, as the *Lord-Chancellor of* England hath for the Time being. He is conſtituted by the Delivery of the *Great Seal* to him, and taking his Oath.

KEEPER *of the Privy Seal*, is a Lord by his Office, through whoſe Hands paſs all Charters ſigned by the King, before they come to the *Great Seal*, and ſome things which do not paſs the *Great Seal* at all. He is of the King's Privy-Council, and one of the Great Officers of the Kingdom.

KEEPER, or *Chief Warden of the Foreſt*, is he who hath the principal Government of all things belonging to the ſame.

KENKS, in the Sea Phraſe, are Doublings in a Cable or Rope, when 'tis handed in or out, ſo that it doth not run ſmooth ; or when any Rope makes Turns, and doth not run ſmooth and clever in the Block, they ſay it makes *Kenks.*

KENNETS, in a Ship, are ſmall Pieces of Timber nailed to the Inſide of the Ship, unto which the *Tacks* and *Sheets* are *belayed*, (as they call it ;) *i. e.* faſtened.

KETCH, a ſmaller Veſſel, but of the ſame Form with a *Hoy.*

KEVELS, or *Chevils*, are ſmall Pieces of Timber nailed to the Inſide of a Ship, unto which the *Tacks* and *Sheets* are belayed or faſtened.

KEY, in Muſick, is a certain Tone, whereto every Compoſition, whether it be long or ſhort, ought to be fitted or deſign'd : And this Key is ſaid to be either *Flat* or *Sharp*, not in reſpect of its own Nature, but with Relation to the Flat or Sharp Third, which is joined with it : See *Muſick*, *Vol.* II.

KIDNEYS : ſee *Reins.*

KINGDOM, a Term uſed by the Chymiſts, who, according to their Cant in other things, call the Three Orders of Natural Bodies, *Animal*, *Vegetable*, and *Mineral*, by the Name of *Kingdom.*

Thus they would ſay, Thoſe Bodies which belong to the *Animal Kingdom*, abound moſt in Volatile Salt.

KING'S-BENCH, is the Court or Judgment-Seat, where the King of *England* was ſometimes wont to ſit in his own Perſon ; and therefore it was moveable with the Court or King's Houſhold, and called *Curia Domini Regis*, and *Aula Regia*, as *Gwin* reports in his *Preface to his Reading*, and that therein, and in the Court of Exchequer, which were the only Courts of the King till *Henry* the Third's Days, were handled all Matters of Juſtice, as well Civil as Criminal.

This Court of the *King's-Bench*, was wont in Ancient Times to be eſpecially exerciſed in all Criminal Matters and Pleas of the Crown, leaving the handling of private Contracts and Civil Actions to the *Common-Pleas*, and other Courts.

KNAVE-LINE, is a Rope in a Ship, faſtened to the Croſs-Trees under the Main or Fore-Top, whence it comes down by the *Ties* to the *Ramhead*, and there 'tis reeved through a Piece of Wood of about two Foot long, and ſo is brought to the Ship's Side, and there haled up taught to the Rails.

Its Uſe is to keep the Ties and Hallyards from turning about one another, as they are apt to do when new and firſt uſed ; and therefore after they are a little uſed and ſtretched, this *Knave-Line* is taken away, of no further Uſe.

KNECK, in the Sea-Language, is the twiſting of a Rope or Cable as it is veering out.

KNEES, are Pieces of Timber in a Ship bowing like a Knee, which are uſed to bind the Beams and Futtocks together, being bolted ſtrongly into them both.

Hence ſuch Timber as is uſeful for this Purpoſe, is called,

KNEE-TIMBER : Thus the Cut-water of a Ship, is called, *The Knee of the Head.*

KNETTELS ; ſo the Seamen call two Pieces of Spun-yarn put together untwiſted.

KNIGHTS, a-board a Ship, are two Pieces of Timber, in each of which go four Shivers, three

for the Halliards, and one for the Top-Ropes. They are uſually ſhaped into the Form of ſome Head; one of them ſtandeth aft the Main-maſt, and therefore is called the *Main-Knight*; the other ſtandeth abaft the Fore-maſt on the ſecond Deck; and this is called the *Fore-Knight*.

KNIGHT-SERVICE was a Tenure, whereby ſeveral Lands in this Nation were held of the King, which drew after it Homage, Eſcuage, Wardſhip, Marriage, *&c.* but taken away by 12 *Car.* II. *cap.* 24.

KNOTS; there are two ſorts of Knots uſed at Sea, one they call a *Bowlin-Knot*, becauſe by this Knot the Bowlin Bridles are faſtened to the Crengles: This is very faſt, and will not ſlip.

The other is a *Wale-Knot*, which is a round Knob or Knot, made with 3 Strands of a Rope; this Knot ſerves for the *Topſail-Sheets* and *Stoppers*.

The Diviſions alſo of the Log-Line are called Knots: Theſe are uſually ſeven Fathom, or forty two Feet aſunder, but they ſhould be Fifty Feet; and then as many Knots as the Log-Line runs out in half a Minute, ſo many Miles doth the Ship ſail in an Hour; ſuppoſing her to keep going at any equal Rate, and allowing for Yaws, Leeway, *&c.* See *Log*.

LABEL, is a long thin Braſs Ruler, with a ſmall Sight at one end, and a Center-hole at the other; commonly uſed with a Tangent-line on the Edge of a Circumferenter, to take Altitudes, *&c.*

LABIA LEPORINA, are ſuch Lips, as by reaſon of their ill make will not come together, which ſome call *Roſtra leporina*; we *Hare Lips*.

LABIAL *Letters*, are (by the Grammarians) accounted ſuch, as in their Pronunciation require chiefly the Uſe of the Lips to form their Sound.

LABORANT, he that attends on and works under a Chymiſt, while he is about any Proceſs or Experiment.

LABORALIS, in the Common Law, is a Writ that lies againſt ſuch as having not whereof to live, do refuſe to ſerve; or for him that refuſeth to ſerve in Summer where he ſerved in Winter.

LABORATORY, or *Elaboratory*, a Room fitted on purpoſe for Chymical Operations, and furniſhed with Variety of Furnaces and Inſtruments neceſſary to that Art.

LABYRINTH, is the Second (ſome ſay the Third) Cavity of the Ear, hollowed in the *Os Petroſum*; and is made of three winding ſemi-circular Pipes, which open by five Orifices into the *Veſtibulum*.

LAC LUNÆ, or *Flores Argenti*, is the Chymiſts Word for a white porous friable Earth, inſipid, but diſſoluble in Water, which it will tinge with a milky Colour: It is a *Sublimate* from a Matter commonly found in Silver Mines, whence the Name.

LACERTUS: ſee *Brachium*.

LACHRYMALE *Punctum*, vel *Foramen*, is an Hole in the Noſe, by which the Matter or Liquor of the Tears paſſes to the Noſtrils. If this Hole grow hard and brawny, from an Ulcer in one of the Glandules at the Corners of the Eyes, thence ariſes a *Fiſtula Lachrymalis*.

LACHRYMÆ, are a Moiſture which is ſeparated by the Glandules of the Eye to moiſten the Eyes; which if it be too much, ſo that it cannot be received by the *Punctum Lachrymale*, it falls from the Eyes in Drops, and is called Tears.

Whatever alſo is ſtrained through, and drops out naturally, is let out by Inciſion, from any Part of a Plant, whether it be *Gum*, *Roſin*, *Oil*, *&c.* is called *Lachrymæ*.

LACONICUM, *Caldarium* and *Aſſa*, or *Balneum æreum*, was formerly a Cellar made to provoke Sweat; which was done by an Hot Vapour, or a Dry Heat included therein. *Blanchard*.

LACTEAL *Veins*, or *Veſſels*: ſee *Vaſa Lactea*.

LACTUCIMINA, the ſame that *Apthæ*.

LACTUMIÆ, the ſame that *Achores*.

LACUNAR, in Architecture, is an arched Roof or Cieling, more-eſpecially the Planking or Flooring above the *Portico's*.

LACUNÆ, are little Pores or Paſſages in the *Vagina* of the Womb, but no where greater than in the lower Part of the Urinary Paſſage: There flows a certain ſerous pituitous Matter out of theſe *Ductus*'s, which lubricates the *Vagina*.

LADDERS in a Ship, are uſually Three: The *Entring-Ladder* is in the *Waſte*, and made of Wood. The Second is the *Gallery-Ladder*, made of Ropes, and hung over the Galleries and Stern of Ships, and are to enter by the Stern of the Ship, out of the Boat, when the Weather is foul, and the Sea high. The Third, *viz. Boltſprit-Ladders* are at the *Beak-Head* made faſt over the Boltſprit, to get upon it; and are only uſed in great Ships.

LADLE, an Inſtrument to load great Guns with Powder. It ought to be ſo proportioned, that two Ladles-full may charge the Piece: Therefore their *Breadth* muſt be 2 Diameters of the Shot; and their Length for double-fortified Cannon 2 and $\frac{1}{2}$ of the Shot; for ordinary Cannon it muſt not exceed 2; but for Culverins and Demi-Culverins, it may be three Diameters of the Shot; and 3 and $\frac{1}{2}$ for leſſer Pieces, in order to load at twice: If you would load at once, this Length of the Ladle muſt be doubled; and obſerve this, That a Ladle 9 Balls in Length, and 2 Balls in Breadth, will hold juſt the Weight of the Iron Shot in Powder.

LAMBITIVE, a pectoral Medicine, to be lick'd off the End of a piece of Licorice-ſtick, the ſame with *Eclegma*: which ſee.

LAMBOIDES, is the backward Suture of the Brain, ſo called, from its Likeneſs to the Letter Λ, *Lambda*.

LAMELLÆ, are the little thin Plates, conſtituted by a Net-work of very ſmall Fibres, of which the *Shells* of Shell-fiſhes conſiſt, or are compoſed.

LAMINÆ, the Plates or Tables of the Skull, being two in Number; whereof the outer is thicker and ſmoother; but the inner more hard, and furrowed on its inner Surface.

LAMPADIAS, a kind of bearded Comet, reſembling a burning Lamp, being of ſeveral ſhapes; for ſometimes its Flame or Blaze runs tapering upward like unto a Sword, and ſometimes it is double or triple-pointed.

LANCETTE, is a Chyrurgeon's little Knife, ſtraight-pointed, two-edged ; uſed in opening Veins, cutting of Fiſtula's, opening of the Fundament, Yard, or Womb that is ſhut.

LAND-*Fall*, a Sea-Term, ſignifying to *fall in with the Land*: Thus when a Ship out at Sea, expects to ſee Land in a little time, and it ſo happens that ſhe doth, they ſay, That they have *made a good Land-fall*.

LAND-*layed* ; they ſay, The Land is *layed*, when a Ship is juſt got out of Sight of the Land.

LAND-*lock'd* : A Ship is ſaid to *ride Land-lock'd* when ſhe is at Anchor in ſuch a Place where there is no Point open to the Sea ; ſo that ſhe is ſafe from the Violence of Winds and Tide.

LAND-*ſhut-in*, is when another Point of Land hinders the ſight of that which a Ship came from ; then they ſay, The Land is *ſhut in*.

LAND-*To*, is when a Ship lies ſo far off from the Shore, that ſhe can but juſt ken Land ; then ſhe is ſaid to lie *Land-to*.

LANGREL-*Shot*, is a ſort of Shot uſed at Sea : It is made of two Bars of Iron, with a Joint in the middle, by which means it can be ſhortened, and ſo put the better into the Gun ; and at each End there is an half Bullet, either of Lead or Iron : when 'tis diſcharged, it flies out at length, and is of uſe to cut the Enemies Rigging, *&c.*

LANIS *de creſcentia Walliæ traducendis abſque Cuſtuma, &c.* is a Writ that lieth to the Cuſtomer of a Port, for the permitting one to paſs over Wools without Cuſtom, becauſe he hath paid Cuſtom in *Wales* before.

LANNIERS, or *Lanniards*, in a Ship, are ſmall Ropes reeved into the *Dead-mens-eyes*, of all the *Shrowds* and *Chains* : Their Uſe is to *ſlacken*, or *ſet taught* the *Shrowds* : The *Stays* alſo of all *Maſts* are *ſet taught* by *Lanniers* : That Rope which faſtens the *Stopper* of the *Halliards* to them, is alſo called a *Lannier*.

L'ANSPESADE, is an inferior Officer ſubordinate to the Corporal, to aſſiſt him in his Duty, and ſupply his Place when he is abſent : He is exempt uſually from all common Duty, except the *Rounds*, and *Sentinels Perdue*.

LAPIDESCENT, that which can turn any Body into a ſtony Nature : Thus thoſe Waters, which by having ſome ſtony Particles diſſolved and ſwimming in them, do in their Courſe depoſite them on the Leaves, Graſs, Sticks, *&c.* that they run over, and ſo produce what are called Petrifications ; theſe are properly *Lapideſcent Waters*.

LAPIS *Infernalis* : ſee *Infernal Stone*.

LAPIS *Prunellæ* : ſee *Sal Prunellæ*.

LAPIS *Medicamentoſus*, is made of two Ounces of Colcothar ; Litharge, Alom and Bole-armoniack, of each 4 Ounces, mingled and put into an unglazed Pan ; and then good Vinegar is poured upon it, to cover it 2 Fingers Height : Cover it, and let it ſtand 2 Days in Digeſtion ; then add 8 Ounces of Nitre, and 4 Ounces of Sal-armoniack ; and ſetting the Pot over the Fire, evaporate all the Moiſture ; after which calcine the remaining Maſs, and keep it for Uſe. 'Tis diſſolved in Water, when uſed, and is a famed Styptick. *Ctolius* gives a Deſcription of a *Lapis Medicamentoſus*, but *Lemery* prefers this before it.

There is alſo a Stone called *Lapis Admirabilis*, whoſe Compoſition ſee in *Lemery, ult. Edit. p.* 429. Alſo another called *The Philoſopher's Stone*, ibid.

LAQUEUS, in Chyrurgery, is a Band ſo tied, that if it be attracted, or preſſed with Weight, it ſhuts up cloſe : Its Uſe is to extend broken or diſjointed Bones, to keep them in their Places when they are ſet, and to bind the Parts cloſe together.

LARBOARD, the Left-hand ſide of a Ship, when you ſtand with your Face to the Head.

LARCENY, in Law, is a wrongful taking away another Man's Goods, with a Mind to ſteal them ; and in reſpect of the Thing ſtollen, is of two ſorts, *viz. Great*, which is called *Theft ſimple*, where the Things ſtollen exceed the Value of Twelve Pence, and that is *Felony* : and *Petit Larceny*, when the Goods ſtollen exceed not the Value of Twelve Pence.

LARGE : The Sea-men ſay, a Ship goes or ſails *Large*, when ſhe goes neither before the Wind, nor upon a Wind, but as it were quartering between both. Wherefore *Large*, *Quartering*, *Veering*, *Lasking*, or *Roomer*, are all of the ſame Signification.

LARMIER, a flat ſquare Member in *Architecture*, which is placed on the *Cornice* below the *Cymatium*, and jets out fartheſt ; being ſo called from its Uſe, which is to diſperſe the Water, and to cauſe it to fall at a Diſtance from the Wall, Drop by Drop, or as it were by Tears : for *Larme* in *French* ſignifies a Tear : ſee *Corona*.

LARYNGOTOMIA, the ſame with *Bronchotomia*.

LARYNX, is properly the Head or Top of the Wind-pipe, or *Aſpera Arteria* ; and it conſiſts of Five *Cartilages*. The Firſt Pair is called *Scutiform*, becauſe ſomething like a Shield, which conſtitutes the Protuberance in the Neck, called *Adam's* Apple : The Second Pair is called *Annular*, becauſe it is round like a Ring : The Third and Fourth Cartilage ſome reckon but one ; but if the Membrane be taken off, it appears to be Two, and is called *Guttulis* and *Glottis* : The Fifth is called *Epiglottis*, which covers the Opening of the Wind-pipe at the Top. Its Uſe is in the Formation of the Voice and Reſpiration.

LASH, the Sea Word for binding up to the Ship's ſide, the Muskets, Buts of Water or Beer, or Pieces of Timber to make *Fiſhes* or ſpare Top-Maſts ; or when any thing is thus faſtened to the Ship, 'tis called *Laſhing*.

But the *Laſhers* are properly thoſe Ropes only which bind faſt the Tackles and the Breeches of the Ordnance, when they are haled or made faſt within Board.

LASHED, a Sea-Term, ſignifying *made faſt* : The Carpenter ought to take Care that there be ſpare Yards *laſhed* faſt to the Ship's ſides ; *i. e.* faſtened there to uſe on Occaſion.

LASKETS, or *Latches*, are ſmall Lines like Loops, faſtened by ſowing into the *Bonnets* and *Drablers* of a Ship ; in order to lace the *Bonnets* to the *Courſes*, or the *Drablers* to the *Bonnets*.

LASKING, when a Ship ſails neither by a Wind, nor directly before the Wind, ſhe is ſaid to go *Lasking* ; which is much the ſame as *Veering*, or going with a Quarterly Wind.

LASSITUDE : ſee *Copus*.

LASSITUDO *Ulceroſa*, is a Symptom uſually attending the cold Fit of an intermitting Fever, conſiſting in a Soreneſs and Wearineſs of all the Joints and Bones.

LATCHES, are thoſe Parts of a Clock, which lock up and unlock the Work.

LATERAL *Equation*, in *Algebra*, is ſuch an one which hath but one Root ; whereas every Quadratick hath 2, every Cubick 3 Roots, *&c.* And ſuch Equations can be determined and conſtructed by the Interſection of two Right Lines, which is a Compoſition of $1 + 1 = 2$. But a Quadratick cannot

cannot be determined or constructed without a ſtrait Line and a Circle cutting each other: See *Wallis's Algebra*, p. 275. *Engl. Edit.*

LATION, is the Tranſlation or Motion of a Body from one Place to another in a Right Line; and ſo is much the ſame as *Local Motion.*

LATISSIMUS *Dorſi*, or *Aniſcalptor*, or *Terſor*, is a Muſcle of the Arm, which receives its firſt Appellation from its large Dimenſions, it with its Partner covering the whole Back; the latter from the Uſe that is ſometimes made of it: Its thin, broad, tendinous Origination is continued from the Seven Inferior Spires of the *Vertebra* of the *Thorax*, and all thoſe of the Loins and Superior Parts of the *Os Sacrum*, and the Poſterior Part of the *Os Ilium*; beginning to grow Carnous as it paſſes over the *Longiſſimus Dorſi* and *Sacrolumbus*; and in its Progreſs over the Curvated Part of the Ribs, it receives ſeveral *Faſciculi* of fleſhly Fibres ariſing from thence, which by their Conjunction compoſe a thick Body, ſtill leſſening it ſelf in its Dimenſions, as it marches towards the *Axilla*; and running over the Inferior Angle of the *Scapula*, from whence ſometimes does ariſe a Fleſhy Part of it; which I have obſerved (ſays M. *Cowper*) in thoſe Bodies in whom the *Teres Minor* was abſent, is at laſt inſerted, by a ſhort, but flat ſtrong Tendon, to the *Os Humeri.*

LATITAT, is a Writ whereby all Men in Perſonal Actions are called Originally to the *King's-Bench*: And it hath this Name, as ſuppoſing that the Defendant doth lurk and lie hid; and therefore being ſerved with this Writ, he muſt put in Security for his Appearance at the Day. And by this Writ, a Man being brought in, is committed to the Marſhal of the *King's-Bench*; in whoſe Cuſtody when he is, he may be ſued upon an Action in that Court.

LATITUDE *of a Place*, is an Arch of the Meridian of that Place, intercepted between its *Zenith* and the *Equator*: Or 'tis an Arch of the Meridian, intercepted between the *Pole* and the *Horizon*; and therefore called the *Poles Height*, &c. It's counted on the brazen Meridian on the Globes.

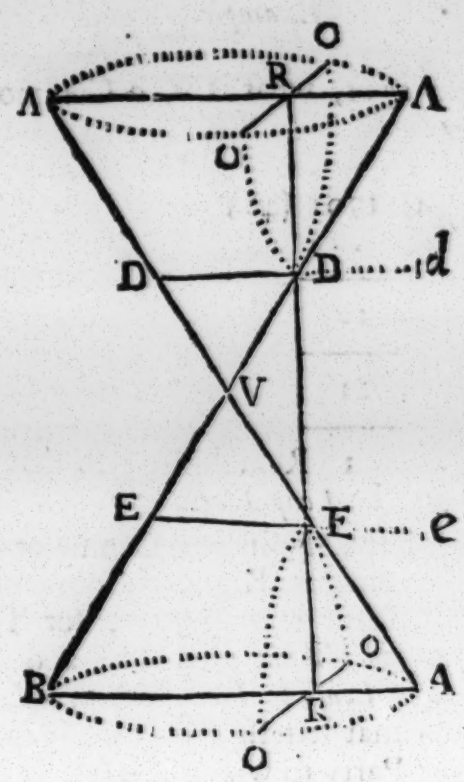
LATITUDE, in *Navigation*, is the Diſtance of a Ship from the Equinoctial, either North or South, and is counted on the Meridian: ſo that if a Ship ſail towards the Equinoctial, ſhe is ſaid to *depreſs the Pole*; but if ſhe ſail from the Equinoctial, or from a leſſer Latitude to a greater, ſhe is ſaid to *raiſe the Pole*: And whenever a Ship ſails to or from the Equinoctial, either North or South, her Way gain'd thus is called her *Difference of Latitude.*

LATITUDE *of a Star or Planet*, is its Diſtance from the *Ecliptick*, being an Arch of a Circle of Longitude, reckoned from the Ecliptick towards its Poles.

LATITUDE *Heliocentrick of a Planet*: See *Heliocentrick.*

LATUS *Rectum*, a Term in Conicks, being the ſame with the *Parameter*; which ſee.

LATUS *Tranſverſum* of the *Hyperbola*, is a Right Line lying between the Vertexes of the two *Oppoſite Sections*: Or that Part of the Common Axis which is between the Vertexes of the Upper and Lower Cone, as the Line *E D* in the following Figure; where alſo *D d* and *E e* may be the *Parameters*, or *Latus Rectums*, belonging to the two oppoſite Sections *G L R O*, and *O E O R.*



To this *Latus Tranſverſum* anſwers the longeſt Diameter in the *Ellipſis*, which *Apollonius* calls the *Tranſverſe Axis* or *Diameter.*

LATUS *Primarium*, is a Right Line belonging to a *Conick Section*, drawn thro' the Vertex of the *Section* of the *Cone*, and within it; as the Line *E E* or *D D* in the preceding Figure.

LAVAMENTUM, the ſame with *Fobus.*

LAUDANUM, is meant only of a Medicine made of an *Opiate*, and that they call an *Opiate Laudanum*, from its excellent Qualities. 'Tis an Extract of the finer and purer Part of Opium, made with Water and Spirit of Wine, and then evaporated to its due Conſiſtence: Of this there are many ways, but *Lemery's* ſeems the beſt: See his *Courſe of Chymiſtry*, laſt Edit. p. 618.

LAUNCH, in the Sea Phraſe, is to *put out*: Thus they ſay, *Launch* a Ship out of the Dock, or out of the Key; *Launch* the *Boat*, *Launch* the *David* in or out; *Launch* out the *Capſtan Bars.* Alſo when they have hoiſted up a Yard high enough, they ſay, in another Senſe, *Launch ho!* that is, Hoiſt no more: Alſo in ſtowing any thing in the Hould of a Ship, they cry, *Launch aft* or *Launch forward on:* ſo when they are pumping, if the Pump ſucks, they ſay *Launch ho!* that is, Pump no more.

LAWS *of Motion*: ſee *Motion.*

LAXATIVES, or *Looſening Medicines*, are thoſe which, with their benign Particles, ſoftning and ſcouring the Inteſtines, cleanſe them of their Excrements.

LAY *the Land*, a Sea Phraſe, which is uſed for ſailing out of Sight of Land; for then they ſay, they have *laid the Land*: And if another Point of Land exclude the Sight of a former, they ſay, they have *ſhut the firſt Land in.*

LEAP-YEAR, or *Biſſextile*, is every fourth Year and ſo called from its *Leaping* a Day more that Year than in a Common Year: For in the Common Year any fixed Day of a Month changeth ſucceſſively the Day of the Week; but in the *Leap-Year* it skips or *leaps* over one Day.

Note, The Common Year hath 365 Days in it, but the *Leap-Year* 366, and then *February* hath 29 Days, which in Common Years hath but 28.

To find the *Leap-Year* you have this Rule:

Divide by 4; *what's left ſhall be,*
For Leap-Year 0; *for paſt*, 1, 2, *or* 3.

Example.

In the Year 1701, what is it, a Common Year, or a *Leap-Year*.

4) 1701 (425

10

21

1 Remainder; ſo that it is the Firſt Year after the *Leap-Year*.

LEASE, in Law, ſignifies a Demiſe or Letting of Lands or Tenements, Right of Common, Rent, or any Hereditament unto another, for Term of Years or Life, for a Rent reſerved; and is either written, called a *Leaſe by Indenture*, or a *Leaſe Parol*. The Party that letteth this *Leaſe*, is called the *Leſſor*; and the Party to whom it is let, is the *Leſſee*: And a *Leaſe* hath in it Six Points: 1. Words ſufficient to import a Demiſe. 2. A *Leſſee* named. 3. A Commencement from a Day certain. 4. A Term of Years. 5. A Determination. 6. A Reſervation of Rent.

LEAVER: ſee *Lever*.

LEAVES, are the Notches of the *Pinion* of a Watch: ſee *Pinion*.

LEDGES in a Ship, are ſmall Pieces of Timber lying athwart Ships, from the *Waſte-Trees* to the *Roof-Trees*, which ſerve to bear up the *Nettings*, or the *Gratings* over the Half-Deck.

LEGACY, in Law, is a particular Thing given by a laſt Will and Teſtament: For if a Man transfer his whole Right or Eſtate upon another, that the *Civilians* call *Hereditary*; and he to whom it is ſo transferred, they call *Hæres*; but in Common Law he is called *Heir* only, to whom all the Man's Lands and Hereditaments deſcend by Right of Blood: The former is *Hæres factus*, the latter *Hæres natus*.

LEE, a Word diverſly uſed at Sea; they mean generally by it, the Part oppoſite to the Wind: Thus the

LEE-*Shore*, is that on which the Wind blows; and therefore to be under the Lee of the Shore, is to be cloſe under the Weather-ſhore, or under Wind. When they ſay,

A-LEE *the Helm*, they mean, put the Helm to the Leeward ſide of the Ship. They ſay alſo, Take care of the

LEE-*Latch*; which is a Word of Command to the Man at the Helm, ſpoken by him that commands, or *Cons*, to take care that the Ship don't go to the *Leeward* of her Courſe: Wherefore they call a

LEEWARD Ship, one that is not faſt by a Wind, or which doth not ſail ſo near the Wind, nor make her Way ſo good as ſhe ſhould.

To lay a Ship by the *Lee*, or to *come by the Lee*, is to bring her ſo, that all her Sails may lie flat againſt her Maſts and Shrouds, and that the Wind may come right upon her Broad-ſide. The way to do which, if all a Ship's Sails be abroad, is to bear up the Helm hard to Windward, to let riſe the Fore-tack, veer the Main-ſheet, and take in the Miſſen-maſt, or at leaſt to *peck* it up; which is called *Spelling the Miſſen*.

LEE-FANG, is a Rope in a Ship, reeved into the *Crengles* of the Courſes, when the Bottom of a Sail is to be haled in, that ſo the Bonnets may be laced on; this Rope is alſo of uſe to take in the Sail.

LEET, and *Court-Leet*, is a Court out of the Sheriff's Turn, and inquires of all Offences under the Degree of High-Treaſon that are committed againſt the Crown and Dignity of the King. But thoſe Offences which are to be puniſhed with Loſs of Life or Member, are only inquirable there, and to be certified over to the Juſtices of Aſſize.

LEETCH *of a Sail*, (aboard a Ship) ſignifies the outward Edge or Skirt of the Sail from the Earing to the Clew; or rather the middle of the Sail between theſe two.

LEETCH-LINES, are ſmall Ropes faſtened to the *Leetch* of the Topſails (only) and then reeved into a Block at the Yard, juſt by the Topſail Ties. Their uſe is to hale in the *Leetch* of the Sail, when the Topſails are to be taken in; which is always firſt done, and then the Sail can be taken in with the greater Eaſe.

LEGAN: ſee *Flotſon*.

LEGGS *of the Martnets*, is the Term for thoſe ſmall Ropes in a Ship, which are put thro' the *Bolt Ropes* of the *Main* and *Foreſail*, in the *Leetch* of each. They are above a Foot in Length, and at either End are ſpliced into themſelves: They have alſo a ſmall Eye, into which the *Martnets* are faſtened by two *Hitches*, and the End is ſeized into the ſtanding part of the *Martnets*.

LEGGS *of a Triangle*: When one ſide of a Triangle is taken as a Baſe, the other two are called *Leggs*.

LEGUMEN, in Botanicks, is that Species of Plants which we call Pulſe; and they are ſo named becauſe they may be gathered by the Hand without cutting. Mr. *Ray* reckons all thoſe Plants which have a *Papilionaceous*, or Butter-fly-like Flower, among the *Legumina*.

LEMMA, is a Term uſed chiefly by Geometrick Writers, and ſignifies a Propoſition, which ſerves previouſly to prepare the way for the more eaſie Apprehenſion of the Demonſtration of ſome Theorem, or for the Conſtruction of ſome Problem. Thus to prove that a Pyramid is $\frac{1}{3}$ of a Priſm or Parallelopiped of the ſame Baſe and Height with it, (the Demonſtration of which, after *Euclid*'s way, in Lines, is a little difficult to conceive) we may premiſe this *Lemma*; which you will find proved under the Word *Progreſſion*, *That the Sum of a Series of the Squares of Numbers in Arithmetical Proportion, beginning from* 0, *and going on in the Natural Order*; *as* 0, 1, 4, 9, 16, 25, 36, &c. *is always ſubtriple of the Sum of as many Terms equal to the greateſt*; or, in other Words, is always $\frac{1}{3}$ of the greateſt Term multiplied by the Number of the Terms.

Thus alſo to find the *Inflection* of a Curve Line, (if it hath any Inflection) this *Lemma* muſt be firſt premiſed, *That a Tangent may be drawn to the given Curve in a given Point*.

LENIENTIA, the ſame with *Laxantia*.

LENO and *Linon*, is that part of the Brain called *Torcular Herophili*, that Place where the third Cavity of the *Dura Meninx* is joined to the firſt, ſecond, and fourth.

LENS, is a Term in Opticks for a ſmall Convex, or Plano-Convex, a Concave, or Concavo-Convex Glaſs.

LENTA *Febris*, the ſlow or lingering Fever, is uſually reckoned among the *Symptomatical*, and proceeds from ſome hidden Putrefaction ſticking to ſome Bowel, ſo that its Subſtance is almoſt corrupted. Such a kind of Fever is often bred in the Conſumption of the Lungs, and degenerates into an *Hectick*. *Blanchard*.

LENTIFORME *Prominences*: See *Corpora Striata*.

LENTIGINES, are what we call *Freckles*.

LEO, is the Fifth of the Twelve Signs of the *Zodiack*.

LEPIDOIDES, is the Scaly Suture of the Skull: See alſo *Mendoſa*.

LEPRA *Arabum*, the ſame with *Elephantiaſis Græcorum*.

LEPROSIE, is a dry Scab, whereby the Skin becomes ſcaly like Fiſh: It differs from *Leuce* and *Alphus*, in that a *Leproſie* is rough to the Touch, and cauſes an Itching; for the Skin is the only Part affected, and therefore that being flead off, the Fleſh underneath appears found and well.

LEPROSO *Amovendo*, is a Writ that lies for a Pariſh, to remove a Leper or Lazar, that thruſteth himſelf into the Company of his Neighbours, either in Church or in other Publick Meetings, to their Annoyance or Diſturbance.

LEPTUNTICA, are attenuating cutting Medicines, which part or cut the croſs and viſcous Humours with their acute Particles.

LEPUS, the *Hare*, a Southern Conſtellation, containing 13 Stars.

LESSER *Circles of the Sphere*, are thoſe whoſe Planes do not paſs through the Center of the Sphere; and which do not divide the Globe into two equal Parts, but are parallel to *Greater Circles*: As the Tropicks and Polar Circles, and all Parallels of Declination and Altitude; which latter being parallel to the Horizon, are called *Almacanters*.

LESSOR and *Leſſee*, are Terms of the Common Law: The *Leſſor*, is he that Leaſeth out Lands or Tenements to another for Term of Life, for Years, or at Will: And the Perſon to whom ſuch a Leaſe is made, is called the *Leſſee*.

LETHARGUS, a *Lethargy*, is a Diſeaſe cauſing an heavy Sleep, like that Diſtemper called *Coma*, but accompanied with a Fever and a *Delirium*; and is ſuppoſed to be an Heap of too much or incongruous moiſt Matter within the Pores of the *Cortical* Subſtance of the Brain. This Diſtemper does not ſeem to come of it ſelf, but rather from the Demigration of Fevers.

LETTERS *Patent*, are Writings ſealed with the Great Seal of *England*, whereby a Man is authorized to do or enjoy any thing that otherwiſe of himſelf he could not. And they are ſo termed of their Form, becauſe they be open, with the Seal affixed, ready to be ſhewed for Confirmation of the Authority given by them. Common Perſons may grant *Letters Patents*; but they are rather call'd *Patents*, than *Letters Patents* to make *Denizens*; yet for Difference ſake, thoſe granted by the King are called *Letters Patent Royal*.

LETTER *of Attorney*, is a Writing authorizing an *Attorney*; that is, a Man appropriated to do a lawful Act in our ſtead: As a *Letter of Attorney* to give Seiſin of Lands, to receive Debts, to ſue a Third Perſon, *&c.*

LETT-FALL, the Word at Sea for putting out a Sail when the Yards are aloft, and the Sail is to come down from the Yard; but when the Yards are ſtricken down, then the Sail is looſed below, before they hoiſe the Yard. Neither is it properly ſaid of *Top-ſails*, becauſe they lie on the Top; and therefore the Word for them is, *Heave out your Top-ſails*. Nor can it be applied to the *Mizzen*; for to it the Word is, *Strike the Mizzen, and ſet it*. So that in Strictneſs it belongs only to the *Main-ſail*, *Fore-ſail*, and *Sprit-ſail*, when their Yards are hoiſted up aloft.

LEVANT and *Couchant*, is when Cattel have been ſo long in another Man's Ground, that they have lain down, and are riſen again to feed.

LEVARI *Facias*, is a Writ directed to the Sheriff, for levying of a Sum of Money upon Lands and Tenements of him that hath forfeited a Recognizance.

LEVARI *Facias damna de diſſeiſitoribus*, is a Writ directed to the Sheriff, for the levying of Damages, wherein the *Diſſeiſor* hath formerly been condemned to the *Diſſeiſee*.

LEVARI *Facias reſiduum debiti*, is a Writ directed to the Sheriff, for the levying the Remnant of a Debt upon Lands and Tenements, or Chattels of the Debtor that hath in part ſatisfied before.

LEVARI *Facias, quando vicecomes returnavit quod non habuit emptores*, is a Writ commanding the Sheriff to ſell the Goods of the Debtor which he hath already taken, and returned that he could not ſell them, and as much more of the Debtor's Goods as will ſatisfie the whole Debt.

LEVATORES *Ani*, are Muſcles, which ariſe fleſhy from each ſide of the *Oſſa Pubis*, internally within the *Pelvis*, as alſo from part of the *Os Iſchium* and *Sacrum*: From theſe Places, like Lines drawn from a Circumference towards a Center, its Fibres deſcend over the *Muſculi Marſupiales* to their Implantation at the lower end of the *Inteſtinum Rectum* in the *Anus*. The Uſe of theſe Muſcles is chiefly to ſuſpend and draw the *Anus* upwards, leſt the *Fæces* ſhould be burthenſom to the *Sphincter*.

LEVATOR *Scapulæ*, is a Muſcle of the Shoulder-Blade, by ſome called *Levator Patientiæ*, becauſe we make uſe of it in large Inſpirations, in order to expire; as when we ſigh (as they call it.) This lies immediately under the *Cucullaris*, ariſing by ſo many ſeparate Originations from the Second, Third, Fourth, and Fifth Tranſverſe Proceſſes of the *Vertebræ* of the Neck; which uniting into one large fleſhy Body, deſcends obliquely to its Inſertion at the ſuperior Angle of the *Scapulæ*: Its Name declares its Office.

LEUCE, is a Cutaneous Diſeaſe, when the Hairs, Skin, and ſometimes the Fleſh underneath, turns white; the Fleſh being pricked with a Needle, is not ſenſible, nor emits Blood, but a Milky Humour. It differs from *Alphus*, in that it penetrates deeper, and changes the Skin, ſo that the Hairs are changed too.

LEUCOMA, is a White Scar in the Horny Tunick of the Eye; the ſame with *Albugo*.

LEUCOPHLEGMATIA, is a pituitous Dropſy, or a Dropſy that ſeizes the whole Body; which in the Beginning is called *Cachexia*, and differs from it only in Degree.

LEVEL *of Carpenters*, is an Inſtrument made of a long piece of Wood at bottom, and with an upright one to hold a Thread and Plummet, which plays about a perpendicular Line there drawn; and when it falls exactly on it, then is the bottom piece in a true Level, or Horizontal Poſition.

LEVEL, is an Inſtrument made of Wood or Braſs, with two Sights and a Glaſs, almoſt filled with coloured Spirit of Wine, but ſo as to leave room for a Bubble of Air to play up and down in it: It hath a Cover, divided into ſeveral equal Parts, whereby to adjuſt the Bubble; with a Spring to fit it to the Three-legg'd Staff, and a long Screw, to rectify the Bubble by the Help of a Plummet that hangs on one of the Sights. Sometimes, inſtead of the long Screw and Spring, there is fitted a Rack, being two Semi-circles at Right Angles, with a Thread or Worm upon two endleſs Screws; which,

with a Key, readily brings the Inſtrument to a true *Level*; and ſometimes to help the Sight, there is added a *Teleſcope*. There alſo belongs to this Inſtrument two or more *Station-Staves*; and it is uſed by *Ingineers*, *Surveyers*, *&c.* to find the true Level for conveying Water to ſupply Towns, making Rivers Navigable, dreining Bogs, *&c.* See *Vol.* II.

LEVER, is the ſecond *Mechanical Power*; and ſo conſidered, is only a *Balance* ſupported by a *Hypomochlion*; only the Center is not in the Middle, as it is in the common *Balance*, but near one End; for which Reaſon 'tis uſed to elevate or raiſe a great Weight; whence comes the Name *Lever*.

LEVIGATION, in Chymiſtry, is the *grinding* any hard Matter to a very fine, or as they ſay, an impalpable Powder upon a Marble, as the Painters grind their Colours.

LEVITY, is the Diminution or Want of Weight in any Body, when compared with another that is heavier; and in this Senſe is oppoſed to *Gravity*. The Schools maintain there is no ſuch thing as *Poſitive* or *Abſolute Levity*; and this they would have to be the Cauſe of the Emergency of Bodies lighter in Specie than Water, up to the Surface of that Liquor. But beſides that, the common Senſe of Mankind diſcovers *Gravity* and *Levity* to be only Relative and Comparative Things; the Honourable Mr. *Boyle* hath by many Experiments ſhewn, That the riſing of Bodies from the Bottom to the Surface of Water, if lighter ſpecifically than it, is by no means ſolvable nor accountable by any ſuch Notion as that of *Poſitive Levity*, but exactly agreeable to the Laws of the *Hydroſtaticks*: See his *New Experiments about the Poſitive or Relative Levity of Bodies*, and *Hydroſt. Paradoxes*.

LIBEL, ſignifies the Original Declaration of any Action in the Civil Law; as alſo a Criminous Report of any Man caſt abroad, or otherwiſe unlawfully publiſh'd, and then called *Famoſus Libellus*; and this is either *In Scriptis*, or *Sine Scriptis*: *In Scriptis*, is when an *Epigram*, or other Writing, is compoſed or publiſh'd to another's Diſgrace, which may be done *Verbis aut Cantilenis*; as where this is maliciouſly repeated or ſung in the Preſence of others; or elſe *Traditione*, when the *Libel*, or any Copy of it, is delivered out to ſcandalize the Party. *Famoſus Libellus ſine Scriptis*, may be two-fold: 1. *Picturis*, as to paint the Party in a ſhameful and ignominious manner; Or, 2. *Signis*, as to fix a Gallows, or other ignominious Signs, at the Door of the Party, or elſewhere.

LIBELLO *habendo*: See *Copia Libelli deliberanda*.

LIBERA *Chaſea habenda*, is a Writ Judicial, granted to a Man for a free Chace belonging to his Mannor, after he hath by a Jury proved it to belong to him.

LIBERTATE, is a Writ iſſuing out of the *Chancery* to the Treaſurer, Chamberlains, or Barons of the *Exchequer*, or Clerks of the *Hamper*, *&c.* for the Payment of any Annual Penſion, or other Sums granted under the Great Seal: Or ſometimes to the Sheriff, *&c.* for the Delivery of any Lands or Goods taken upon Forfeits of Recognizance. It lies alſo to a Gaoler, for the Delivery of a Priſoner that hath put in Bail for his Appearance.

LIBERTATIBUS *Allocandis*, is a Writ that lies for a Citizen or Burgeſs of any City or Borough, that contrary to the *Liberties* of the City or Town whereof he is, is impleaded before the King's Juſtices, or Juſtices Errant, or Juſtice of the Foreſt, *&c.* to have his Privilege allowed.

LIBERTATIBUS *Exigendis in Itinere*, is a Writ whereby the King willeth the Juſtices in *Eyre* to admit of an Attorney for the Defence of another Man's *Liberty* before them.

LIBERTY, is the Power a Man hath to do, or forbear doing, any particular Action, according as its Doing or Forbearance has the actual Preference in the Mind; which is the ſame thing as to ſay, according as he himſelf *wills* it.

LIBRA, one of the Twelve Signs of the *Zodiack*, being exactly oppoſite to *Aries*.

LIBRATION *of the Moon*, (ſee *Evection*) is of three Kinds:

1. Her *Libration in Longitude*; which is a Motion ariſing from the Plane of that Meridian of the Moon, (which is always, nearly, turned towards us) being directed not to the Earth, but towards the other Focus of the Moon's Elliptical Orbit; and ſo to an Eye on the Earth ſhe ſeems to librate to and again in Longitude, or according to the Order of the Signs in the Zodiack. This *Libration* is of no Quantity twice in each Periodical Month; *viz.* when the Moon is in her Apogee, and in her Perigee; for the Plane of her Meridian abovemention'd, is directed alike to both the Foci.

2. Her *Libration in Latitude*; which ariſes hence, That her Axis not being perpendicular to the Plane of her Orbit, but inclined to it, ſometimes one of her Poles, and ſometimes the other, will *nod* (as they call it) or dip a little towards the Earth; (as is the Caſe of the Poles of the Earth towards the Sun) and conſequently ſhe will appear to librate a little, and to ſhew ſometimes more of her Spots, and ſometimes leſs of them, towards each Pole: Which *Libration* depending on the Poſition of the Moon, in reſpect of the Nodes of her Orbit with the Ecliptick, (and her Axis being perpendicular nearly to the Plane of the Ecliptick) is very properly ſaid to be in *Latitude*.

And this is compleated in the Space of the Moon's *Periodical Month*; or rather while the Moon is returning again to the ſame Poſition, in reſpect of her Nodes.

3. There is alſo a *Third kind of Libration*, by which it happens, that though another Part of her is not really obverted to the Earth, as in the former *Librations*, yet another is illuminated by the Sun: For ſince her Axis is perpendicular nearly to the Plane of the Ecliptick, when the Moon is moſt Southerly, in reſpect of the Ecliptick *North Pole*; ſome Parts nearly adjacent to it will be illuminated by the Sun; while, on the contrary, the South Pole will be in darkneſs, In this Caſe therefore, if it happen that the Sun be in the ſame Line with the Moon's Southern Limit; then will ſhe, as ſhe proceeds from Conjunction with the Sun towards her aſcending Node, appear to dip her Northern Polar Parts a little into the dark Hemiſphere, and to raiſe her Southern Polar Parts as much into the Light; and the contrary to this will happen the next Fortnight, while the New Moon is deſcending from her Northern Limit; for then her Northern Polar Parts will appear to emerge out of Darkneſs, and the Southern Polar Parts to dip into it. And this *ſeeming Libration*, or rather theſe Effects of the former *Libration in Latitude*, depending upon the Light of the Sun, will be compleated in her *Synodical Month*. *Greg. Aſtron. Lib.* 4. *Sect.* 10.

LICENSE *to ariſe*, is a Liberty given by the Court to a Tenant that is Eſſoined *de malo lecti* in a real Action: For the Law is, That in this Caſe he may not ariſe out of his Bed, or at leaſt go out of his Chamber, until he have been viewed by Knights thereunto appointed, and have a Day aſſigned him to

to appear: And the Reaſon of this is, That it may appear whether he cauſed himſelf to be Eſſoined deceitfully, or not; and therefore if the Demandant can prove that he was ſeen abroad before the View or *Licenſe* of the Court, he ſhall be adjudged to be deceitfully Eſſoined, and to have made Default.

LICENTIA *Surgendi*, is a Writ whereby the Tenant Eſſoined *de malo lecti*, obtaineth Liberty to riſe.

LICHEN, barbarouſly called by ſome *Serpigo* or *Zerma*: *Halliabbus* calls it *Petigo* and *Sarpedo*; the Vulgar *Voliacita*. *Lichens* are certain Aſperities of the Skin, and as it were Tumours, which itch much, and ſend forth Matter. The *Greeks* and *Arabians* have made two ſorts of *Lichens*; the one mild and gentle, the other fierce and cruel: And according to *Avicen*, ſome are moiſt; which being rubbed, ſend forth a kind of Dew; others are dry: And the Moiſt are more ſafe; but the Dry is made of ſalt pituitous Matter, turn'd into Melancholy Blood. And again he writes, That one *Impetigo* brings off the Skin, by reaſon of its great Dryneſs, and another does not; and that one is Ambulatory and Malignant, and another Fixed and Standing; as alſo one is Old, another Freſh. Hence it appears, That the *Scabies* of *Corn*. *Celſus* was nothing but theſe *Lichens* of the *Greeks*, and the *Impetigo*, of the *Arabians*. It comes in any Part of the Body but eſpecially in the Face and Chin, as *Galen* has it: For a *Lichen*, ſays he, is a moſt ungrateful Diſtemper in the Chin, becauſe, it makes it itch exceedingly, and ſtretches out the Parts affected: It is not a little dangerous; it ſpreads over the whole Face, and ſometimes reaches the Eyes, and at laſt makes the Perſon affected extream filthy and loathſome. *Blanchard*.

LICHEN *of the Greeks*, is *Pliny*'s *Impetigo*, or an Inequality of the Skin, extending it ſelf to the neighbouring Parts, and accompanied with an extraordinary Itching, and dry Pimples. *Blanchard*.

LIE *under the Sea*: The Sailors ſay a Ship lies under the Sea, when her Helm being made faſt *a-Lee*, ſhe lies ſo *a-Hull*, that the Sea breaks upon her *Bow*, or her *Broad-ſide*.

LIEGE, is a Word borrowed from the *Feudiſts*, and hath two ſeveral Significations in the Common Law, ſometimes being uſed for *Liege-Lord*, and ſometimes for *Liege-Man*. *Liege-Lord*, is he that acknowledgeth no Superior; *Liege-Man*, is he that oweth Allegiance to his *Liege-Lord*.

LIEN, the ſame with *Spleen*; which ſee.

LIENTERIA, is a kind of Looſeneſs, where the Meat or Aliment taken in, is ſent out of the Body before it be altered, or at leaſt before it be digeſted,

LIFE-RENT, in Law, is a Rent or Exhibition which a Man receives, either for Term of Life, or for Suſtentation of Life.

LIFTING-PIECES, are Parts of a Clock which do lift up and unlock the Detents in the Clock-part.

LIFTS, are Ropes in a Ship belonging to the Yard-arms of all Yards: And their Uſe is to *Top the Yard-arms*, *i. e.* to make the Ends of the Yards hang higher or lower, as Occaſion ſerves. The *Top-ſail Lifts* do ſerve as *Sheats* for the Top-gallant Yards, as well as for *Lifts* to the Top-ſail Yards. The Haling of theſe Ropes is called *Topping the Lifts*: Thus they ſay, *Top a Starboard*, or *Top a Port*; *i. e.* hale upon the *Starboard* or *Larboard-Lift*.

The *Lifts* for the Sprit-ſail Yard, they call *Standing-Lifts*.

LIGAMENTUM: A *Ligament* is a ſolid and very fibrous Part of an Animal Body, proceeding almoſt from Matter like a *Cartilage*, different in Size, Number and Situation, broad and round, cold; as it comes near the Conſtitution of a Membrane or a *Cartilage*, drier or moiſter, harder or ſofter, more or leſs, tough and flexible. Its Uſe is to connect the Parts, eſpecially Bones, that they may better perform their Motions. Thoſe which tie the Bones together are wholly inſenſible, and the others have but a dull Senſe.

LIGAMENTUM *Ciliare*: See *Ciliare Ligamentum*.

LIGEANCY, is ſuch a Duty or Fealty as no Man may owe to more than one Lord; and therefore it is moſt commonly uſed for the Duty and Allegiance which every good Subject owes to his *Liege-Lord* the King.

Ligeantia, ſays my Lord *Coke*, *eſt duplex, ſicut ſubditus tenetur Regi ad Obedientiam, ita Rex tenetur ſubdito ad Protectionem*: And in another Place, *Duplex eſt Ligamen inter Regem & populum, &c. Vid. 7 Rep. Calvin's Caſe.*—— Which Paſſages ſome will have to be an expreſs Authority in Law, to prove the Original Contract between the King of *England* and the People.

LIGHT, is uſed to ſignify Three Things:

1. That Senſation which ariſes in us from the View of any Luminous Object, as the Sun, a Star, or a Candle.

2. *Light* ſignifies the Cauſe of that Senſation in us, as it is an Action or Property exiſting in the Luminous Body.

3. By this Word ſome alſo underſtand the *Action* of the *Medium* interpoſed between us and the Luminous Object; and others, That *Train of Rays*, which coming forth from thence, pervades the *Medium* before it can come to affect our Eyes.

Light is undoubtedly produced by Motion, but yet 'tis not every Motion that will produce *Light*. The Learned Dr. *H.* in his *Micrography*, *P.* 55. judges the Motion that produces *Light* ought to have theſe Requiſites: 1. That it be *exceeding quick*, like the Motions of Fermentation and Putrefaction; (as you ſee in ſhining Pickles and rotten Wood:) 2. It muſt be a *Vibrative Motion*, and alſo have its Vibrations exceeding ſhort: This he concludes from the ſhining of Diamonds, when chafed or rubbed.

As to the Trajection of *Light* through the Medium, the moſt freely that can be, he well obſerves, 1. That the Medium muſt be ſuſceptible and impartible of this Motion. 2. That the Parts of it muſt be Homogeneous. 3. That their Conſtitution be ſuch, that *Light* may be propagated through them as ſoon as poſſible: Though he aſſerts, That it can by no Means be Inſtantaneous; and ſeems (ſo long ago) fully ſatisfied, That Light requires much the ſame Time for its Trajection, as Mr. *Romer* found it afterwards to do by the Eclipſes of *Jupiter*'s Satellites: See *Philoſ. Tranſ. N.* 136. *P.* 198.

The Incomparable Sir *Iſaac Newton* allows, with other Aſtronomers, about 10 Minutes of an Hour for the Motion of a Ray of *Light* from the Sun to the Earth. *Princip. P.* 231.

He found alſo, by plain and repeated Experiments, That the Rays of *Light* being in the Air, and paſſing near or through the Edges of any opacous or tranſparent Body, (ſuch as Pieces of Gold or Silver Coin, or ſquare Pieces of thoſe Metals;

the Edges of Knives, or of broken Glaſs, &c.) are always *bent* or *incurvated* towards ſuch Bodies, as if they were *attracted* by them; and of theſe, thoſe Rays which paſs neareſt the Edges, are moſt *incurvated*.

And from hence it will follow, That the Refraction of the Rays of *Light*, (eſpecially of thoſe which fall near the Edges of Bodies) is not made juſt at the Point of Incidence, but a little before the Rays enter into the denſer Medium, and a little after they are gotten within it.

The ſame Perſon found alſo by curious Experiments made with *Priſms*, That the vividly coloured Image, tranſmitted through a Hole, in a darkened Room, oppoſite to the Sun-beams, and caſt on a white Wall, was five times as long as it was broad: This ſtrange Diſproportion between the Length and Breadth of the coloured Spectrum put him upon ſeveral Thoughts; but at laſt he thought of this *Experimentum Crucis*: He took two Boards, and placed one cloſe behind the Priſm at the Window, ſo that the *Light* paſſing through a ſmall Hole purpoſely made in it, might fall on another Board placed nearer the Wall, at about 12 Foot Diſtance from the former; and having alſo a ſmall Hole in it too, for ſome of the incident *Light* to paſs thro'. Behind this Board he placed a ſecond Priſm, that the Rays paſſing through it and the two Holes in the Boards, might be again refracted before it came to the Wall. Then he turned the firſt Priſm at the Window ſlowly about its Axis, ſo as to make the ſeveral Parts of the Image caſt on the ſecond Board ſucceſſively paſs through the Hole in it, that ſo he might obſerve to what Places on the Wall the ſecond Priſm would refract them. And then he ſaw plainly, *by the Variation of thoſe Places, that the* Light *tending to that End of the Image towards which the Refraction of the firſt Priſm was made, did in the ſecond Priſm ſuffer a Refraction conſiderably, the* Light *tending to the other End.* And ſo the true Cauſe of the Length of that Image was detected to be no other, than that *Light conſiſts of Rays differently refrangible*; which, without reſpect to any Difference in their Incidence, were according to their Degrees of Refrangibility tranſmitted towards divers Parts of the Wall. From whence he juſtly concluded, That *Light it ſelf was an Heterogeneous Mixture of differently Refrangible Rays. Philoſophical Tranſactions*, N. 80.

He demonſtrates alſo, That ſince *Light* is always propagated in Right Lines, it cannot poſſibly conſiſt in Action only, (*Prop.* 41, 42. *Lib. Princip. Phil. Mathem.*) as the *Carteſians* do aſſert.

In another Place of the *Tranſactions* he gives the following Definitions and Propoſitions.

DEFINITIONS.

1. *Homogeneal*, *Similar*, or *Uniform Light*, is that whoſe Rays are equally refrangible.

2. *Heterogeneal Light*, is that whoſe Rays are unequally refrangible.

Note, There are but Three Affections of *Light* in which he obſerved its Rays to differ; *viz. Refrangibility*, *Reflexibility*, and *Colour*: And thoſe Rays which agree in *Refrangibility*, agree alſo in the other two; and therefore may well be defined *Homogeneal*, eſpecially ſince Men uſually call thoſe things *Homogeneal*, which are ſo in all other Qualities that come under their Knowledge; though in other Qualities their Knowledge extends not to, there may poſſibly be ſome *Heterogeneity*.

3. Thoſe *Colours* he calls *Simple* or *Homogeneal*, which are exhibited by *Homogeneal Light*.

4. And thoſe Compound or *Homogeneal*, which are exhibited by *Homogeneal Light*.

5. Different Colours he calls not only the more eminent Species, Red, Yellow, Green, Blue, Purple, but all other the minuteſt Gradations; much after the ſame manner, that not only the more eminent Degree in Muſick, but all the leaſt Gradations are eſteem'd different Sounds.

PROPOSITIONS.

1. The Sun's *Light* conſiſts of Rays differing by indefinite Degrees of Refrangibility.

2. Rays which differ in Refrangibility, when parted from one another, do proportionably differ in the Colours which they exhibit. Theſe two Propoſitions are Matter of Fact.

3. There are as many Simple or Homogeneal Colours, as Degrees of Refrangibility; for to every Degree of Refrangibility belongs a different Colour, by *Prop* 2. And that Colour is Simple, by *Def.* 1. and 3.

4. Whiteneſs, in all reſpects like that of the Sun's immediate *Light*, and of the uſual Objects of our Senſes, cannot be compounded of two ſimple Colours alone; for ſuch a Compoſition muſt be made by Rays that have only two Degrees of Refrangibility, by *Def.* 1. and 3. And therefore it cannot be like that of the Sun's *Light*, by *Prop.* 1. Nor for the ſame Reaſon, like that of ordinary White Objects.

5. Whiteneſs, in all reſpects like that of the Sun's immediate *Light*, cannot be compounded of Simple Colours, without an indefinite Variety of them: For to ſuch a Compoſition there are required Rays endued with all the indefinite Degrees of Refrangibility, by *Prop.* 1. And thoſe infer as many Simple Colours, by *Def.* 1, and 3. and *Prop.* 2. and 3.

6. The Rays of *Light* do not act on one another, in paſſing through the ſame Medium.

7. The Rays of *Light* ſuffer not any Change of their Qualities from Refraction.

8. Nor afterwards from the adjacent quiet *Medium*. Theſe two Propoſitions are manifeſt *de facto* in *Homogeneal Light*, whoſe Colour and Refrangibility is not at all changeable, either by Refraction, or by Contermination of the quiet *Medium*.

And as for *Heterogeneal Light*, it is but an Aggregate of ſeveral ſorts of *Homogeneal Light*; no one ſort of which ſuffers any more Alteration than if it were alone, becauſe the Rays act not upon one another, by *Prop.* 6. and therefore the Aggregate can ſuffer none.

9. There can no Homogeneal Colours be reduced out of *Light* by Refraction, which are not commixt in it before; becauſe, by *Prop.* 7, and 8. Refraction changeth not the Qualities of the Rays, but only ſeparates thoſe which have divers Qualities, by means of their different Refrangibility.

10. The Sun's *Light* is an Aggregate of an indefinite Variety of Homogeneal Colours, by *Prop.* 1, 3, and 9. And hence it is, that Homogeneal Colours may be called Primitive or Original.

That *Light* is a Body, M. *Molyneux*, in his *Dioptricks*, proves from the various Properties of it; As,

1. By the Affection of its being *Refracted*, 'tis manifeſt, that *Light*, in its Paſſage through this and t'other Diaphanous Body, does find a *different Reſiſtance*. Now 'tis unconceivable how any thing but Body ſhould ſuffer *Reſiſtance*; but we may conceive

ceive the Reſiſtance that *Light* ſuffers in its Paſſage through different Diaphanous Bodies to proceed from the Medium hindering the *Diffuſion* or *Diſtribution* of *Light* through *more* of the Parts of this Medium, and conſequently it may be ſaid to be *leſs illuminable*: For from the Nature of it, *Light* endeavours to *diffuſe* it ſelf: And the contrary, by how much *Light* does more equally or uniformly affect the Parts of the Medium, which it enlightens; or by how much it communicates its *Energy* to *more* of the *Particles* of the enlightened *Space*, that Medium may be ſaid to be by ſo much the *more illuminable*, or *leſs to reſiſt* the Progreſs of *Light*. Whence it is, that by how much the affected Parts of the Medium are *more ſolia* and *ſmall*, and admit between them the *leſs Space* for any other *Heterogeneous* Matter that ſuffers not by *Light*, by ſo much the Medium is ſaid to be *more enlightned*.

And 'tis certain, That *Reſiſtance* muſt proceed from the *Contact* of two *Bodies*; and *Contact*, either *Active* or *Preſſive*, belongs *only to Body*.

The Second Property that confirms *Light* to be a *Body*, and a *Body* moved or thruſt forward, is, That it requires *Time* to paſs from one Place to another, and does it not in an *Inſtant*, but is only of all Motions the *quickeſt*: For Mr. *Romer* has demonſtrated, beyond all Contradiction, from the Obſervations of the *Immerſions* and *Emerſions* of the *Satellites* of *Jupiter*, *That Light requires the Time of one Second to move the Space of* 3000 *Leagues*, or 9000 *Miles*, *which is near the Earth's Diameter*; as may be ſeen in the *Journal des Sarvans*, 1676. *Decemb.* 7. *Philoſophical Tranſactions*, *Num.* 136. Or Sir *Iſaac Newton's Philoſ. Natur. Math. Lib.* 1. *Schol. Prop.* 96. where 'tis aſſerted, That *Light* requires about 10 Minutes Time to come from the *Sun* to the *Earth*: And 'tis moſt evident, without this Allowance for the Time ſpent in *Light*'s Motion, the Appearances of the *Satellites*, *Eclipſes*, and *Emerſions*, are not to be explicated by any *Excentricity*, or other Hypotheſis.

A Third Proof that *Light* is a *Body*, is, That it cannot by any Art or Contrivance whatſoever, be *increas'd* or *diminiſh'd*; that is to ſay, we cannot magnify (for Inſtance) the *Light* of the *Sun*, or a *Candle*, no more than we can magnify a Cubick Inch of *Gold*, or make it *more* than a Cubick Inch: For whenever we ſee *Light* increaſed, 'tis by robbing it of ſome other Part of the Medium of its *Light*, or by bringing the *Light* that naturally ſhould have been diffuſed through ſome other Part, to the more enlightned Place: Thus, for Inſtance, in a Burning-Glaſs, by which the *Light* of the *Sun* is highly increaſed in its *Focus*, or Burning-Point, we are firſt to conſider, That in this *Focus* the Image of the *Sun* is projected, as being the *diſtinct* Baſe of the Glaſs: And Secondly. We may obſerve all round about this bright Spot of the Sun's Image, there is caſt the ſtrong Shadow of the whole Breadth of the Burning-Glaſs: For all the Rays from the Sun, that would have fallen on this broad ſhaded Space, are now brought together, and crowded cloſe in this bright Spot, there raiſing a vigorous *Light* and violent Heat.

This is abundantly confirmed by an eaſy Experiment: For cover all the Burning-Glaſs, except one ſmall round Space in its Middle, juſt the Bigneſs of the bright burning Spot in its Focus; and though there be a ſhaded Space round the bright Speck, as before, yet we ſhall not be ſenſible of any *Increaſe* either of *Light* or *Heat*; which plainly ſhews, That this *Increaſe* of *Light* (when the Glaſs is all bare (proceeds from the crowding together of thoſe Rays that would have fallen on the reſt of the Glaſs, and which (were not the Glaſs interpoſed) would have fallen on the ſhaded Space round about the bright Speck.

There ſeems but one Objection againſt what is here laid down; and that is, That *Light* is *increaſed* by Reflexion, without depriving any Place of the *Light* it would otherwiſe receive; or without bringing to the enlightened Part any *Light* that would otherwiſe eſcape it, or never come at it. But if we conſider the Matter more attentively, we ſhall find it otherwiſe: For ſuppoſe an *Hole* of a Foot Square in the Side of a Chamber, and that a Candle were placed cloſe to, and juſt before the Middle of this Hole; there is but half this Candle that now enlightens this Room, the other half of its Rays proceeding directly out at the Hole: Let now a Looking-Glaſs be placed ſo, as juſt to fill up this *Hole*; the Rays which before would have gone out at the Hole, are now reflected into the Room; ſo that the Hemiſphere without the Chamber, which was enlightened whilſt the Hole continued open, is now robbed of its *Light*; and all this *Light* is now reflected into its Room, whereby the *averſe* Side of the Flame is made to enlighten, as well as the Side *directly* expoſed to the Chamber. What is ſaid of this Caſe, may be accommodated to all: For ſo a Looking-Glaſs lying horizontally, and reflecting the Sun-beams to the Ceiling of the Room, does plainly hinder the direct Progreſs of the Rays to ſome other Part, and conſequently robs that Part of its *Light*. This is evident, by ſuppoſing an Hole behind the Glaſs, as in the former Caſe.

From whence 'tis manifeſt, how vainly they attempt, who offer at *increaſing Light uniformly*, that is, equally throughout the whole Sphere of a Luminous Body, or Radiating Point: Such are the Pretences of thoſe that would perſwade the World of Contrivances for making the ſmall Flame of a Lamp enlighten *ſtrongly* a whole Chappel, Hall, or Court, by being hung up in the midſt thereof: For theſe things are impoſſible to be effected in Nature, and they had as well pretend to create *Light*; for there is no other way of *increaſing* it, unleſs by robbing another Place of its *Light*, and then 'tis not *uniformly increaſed*. We have a very ſenſible Inſtance of this in the *new-invented Lanthorns*, now much uſed in *London*, which, by the Convex-Glaſſes in their Sides, do ſtrongly throw thoſe Rays along the Walks of the Paſſengers, which, would otherwiſe (were the Glaſſes away, and the round Holes left open) be ſpent on Parts of the Streets not frequented; whereby the untrodden Parts of the Streets are robbed of their *Light*, more ſtrongly to ſupply and enlighten the Paths where the *Light* is requiſite.

The Intenſeneſs of *Light* (as alſo of *Heat*) is always proportionable to the Denſity of the Rays that produce it: And that Denſity always is in all Places, or at all Diſtances from the Center of Radiation, as the Squares of ſuch Diſtances *reciprocally*: See *Quality*.

In the *French* Memoirs of the Royal Academy of Sciences, there is an Account of a New Theory of *Light*, which is ſtarted by M. *Malebranche*: He thinks *Light* and *Colours* do ariſe from Vibrations of the inſenſible Parts of Bodies, as Sounds do: And therefore, according to the Degree of the Rapidity of the Motion of the Parts of a Luminous Body, it will appear enlightened more or leſs; and in leſſer Degrees of ſuch vibrating Motion, it will appear not Luminous, but of ſuch and ſuch Colours: ſee *Vol.* II.

LIKE *Quantities*, in *Algebra*, are ſuch as are expreſs'd by the ſame Letters equally repeated in each Quantity. Thus 2 *b* and 3 *b*, and 9 *ff* and 3 *ff*, are *like Quantities*; but 2 *b* and 3 *b b*, and 9 *ff* and 3 *f f f*, are *unlike* ones; becauſe the Quantities have not every where the ſame Dimenſions, nor are the Letters equally repeated.

LIKE *Signs*, in *Algebra*, are when both are Affirmative, or both Negative; but if one be Affirmative, and the other Negative, they are *unlike Signs*. Thus + 64 *d* and + 5 *d* have *like Signs*; but 9 *ff* and — 7 *ff* have *unlike Signs*.

LIKE *Figures*, in *Geometry*, are ſuch as have their Angles equal, and the Sides about theſe equal Angles proportional.

LIKE *Arks*, in the Projection of the Sphere in *Plano*, are Parts of Leſſer Circles, containing an equal Number of Degrees with the correſponding Arks of Greater ones.

LIKE *Solid Figures*, in *Geometry*, are ſuch as are contained under like Planes, equal in Number.

LIMBER *Holes*, in a Ship, are little ſquare Holes cut in the Bottom of all her Ground-timber and Hooks, about 3 or 4 Inches ſquare: Their Uſe is to let the Water to the Well of the Pump, which elſe would reſt between thoſe Timbers where the Keel-Rode runs.

LIMB, ſignifies the outermoſt Border or graduated Edge of an *Aſtrolabe*, or the like Mathematical Inſtrument; or the Circumference of the primitive Circle in any Projection of the Sphere in *Plano*: Alſo the outermoſt Border of the Sun's or Moon's Disk in an Eclipſe of either Luminary.

LIMIT *of a Planet*, is the greateſt Heliocentrick Latitude; which ſee.

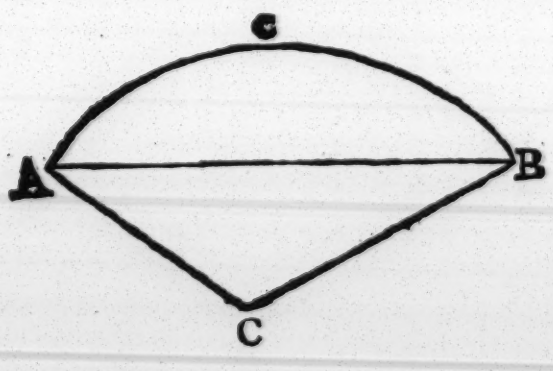
LIMITATION *of Aſſize*, is a certain Time ſet down by Statute, wherein a Man muſt alledge himſelf, or his Anceſtor, to have been ſeized of Lands. ſued for by a Writ of Aſſize.

LIMITED *Problem*, (for ſo I tranſlate Mr. *Ozanam*'s Word *Ordonne*) ſignifies a Problem that hath but one only Solution, or which can be done but one only way; as to make a Circle paſs thro' 3 Points given, not lying in a Right Line; to deſcribe an Equilateral Triangle on a Line given.

LINCH *Pins*, are thoſe Pins that keep on the Trucks or Wheels on the Carriage of a Piece of Ordnance.

LINCTUS, the ſame with *Eclegma*; which ſee.

LINE: A Line in Geometry, is a Quantity extended in Length only, and is ſuppoſed to have no *Breadth* or *Thickneſs*. It is made by the Motion of a Point; as, if the Point *A* be moved towards *B*,



it will by its Motion trace out or deſcribe a *Line*; which, if it go the neareſt way between *A* and *B*, will be a *Right* or *Straight Line*, whoſe Definition therefore will be the *neareſt or ſhorteſt Diſtance between any two Points*. But if the Point go any way about, as in any of the Lines *A C B*, then it will trace out either a *Crooked Line*, as the upper *A C B*; or elſe two or more *Straight ones*, as in the lower *A C B*.

From which Geneſis or Production of a Line, ſeveral Conſequences will fairly follow; ſome of which are needleſs Propoſitions in *Euclid*.

1. Two Right Lines cannot include a Space; but if drawn from the ſame Point to the ſame Point, will always be *coincident*; and drawn any how elſe, can only meet and make an Angle, but can never bound or terminate a Space. *Axiom.* 14. 1 *Euclid*.

2. In any Triangle, as *A C B*, any two ſides, as *A C* and *C B* taken together, are longer than the third *A B*; becauſe *A B* is the ſhorteſt Diſtance between the two Points *A* and *B*. 20 *e*. 1 *Euclid*.

3. A Tangent (or Line touching the Circumference of a Circle) can touch it but in one Point, and conſequently will be all of it without the Circle. 16. *e*. 3 *Euclid*.

4. A Right Line drawn between any two Points in the Circumference of a Circle, falls all within the Circle. 2 *e*. 3 *Euclid*.

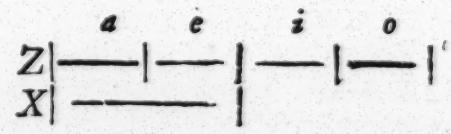
LINE *of Meaſures*, ſo Mr. *Oughtred* calls the Diameter of the primitive Circle in the *Projection of the Sphere in Plano*; or that Line in which the Diameter of any Circle to be *projected* falls.

LINE *of Numbers*, is a Line ſo called by its Inventor Mr. *Gunter*, and therefore frequently called *Gunter's Line*. This is uſually placed on a Ruler, or the Back of a Sector; and running parallel with it, you have the *Artificial Lines*, as we uſually call them.

LINES and their *Properties*; ſee *Vol.* II.

The Second Book of *Euclid* treats moſtly of Lines, and of the Effects of their being divided, and then multiplied into one another; as alſo do the firſt Six Propoſitions of Book the 13th. The former of which you have here very briefly demonſtrated Algebraically.

1. If there be two Lines z and x; one of which, as z, is divided into any Number of Parts, as into $a+e+i+o$. the Rectangle under the two whole Lines $z\ x$, is equal to the Sum of all the Rectangles made by x multiplied into the Parts of z.



That is $z\ x = x\ a + x\ e + x\ i + x\ e$. This is ſo plain, it needs no Proof.

2. If a Right Line, as z, be divided into two Parts $a+e$, the Rectangles made by the whole Line, and both its Parts are equal to the Square of the whole Line: ſee *Fig.* 2.

That is, $z\ a + z\ e = z\ z$.

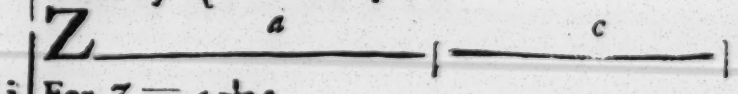
For $z\ a = a\ a + a\ e$.

And $z\ e = a\ e + e\ e$.

Therefore $z\ z = a\ a + z\ a\ e + e\ e$. *Q. E. D.*

3. Let the Line z be cut into $a+e$; then ſhall the Rectangle under the whole Line (z) and the Part (a) be equal to the Square of that Part a, together with the Rectangle made by the two Parts a and e.

That is, $z\ a = a\ a + a\ e$.

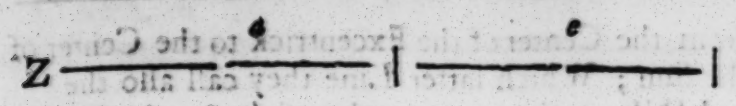


For $z = \frac{a+e}{}$

And $a+e \times a = a\ a + a\ e$. *Q. E. D.*

4. The Square of any Line, as z, divided into any two Parts a and e, is equal to both the Squares of thoſe Parts together, with the Rectangles made out of thoſe Parts.

That is, $z\ z = a\ a + 2\ a\ e + e\ e$.

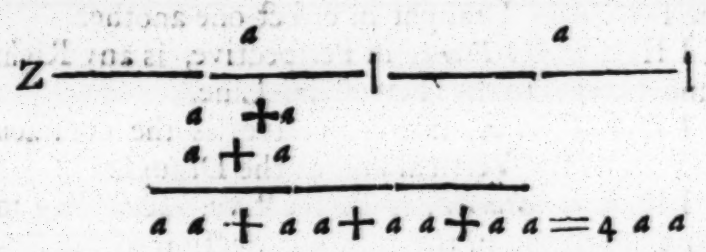


Multiply $a+e$ by it self, and the Thing is plain.

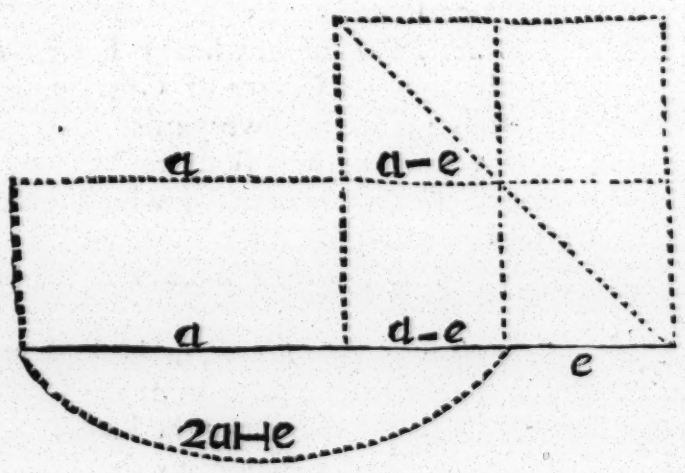
$$\begin{array}{r} a+e \\ a+e \\ \hline aa+ee \\ +ae+ee \\ \hline aa+2ae+ee \end{array}$$

COROLLARIES.

Hence 'tis plain, that the Square of any Line is equal to four times the Square of its half. For ſuppoſe Z to be biſſected, then each Part will be a; and multiplying $a+a$ by it ſelf, the thing will plainly appear.

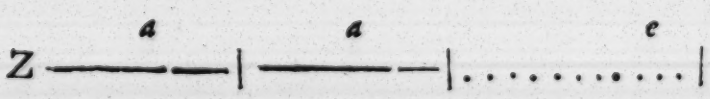


5. If a Line be divided into two Parts equally, and into two other Parts unequally, the Rectangle under the unequal Parts, together with the Square of the intermediate Part, the Difference between the equal and unequal Parts, is equal to the Square of half that Line.



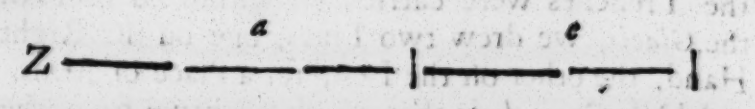
Let the whole Line be $2a$, then each Part will be a; let the leſſer unequal Part be e, then the greater unequal Part will be $2a-e$; which multiplied by e, produces $2ae-ee$: To which adding the Square of the Difference, or intermediate Part $a-e$, which is $aa-2ae+ee$, the Sum will be only aa, the Square of half the Line.

6. If a Line be biſſected, and then another Right Line be added to it, the Rectangle or Product of the whole augmented Line multiplied by the Part added, together with the Square of the half Line, is equal to the Square of the half Line, and part added, as one Line.



Let the firſt Line be $2a$, and the Part added e, then the whole will be $2a+e$; which multiplied by e, produces $2ae+ee$, and the Square of half the Line a a being added to it, it will be $2ae+ee+aa$, which is equal to the Square of $a+e$, by *Prop.* 4.

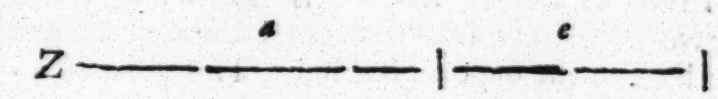
7. If a Quantity or Line be divided any how into two Parts, the Square of the whole added to the Square of one of the Parts, ſhall be equal to two Rectangles contained under the whole Line and that Part, added to the Square of the other Part.



Let a be one Part, and e the other; the Square of the whole, and if the leſſer Part e, makes $aa+2ae+2ee$. Then if the whole $a+e$ be multiplied twice by e, it will produce $2ae+2ee$; and if to this be added the Square of the other Part aa, the Sum will be

$aa+2ae+2ee$, equal to the former.

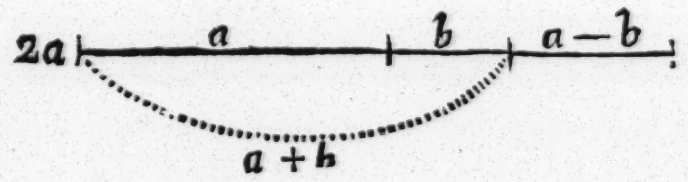
8. If a Line cut any how into two Parts, the Quadruple Rectangle under the whole Line and one of the Parts, added to the Square of the other Part, is equal to the Square of the whole, and the other Part added to it, as if it were but one Line.



Let the whole Line be $a+e$, then four times that multiplied by e (or the Quadruple Rectangle under that and e) will be $4ae+4ee$; to which adding the Square of the other Part aa, the Sum will be $aa+4ae+4ee$.

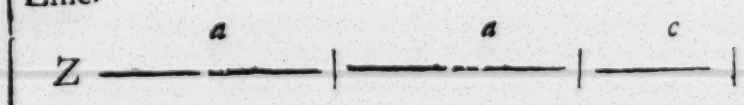
And if you ſquare $a+2e$, which expreſſes the whole Line, with e added to it, the Product will be the former Sum of $aa+a4ae+4ee$.

9. If a Line be biſſected, and alſo cut into two other unequal Parts, the Sum of the Squares of the unequal Parts will be double to the Sum of the Squares of the half Line, and of the Difference between the two unequal Parts.



Let the whole Line be $2a$, and the Difference between the equal and unequal Parts b; then the greater unequal Part will be $a+b$, and the leſſer $a-b$: The Sum of the Squares of the unequal Parts will be $2aa+2bb$. which is double to the Square of half the Line added to the Square of the Difference. *Q. E. D.*

10. If a Line be biſſected, and then another Line added to it; the Square of the whole increaſed Line, together with the Square of the Part added, is double the Sum of the Squares of the half Line, and of the half Line and Part added, taken as one Line.



Let the whole Line be $2a$, and the Part added e; then the whole increaſed Line will be $2a+e$; and the half Line and Part added, will be $a+e$. The Sum of the Squares of $2a+e$, and of e, is $4aa+4ae+2ee$; which is plainly double to aa, and $aa+2ae-ee$ added together. *Q. E. D.*

LINE, in Fortification, is that which is drawn from one Point to another, in delineating a Plane

upon Paper. But in the Field it is ſometimes taken for a Ditch bordered with its Parapet, and ſometimes for a Row of *Gabions*, or Sacks of Earth, extended in Length on the Ground, to ſerve as a ſhelter againſt the Enemies Fire. Thus they ſay, when the Trenches were carried on within 30 Paces of the *Glacis*, we drew two Lines, one on the Right Hand, the other on the Left, for a Place of Arms.

LINE *Capital*, is that which is drawn from the *Angle of the Gorge* to the *Angle of the Baſtion*.

LINE *Cogritel*, is that which is drawn from the *Angle of the Center* to that of the *Baſtion*.

LINE *of Defence*, is that which repreſents the Courſe of the Bullet of any ſort of Fire-Arms, more eſpecially of a Muſquet-Ball, according to the Situation which it ought to have to defend the Face of the Baſtion.

LINE *of Defence Fix'd or Fichant*, is that which is drawn from the *Angle of the Curtain* to the *flank'd Angle* of the oppoſite *Baſtions*; nevertheleſs without touching the Face of the Baſtion. This muſt never exceed 800 Feet, which they reckon the Diſtance a Muſquet-Ball will do Execution.

LINE *of Defence Razant*, is that which being drawn from a certain Point of its Curtain, Raſeth the Face of the oppoſite Baſtion. This is called alſo the *Line of Defence Stringent* or *Flanking*.

LINE of *Approach*, or of *Attack*, ſignifies the Work which the Beſiegers carry on under *Covert*, to gain the Moat, and the Body of the Place.

LINE of *Circumvallation*, is a *Line* or *Trench* cut by the Beſiegers within Cannon ſhot of the place, which rangeth round their Camp, and ſecures its Quarters againſt the Relief of the Beſieged.

LINE *of Contravallation*, is a Ditch border'd with a Parapet, which ſerves to cover the Beſiegers on the ſide of the place, and to ſtop the Sallies of the Garriſon.

LINES *within ſide*, are the Moats towards the place, to prevent the like Sallies.

LINES *without ſide*, are the Moats towards the Field, to hinder Relief.

LINES *of Communication*, are thoſe that run from one Work to another. But the *Line of Communication*, more eſpecially ſo called, is a continued Trench with which a *Circumvallation* or *Contravallation* is ſurrounded, and which maintains a *Communication* with all its *Forts*, *Redoubts*, and *Tenables*.

LINE *of the Baſe*, is a Right Line which joins the points of the two neareſt *Baſtions*.

To LINE *a Work*, is to ſtrengthen a Rampart with a firm Wall, or to encompaſs a Parapet or Moat with good Turff, *&c.*

LINEA *Apſidum*, or the *Line of the Apſes*, in the Old Aſtronomy, is a Line paſſing through the Center of the World. and the Center of the Excentrick; and whoſe two Ends are, one the *Apogee*, the other the *Perigee* of the Planet. That part of this Line which lies between the Center of the World and that of the Excentrick, is called the *Excentricity*.

LINE *of Greateſt or Leaſt Longitude of a Planet*, is that part of the *Linea Apſidum* reaching from the Center of the World to the *Apogee* or *Perigee* of the Planet. But the

LINE *of Mean Longitude*, is one drawn through the Center of the World at Right Angles to the *Linea Apſidum*, and is there a new Diameter of the *Excentrick* or *Deferent*; and its Extream Points are called the *Mean Longitudes*.

LINE *of the mean Motion of the Sun*, in the Old Aſtronomy, is a Right Line drawn from the Center of the World as far as to the Zodiack of the *Primum Mobile*, and parallel to a Right Line drawn from the Center of the Excentrick to the Center of the Sun; Which latter Line they call alſo the

LINE *of the mean Motion of the Sun in the Excentrick*, to diſtinguiſh it from the former; which is the Line of mean Motion in the Zodiack of the *Primum Mobile*.

LINE *of the Sun's True Motion*, is a Line drawn from the Center of the World to the Center of the Sun, and produced as far as the Zodiack of the *Primum Mobile*.

LINE *Horizontal*, is a Right Line parallel to the *Horizon*.

——In *Dialling*, it is the common Section of the *Horizon* and the *Dial-Plane*.

——In *Perſpective*, it is the common Section of the Horizontal Plane, and that of the Draught or Repreſentation, and which paſſes through the principal Point.

LINE *Geometrical*, in Perſpective, is a Right Line drawn any how on the Geometrical Plane.

LINE *Terreſtrial*, in Perſpective, is a Right Line, wherein the Geometrical Plane, and that of the Picture or Draught interſect one another.

LINE *of the Front*, in Perſpective, is any Right Line parallel to the Terreſtrial Line.

LINE *Vertical*, in Perſpective, is the common Section of the Vertical and of the Draught.

LINE *of Station*, is Perſpective, according to ſome Writers, in the common Section of the *Vertical* and *Geometrical* Planes. Others, as *Lamy*, mean by it the perpendicular Height of the Eye above the Geometrical Plane. Others, a Line drawn on that Plane, and perpendicular to the Line, expreſſing the Height of the Eye.

LINE *Objective*, in Perſpective, is the Line of an Object, from whence the Appearance is ſought for in the Draught or Picture.

LINE *of Gravitation*, of any heavy Body, is a Line drawn through its Center of Gravity, and according to which it tends downwards.

LINE *of Direction*, of any Body in Motion, is *that* according to which it moves, or which directs and determines its Motion.

LINE *of the ſwifteſt Deſcent of a heavy Body*: See the *Cycloid*.

LINE *of the Anomaly of a Planet*, in the Ptolemaick Syſtem, a Right Line drawn from the Center of the Excentrick to the Center of the Planet.

LINE *of the Apogee of a Planet*, in the Old Aſtronomy, is a Right Line drawn from the Center of the World, through the point of the *Apogee*, as far as the Zodiack of the *Primum Mobile*.

LINE *of the Nodes of a Planet*, in the New Aſtronomy, is a Right Line from the Planet to the Sun, being the common Interſection of the Plane of the Planets Orbit with that of the Ecliptick.

LINE *Synodical*, in reference to ſome Theories of the Moon, is a Right Line ſuppoſed to be drawn through the Centers of the Earth and Sun: And if it be produced quite thro' the Orbits, 'tis called the

LINE *of the True Syzygies*. But a Right Line imagined to paſs through the Earth's Center, and the mean Place of the Sun is called the

LINE *of the Mean Syzygies*.

LINE *Horary*, or the *Hour-lines*, in Dialling, are the common Interſections of the Hour-Circles of the Sphere, with the Plane of the Dial.

LINE *Subſtylar*, is that Line on which the Style or Cock of the Dial is Erected, and is the Repreſentation of ſuch an Hour-Circle as is perpendicular to the Plane of that Dial.

LINE *Equinoctial*, in Dialling, is the common Interſection of the Equinoctial, and the Plane of the Dial.

LINES, in the Art of War, ſignify the Poſition of an Army ranged in Order of Battel, extending themſelves to ſuch a length, or as far as the Ground will allow, to prevent flanking. Armies do uſually place themſelves in three Lines: The firſt of which is the *Van*, or *Advanc'd Guards*; the ſecond the *Main Body*; the third the *Rear-Guard*, or *Reſerve*. There is left the Diſtance of about 150 Paces between the two firſt Lines, and about double that Diſtance between the ſecond and laſt. To

LINE *Hedges*, is to plant Muſqueteers all along them under their Covert, to fire upon an Enemy that comes open, or for a Defence againſt Horſe.

LINEA *Alba*, is a Concourſe of the Tendons of the Muſcles of the *Abdomen*, excepting the Tendons of the ſtraight ones; for the Tendons of the oblique Muſcles unite, and meet ſo on both Sides, that they make a kind of Tunick that covers the *Abdomen*, as if they were all but one Tendon. It is white, and not fleſhy, proceeding from the *Cartilago Enſiformis* to the *Os Pubis*; and is narrower below the Navel than above.

LINEAR *Problem*, in Mathematicks, is ſuch an one as can be ſolved Geometrically by the Interſection of two Right Lines; as *to meaſure an inacceſſible Height by the means of two unequal Sticks or Staves.* This is alſo called a *ſimple Problem*, and is capable but of one Solution.

LINEAR *Numbers*, are ſuch as have relation to Length only; as (*v. gr.*) ſuch as repreſent one ſide of a plane Figure: And if the plane Figure be a Square, the *Linear Number* is called a *Root*.

LINES *of Chords, Sines, Tangents, Secants, Verſed Sines, &c.* See *Scale*.

LINED *Moat*, a Term in Fortification: See *Moat*.

LINGOT, the Term in Chymiſtry for the *Molds* they make to caſt melted Metals, or the *Regulus of Antimony, &c.* into.

LINGUA, the Tongue, is an oblong, broad, thick Member, and thicker at the Root, and thinner and ſharper at the End; of a moderate Bigneſs, that it may move more quickly. In the exterior or upper Part of the Tongue there are a great many little Bodies, which break out from the Surface of the Tongue, and bending a little, incline backwards towards the Root, ſo that they look like a Comb to card Wool. Theſe Cartilaginous Bodies, in an Ox eſpecially, ſeem to reſemble the Figure of a Boar's Tooth. In the lower Part they have a certain Cavity. They are made of a thick tenacious fibrous Matter, which ſeems like a Heap of little Rods: About the Sides of the Tongue they grow ſmaller and ſmaller, ſo that they almoſt diſappear; and certain Membranous Bodies are placed at their Baſis, which appear at firſt of a Conical Figure, and then by and by of a more obtuſe one, and of a pappy Subſtance. All the little Protuberances are cloathed with the Membranes of the Tongue: They are firmly implanted in a certain tenacious Tunick of the Tongue, there being under them a craſs, viſcous or nervous Subſtance, eſpecially in thoſe Places where there are remarkable Pits in the Tongue diſpoſed in like Order and Manner; ſo that in the inner Part of the Tongue there are a great many of them, which are firmly implanted in a kind of viſcous Body. When the Membrane that covers the whole Tongue is taken off, there appears a certain Glutinous Subſtance; then a Nervous Pappy Body, ſomething Yellow, which ſpreads like the Membrane, and diſcovers ſeveral remarkable Nervous Protuberances, diſpos'd and order'd in a wonderful Order. The next Things that appear are like Nipples, in greater abundance than thoſe before-mentioned, and of another Order; for as many little Protuberances as cover the Outſide of the Tongue, ſo many Nervous Nipples of this ſort are found within. Theſe proceed from the common pappy Subſtance, grow tolerably high, and ſhoot out further into Nervous Sprouts from the Top of them; about which you diſcover innumerable little Protuberances proceeding from the Stock, and of an equal Height, only ſlenderer, like a Cone, and which go within their proper Cavities, ready made in the craſs viſcous Subſtance before-mentioned, and at laſt end toward the outermoſt Membrane. Farthermore, the Subſtance of the Tongue is Muſculous: The Central Parts of the Tongue conſiſt of ſeveral ſorts of Fibres, long, tranſverſe and oblique, which being mutually interwoven with one another, look like a Coverlid or Blanket. It owes its Motion to peculiar Muſcles of its own, wherewith it is contracted and abbreviated. The Pairs of Muſcles are the *Styloglosſum*, *Baſioglosſum*, *Genioglosſum*, *Ceratoglosſum* and *Myloglosſum*; which ſee. *Blanchard*.

LINGUALIS, is taken by ſome to be a large and fleſhy Muſcle ariſing from the Baſis of the *Os Hyoides*, and runs forward to the Tip of the Tongue; and *Spigelius* gives it this Uſe, That its tranſverſe Fibres do thicken, and as it were conſtringe the Tongue, and dilate it by its oblique Fibres, and bring it towards the Palate by its right Fibres: But it is diſputable whether it be a *Muſcle* or not.

LINTER: See *Scapha*.

LINUM *Vivum*: See *Aſbeſtine Cloth*.

LIONCELES, the Herald's Term for *Lions*, when there is more than two of them born in any Coat of Arms, and no Ordinary between them; and 'tis all one as a ſmall or young Lion.

LIPOTHYMIA, or *Lipoſychia*, is a ſwooning or fainting away, being an imperfect *Syncope*; which ſee.

LIQUIDS, are ſuch Bodies as have all the Properties of *Fluidity* (ſee that Word); and withal, have their Particles ſo formed, figured or diſpoſed, that they do adhere to the Surfaces of ſuch Bodies as are immerſed in them, which we call *wetting*: And this Property of Liquid Bodies is ſometimes called *Humidity* or *Moiſture*.

LIQUOR *of Fix'd Nitre*: See *Fix'd Nitre*.

LIST, in Architecture, is a ſtraight upright Ring, which runs round the lower Part of any of the Columns juſt above the *Tore*, and next to the Shaft or Body of the Pillar.

LISTEL, a ſmall Band, or a kind of a Rule in the Mouldings of Architecture: Alſo the Space between the Channellings of Pillars.

LITERAL *Algebra*: See *Algebra*.

LITHARGE, what, and how made, ſee *Purification of Silver*.

LITHIASIS, the Breeding of the Stone in the Kidneys or Bladder.

LITHONTRIPTICKS, are Medicines which break the Stone, either in the Bladder or the Kidneys.

LITHOTOMIA, is the Grand Operation of cutting the Stone out of the Bladder; and is thus deſcribed by *Blanchard*. The Operator lays the ſick Perſon upon a ſoft Pillow, in the Boſom or Lap of ſome ſtrong Man, after he has leap'd three or four times from on high, then he ties the Hands on

each ſide faſt to the Sole of the Foot, and two People ſtanding on each ſide hold the Knees as open as poſſible. After this, the Operator moiſtening one Finger of his Left-Hand, or if Neceſſity require the two foremoſt, with Oyl of White Roſes, thruſts them up into the Fundament, and with his Right-Hand preſſes the Upper Parts of the Secrets lightly, that by this means the Stone may be brought to the *Perinæum*; which when he has forced thither, with his Fingers, he cuts with a two-edged Knife, proportionably to the Bigneſs of the Stone, in the Left Side, betwixt the Teſticles and the Fundament, near to the Suture of the *Perinæum*, bringing the Stone towards the Knife: And if the Stone come not out, either of its own Accord, or by thruſting of the Fingers, he draws it out with the *Forceps*; *i. e.* a pair of Pincers, or ſome ſuch Inſtrument of Art. The Stone being drawn out, and all the Bands being looſed, he cloſes the Wound duly, applies Remedies, ſtops the Blood, and takes Care that the Wound be cloſed up, leſt the Urine ſhould continually drop through. This Way is called *Apparatus minor*, and is uſed eſpecially in Boys, though it be frequently practiſed too in Adult Perſons in theſe Countries. This we in *England* call *Cutting upon the Gripe*, and is the Method that our *Suters* always cut by: But in the *Apparatus major*, or the greater Operation, which we call *Cutting upon the Staff*, the Patient, bound as before, is ſet upon a Table, and held there; then the Chyrurgeon thruſts in his Inſtrument, called *Itinerarium*, by the Urinary Paſſage into the Bladder, as far as the very Stone; and cutting an Hole, as before, he puts another Inſtrument called *Conductor*, into the hollow Part of the *Itinerarium*, through the Wound; then the *Itinerarium* being taken out of the Urinary Paſſage, he puts in the Inſtrument called *Forceps* (a ſort of Pincers) or any other fit to pull out the Stone through the Wound before made, that he may lay hold of the Stone, and bring it out: This being done, the Wound is bound up, and conſolidated, as 'tis in Children; only if it be large, it is ſtitched up, and an Inſtrument of Silver applied to it for Two or Three Days, which is uſeful to let out concreted Blood, Phlegm, and Gravelly Urine. There is yet another Way of taking out the Stone, to wit, By making a Hole in the *Abdomen*, by which the Stone is taken out of the Bottom of the Bladder; and in this way no dribling of Urine need to be feared. *Blanchard.*

LITHOTOMIST, is a Chyrurgeon who is skilful in cutting out the Stone of the Bladder.

LITOTES, or *Diminutio*, is a Trope in Rhetorick, by which we ſpeak leſs than we think: As when we ſay, *I cannot commend you*; it implies a ſecret Reprehenſion for ſomething committed that hinders us.

LITTORAL *Shells*, are with the Writers of Natural Hiſtory, ſuch Sea-ſhells as are always found near the Shores, and never far off in the Deep: But ſuch as are found there in the Bottom of the Sea, remote from the Shore, they call Ἐμβύθιοι and *Pelagiæ.*

LIVER *of Antimony*: See *Crocus Metallorum.*

LIVERY hath Three Significations: In one it is uſed for a Suit of Cloth or Stuff that a Gentleman giveth in Coats, Cloaks, Hats, or Gowns, with Cogniſance, or without, to his Servants or Followers. In the other, it ſignifies a Delivery of Poſſeſſion to thoſe Tenants which held of the King *in Capite*, or Knight's Service; for the King, by his Prerogative, hath *primier Seiſin* of all Lands and Tenements ſo holden of him. In the Third Signification, *Livery* is the Writ which lies for the Heir to obtain the Poſſeſſion of Seiſin of his Land at the King's Hands.

LIVERY *of Seiſin*, is a Delivery of Poſſeſſion of Lands or Tenements, or rather Things Corporeal, unto one that hath Right, or a Probability of Right to them. This is a Ceremony in the Common Law, uſed in Conveyance of Lands or Tenements, *&c.* where an Eſtate in Fee-ſimple, Fee-tail, or a Free-hold, ſhall paſs; and is a Teſtimonial of the willing departing of him who makes the *Livery*, from the Thing whereof *Livery* is made; and the Receiving of the *Livery* is a willing Acceptance of the other Party. And it was invented, that the Common People might have Knowledge of the Paſſing or Alteration of Eſtates from Man to Man, that thereby they might be the better able to try in whom the Right of Poſſeſſion of Lands and Tenements were, if they ſhould be impannelled in Juries, or otherwiſe have to do concerning the ſame. Of this *Livery* there be two kinds, *viz.* a *Livery in Deed*, and a *Livery in Law*: A *Livery in Deed*, is when the Feoffer taketh the Ring of the Door, or Turf or Twig of the Land, and delivereth the ſame to the Feoffee in the Name of the *Seiſin* of the Land. A *Livery in Law*, is when the Feoffer ſaith to the Feoffee, being in View of the Houſe or Land, *I give to you yonder Land, to you and your Heirs; and therefore enter into the ſame, and take Poſſeſſion thereof accordingly*: And the Feoffee doth accordingly, in the Life of the Feoffer, enter: This is a good Feoffment.

LIVIDUS: See *Pectineus.*

LIXIVIOUS, or *Lixiviate Salts*, are the fix'd Salts of Plants, *&c.* They are drawn by *Calcination* of the Plant, and then making a Lye or Lixivium of the Aſhes and Water; whence this Name. See *Salts.*

Mr. *Boyle* ſaith, The diſtinguiſhing Mark of *Lixivious Salts*, whereby they differ from Urinous ones, is, That they will turn a Solution of Sublimate in Common Water, into a Yellow Colour: See *Experiments on Colours.*

LIZIERE, a Term in Fortification; the ſame with *Berme*; which ſee.

LOADSTONE: See *Magnet.*

LOBE, a Word uſed moſtly by Anatomiſts for the Diviſion of the Lungs into ſeveral Parts, which they call *Lobes*: And by Botaniſts, for the Diviſion or Parts of the Bulk of Seeds, which uſually conſiſt of two Parts or Lobes; as is very conſpicuous in Beans.

LOBUS *Auris*, is the lower Part or Tip of the Ear.

LOCAL, is whatever is ſuppoſed to be tied or annexed to any particular Place: Thus in Law, they ſay the Thing is *Local*, and annexed to the Free-hold.

And an Action of Treſpaſs for Battery, *&c.* is Tranſitory, not *Local*; that is, it is not needful that the Place where the Battery was committed, ſhould be ſet down as material in the Declaration; or if it be ſet down, the Defendant cannot traverſe it, by ſaying he did not commit the Battery in the Place mentioned in the Declaration, and ſo avoid the Action.

LOCAL *Medicaments*, are thoſe which are applied outwardly, as Plaiſters, Ointments, Salves, &c. Theſe are alſo frequently called *Topicks*.

LOCAL *Problem*, in Mathematicks, is ſuch an one as is capable of an infinite Number of different Solutions: ſo that the Point which is to reſolve the Problem, may be indifferently taken within a certain Extent; as ſuppoſe any where in ſuch a Line, within ſuch a Plane Figure, &c. which is called a *Geometrick Place*, and the Problem is ſaid to be a *Local* or *Indetermined* one. And this *Local Problem* may be either *Simple*, when the Point ſought is in a Right Line; *Plane*, when the Point ſought is in the Circumference of a Circle; *Solid*, when the Point required is in the Circumference of a Conick Section; or, laſtly, *Surſolid*, when the Point is in the Perimeter of a Line of the *ſecond Gender*, as the Geometers call it.

LOCH, or *Lohoch*, the ſame with *Eclegma*.

LOCHIA, are the Natural Evacuations of Women in Child-bed, after the Birth of the *Fœtus*, and the Excluſion of the Membranes call'd *Secundinæ*, or the After-birth.

LOCKER, in a Ship, is a kind of Box or Cheſt made along the ſide of a Ship, to put or ſtow any thing in.

LOCKING-WHEEL, ſee *Count-Wheel*, a Term in Watch-work.

LOCK-SPIT, a Term in Fortification, ſignifying the ſmall Cut or Trench made with a Spade, to mark out the firſt Lines of any Work that is to be made.

LOCULAMENTUM, in Botanicks, is a little diſtinct Cell or Partition within the common *Capſula ſeminalis* of any Plant; as thoſe within the Seeds of Poppies, &c. by which one Parcel of the Seeds is kept diſtinct from another.

LOCUS, or the *Place* of any Body, is rightly, by Mr. *Newton*, diſtinguiſhed into *Abſolute* and *Relative*: And ſo ought *Space* to be accounted; for the

LOCUS *Abſolutus*, or *Primarius* of any Body, is that Part of the abſolute and immovable Space, or extended Capacity, to receive all Bodies which this individual one takes up: But the

LOCUS *Relativus*, or *Secundarius*, is that apparent and ſenſible Place in which a Body is determined to be placed in by our ſelves, and with relation to other adjoyning or contiguous Bodies.

LOCUS *Apparens*, a Term in Opticks: See *Apparent Place of any Object*. 'Tis alſo in Aſtronomy, that Place in which any Planet or Star appears, when viewed from an Eye at the ſenſible Horizon.

LOCUSTÆ, are the Beards and pendulous Seeds of Oats, and of the *Gramina paniculata*; to which the Botaniſts gave this Name from their Figure, which ſomething reſembles that of a Locuſt.

LODGMENT, in Military Affairs, is ſometimes an Incampment made by an Army; or oftner, it is a Retrenchment dug for a Covert or Shelter, when the Counterſcarp, or ſome other Poſt, is gain'd. It is alſo taken for the Place where the Soldiers quarter among the Burghers, either in Huts, Baraques, or Tents.

LODGMENT *of an Attack*, is a Work caſt up by the Beſiegers, during their Approaches in a dangerous Poſt, where it is abſolutely neceſſary to ſecure themſelves againſt the Enemy's Fire; as in a *Covert-way*, in a *Breach*, in the Bottom of the Moat, or elſewhere. This Lodgment conſiſts of all the Materials that are capable to make Reſiſtance, *viz.* *Barrels* and *Gabions* of Earth, *Palliſadoes*, *Woolpacks*, *Mantelets*, *Faggots*, &c.

LOG, and *Log-line*: The *Log* aboard a Ship, is a Piece of Board or Wood about 7 or 8 Inches long, of a Triangular Figure, and with as much Lead caſt into it at one End, as will ſerve to make it ſwim upright in the Water; at the other End of which is faſten'd a ſmall long Line, called The

LOG-LINE; which is wound about a Reel for that Purpoſe, fix'd in the Gallery of the Ship. This Line, for about 10 Fathom from the Log, hath, or ought to have, no Knots or Diviſions; becauſe ſo much ſhould be allowed for the Log's being clear out of the Eddy of the Ship's Wake before they turn up the Glaſs: But then the Knots or Diviſions begin, and ought to be at leaſt 50 Foot from one another; tho' the common erroneous Practice at Sea, is to have them but at 7 Fathom, or 42 Foot Diſtance.

The Uſe of this *Log* and *Line* is to keep an Account, and make an Eſtimate of the Ship's Way; for as many Knots as run out in half a Minute of Time (which they meaſure by a Half-minute Glaſs) ſo many Miles do they account the Ship to ſail in an Hour; or ſo many Leagues and Miles doth ſhe run in a Watch: as, if there be veered out 4 Knots in half a Minute, the Ship runs 4 Miles an Hour, or 5 Leagues and 1 Mile in a Watch.

The Practice of heaving the *Log*, is firſt to let it down into the Water, and then to let it run away ſo far, as to be out of the Eddy of the Ship's Wake; and then one having an Half-minute Glaſs in his Hand, turns it up juſt when the firſt Knot runs off the Reel (tho' ſome turn up the Glaſs juſt when the Log touches the Water) and then the Line running eaſily off, when the Glaſs is out, he cries, *Stop!* The other ſtops the Reel; and then they count the Knots run out, and if they can be ſo exact, as to account the odd Feet, which the Line ſhall run out above any Knot, they ought to account 5 Feet for a Tenth part of a Mile more: And thus, if 3 Knots 45 Feet run out in an half Minute, the Ship goes at the rate of 3 Miles 9 Tenths in an Hour.

Now tho' this at beſt be but a precarious way, 'tis however the moſt exact of any in uſe, and much better than that of the *Spaniards* and *Portugueſe*, who gueſs at the Ship's Way by the running of the Froth or Water by the Ship's ſide; or than that of the *Dutch*, who uſe to heave over a Chip into the Sea, and ſo to number how many Paces they can walk on the Deck, while the Chip ſwims or paſſes between any two Marks or Bolt-heads on the ſide. And the Ground and Reaſon of this Practice of keeping an Account of a Ship's ſailing by the *Log*, is this:

1. That 5 of our *Engliſh* Feet make a Pace, and 1000 of ſuch Paces a Mile, and 60 of ſuch Miles a Degree, and conſequently a Degree would contain 300000 Feet. But this is erroneous on all Accounts; for there are both 1006 Paces in a Mile, and 72 ſuch Miles in a Degree.

2. But then this hath been corrected by Mr. *Norwood*, in his *Seaman's Practice*; who, by moſt exactly meaſuring the Diſtance of two Places under the ſame Meridian, and finding alſo the Latitudes of thoſe two Places by moſt accurate Inſtruments and Obſervations, he found, That to a Degree of a Great Circle on the Earth there muſt be 367200 *Engliſh* Feet: And this hath been in a good meaſure confirmed by the *French* Obſervations and Menſurations, who found a Degree to contain 365184 Feet. And yet Mr. *Norwood* conſidering that the

Ship's Way is really more than what is found by the *Log*, and alſo knowing that 'tis better and ſafer to have the Reckoning to be ſomething before the Ship, and probably alſo becauſe 'tis a round Number, caſt away the 7200 odd Feet, and ſuppoſe a Degree to contain juſt 360000 Feet. Then will a Minute of a Degree contain 6000 ſuch Feet; and that is to be reckoned for the true *Sea Mile*, 60 of which make a Degree: And ſince 5280 Feet are a Statute Mile, there will be 68 $\frac{2}{11}$ ſuch Miles in a Degree; and of the *Italian* Miles, of 5000 Feet, 72, or 24 Leagues in a Degree. And after this way of accounting, the whole Circumference of our Globe will be 8640 Leagues, or 25920 Miles; which is 120 Leagues, or 360 Miles leſs than the *French* make it: And yet this is probably leſs than the Truth, and in Fact leſs than Mr. *Norwood*'s Account.

Now to apply all this to the Eſtimation of a Ship's Way by the *Log*: If it be conſidered that an half Minute is the 120th part of an Hour, 'tis plain the Diſtance between Knot and Knot in the *Log-line*, muſt be alſo the 120th part of a Minute of a Degree of a great Circle on the Earth; or 120th part of a true Sea Mile or Minute, which is before ſhewed to contain 6000 Feet: And therefore the Diſtance between the Knots muſt be 50 Foot; (for 50 multiplied by 120, produces 6000) becauſe as 30 Seconds is to an Hour, or 3600 Seconds is to a Day; ſo is 50 Feet to 6000 Feet. Wherefore as many times 50 Feet as a Ship ſails in half a Minute, ſo many Miles muſt ſhe go in an Hour, ſuppoſing her to keep on at the ſame Rate. To try which, in long Voyages to the *Eaſt-Indies*, *&c.* the *Log* is heaved every Hour; but in ſhorter Voyages they content themſelves with doing it but every two Hours; tho' always the oftner 'tis done, the better.

And from hence plainly appears the groſs Error of having but 42 Feet or 7 Fathom between Knot and Knot, which is the common Diviſion of the *Log-line* at Sea. Indeed, being ſenſible their Diviſions are too ſhort, they leſſen their Half-minute Glaſs proportionably, as having that made of only 24 or 25 Seconds. But this is nothing but correcting one Blunder or Error by another; and ſhews plainly that the Common Sailors will not go out of their way, tho' they are ſure they are in the wrong.

Commonly in the Steerage, or ſome ſuch convenient Part of the Ship, hangs up a Board called the

LOG-BOARD; which is a Table divided into Five Columns, and ought to be of the following Form, or one like it.

This *Log-Board*'s Account ought daily at Noon (when if poſſible, let there be an Obſervation of the Latitude) to be entred into the *Log-Book* or *Traverſe-Book*, ruled and columned juſt as the *Log Board* is; from whence it may be tranſcribed into the Journals, and how much way the Ship hath gained in her Courſe, eſtimated daily.

To meaſure whether the Half-minute Glaſs be true, or to make one upon Occaſion, when you can get aſhore, you may uſe this Method:

Faſten a moderately heavy Plummet or Weight at the End of a ſmall String, which hang up againſt a Wall by a ſmall Pin or Wire, *&c.* and let its Length from the Pin where it hangs, to the Center of the Plummet or Weight, be juſt 39 Inches $\frac{1}{8}$. Then draw by the Lines hanging ſtill, a Perpendicular on the Wall behind, with a Pencil or ſome ſuch thing: And taking the Plummet in your Hand, move the Pendulum from the Perpendicular either way 6 or 7 Inches, and then let it ſwing freely by

Hour of the Day.	*Ships Courſe.*	*Log-lines run* Knots	Feet.	*Winds, Weather, Accidents, &c.*

the Wall; after which take your Half-minute Glaſs, and turn it up juſt when you ſee the String come right againſt the Perpendicular on the Wall, and then count the Swings of the Pendulum from its paſſing by the Perpendicular; and if your Glaſs is out, juſt when it hath made 30 Swings, it is right, elſe not; for this Pendulum ſwings exactly Seconds.

LOGARITHMS, which Captain *Halley* very well defines to be the Indexes of the *Ratio*'s of Numbers one to another, were firſt invented by my Lord *Neper*, a *Scotch* Baron; and afterwards compleated by Mr. *Henry Briggs*, Savilian Profeſſor of Geometry at *Oxford*.

1. *Logarithms* are a Series of Artificial Numbers (invented for the Eaſe and Expedition of Calculation) proceeding in an Arithmetical Proportion, as the Numbers they anſwer to do in a Geometrical one: As for Example,

1, 2, 4, 8, 16, 32, 64, 128, 256, are Numbers proceeding from Unity, in a Geometrical Proportion continued. Now if over theſe you place a Series of Numbers (beginning with 0) in an Arithmetical Proportion, they will ſtand thus:

0	1	2	3	4	5	6	7	8	9
1.	2.	4.	8.	16.	32.	64.	128.	256.	512, *&c.*

And the Numbers above, beginning with (0), and Arithmetically Proportional, are called *Logarithms*.

2. The Addition and Subtraction of *Logarithms* anſwers to the Multiplication and Diviſion of the Numbers they anſwer to. Thus the *Logarithm* 2 added to 4, makes the *Logarithm* of 6, whoſe correſponding Number is 64, (the Product of the Number 4 multiplied into 16). Alſo the *Logarithm* 5 ſubtracted from 9, leaves the *Logarithm* of 4, whoſe Number is 16, (equal to 512 divided by 32).

And the Caſe would be the ſame if any other Rank of Numbers in an Arithmetical Proportion were

were made to anſwer to the Numbers below. And therefore there may be many ſorts of *Logarithms*, as indeed there are.

And thus alſo will Extraction of Roots be performed by biſſecting the *Logarithms* of any Numbers for the Square Root, and triſecting them for the Cube: As for Inſtance,

To extract the Square Root of 256, divide its *Logarithm* 8 by 2, and it will quote 4; which *Logarithmick* Number 4, hath for its abſolute Number 16, and therefore 16 is the Square Root of 256.

To extract the Cube Root of 64, divide its *Logarithm* 6 by 3, and the Quote will be 2, which is the *Logarithm* of 4, the Cube Root of 64.

3. To apply this Matter for the making of a *Canon* or Table of *Logarithms*, that ſhould anſwer to Common Numbers in their natural Order, the Inventers proceeded in this Method:

They pitched on thoſe which are naturally Geometrically proportional; as

1, 10, 100, 1000, 10000, 100000, 1000000, 10000000, *&c.*

And to theſe they fitted not the ſingle *Logarithms*, 0, 1, 2, 3, *&c.* as in our Inſtance, Numb. 1. above, but *thoſe* augmented with many Cyphers, in order to fit proper *Logarithms* for all intermediate Numbers between 1 and 10, 10 and 100, 100 and 1000, *&c.* They made therefore 0000000 to be the *Logarithm* of 1, and 10000000 to be the *Logarithm* of 10; alſo 20000000 they put for the *Logarithm* of 100, and 30000000 for the *Logarithm* of 1000, making ſtill the *Index* or *Characteriſtick* of the *Logarithm* to be one leſs than the Number of Places in the Abſolute Number, becauſe they appointed 0000000 as the *Logarithm* of 1.

5. But then the greateſt Difficulty and Pains was yet to come, which was to find *Logarithms* for all the intermediate Numbers correſponding with thoſe appointed for 1, 10, 100, 10000, *&c.* which with moſt indefatigable Pains and Care they thus effected. In order (*e. g.*) to get the *Logarithm* of 9, they found a middle Proportional between the abſolute Numbers 1 and 10, encreaſed with ſeven Cyphers each: Then that Number not being exactly the abſolute Number 9, but bigger or leſſer than 9, (with ſeven Cyphers added to it) they accordingly found out new Geometrical mean Proportionals between that Number and 10, if it were leſs; and between *that* and the next leſs than it, as ſoon as it came to be bigger, *&c.* till at laſt, after a prodigious Number of Trials, *viz.* 25. they came to the abſolute Number 8, 9999998, which approacheth very near to 9, 0000000. And in order to find the *Logarithm* of this Number 8, 9999998, they found an Arithmetical mean Proportional between the *Logarithm* of 0 and 10 (*i. e.* between 0000000 and 10000000). And then another between *that ſo found*, and 10000000 again; and ſo on, 'till at laſt they came to 0, 9542450. the exact *Logarithm* of 9.

They were forced to proceed after the ſame manner alſo to gain the *Logarithm* of 5; but then their Work grew ſomething eaſier, and more expeditious.

1. For ſince by dividing 10 by 5, the Quotient is 2; therefore the *Logarithm* of 5, ſubtracted from the *Logarithm* of 10, muſt give the *Logarithm* of 2.

2. And as 10, multiplied by 2, gives 20; therefore the *Logarithm* of 9 being divided by 2, or halved, muſt give the *Logarithm* of 3.

3. Since the Square Root of 9 is 3; therefore the *Logarithm* of 9 being divided by 2, or halved, muſt give the *Logarithm* of 3.

4. By ſubtracting the *Logarithm* of any one known Number, from that of another; you have the *Logarithm* of the Quotient of the former Number dividing the latter.

And after this or the like manner they proceeded till they had compleated the Canon of *Logarithms* to Numbers reaching to 10000.

If you would ſee an eaſie and expeditious way of making ſeveral ſorts of *Logarithms* to a large Radius, conſult Capt. *Edm. Halley's Diſcourſe in Phil. Tranſ.* N. 216. Where from the pure Conſideration of Numbers, and withal by the Help of Sir *Iſ. Newton's* Method of finding the *Unciæ* of the Numbers of a Binominal Power, he ſhews how to find readily the *Logarithms* of all Numbers to above 30 Places; and he gives there ſeveral *Series* for this Purpoſe; ſome Univerſal, and ſome appropriated to peculiar ſorts of *Logarithms*.

Nicholas Mercator alſo did a good while ſince make ſome Improvements in this Affair, of which you have Dr. *Wallis's* Thoughts in *Phil. Tranſ.* N. 38.

And *John Gregory* hath alſo ſhew'd a way to make *Logarithms* to 25 Places, by means of the *Hyperbola*.

For the *Characteriſtick* of a *Logarithm*, ſee in *Index*.

The Uſe of the Table of *Logarithms*.

1. *To find a Logarithm.*

N. B. I here deſcribe only the Common Canon of *Logarithms* contrived by Mr. *Briggs*, and publiſhed in Sir *Jonas Moore's Mathematicks*, and in moſt Books of *Trigonometry*, *Navigation*, *&c.*

1. If the Number, whoſe *Logarithm* you would find, be under 100, you have it always in the firſt Page: Thus the *Logarithm* of 55 is 1.740363.

2. If the Number conſiſts of three Places, that is, a Number under 1000, look for it in the Table under *N.* and the *Logarithm* is found in the Column under 0. Thus the *Logarithm* of 216 is 2.334454.

3. If the Number be of four Places, and under 10000, ſeek the three firſt Figures under *N.* as before, and the laſt Figure on the Top; under which, in that Column lineally againſt the firſt three Figures, you have the *Logarithm* required: Thus the *Logarithm* of 3583 is 3.554247, find 358 under *N.* againſt which, in the Column under 3, ſtands your *Logarithm*.

4. If the Number be above 10000, and under 100000, you muſt find it by the *Difference* and Table of Parts Proportional: Thus, if the *Logarithm* of 35786 be required, firſt ſeek the *Logarithm* of the former four Figures 3578, which will be 3.553649; and the common Difference under *D.* is 121: With this Difference enter the Table of Parts proportional, and find 121 in the firſt Column under 3: and then lineally againſt that Number, and under 6, the laſt Figure of the Number 35786, found at the Head of the ſeventh Column, you will find 72; which being added to the *Logarithm* of 3578, *viz.* 553649, makes 4.553721, the *Logarithm* of 35786; and the Index muſt be 4, becauſe the Abſolute Number conſiſts of five Places.

5. If the Number be above 100000, and under 1000000, as ſuppoſe 357865; then find (as before) the *Logarithm* of the firſt five Figures, *viz.* 35786, and 'twill be found to be (omitting the Characteri-

ſtick

ſtick 5) 553721 : After this, multiply the remaining Figure (5) of the given Number, by the common Difference 70, (found under *D.*) and 'twill produce 350 ; then cut off (0) the laſt Figure of the Product, and add the remaining (35) to the *Logarithm* 553721 aforeſaid, the Sum is 553756 ; to which prefix the proper Characteriſtick (5) becauſe the Number given hath ſix Places, and 5.553756 is the *Logarithm* required for 357865.

If the Number be above 1000000, and under 10000000 ; find the *Logarithm* of the firſt five Figures (as before) and multiply the common Difference by the two remaining Figures ; from which Product cut off the two laſt Figures, and add the other (as before) prefixing 6 for a Characteriſtick, *&c.*

7. And ſo for any other greater Number proportionably ; only be ſure to cut off from the Sum ſo many Figures as you multiply the common Difference by ; and add the Remainder to the *Logarithm*, and prefix the Characteriſtick proper, that is, a Figure of one place leſs than the abſolute Number, whoſe *Logarithm* is required.

2. Next I will ſhew the *Way of finding the Number anſwering to a* Logarithm *given.*

Omitting the Characteriſtick, ſeek in the Table for that *Logarithm*, which is equal or next leſs to the *Logarithm* given, the Abſolute Number in the Column under *N*, with that on the Top over the *Logarithm*, is the Number deſired, which muſt be ordered according to the Characteriſtick.

Thus, to find what Number anſwers to the *Logarithm* 3.544821 ; omitting the Index 3, I find 544821 to anſwer to 3506, which the Index 3 ſhews to be all Integers ; but if the Index had been 1, then the Number would have been 35.06, that is, 35 Integers and .06 hundred Parts.

But if the *Logarithm* be not exactly to be found in the Tables, and five places be required, find the Number to four places (as before) noting the common Difference under *D*, then take the Difference betwixt the *Logarithm* given, and the *Logarithm* found in the Table leſs than it ; ſeek the common Difference in the Table of proportional Parts under *D*, and in that Line find out the Difference of the *Logarithms*, and at the Top juſt about it you have the fifth Figure : Thus, if the *Logarithm* required had been 2.543612, the *Logarithm* next leſs is 543571, anſwering to 3496 ; the common Difference is 124, the Difference of the *Logarithms* is 41, which, in the Table of proportional Parts againſt 124, gives 3 ; ſo that the Abſolute Number is 34963 : And becauſe the Index is 2, the Number will be 349 Integers, and $\frac{36}{100}$ Parts, or 349.63.

To find the Number of a Logarithm, *whoſe Index is* 5 *or more.*

Suppoſe 4 to be the Characteriſtick, and find (by the foregoing Directions) the *Logarithm* as near as you can (ſo it be but leſs) ; then ſubtract this *Logarithm* from the *Logarithm* given ; and to the Right Hand of the Remainder, if the Index be 5, ſet 0 ; if the Index be 6, ſet 00 ; if 7, ſet 000 ; and ſo on proportionally : This done, divide the Sum by the common Difference, and the Quote gives the Figure or Figures to be placed on the Right Hand of the Number anſwering to the firſt found *Logarithm*.

Example.

Let 6.64876 be the Logarithm given : Suppoſe 6 to be 4, the neareſt Logarithm leſs will be 4.648974, whoſe Abſolute Number is 44563. Subtract 4.648974 from the given Logarithm, the Remainder is 2 ; to the Right Hand of which ſet 00, (becauſe the Characteriſtick was 6) the Sum is 200 ; which divide by the common Difference 97, the Quotient is 2, (and an inconſiderable Fraction, which you may omit) which 2 ſet on the Right Hand of 44563, it makes 445632 ; but ſince the Index is 6, the Number muſt have 7 places ; therefore ſet 0 on the Right again, and it makes 4456320, which is the Number nearly correſponding to the Logarithm 6.648976.

Addition, Subtraction, Multiplication, and *Diviſion* in *Logarithms.*

3. In the Addition of two or more Logarithms together, obſerve theſe Rules :

1. If the Indices be Integers, add them as is uſual in common Arithmetick.

2. If the Indices be ſome Integers, and ſome the Indices of Parts or Fractions, they will be *unlike* ; and therefore if when added, their Sum be 10, or above, caſt away 10, the Remainder is the Index of Integers ; if under 10, Decimal Parts : Thus,

2.057821	2.237242
7.583210	9.875062
9.641031	8.698971
	0.811275

3. If the Indices be all Decimals, and when added, make a Sum under 10, then add 10 to the Sum ; if juſt 10, then add Unity ; as above 10, caſt 10 away, and the Index thus gotten is always Decimal Parts : Thus,

9.397941	8.698972
9.875062	9.875061
9.273002	8.574033

4. *Subtraction of* Logarithms.

1. If the Indices be Integers, then proceed as uſually.

2. If the Indices be either of them, or both, Decimal Parts, obſerve whether the Index of the upper Quantity be a ſmaller Number than that of the ſubtrahend or the lower ; if it be, add 10 to it : And if the upper be of a greater Value than the lower, (that is, a bigger Index by Place) then the Remainder will be Integers ; if not, Decimal Parts.

Examples.

2.033421	9.875062	9.875062	1.235781
9.875062	2.033421	8.574031	3.572141
2.158359	7.841641	1.301031	7.663640

5. *The* Logarithm *of a Fraction is thus found.*

Subtract the Logarithm of the Denominator from the Logarithm of the Numerator, the Remainder gives the Logarithm of the Fraction ; as of $\frac{3}{4}$, the Logarithm of 4 is 0.602060, out of the Logarithm of 3, 0.477121, the Difference 9.875061 is the Logarithm of $\frac{3}{4}$, or 75.

6. *To*

6. *To Multiply a* Logarithm.

If the Index be Negative, obſerve, That in multiplying the Figure next the Index, the Tens to be carried in Mind are Affirmative, and are to be deducted out of the Product of the Negative Indices: Thus,

2.543211	1.987214
3	5
5.629633	1.936070

7. *To Divide a* Logarithm, *having a Negative or Fractional Index.*

Obſerve whether the Diviſor will evenly divide the Index, then there is no Difficulty; but if it do not evenly divide the Index, add to the Index ſo many Units, till it may be evenly divided, ſetting the Quotient down for a new Index, augmenting the next Figure by ſo many times 10 as you added to the firſt.

3) 5.321412	2) 5.61228
2.440470	3.80614

8. *Multiplication of Numbers by the* Logarithms.

Add the *Logarithms* of the Numbers together, and the Sum is the *Logarithm* of the Product required.

Multiplicand,	32	1.505150	5.12	0.709265
Multiplier,	52	1.71003	1.55	0.899497
	1664	3.221153	7.936	0.899497

9. *Diviſion of Numbers by* Logarithms.

This is done only by ſubſtracting the *Logarithm* of the Diviſor from the *Logarithm* of the Dividend; and the Remainder will be the *Logarithm* of the Quotient.

Dividend	7286	3.862489	.5512	9.654369
Diviſor	32	1.505150	.0315	8.498311
Quotient	227.8	2.357359	1432	1.156058

10. *Extraction of Square, Cube,* &c. *Roots by* Logarithms.

To extract the Square Root of any Number, is to divide the *Logarithm* of that Number by 2, for the Cube Root by 3. *&c.* That is, in general, divide the *Logarithm* of the Number, by the Index of the Power.

Number	75832	Log. 4.879852	
Square Root,	275.37	2) 2.439926	for the Square R.
Cube Root,	42.327	3) 1.626614	for the Cube Root.

11. *To find a Mean Proportional betwixt two given Numbers by* Logarithms.

Half the Sum of their *Logarithms*, gives the *Logarithm* of the Mean Proportional betwixt them.

The Numbers are,	9	0.954242
	16	1.204120
Sum,		2.158362

Mean Proportional, 12 $S = 1.079181$.

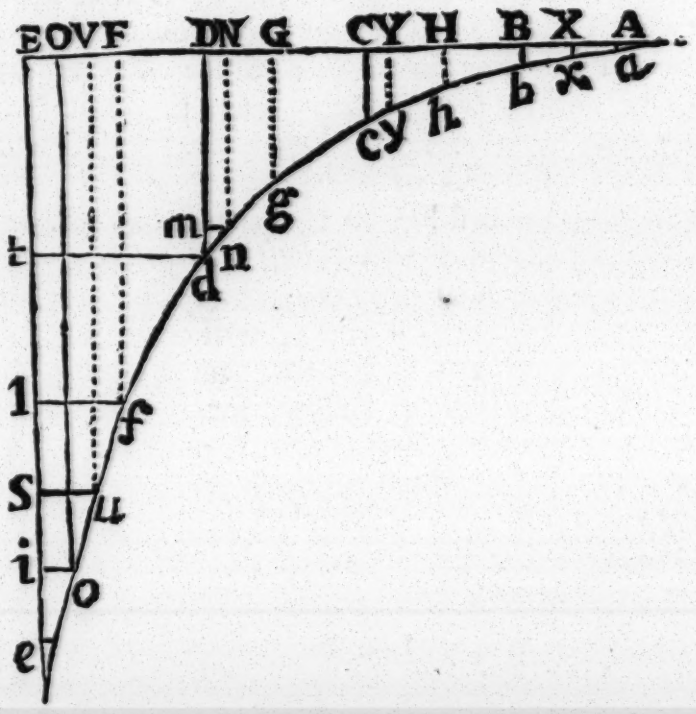
To find any Number of Mean Proportionals betwixt any two Numbers.

Take the Difference of the *Logarithms* of the two given Numbers, which divide by a Number more by one than the Number of Means deſired; and this Logarithmetick Quotient added to the *Logarithm* of the leaſt, gives the *Logarithm* of the *firſt Mean* next it; and then added to the *laſt* Sum, finds the next, *&c.*

As ſuppoſe it were required to find 3 Mean Proportionals between 4 and 64; the *Logarithm* of 4, is 0.602060; of 64, is 1.806180; their Difference, 1.204120 divided by 4, (*i. e.* 3 + 1) gives 0.301030; which added to the *Logarithm* of 4, makes 0.903090, the *Logarithm* of 8, the *firſt Mean*; and again, added to the laſt Sum, gives 1.204120, the *Logarithm* of 16; and again added, gives the *Logarithm* of 32; which are the three Means betwixt 4 and 64.

LOGARITHMICK-LINE *of Pardie*, is a Curve which diſcovers perfectly all the Myſteries of *Logarithms*, with ſeveral other very excellent Properties and Uſes; and is thus delineated.

Let the Right Line *AE* be divided into the equal Parts *AB*, *BC*, *CD*, *DE*, *&c.* from the Points *A*, *B*, *C*, *D*, *E*, *&c.* let the Lines *Aa*, *Bb*, *Cc*, *Dd*, and *Ee*, be drawn all perpendicular to *AE*, and conſequently parallel to one another.



And let them all be in a Geometrical Progreſſion; as let *Aa* be 1, *Bb* be 10, *Cc* 100, *Dd* 1003, *Ee* 10000, *&c.* Then ſhall we have two Progreſſions of Lines, Arithmetical and Geometrical: For the Lines *AB*, *AC*, *AD*, *AE*, are in Arithmetical Progreſſion, or as 1, 2, 3, 4, 5, *&c.* and ſo do repreſent the *Logarithms* to which the Geometrical Lines *Aa*, *Bb*, *Cc*, *&c.* do correſpond.

Let each of the equal Parts *ED*, *DC*, *CB*, *&c.* be divided equally again in *F*, *G*, *H*; and let the Parallels *Ff*, *Gg*, *&c.* be drawn, and be Mean Proportionals between the collateral ones; that is, *Ee* : *Ff* : : *Ff* : *Dd* : : *Dd* : *Gg*, *&c.*

Let there alſo be more Mean Proportionals drawn from the Middle of each Subdiviſion *E F*, *F D*, *D G*, *&c.* and ſo on, till theſe parallel Lines growing very numerous, have at laſt but a very ſmall Diſtance from each other: Then imagine a Curve Line drawn through all the Extremities of theſe parallel Lines, as *e o u d g h a*, and this is called the *Logarithmical Line*.

If this Figure were drawn on a very large Table, and with all requiſite Exactneſs, each Part, *A B*, *B C*, *&c.* might be divided not only into an 100 or 1000, but even into 10000, 100000 equal Parts, and more: So that *A B* being 100000, *A C* would be 200000, *A D* 300000, *&c.* as muſt always be in an Arithmetick Progreſſion.

The Line *E e* being ſuppoſed to contain 10000 Parts, let us imagine through each of thoſe Diviſions a Parallel to be drawn to the Line *A E*, cutting the Curve in ſo many Points, *v. gr.* let the Line *i o* be drawn through the Diviſion 9900 of the Line *E e*, and which cuts the Curve in the Point *o*. Let there be alſo ſuppoſed the Parallel *O o*, cutting the Line *A E* in the Diviſion 399.63; then any one may know that 399563 is the *Logarithm* of the Number 9900. In like manner, if *S u* paſſed through the Diviſion 9000 of the Line *E e*, the Line *V u* were drawn cutting *A E* in 395424, then would that Line *u V*, be the *Logarithm* of 9000, *&c.*

So that by this means a Table of *Logarithms* from 1 to 10000, may eaſily be made; and farther, by producing the Line *A E*.

Note, To obtain all the *Logarithms* from 1 to 10000, 'twill be enough to ſeek the *Logarithms* from 1000 to 10000; that is, (having drawn the Parallel *d t*) to take the *Logarithms* of all the Diviſions from *t* to *e*; which *Logarithms* are all contained between *E* and *D*: For by this you will have the *Logarithms* of all the Parts that are between *t* and *E*, and whoſe *Logarithms* lie between *D* and *A*. For Example; Since *O o* is 9900 Parts, and its *Logarithms* 399563, the ſame Number may be taken for the *Logarithm* of 990, which is *N n*: As alſo of the Number *Y y* 99, changing only the firſt Figure 3; becauſe, according to the Compoſition of this Line, *O N* or *N y*, ought to be equal to *E D* or *D C*; as any one may eaſily prove: So that *O N* or *N y*, will contain 100000. And becauſe *A O* is 399563, ſubſtracting *O N* 100000, there will reſt 199563 for *A y*. And after the ſame manner, having *A y* 395424 for the *Logarithm* of *V v*, which is 9000, you may have alſo 095424 for the *Logarithm* of *X x*, which is 9; or 195424 for the *Logarithm* of 90; or 295424 for the *Logarithm* of 900.

All this may be reduced to Practice for Calculation, without actually drawing theſe Figures, but only imagining them to be drawn: For by the Rules of Common Arithmetick, we may find out *F f*, the Mean Proportional between *d D* and *F f*, or between *F f* and *E e*, &c. But what we have here explain'd, is ſufficient to gain the Knowledge of the Nature and Compoſition of the *Logarithms*.

Though indeed there will not ariſe ſuch Advantage for making *Logarithms* by this Obſervation, as it may at firſt Sight ſeem to promiſe; becauſe there are 9000 Numbers between 1000 and 10000, whoſe *Logarithms* muſt be found alſo; and but 900 between 100 and 1000, and but 90 between 10 and 100, and but 9 between 1 10 and ſo in all 999, which is not the Ninth Part of the former.

In *Phil. Tranſ. N.* 245, is a Quadrature of that Part of the Space contained between any two Ordinates of the Curve and this *Abſciſſa*, by Mr. *John Craig*; and Dr. *Barrow*, in his *Lections*, hath carried the Matter farther: See in *Philoſophical Tranſactions*, *N.* 38. An Account of a very ſhort Way of making *Logarithms*, contrived by *Nicholas Mercator*, with Dr. *Wallis*'s Thoughts upon it, and Additions to it.

Mr. *James Gregory* alſo, in his *Vera Quadratura Circuli & Hyperbolæ*, Printed at *Padua*, *A. D.* 1667. applies the Quadrature of the Hyberbola to the making of *Logarithms*, and computes the *Logarithm* of 10 to 25 Places.

But our Learned Capt. *Halley*, in *Phil. Tranſ. N.* 216, gives a Way from the bare Conſideration of Numbers only; and withal, by the Help of Sir *Iſaac Newton*'s admirable Invention, to find the *Unciæ* of the Members of any Power, (which you have under the Word *Unciæ*) moſt compendiouſly to find the *Logarithms* of all Numbers to above 30 Places, with more Eaſe and Expedition than was ever done before: And he gives there ſeveral *Series* for this Purpoſe, ſome univerſal, ſome applicable to one ſort of *Logarithms*, and ſome to another.

LOGARITHMETICK *Curve*, is the ſame with *Pardie*'s *Logarithmetick Line* above deſcribed.

LOGICK, is the Art of right Thinking, or uſing our Rational Faculty aright: And the Power or Force of Reaſon, unaſſiſted by Art, is called *Natural Logick*.

Logick is derived from thoſe Reflections which Men have made on the Four Principal Operations of the Mind, *viz. Apprehenſion*, *Judgment*, *Diſcourſe*, and *Method* or *Diſpoſition*; which ſee.

The Buſineſs of *Logick* is chiefly to teach us how to make proper Animadverſions on the Operations of our Minds; and from its true Uſe we gain theſe Three Advantages.

Firſt, We are thereby aſſured that we make a right Uſe of our Reaſon: For the Conſideration of Rules, begets in us a more fervent Application and attentive Induſtry of the Mind.

Secondly, That thereby we more eaſily detect and explain the Errors and Defects which we meet with in the Operations of the Mind: For oftentimes it falls out, that we diſcover by the meer Light of Nature the Faults of Ratiocination; yet are not able to give a Reaſon why it is falſe: Thus they who know not what belongs to Painting, may take Exceptions at the Defects of a Picture, tho' they are not able to tell the Reaſon why they find fault.

Thirdly, That we are brought to a more accurate Knowledge of the Nature of our Underſtanding by theſe Reflections upon the Operations of the Mind, which, if we look no farther than meer Speculation, is to be preferr'd before the Knowledge of all Corporeal Things.

LOGISTICAL *Arithmetick*, was formerly the Arithmetick of Sexageſimal Fractions, and uſed by Aſtronomers in their Calculations. I ſuppoſe it was ſo called from a *Greek* Treatiſe of one *Barlaamus Monachus*, who wrote about Sexageſimal Multiplication very accurately, and entituled his Book, Λογιστική. This Author *Voſſius*, in his Book *de Scientiis Mathematicis*, places about the Year 1350, but miſtakes it for a Treatiſe of *Algebra*.

Thus alſo *Shakerly*, in *Tabulæ Britannicæ*, hath a Table of *Logarithms* adapted to Sexageſimal Fractions, which therefore he calls *Logiſtical Logarithms*; and the Expeditious Arithmetick of them, which is by this Means obtained, and by which all

the Trouble of Multiplication and Diviſion is ſaved, he calls *Logiſtical Arithmetick*; though ſome by

LOGISTICKS, will underſtand the firſt General Rules in *Algebra* of *Addition*, *Subſtraction*, *&c.*

LOHOCH, or *Loch*, the ſame with *Eclegma*.

LONCHITES, or *Haſtiformis*, a Species of Comets reſembling a Lance or Spear: Its Head is of an Elliptick Form, and its Tail or Stream of Rays very long, thin, and pointed at the End.

LONG *Accent*, in Grammar, ſhews that the Voice is to ſtop upon the Vowel that has that Mark, and it is expreſſed thus, (-).

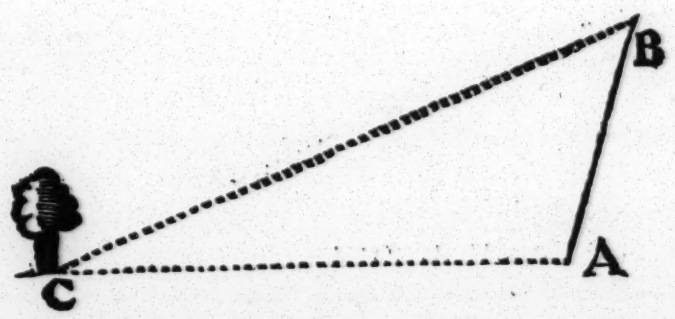
LONG-BOAT, is the largeſt and ſtrongeſt Boat belonging to a Ship, that can be hoiſed aboard of her: Its Uſe is to bring any Goods, Proviſion, *&c.* to or from the Ship; or, on Occaſion, to land Men any where; and particularly to weigh the Anchor; for which End ſhe hath a *David* to be ſet over her Head, with a *Shiver* in it, in which the *Buoy-rope* runs, to weigh the Anchor. She hath Maſt, Sail, and Oars, as other Boats, as alſo her *Tiller* to the Rudder, which anſwers to the *Helm* of a Ship.

LONGANON, the laſt Gut: See *Inteſtinum rectum*.

LONGIMETRY, is the Art of meaſuring Lengths or Diſtances: Or to take the Diſtances of *Trees*, *Steeples*, or *Towers*, &c. either one or many together; for which Purpoſe the *Theodolite* is reckoned to be the beſt Inſtrument, whereof we'll give the following Inſtances.

To Meaſure one ſingle Diſtance.

As ſuppoſe you ſtand at *A*, and would know the Diſtance to the Tree at *C*.



1. Set your Inſtrument at *A*, laying the *Index* with *Sights*, on the North and South Diameter, and turn it about till through the Sights you ſee the Tree at *C*, there fix your Inſtrument faſt.

2. Then from *A*, meaſure any Number of Feet, Yards, or the like, any way; as to *B* 100 Foot, and ſet up a Mark at *B*.

3. Take the Angle *B A C*, 120 deg. 10 min. which ſet down.

4. Set a Mark at *A*, and remove your Inſtrument to *B*, and take the Angle *A B C* 50 Degrees.

Now you have an *Oblique Angled Triangle*, wherein there is given the Angles *B A C* 120 deg. 10 min. *A B C* 50 deg. and the Diſtance *A B* 100 Foot, and conſequently the Angle *C* 9 deg. 50 min. (being the Complement of the other two, to 180 deg.)

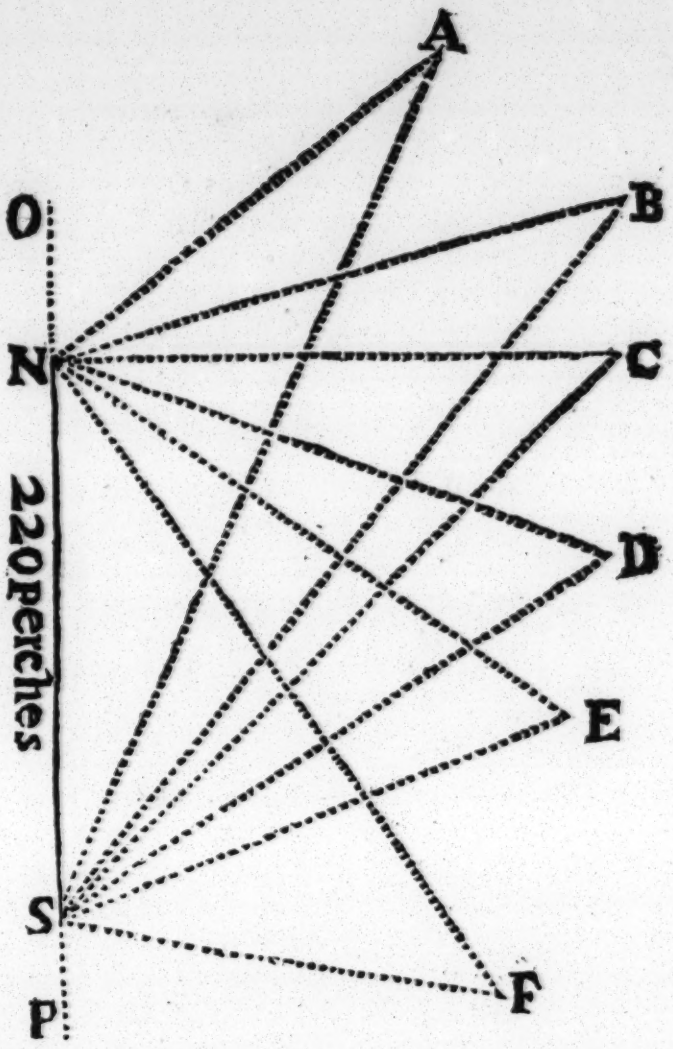
Then S. B C A : A B :: S. C B A : A C.
9° 50′ : 100 :: 50° 00′ 448, 6

And S. C B A : C A :: S, compl. C A B : C B
50° 00′ : 448, 6 :: 59° 50′ : 506, 2

So the Diſtance from C to A is 448, 6 Foot and from C to B 506, 2 Foot.

How to take the Diſtances *of divers Things remote from you; as*, Churches, Towers, Ships at Sea, *or ſuch like; and to make a* Map *of the ſame.*

Suppoſe that the Points A, B, C, D, E and F, were Houſes, Churches, Towers, or the like, and that it was required to make a Draught of them, repreſenting their Situation and true Diſtance one from another.



Let your Stations be *S* and *N*. Set your Inſtrument at *N*, and turn it about upon the Socket till the Needle hang directly over the *Meridian Line* of the *Chard* in the Bottom of the Box, the North end of the Needle over the *Flower-de-lis*; then ſkrew your Inſtrument faſt.

Then turn the *Index* about, till through the Sights you ſee *A*, and note what Degree the *Index* cuts, which ſuppoſe to be 60. Then turn the *Index* about till you ſee *B*, and mark what Degrees is cut by the *Index*; as 74 deg. 30 min. Do thus with all the reſt, be there never ſo many.

Alſo meaſure the Diſtance between *N* your firſt Station, and *S* the ſecond Station; which is 220 Perches: And bring your Inſtrument from *N* to *S*, where it muſt be ſet up, laying the Index upon the North and South Diameter: Turn it about till you ſee the firſt Station *N*, then fix it.

And turn the Index about, till thro' the Sights you ſee *A*, and note what Degrees the *Index* cutteth; as 31 deg. 30 min. Then turn the *Index* about to *B*, *C*, *D*, *&c.* noting the Degrees cut by the *Index* at every moving, and ſet them down in a Table ruled for that Purpoſe, thus,

		At the first Station the Index cut.		At the second Station the Index cut.	
		D.	M.	D.	M.
At	A	60	00	31	30
	B	74	30	38	40
	C	84	30	43	20
	D	104	50	54	00
	E	117	00	68	10
	F	145	10	97	00

Stationary Distance is 220 Perches.

How to Protract these Observations.

1. Draw a Line at Length, as O P; whereon take any Point, as N, for your first Station: Apply the Center of your Protractor to N, and its Diameter upon the Line O P.

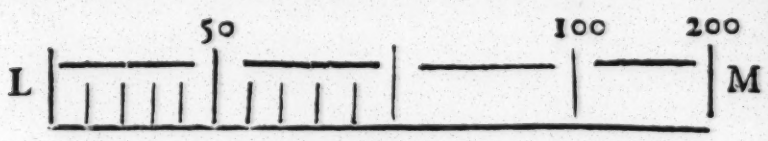
2. Having your *Table of Observations* before you, prick off the Degrees observed, along the Limb of your Protractor; and draw the obscure Lines N A, N B, N C, &c.

3. From some *Scale* of equal Parts (answerable to the Bigness you intend your Plot) take off 220 Perches, and set them from N to S.

4. Apply the Center of the Protractor to S, and its Diameter upon O P, and prick off your Observations at the second Station; and draw the obscure Lines S A, S B, S C, &c. (from S, through the several Marks made on the Paper) cutting the Lines drawn before, N A, N B, N C, &c. in the Points, A, B, C, D, &c. which Points shall represent the several Ships, as they lie at Anchor; or the several Towers, or remarkable Places to be plotted.

To make a Scale *to measure any Distance upon this Plot.*

Let a Line be so divided, that the Distance N S may be 220 Parts thereof, as the Line L M; for the Distance N S, set upon this *Scale*, will reach from 200 to 20 on the small Divisions.



And the *Scale* being thus Divided and Numbred, you may measure any Distance upon the Plot.

To measure any Distance, *thus laid down, by* Trigonometrical Calculation.

The Visual Lines made at both *Stations*, by their Intersections, do constitute several *Right-lined Triangles*; in either of which you will have enough given to find whatsoever Distance you shall require; as suppose the Distance N A were required.

In the *Right-lined Triangle* A N S, you have given; the Angle A N S, 120 deg. (being the Complement of 60 deg. the Angle observed at A, to 180 Degrees) The Angle N S A 31 deg. 30 min. being the Complement of the other two, to 180 Degrees.

Therefore, as S, N A S: N S :: S, N S A: N A.

To find A S, say,
As, S, N A S: N S :: S, A N S: A S.

By the same Method any other Distance may be found: And in this manner may the *Maps* or *Plots* of all eminent *Places* in Cities, Towns, &c. be taken.

LONGISSIMUS *Pollicis*: See *Flexor tertii Internodii.*

LONGISSIMUS *Femoris*; vid. *Sartorius.*

LONGITUDE *of a Place*, is an Ark of the *Equator* intercepted between the Meridian of that Place, and the *first Meridian*: Or 'tis more truly the Difference, either *East* or *West*, between the *Meridians* of any two Places, counted on the *Equator.*

LONGITUDE *in the Heavens*, is an Ark of the *Ecliptick*, counted from the beginning of *Aries*, to the place where the Stars Circle of Longitude crosses the *Ecliptick*: So that, 'tis much the same as the *Stars Place in the Ecliptick*, reckoned from the beginning of *Aries*; which how to find: See, *Place of the Sun or Star.*

LONGITUDE *of the Sun or Star from the next Equinoctial Point*, is the Number of Degrees and Minutes they are from the beginning of *Aries* or *Libra*, either before or after them; which can never be more than 180 Degrees.

LONGITUDE *in Navigation*, is also the Distance of a Ship or Place, East or West from another (counted in proper Degrees); but if in Leagues or Miles, or Degrees of the Meridian, and not in those proper to the *Parallel of Latitude*, it's commonly called *Departure.*

LONGITUDE *in Drolling.* The Ark of the Equinoctial, intercepted between the Substilar Line of the Dyal and the true Meridian, is called the *Planets Difference of Longitude.*

To find the Longitude *and* Latitude *of any Star by the Globe.*

Bring the Solstitial Colure to the Brass Meridian, and there fix the Globe; then will the Pole of the Ecliptick be just under 23 deg. 30 Min. accounted from the Pole above the Horizon, stand on the same Meridian: There skrew the Quadrant of Altitude, and then bring its graduated Edge to the Star, and there stay it; and so the Quadrant will cut the Ecliptick in the *Star's Longitude*, as also its *Latitude* on the Quadrant, reckoned from the Ecliptick.

LONGITUDE *of Motion*, is a Term used by Dr. *Wallis* in his *Mechanicks*, and others, for the Measure of Motion estimated according to the Line of Direction; so that 'tis the Distance or Length which the Center of any moving Body runs through, as it moves on in a Right Line.

And he calls the Measure of any Motion estimated according to the Right Line, or Line of Direction of the *Vis Motrix*, the *Altitude* of it.

LONGUS a Muscle of the *Cubit*, which helps to extend the Arm forwards.

LONGUS, a Muscle of the *Radius*, serving to turn the Palm of the Hand upwards.

LONGUS, a Muscle of the *Tarsus* so called: See *Peroneus Primus.*

LONGUS *Colli*, is a Muscle of the Neck which arises partly tendinous, but chiefly fleshy, from the fore-part of the Five *Vertebræ* of the *Thorax*; and being dilated in its Middle to a fleshy Belly, is inserted to the fore-part of all the *Vertebræ* of the Neck: This with its Partner acting, bends the Neck right forward. Between this and the *Scalenus* lies the *Rectus Internus Major.*

LOOF, or as they usually pronounce it, *Luff* is a Term used in *Cending* of a Ship: Thus *Luff up*,

is to bid the Steers-man keep nearer to the Wind. To *Loof into an Harbour*, is to Sail into it, close by the Wind. To *spring the Luff*, is when a Ship, that before was going *large* before the Wind, is brought close, or, as they say, *claps* close by the Wind. When a Ship sails upon a Wind, as they say, that is, on a Quarter-Wind, the Word of him that cons to the Steers-man, is, *Luff! Keep your Luff! Veer no more! Keep her to! Touch the Wind! Have a care of the Lee-latch*: All which Words signifie much the same thing, and bid the Man at Helm to keep the Ship near the Wind. But on the contrary, if the Ship is to go more *Large*, or Right before the Wind, the Word is, *Ease the Helm! No near! Bear up!*

Steady, is a Word common to both these ways of Sailing, either *on a Wind*, or *Large*, and signifies, that the Man at Helm should keep the Ship straight to her Course, and not let her go in and out, or make *Yawes*, as they call it.

LOOF-HOOK, is a Tackle aboard a Ship, with two Hooks to it, one of which is to hitch into the *Crengle* of the Main and Fore-sail, and the other is to hitch into a certain *Strap*, which is spliced into the *Chesse-tree*, and so down the Sail. Its Use is to succour the *Tackles* in a large Sail, that all the Stress may not bear upon the *Tack*. Sometimes also 'tis used when the *Tack* is to be seized the surer.

LOOF *of a Ship*, is that part of her *a-loft*, which lies just before the *Chesse-trees*; and hence the Guns that lie here are called her *Loof-Pieces*.

LOOF-TACKLE, or *Luff-Tackle*, is a small Tackle in a Ship, serving to lift all small Weights in or out of a Ship.

LOOME: If a Ship appears big at Sea, when seen at a Distance, they say, she *loomes*, or appears a great Sail.

LOOME-GALE, is a gentle, easie Gale or Wind, in which a Ship can carry her Top-sails *a-trip*: see *Trip*.

LOPIDOIDES, the same with *Lepoides*.

LORD, by the Writers of the Law, is divided into *Lord Paramount* and *Lord Mesne*.

Lord Mesne, is he that is Owner of a Mannor, and by Virtue thereof hath Tenants holding of him in Fee, and by a Copy of Court-Roll, and yet holdeth himself of a superior Lord, called *Lord Paramount*. Also he is called *Lord in Gross*, that is, a Lord having no Mannor, as the King in respect of his Crown: And there is a Case wherein a Private Man is *Lord in Gross*; as when a Man makes a Gift in Tail of all the Land he hath, to hold of him, and dieth, his Heir hath but a *Seigniory in Gross*.

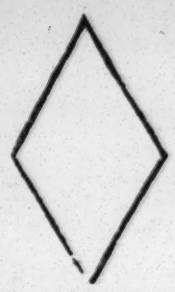
LORDOSIS, by some Writers, is the Term for the bending of the Back-bone forwards in Children, *&c.*

LOTION, a Term used by some Chymists and Pharmacal Writers, signifying only the washing of any Medicine in Water. Some also call Remedies which are between a *Fomentation* and a *Bath*, and which are used to wash the Head, or any Part affected, by this Name of *Lotion*.

LOWER *Flank*, or *Retir'd Flank*; see *Flank*. A Term in Fortification.

LOXODROMIQUES, is the Art or Way of oblique Sailing by the *Rhumb*, which always makes an equal Angle with every Meridian; *i. e.* when you sail, neither directly under the Equator, nor under one and the same Meridian, but obliquely or across them, Hence the Table of Rhumbs, or the Traverse-Table of Miles, with the Difference of Longitudes and Latitudes, by which the Sailor may practically find his Course, Distance, Latitude or Longitude, is by Sir *J. Moore*, and others, called by this Name of *Loxodromiques*; and such Tables as serve truly and expeditiously to find the several Requisites, or resolve the Cases of Sailing, are called *Loxodromical Tables*.

LOZENGE, is that Figure in Heraldry which the Geometers call a *Rhombus*, *i. e.* a Parallelogram, whose Angles are oblique, but Sides all equal; and the Distance between the two obtuse Angles always equal to the Length of one of the Sides. Thus,



In which it differs from the *Fusil*; which see.

In this Figure all unmarried Gentlewomen and Widows do bear their Coats of Arms; because, as some say, 'twas the Figure of the *Amazonian Shield*; or, as others, because 'tis the Ancient Figure of the *Spindle*.

LUCIDA *Coronæ*, a Fixed Star of the Second Magnitude, in the *Northern Garland*; whose Longitude is 217 deg. 38 min. Latitude 44 deg. 23 min. *Right Ascension* 230 deg. 12 min.

LUCIDA *Hydræ*: see *Cor Hydræ*.

LUCIDA *Lyræ*, a bright Star of the first Magnitude, in the Constellation *Lyra*; whose Longitude is 10 deg. 43 min. Latitude 61 deg. 47 min. *Right Ascension* 276 deg. 27 min. and *Declination* 38 deg. 30 min.

LUCIFEROUS, that which brings Light; a Word used by my Lord *Bacon*, and some other Naturalists, for such Experiments in Philosophy as do not so much inrich a Man, as inform and inlighten his Mind about some Physiological Truth, or Speculation in Physicks.

LUES *Venerea*, *Morbus Gallicus*, the *French Pox*, is a malignant and contagious Distemper, communicated from one to another by Coition, or other impure Contact; proceeding from virulent Matter, and accompanied with many ill Symptoms, such as *Gonorrhæa's*, with the Falling-off of the Hair, Spots, Swellings, Ulcers, Pains in the Bones, &c.

LUES *Deifica*: see *Caducus Morbus*.

LUFF, a Sea Term; the same with *Loof*: Which see.

LUMBAGO, is a Pain in the Muscles of the Loins, which *Blanchard* takes to be clogged with Scorbutick Matter; so that the Patient is forced to stand upright, being not able to sit down without great Pain.

LUMBALES *Musculi*: see *Psoas Magnus*.

LUMBARIS *Vena*, a Vein arising from the descending Trunk of the *Cava*, and is not always one, but often two or three on each side, which they divide into the *Lumbaris Superior* and *Inferior*; they are bestowed on Muscles of the Loins, and on the *Peritonæum*.

LUMBARIE *Arteries*, are by some said to come from the *Aorta*, unto all the Parts of the Loins, and to the Marrow of the Back-bone; sending as many Branches to its Joints, as there are Holes in it.

LUMBRICAL *Muscles*, are with some Anatomists, those Four Muscles which serve to move the Fingers or Toes, and are so called from their Worm-like Form.

LUMBRICALES, *seu Vermiculares*, are Muscles of the Fingers, so called from their Figure, being not much unlike the common Earth-Worms; they are also called *Flexores primi internodii digitorum*, from their Use. Those probably perform those minute Motions of the Fingers, when the second and third Internodes are curvated by the two last-treated

of

of Muſcles; and therefore uſed in playing on Muſical Inſtruments, and may be thence named *Muſculi Fidicinales*.

LUMBRICALIS *Pedis*, is a Muſcle of the leſſer Toes, ſpringing from the internal Part of the *Os Calcis*; and becoming tendinous, joyns with the Tendons of the *Perforans* in the middle of the Sole of the Foot; then dividing it ſelf into Four (as it were) diſtinct fleſhy Muſcles, they all become tendinous at their Inſertions to the internal Parts of each leſſer Toe, laterally, next the Great Toe.

LUMINARIES. The *Sun* and *Moon* are ſo called by way of Eminence, for their extraordinary Luſtre, and the great Proportion of Light that they afford us.

LUNA *Cornea*, is a tough inſipid Maſs, almoſt like Horn, made by pouring warily on Chryſtals of Silver (which Chryſtals were made by diſſolving that Metal in good Aqua-fortis or Spirit of Nitre) either Spirit of Salt, or a ſtrong Brine made of common Salt and Water. The Mixture is dried, and then brought to Fuſion in a Crucible, or a Glaſs Phial; where, after it hath been kept a little while ſo, it turns into this Shape, which the Chymiſts call *Cornea Lunæ*.

In which Proceſs, 'tis very remarkable, that tho' a Solution of Silver be commonly one of the worſt of Bitters, and Spirit of Salt have a very ſowre and acid Taſte, yet the Union of theſe together, produces a Body perfectly inſipid; which plainly ſhews that Taſtes depend on Mechanical Principles, and are various, according to the various Textures of Bodies.

LUNARY *Months*, are either *Periodical*, *Synodical*, or *Illuminative*; which ſee in their proper Places.

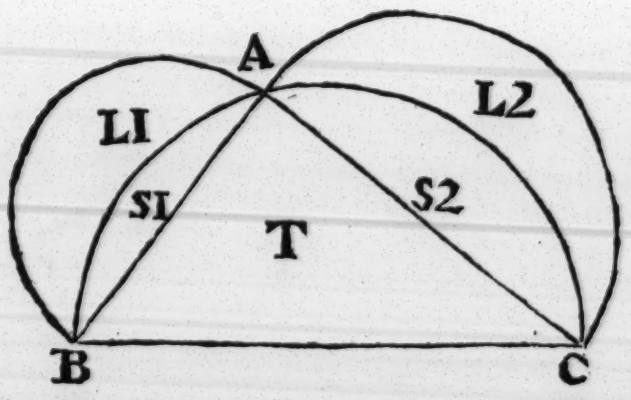
LUNAR *Cycle*: ſee *Cycle of the Moon*.

LUNATIONS *of the Moon*, are the Times between one New Moon and another: And this is greater than the Periodical Month by two Days and five Hours; and is called the *Synodical Month*, conſiſting of 29 Days, 12 Hours, and $\frac{3}{4}$ of an Hour.

LUNES, or *Lunulæ*, in Geometry, are Figures in the Form of a Creſcent or Half-moon, made by the Arks of two interſecting Circles; as in the following Figures the Space *L* is called a *Lune*.

PROPOSITION I.

1. *The Quadrature of* Hippocrates *his Lunes.*



I ſay, The Triangle *T*, is equal to the two *Lunes* *L* 1, and *L* 2.

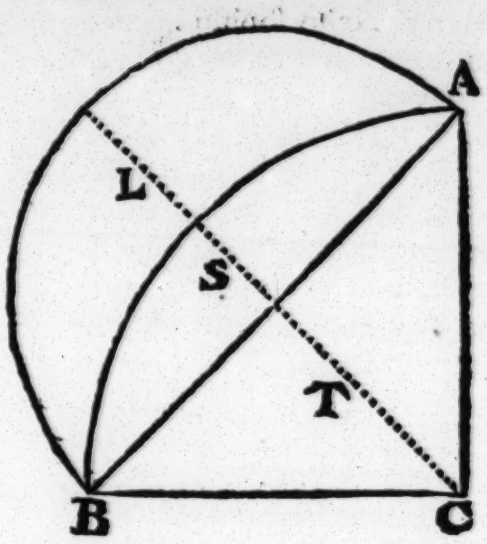
DEMONSTRATION.

The Semi-circle on *BC*, is equal to the Semi-circles on *BA* and *CA*.

And the Segments, *S* 1 and *S* 2, are common to all the three Semi-circles: Which being taken from the greater Semi-circle, they leave the Triangle *T*; and taken from the two leſſer Semi-circles, they leave the two *Lunes*, *L* 1 and *L* 2.

Therefore the Triangle T = to both the *Lunes*. *Q. E. D.*

2. Otherwiſe in a *Quadrant*,



I ſay, The Triangle *T*, is equal to the *Lune L*.

DEMONSTRATION.

The Triangle *T* being Quadrantal and Iſoſcelar, it muſt be that $AB\,q = 2\,BC\,q$.

But $2\,BC = \frac{1}{2}$ Square of $2\,BC = \frac{1}{2}$ the Square of the Diameter of the greater Circle; that is, the Square of the Diameter of the greater Circle, is double the Square of the Diameter of the leſſer Circle *AB*,

Therefore the Semi-circle on $2\,BC$ = twice the Semi-circle *BLA*; and conſequently the Quadrant *ABC* = Semi-circle *BLA*.

Take therefore from each the common Segment *S*, and there remains the *Lune L* = to the Triangle *T*. *Q. E. D.*

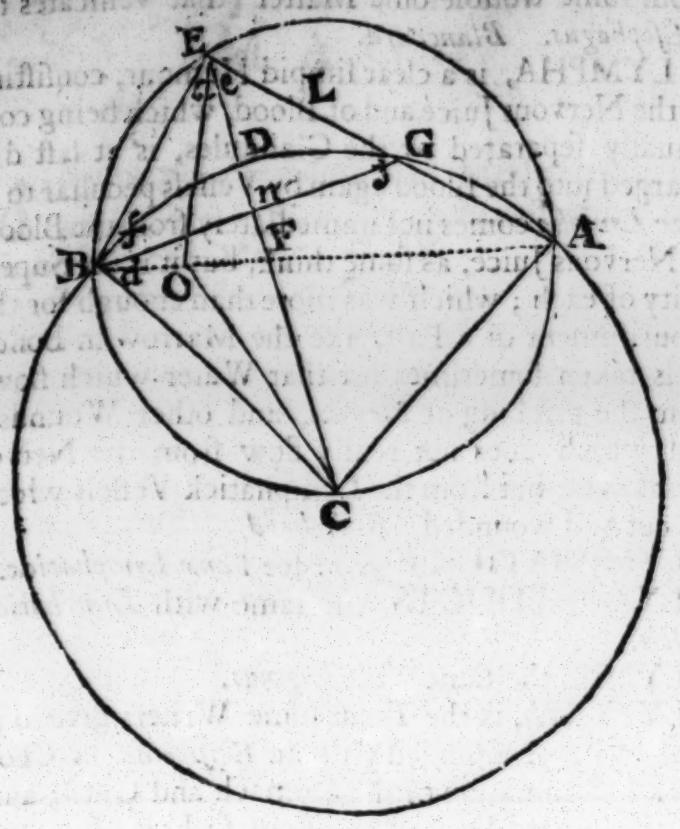
3. *To ſquare the Half of the* Lune *L*.

'Tis certain, that a Right Line drawn from *C* thro' *c* the Center of the leſſer Circle, muſt divide both Triangle, Segment and *Lune* into two equal Parts, and conſequently $\frac{1}{2}\,T = \frac{1}{2}\,L$: And thus the Half-Lune is ſquared.

4. *To ſquare any Part leſs or greater than Half the* Lune.

Let there be a Quadrant, as before, *BAC*, and a *Lune*, as *L*: 'Tis required to find the Segment of the *Lune BED*, made by the Line *EC* drawn to the Center of the greater Circle; which *Pardie* ſaith, is as difficult as ſquaring the Circle. *Lib.* 6. *Art.* 64.

CONSTRUC-



CONSTRUCTION.

Draw *E B* and *E A*, and *B G* at Right Angles with *E C*.

I ſay, the Triangle *B E F* is equal to the Part of the *Lune B E D*.

DEMONSTRATION.

1. The Angle at $G = \frac{1}{2}$ of a Right Angle, becauſe 'tis equal to $o + a + f$, as being external to the Triangle *G E B*: But the Angle at *E* (or $a + o$) = to a Right Angle, becauſe in *a* Semi-circle; and *f* muſt be half a Right Angle, becauſe *o* being in the ſame Segment, is equal to *d*, and conſequently is half a Right Angle; wherefore *g* alſo muſt be half a Right Angle (becauſe *n* is a Right Angle by Conſtruction) and conſequently *f* muſt be half a Right Angle: Wherefore the Right Angle at *E*, and the Right Line *B G*, and alſo the Segment *B D G*, are all biſſected.

2. Alſo the three Triangles, *G E B*, *E G F*, and *E F R*, are Iſoſceles and Rectangled; therefore each one muſt be the half of a Square.

3. Therefore *G B* : *E B* :: $\sqrt{2}$: $\sqrt{1}$. becauſe the Square of *G B* = twice the Square of *E B*.

4. Conſequently the Segment on *G B*, to that on *E B* :: 2 : 1, becauſe they are ſimilar Segments.

5. Therefore $\frac{1}{2}$ of one (*D B F*) = the whole other *E B*; which being taken from the Triangle, and added to the *Lune*, the whole muſt be equal.

And therefore the Triangle *B E F* is equal to the part of the *Lune*. *Q. E. D.*

The Ground of all which is this, That the Angle *BCE* being at the Center of one Circle, and at the Circumference of the other; the Line *E D C* muſt divide the Quadrantal Ark *A G B* in the ſame Proportion as it doth the Semi-circular one *B E A*: Whence follows the Equality of the Segments *B E* and *B D F*, on which all depends.

6. And ſince the $\triangle$ *B C A* = to the whole *Lune B E A G B* by *N.* 3. 'Tis eaſie to take thence a Part (as the Triangle *B O C*) equal to the aſſigned Portion of the *Lune*. For having let fall a Perpendicular from *E*, to find the Point *O*, draw *O C*, I ſay, the Triangle *BOC* = to $\triangle$ *BEF*, and conſequently to the Segment of the *Lune E B D*.

For the Triangle *B C A* and *B E F* are ſimilar, as being each the Half of a Square. Therefore the former is to the latter, as the Squares of their Homologous Sides, *i. e.* in a Duplicate *Ratio* of *B A* to *B E*. That is, as *B A* is to *B O*; by 8 *e.* 6 *Eucl.* The Triangle *A B C*, alſo having the ſame Height with *O B C* will be to it as the Baſe *B A* to the Baſe *A O*, by 1 *e.* 6 *Eucl.* Wherefore the Triangles *A E F* and *B O C* having the ſame Proportion to one and the ſame thing, are equal, by 9 *e.* 5 *Eucl. Q. E. D.*

Wherefore to divide the *Lune* according to any given *Ratio*, you need only divide the Diameter *A B*, according to that *Ratio* in the Point *O*: And from thence erecting a Perpendicular to find the Point *E*, draw *E C*, which ſhall cut off the Portion of the *Lune* deſired.

That Excellent Mathematician and Algebriſt, Mr. *Abr. de Moivre*, hath in *Philoſ. Tranſact.* N. 265. given an Account of the Dimenſion of the Solids generated by the Converſion of *Hippocrates* his *Lune*, and of its Parts about ſeveral Axes, with the Surfaces alſo generated by ſuch Converſion.

LUNETTES, in Fortification, are *Evolopes*, *Countergardes*, or Mounts of Earth caſt up before the Curtain, about five Fathom in Breath, whereof the Parapet takes up three. They are uſually made in Ditches full of Water, and ſerve to the ſame purpoſe as *Falſe Braies*. Theſe *Lunettes* are compos'd of two Faces, which form a Re-entring Angle; and their Platform being only Twelve Foot Wide, is a little raiſed above the Level of the Water, and hath a Parapet three Fathom thick.

LUNULÆ, the ſame with *Lunes*; which ſee.

LUPIA, is a Tumor, or Protuberance, about as big as a ſmall ſort of Bean; ſome take it for a *Meliceris*, others for a *Ganglio*. *Blanchard.*

LUPUS, a Southern Conſtellation, conſiſting of two Stars.

LUPUS, a ſort of Canker in the Thighs and Legs. *Blanchard.*

LUST, If a Ship *heel* either to *Starboard* or *Port*, the Seamen ſay that ſhe hath a *Luſt* that way; and they ſay ſo, tho' it be occaſional only by the *Shooting* of her Ballaſt, or by the unequal *ſtowing* of things in her *Hold*. Tho 'tis more properly ſaid of a Ship, when ſhe is inclined to *heel* any way, upon the Account of her *Mold* or *Make*.

LUTATION, is a cementing of Chymical Veſſels cloſe together.

LUTE (in Chymiſtry) is that wherewith the Chymiſts join together the Necks of the Retorts and Receivers, or wherewith they coat over the Bodies of Glaſs Retorts, to ſave them from being melted in very violent Fires.

The following Compoſition *Lemery* commends as good *Lute*. Take of Sand, Droſs of Iron and Potters Earth in Powder, of each five Pounds; Horſedung cut ſmall, a Pound; powdered Glaſs and Sea-ſalt, of each four Ounces. Temper all theſe well with Water, and then with the Paſt coat the Retorts as far as to half the Neck; or uſe it to *lute* together (as they call it) the Necks of the *Retorts* and *Receivers*. When 'tis dry, 'twill be exceeding hard; and therefore when you would ſeparate the Veſſels, you muſt wet it firſt well with exceeding wet Cloths.

The *Lute* which *Lemery* uſed himſelf, was only two parts of Sand, and one of Clay, tempered together in Water: Which will do very well to join the Noſes of Retorts, and their Receivers in the Diſtillation of Volatile Spirits, *&c.* When you diſtil by the Alembick, or *Veſica*, or Copper Body, with its Head and Serpentine, a wet Bladder will ſerve very well to *lute* the Junctures of the Veſſels. But when corroding Spirits are to be diſtilled, 'twill be better to uſe the following *Lute*. Take fine Flower

Slack'd

Slack'd-lime, of each an Ounce; Potters-Earth, or Powder of Pots, half an Ounce. Make a moiſt Paſte of theſe with Whites of Eggs, well beaten before with a little Water, and this will ſtop exceeding cloſe. *N. B.* This may be very well uſed to ſtop the Cracks that will often happen in Glaſs Veſſels; and there muſt be three Lays of the Paſte bound on with Paper.

Mr. *Boyle* recommends on Experience for this laſt Purpoſe, the following Compoſition, *viz.* Good Quick-lime and Scrapings of Cheeſe pounded in a Mortar, with as much Water as will juſt bring the Mixture to a ſoft Paſte; then ſpread it on a piece of Cloth, and apply it, as Occaſion requires.

LUXATION, a Term in Chyrurgery, is the Diſlocation, diſplacing, or putting any Bone or Joint out of its place.

LUXATOR *Externus*, a Muſcle ſo called: See *Externus Auris*.

LYCANTHROPIA, *Rabies Hydrophobica*, a Madneſs proceeding from the Bite of a mad Wolf, wherein Men imitate the howling of Wolves. *Blanchard*.

LYGMOS, the Hickets, is a convulſive Motion of the Nerves, which ſpread up and down the Gullet, returning after ſhort Intermiſſions: It proceeds from ſome troubleſome Matter [that vellicates the *OEſophagus*. *Blanchard*.

LYMPHA, is a clear limpid Humour, conſiſting of the Nervous Juice and of Blood, which being continually ſeparated by the Glandules, is at laſt diſcharged into the Blood again by Veſſels peculiar to it. The *Lympha* comes not immediately from the Blood, or Nervous Juice, as ſome think, but it is the Superfluity of each; which was more than enough for the Nouriſhment of a Part, like the Marrow in Bones. It is taken ſometimes for that Water which flows from the pricking of Nerves, and other Wounds; and which does not really flow from the Nerves themſelves, but from the Lymphatick Veſſels which are cut and wounded. *Blanchard*.

LYMPHATICK *Veſſels*: ſee *Venæ Lymphaticæ*.

LYMPHEDUCTS, the ſame with *Lymphatick Veſſels*.

LYNX, the ſame with *Lygmus*.

LYPYRIA, is the Term ſome Writers give to a kind of Fever attended with an *Eryſipelas*, or Cholerick Inflammation of the Stomach and Guts; and tho' the inward Parts of the Body feel very hot, yet the outward ones are very cold. *Blanchard*.

LYRA, the *Harp*, a Conſtellation in the Northern Hemiſphere, conſiſting of 13 Stars.

MACHINE, or *Engine*, in Mechanicks, is whatſoever hath Force ſufficient either to raiſe or ſtop the Motion of a Body. Theſe *Machines* are either *Simple* or *Compound*.

Simple Machines, are commonly reckoned to be Six in Number, *viz.* the *Balance*, *Leaver*, *Pulley*, *Wheel*, *Wedge* and *Screw*. To theſe might be added the *Inclined Plane*, ſince 'tis certain that the heavieſt Bodies may be lifted up by the means thereof, which otherwiſe could ſcarce be moved.

Compound Machines, or *Engines*, are innumerable, in regard that they may be made out of the *Simple*, almoſt after an infinite manner.

MACHINA *Boyliana*, Mr. *Boyle*'s Air-pump; which ſee. So called from that Noble Gentleman, being the firſt Inventor of that Engine.

MACROCOSM, is the whole Univerſe, in Contra-diſtinction to *Microcoſm*; which ſome will have to expreſs the Leſſer World, or the Body of Man.

MACULA *Epatica*, is a Spot of a brown or of a ſad yellow Colour, about an Hand's Breadth broad, chiefly ſeizing upon the Groins, the Breaſt and Back, nay, ſometimes it covers the whole Body; is attended with a certain ſlight Aſperity of the Skin, which lets fall Scales, or a ſort of Dendriff from it, which yet do not ſtick all together, but are diſſeminated here and there, and ſometimes diſappear, ſometimes break out again. *Blanchard*.

MACULÆ *Solares*; ſee *Spots in the Sun*.

MACULA *Volatica*, is a red or purple Spot here and there in the Skin; which, if it touch any Orifice in the Body, as the Mouth, Noſtrils, Eyes, Ears, &c. and pierce ſo far, it becomes mortal: It is often fatal to Children. *Blanchard*.

MADRIER, in Fortification, is a thick Plank arm'd with Plates of Iron, and having a Concavity ſufficient to receive the Mouth of the Petard when charged, with which it is applied againſt a Gate, or any thing elſe that you deſign to break down. This Term is alſo appropriated to certain flat Beams, which are fix'd at the Bottom of a Moat, to ſupport a Wall. There are alſo *Madriers* lined with Tin, which are cover'd with Earth, to ſerve as a Defence againſt artificial Fires.

MAGDALEONES, are Pieces of Plaiſter made up in Form of a Cylinder, or long Roll.

MAGICK *Square*, is when Numbers in Arithmetick Proportion are diſpoſed into ſuch parallel and equal Ranks, as that the Sums of each Row, as well diagonally, as laterally, ſhall be all equal.

5	10	3
4	6	8
9	2	7

Thus theſe Nine Numbers, 2, 3, 4, 5, 6, 7, 8, 9 and 10, being diſpoſed into this Square Form, they do every way, directly and diagonally, make Eighteen.

MAGICK-*Lantern*, a little Optick Machine; by the means of which are repreſented on a Wall, in the Dark, many Phantaſms and terrible Apparitions, which are taken for the Effect of *Magick*, by thoſe that are ignorant of the Secret. This Machine is compoſed of a Concave Speculum, reflecting the Light of a Candle, which paſſeth through the little Hole of a Tube, at whoſe End there is faſten'd another Glaſs: Between theſe two are ſucceſſively placed many ſmall Glaſſes, painted with different Figures, of which the moſt formidable are always choſen, and ſuch as are moſt capable of terrifying the Spectators; ſo that all theſe Figures may be repreſented at large on the oppoſite Wall.

A Convex Glaſs will do the Thing as well as a Concave one. See the Theory of it fully explained in M. *Molyneux* his Excellent *Dioptr. Nova*, Prop. 56. p. 183. They are ſold by all Perſpective-makers, and particularly by Mr. *John Marſhal*, at the *Archimedes* on *Ludgate-hill*, *London*; and Mr. *Yarwell* in the ſame Street.

MAGISTERY, a Word uſed by the Chymiſts, ſometimes for *very fine Powders*, made by Solution and Precipitation of the Matter; as *Magiſtery* of *Biſmuth*, *Lead*, &c. And ſometimes 'tis made to ſignifie *Reſins* and *Reſinous Extracts*. Thus the Reſins of Jalap, Scammony, &c. are called *Magiſteries*.

Mr. *Boyle* takes the true Notion of a *Magiſtery* to be a Preparation of Body (not an Analyſis of it, for the Principles are not ſeparated) whereby the whole, or very near the whole of it, by ſome Additament, is turned into a Body of a different kind; as when Iron or Copper is turned into Chryſtals of *Mars* or *Venus*, &c.

The Canting Alchymiſts talk alſo of the *Magiſtery* of the *Philoſopher's Stone*, which will be worth enquiring into, when they will tell us what the Stone it ſelf is. For an Inſtance how they are made, I will mention two or three.

Magiſtery of Biſmuth, is made by diſſolving the Biſmuth in Spirit of Nitre, and pouring upon it Salt-water, which will precipitate the *Magiſtery* to the bottom in a white Powder.

Magiſtery of Lead, is made by diſſolving *Saccharum Saturni* in diſtilled Vinegar; and then precipitating it with Oyl of Tartar, made *per deliquium*.

Magiſtery or *Reſine of Scammony*, *Jalap*, *Turbith*, &c. is made by a Diſſolution of the Matter in Spirit of Wine; and then precipitating it by common Water, or Water impregnated with a little Alum. And after theſe manners are moſt other *Magiſteries* made.

MAGISTERY *of Tartar*. See *Tartar Vitriolate*.

MAGMA, ſignifies the Dregs that are left after the ſtraining of Juices.

MAGNA *Aſſiſa eligenda*, is a Writ directed to the Sheriff, to ſummon four Lawful Knights before the Juſtices of *Aſſize*, there upon their Oath to chuſe twelve Knights of the Vicinage, &c. to paſs upon the Great *Aſſize* between *A.* Plaintiff, and *B* Defendant, &c.

MAGNA *Charta*, was granted the Ninth Year of *Henry* the Third, and confirmed by *Edward* the Firſt. The Reaſon why it is termed *Magna Charta*, was either for that it contain'd the Sum

of all the Liberties of *England*, or elſe becauſe there was another *Charter*, called *Charta de Foreſta*, eſtabliſh'd with it, which was the leſs of the two; or becauſe it contained more than many other *Charters*, or more than that of King *Henry* the Firſt, or of the great and remarkable Solemnity in the denouncing Excommunication, and direful *Anathema's* againſt the Infringers of it. *Holinſhed* tells us, That King *John*, to appeaſe his Barons, yielded to Laws or Articles of Government, much like to this *Great Charter*; but we have now no ancienter Law written than this, which was thought to be ſo beneficial to the Subject, and a Law of ſo great Equity, in compariſon of thoſe which were formerly in uſe, that King *Henry* for the granting of it, had the Fifteenth Peny of all the moveable Goods, of both *Temporality* and *Spirituality*.

MAGNESIA *Opalina*, is a kind of *Crocus Metallorum*, or Liver of *Antimony*, but of a redder or more *Opaline* Colour than the common one. 'Tis made after the common manner, with equal Parts of *Antimony*, *Salt-peter*, and *Sea Salt* decrepitated. 'Tis leſs Emetick than the common one, becauſe the *Sea Salt* fixes ſome of the active Sulphurs of the *Antimony*, and locks them up.

MAGNET, or *Loadſtone*, is a Foſſile approaching to the Nature of Iron-Oar, and endowed with the Property of attracting Iron, and of both pointing it ſelf, and alſo inabling a Needle touch'd upon it, and then poiſed, to point towards the Poles of the World.

MAGNET. *Sturmius* in his *Epiſtola Invitatoria Dat. Altorf.* 1682. obſerves, That the attractive Quality of the *Magnet* hath been taken Notice of beyond all Hiſtory: But that it was our Countryman *Roger Bacon*, who firſt diſcovered the *Verticity* of it, or its Property of pointing towards the Pole, and this about 400 Years ſince. The *Italians* firſt diſcovered, that it would communicate this Virtue to Steel or Iron. The various Declination of the Needle, under different Meridians, was firſt diſcovered by *Sebaſtian Cabott*; and its *Inclination* to the nearer Pole by our Countryman *Robert Norman*. The *Variation of the Declination*, ſo that 'tis not always the ſame in one and the ſame place, he obſerves, was taken Notice of but a few Years before, by *Hevelius*, *Auzout*, *Petit*, *Volckamer* and others.

The Properties, or Phænomena, *of this Wonderful Stone, as they have been diſcovered by* Gilbert, Kircher, Cabeus, Des Cartes, *and others, are theſe:*

1. That in every *Magnet* there are two Poles, one pointing North, the other South; and if a Stone be cut or broken into never ſo many pieces, there are theſe two Poles in each piece.

2. That theſe Poles in divers Parts of the Globe, are diverſely inclined towards the Earth's Centre.

3. That theſe Poles, tho' contrary to one another, do help mutually toward the *Magnet*'s Attraction and Suſpenſion of Iron.

4. If two *Magnets* are Spherical, one will turn or conform it ſelf to the other, ſo as either of them would do to the Earth; and that after they have ſo conformed or turned themſelves, they endeavour to approach to join each other; but if placed in a contrary Poſition, they avoid each other.

5. If a *Magnet* be cut thro' the Axis, the Parts or Segments of the Stone, which before were joined, will now avoid and fly each other.

6. If the *Magnet* be cut by a Section perpendicular to its Axis, the two Points which before were conjoined, will become contrary Poles, one in one, the other in the other Segment.

7. Iron receives Virtue from the *Magnet* by Application to it, or barely from an Approach near it, though it doth not touch it; and the Iron receives this Virtue variouſly, accçording to the Parts of the Stone 'tis made to touch, or made approach to.

8. If an Oblong piece of Iron be any how applied to the Stone, it receives Virtue from it only as to its Length.

9. The *Magnet* loſes none of its own Virtue by communicating any to the Iron, and this Virtue it can communicate to Iron very ſpeedily; tho' the longer the Iron touches or joins the Stone, the longer will its communicated Virtue hold; and a better *Magnet* will communicate more of it and ſooner, than one not ſo good.

10. That Steel receives Virtue from the *Magnet* better than Iron.

11. A Needle touch'd by a *Magnet*, will turn its Ends the ſame way towards the Poles of the World, as the *Magnet* will do it.

12. That neither Loadſtone nor Needles touch'd by it, do conform their Poles exactly to thoſe of the World, but have uſually ſome Variation from them: And this Variation is different in divers Places, and at divers Times, in the ſame Place.

13. That a Loadſtone will take up much more Iron when arm'd or cap'd, than it can alone: And that tho' an Iron Ring or Key be ſuſpended by the Loadſtone, yet the Magnetical Particles do not hinder that Ring or Key from turning round any way either to the Right or Left.

14. That the Force of a Loadſtone may be variouſly increaſed or leſſened, by the various Application of Iron, or another Loadſtone to it.

15. That a ſtrong *Magnet*, at the leaſt Diſtance from a leſſer or a weaker, cannot draw to it a piece of Iron adhering actually to ſuch leſſer or weaker Stone; but if it come to touch it, it can draw it from the other: But a weaker *Magnet*, or even a little piece of Iron, can draw away or ſeparate a piece of Iron contiguous to a greater or ſtronger Loadſtone.

16. That in our North Parts of the World, the South Pole of a Loadſtone will raiſe up more Iron than the North Pole.

17. That a Plate of Iron only, but no other Body interpoſed, can impede the Operation of the Loadſtone, either as to its Attractive or Directive Quality. Mr. *Boyle* found it true in Glaſſes ſealed Hermetically; and Glaſs is a Body as impervious as moſt are, to any Effluvia.

18. That the Power or Virtue of a Loadſtone may be impaired by lying long in a wrong Poſture, as alſo by Ruſt, Wet, *&c.* and may be quite deſtroyed by Fire.

EXPERIMENTS of the Nature and Properties of the MAGNET.

1. Mr. *Boyle* found, that by heating a *Magnet* red hot, it could be ſpeedily deprived of its *Attractive Quality*.

2. If

2. If a Loadſtone be heated red hot, and then cooled either with its South Pole to the North, in a Horizontal Poſition, or with its South Pole downwards in a Perpendicular one, it will change its Polarity, the South Pole becoming the Northern one, and *vice verſa*.

3. By applying the Poles of a very ſmall Fragment of a Loadſtone, to the oppoſite vigorous ones of a good larger *Magnet*, Mr. *Boyle* found he could ſpeedily change the Poles of the Fragment; but he could not effect it in a Fragment that was conſiderably bigger, tho' he tried many Hours.

4. He obſerved, That well-temper'd and harden'd Iron Tools, when heated by Attrition, Turning, Filing, *&c.* they would, while warm, attract thin Filings, or Chips of Iron and Steel, but not when cold Yet I remember once to have ſeen my ſelf, and tried, that a Piece of a File, which was in the Hands of Mr. *Yarwell* the Spectacle-maker, did retain ſuch an Attractive Quality, that it would take up, and keep ſuſpended, the Key of a Cabinet, or *Eſcritoire*, and needed no Attrition to excite this Magnetical Virtue.

5. The Iron Bars of Windows, which have long ſtood in an erect Poſition, do grow permanently Magnetical, the lower Ends of ſuch Bars being the North Poles, and the upper the Southern: For according to the Laws of *Magnetiſm*, we find the lower Ends of ſuch Bars will drive away the North End of a poiſed Needle, and will attract the Southern; which ſhews, that by the continual Paſſage of the Subtile Magnetical Particles thro' them, they are turned into a kind of *Magnet* themſelves.

6. If a Bar of Iron that hath not long ſtood in an erected Poſture, be only held Perpendicularly, its lower End will be the North Pole, and attract the South Point of a Touch'd Needle: But then this Virtue is tranſient, and will ſhift as you invert the Bar, for the other End when held lowermoſt, will preſently become the North Pole; wherefore, in order to render the Quality of Verticity permanent in an Iron Bar, it muſt remain a long time in a proper Poſition. But the Fire will produce this Effect in a very ſhort time; for as it will immediately deprive a Loadſtone of its Attractive Power, or change its Poles, (as in *Exper.* 1. 2.) ſo it will as ſoon give a Verticity to a Bar of Iron, if being heated red hot, it be cooled in an erect Poſition, or directly North and South. Nay, it hath been obſerved often, that even Tongs and Fire-forks, by being often heated, and then ſet to cool in a Poſition near to erect, have gained this Magnetical Property.

The Reaſon of which very different Effects of the Fire on a *Magnet*, and on Iron, Mr. *Boyle*, with his uſual Modeſty, ſuggeſts to be this: That the peculiar Texture or Conſtitution by which a *Magnet* differs from common Iron Ore, being accurate and fine, is ſpoiled by the rude and violent Attacks of the Fire: But this mighty Agent, by working upon Iron, ſoftens and opens the Pores of the Metal (which is harder than Iron Ore); ſo that it becomes capable of being pervaded by the Magnetical Particles, and by that means gains a *Vertical Quality*.

7. Mr. *Boyle* found that by heating a Piece of *Engliſh Oker* red hot, and placing it to cool in a proper Poſture, it plainly gained a Magnetick Power.

8. The ſame Noble Gentleman found, that an excellent Loadſtone of his own, having lain almoſt a Year in an inconvenient Poſture, had its Virtue ſo impaired, that he at firſt thought ſome Body had got at it, and ſpoiled it by Fire.

9. If a Needle be well touch'd on a good Loadſtone, 'tis known it will, when duly poiſed, point North and South; but if it have one contrary Touch of the ſame Stone, it will immediately be deprived of that Faculty; and by another ſuch Touch, it will have its Poles quite changed; ſo that the End which before pointed North, ſhall now point Southward.

10. Dr. *Power* and Mr. *Boyle* both tried, that after a red-hot Iron had gain'd a *Verticity*, by being well heated and cooled North and South; and then alſo hammer'd at the Ends, this Virtue would immediately be deſtroyed by two or three Blows of a ſtrong Hammer ſmartly given about the middle of it.

11. Mr. *Boyle* found by drawing the Back of a Knife, or long Piece of Steel Wire, *&c.* over the Pole of a Loadſtone leiſurely, once or divers times, beginning the Motion from the Equator or middle of the Stone, towards the Pole, the Knife or Wire will accordingly attract one End of a poiſed Magnetical Needle; but if you take another Knife or Wire, and thruſt it leiſurely over the Pole, from the Pole towards the Equator or middle of the Equator, this Knife ſhall expel or drive away the ſame End of the Needle, which the former Knife would attract: Which Experiment makes it very probable, that the Operation of the *Magnet* depends on the Flux of ſome fine Particles, which go out at one Pole, then round about, and in again at the other.

12. Becauſe it is one of the Univerſal Laws of Nature, That *Action and Reaction are always equal*: Therefore 'tis plain, the Iron muſt attract the *Magnet*, as much as that doth the Iron: And ſo you may eaſily experiment it to be in Fact, if you place a *Magnet* or Piece of Iron on a Piece of Cork, ſo as that it may ſwim freely in the Water; for then you will ſee, that which ſoever you hold in your Hand, will draw the other towards it.

From all which Experiments, 'tis plain (as Mr. *Boyle* concludes) *That Magnetiſm doth much depend upon Mechanical Principles.* As alſo, That there is ſuch a Thing as the *Magnetiſm of the Earth*; or that there are *Magnetical Particles*, which continually are paſſing from Pole to Pole; but Sir *Iſaac Newton* demonſtrates, that *Gravity* is a very different Thing from *Magnetiſm*; ſince the former is always as the Quantity of Matter attracted, but *Magnetiſm* by no means ſo.

Mr. *Joblot*, Profeſſor of the Mathematicks in the *French* Academy of Painting, *&c.* hath found out (as it is ſaid) a Method of making *Artificial Magnets*.

MAGNETISM, or *Magnetical Attraction*, or, as ſome are pleaſed to call it, *Coition*; is effected (ſay they) by the *Effluvia* of each Body, which drive away the Air between the Iron and the Stone; ſo that an Union of the Stone and the Iron is occaſion'd by the joint Protruſion or Pulſion of the Air behind each.

But this Opinion is plainly refuted by Mr. *Boyle*'s Experiment of a Loadſtone's being equally Vigorous and Attractive in the exhauſted Receiver, as in the open Air.

MAGNETICAL *Amplitude*, is an Arch of the Horizon, contain'd between the Sun at his Riſing or Setting, and the Eaſt and Weſt Point of the Compaſs: Or it is the different Riſing or Setting of the Sun from the Eaſt or Weſt Points of the Compaſs; and is found by obſerving the Sun at his Riſing or Setting, by an *Amplitude Compaſs*.

MAGNETICAL *Azimuth*, is an Arch of the Horizon, contained between the Sun's *Azimuth Circle*, and the *Magnetical Meridian*: Or it is the apparent Diſtance of the Sun from the North or South Point of the Compaſs; and may be found by obſerving the Sun with an *Azimuth Compaſs*, when he is about 10 or 15 Degrees high, either in the Forenoon or Afternoon.

MAGNETICAL *Meridian*; See *Meridian*.

MAGNIFIE, is a Word uſed chiefly in reference to *Microſcopes*; which are uſually ſaid to *magnifie* Objects, or to make them appear bigger than they really are.

But in reality, *Microſcopes* do not, nor can at all *magnifie* any Object, but only ſhew more of it to the Eye than before was taken Notice of; as will be apparent from the following Conſiderations.

For, Firſt, 'Tis clear that the Images of all Objects which are repreſented or pictured on the *Retina* in the Bottom of our Eyes, (and by which way all Viſion is made) thoſe Images, I ſay, muſt of neceſſity be very ſmall, in Proportion to the Objects themſelves; as is demonſtrable to any one's Reaſon, that will conſider the Smallneſs of the *Fundus Oculi*; and to his Senſes, that will but take the Pains to try the *Carteſian* Experiment, of putting a Bullock's Eye in the Hole of a darkned Room. (Vid. *Cart. Diopt.* cap. 5.) Now there being no Reaſon to ſuppoſe, that the bare Communication of that Picture to the Brain by the Optick Nerve, or Animal Spirits, can magnifie it again, ſo as to equal it with the Objects themſelves; it muſt and doth follow, that we always have Things repreſented to us leſs than they are, in the common way of Viſion.

2. At any conſiderable Diſtance we ſee but very little of the Object we behold, in Compariſon of what evades our Sight; and the nearer we come to it, the more ſtill we diſcover of it; and whenever we look in groſs upon an Object, our Eye cannot take Notice of many minute Differences, which, when we come to obſerve them ſingly, do yet very plainly appear; and after the neareſt View we can make with our bare Eye, very many Parts will yet remain undiſcoverable to us: So that all that the *Microſcope* doth, is (by taking off the Circular Radiation of Light) to direct our Eye to contemplate theſe minute Parts diſtinctly, ſingly, or by themſelves, which before we could either but confuſedly, or not at all, diſcern; and which now appearing (our Eyes thus armed with a Glaſs) very plain to us, make us attribute a new Magnitude to the Body we look on, becauſe we cannot imagine it can have thoſe Parts (which we now ſo diſtinctly ſee, and which before we could not ſee) unleſs its viſible Parts lie farther aſunder from each other than they did before, to make Room for theſe new to come between them.

3. But 'tis yet farther plain, that 'tis impoſſible any Glaſs can *magnifie* an Object, or make it bigger to us than it really is in it ſelf: For to do this, muſt be to give it new Parts, and to remove the viſible Parts it hath already to a greater Diſtance from each other; both which are utterly impoſſible.

4. If you make a very ſmall Hole in a Piece of Tin or Braſs, and look thro' it on any Object, it will make it appear much bigger than before, and ſo much bigger as the Hole is leſſer; which plainly proves, that the Reaſon of any Object's appearing bigger thro' a *Microſcope* is, as before, only bringing the Object nearer to the Eye, and letting ſome Parts of it be ſeen, which before were not diſceverable by the bare Eye.

MAIM, or *Mayhim*, in Common Law, ſignifies a Corporeal Hurt, by which a Man loſeth the Uſe of any Member that is or might be of any Defence to him in Battel. But the cutting off an Ear, or Noſe, the breaking of the hinder Teeth, or ſuch like, is no *Maim*; and rather a Deformity of the Body, than diminiſhing of Strength: Yet cutting off a Noſe, or cutting or diſabling any Limb or Member, is Felony without Benefit of the Clergy.

Maim is commonly tryed by the Juſtices inſpecting the Party; and if they doubt whether it be a *Maim*, or not, they uſe to take the Opinion of ſome able Surgeon.

MAIN-*Maſt* of a Ship, is a long, large, and round Piece of Timber, ſtanding upright in her Middle or Waſt, on which is born her *Main-Yard*, and *Main-Sail*. Its Length is uſually 2 ½ of the Length of the Mid-ſhip Beam.

MAIN-TOP-*Maſt*, is one half of the Length of the *Main-maſt*; and the *Top-gallant-maſt* half the Length of the *Main-top-maſt*.

MAINOUR, *Manour*, or *Meinour*, in a Legal Senſe, ſignifieth a Thing that a Thief taketh away, or ſtealeth: As to be taken with the *Mainour*, is to be taken with the Thing ſtollen about him.

MAINPERNABLE, is he that may be let to Bail. See the Statute of *Weſtm.* 1. *cap.* 15. made *Anno* 3 *E.* 1. what Perſons be *mainpernable*, and what not.

MAINPERNORS, are thoſe Perſons to whom a Perſon is delivered out of Cuſtody or Priſon, and they become Security for him, either for Appearance, or Satisfaction. They are called *Manucaptores*, becauſe they do as it were *manu capere & ducere captivum è cuſtodia vel priſona*: And the Priſoner is ſaid to be delivered to *Bail*, from the Words of the *Bail-piece*, viz. *A. B. &c. traditur in Ballium* J. D. & R. R. *&c.*

MAINPRISE, in our Law, ſignifies the taking or receiving a Man into Friendly Cuſtody, that otherwiſe is or might be committed to Priſon, upon Security given for his Forth-coming at a Day aſſigned: And they that thus undertake for any, are called *Mainpernors*, (which ſee) becauſe they receive him into their Hands; whence alſo comes the Word *Mainpernable*, denoting him that may be thus bail'd: For in many Caſes a Man is not *mainpernable*; whereof ſee *Bro. Tit. mainpriſe per totum*; and *F. N. B.* fol. 249. When *Mainpriſes* may be granted, and when not, ſee *Cromp. Juſtic. of Peace*, fol. 136, and 141. And the *Mirror of Juſtices* ſays, That *Pledges* be thoſe that Bail or Redeem any Thing but the Body of the Man; but *Mainpernors* are thoſe that free the Body of a Man; and therefore that *Pledges* belong properly

to

to real and mix'd Actions, and *Mainpernors* to perſonal.

MAINTAINOR, is he that ſupports or ſeconds a Cauſe depending in Suit between others, either by disburſing Money, or making Friends for either Party, towards his Help.

MAINTENANCE, is a Law-Term, ſignifying the Act of a *Maintainer*, when he ſeconds a Cauſe depending between others: And when it is accounted *Maintenance*, and when not, ſee *Broke Tit. Maintenance.* The Writ that lies againſt a Man for this Offence, is alſo called *Maintenance.*

MAJOR-*General*, is an Officer in an Army, that receives the General's Orders, and delivers them out to the Majors of the Brigades, with whom he concerts what Troops are to mount the Guard, what to go out upon Parties, what to form Detachments, or to be ſent on Convoys, *&c.* 'Tis his Buſineſs alſo to view the Ground to incamp on, and he is next ſubordinate to the General and Lieutenant-General.

MAJOR *of a Brigade*, either of Horſe or Foot, is he that receives Orders, and *the Word*, from the Major-General, and gives them to the particular Majors of each Regiment. And the

MAJOR *of a Regiment*, is an Officer whoſe Buſineſs it is to convey all Orders to the Regiment; to draw it up, and to exerciſe it; to ſee it march in good Order, to look to its Quarters, and to rally it, if it happen to be broken in an Ingagement, *&c.* He is the only Officer in a Regiment of Foot, that is allowed to be on Horſeback in Time of Service; but he is mounted, that he may ſpeedily get from Place to Place, as Occaſion ſerves. There is alſo in a Garriſon an Officer next to the Deputy-Governor, which is called the *Town-*

MAJOR; He ought to underſtand Fortification, and hath Charge of the Guards, Rounds, Patroilles and Sentinels.

MAJUS-*Jus*, is a Writ or Proceeding in ſome Cuſtomary Manors, in order to a Tryal of Right of Land.

MAKE; a Word frequently uſed by Lawyers, ſignifying, to Perform or Execute: As, to *make his Law*, is to perform that Law which he hath formerly bound himſelf to; that is, to clear himſelf of an Action commenced againſt him by his Oath, and the Oaths of his Neighbours. To *make Services* or *Cuſtoms*, is nothing elſe but to perform them; and to *make Oath*, is to take Oath.

MALACIA, is a depraved Appetite, which covets thoſe Things which are not fit to be eaten; alſo a Tenderneſs of Body. *Blanchard.*

MALACTICA, or *Emollientia*, are Things which ſoften the Parts by a moderate Heat and Moiſture, by diſſolving ſome of them, and diſſipating others. *Blanchard.*

MALAGMA, the ſame with *Cataplaſm*; alſo 'tis uſed in the ſame Senſe as *Malactica.*

MALIGNUS *Morbus*, a malignant Diſeaſe, is that which rages more vehemently and continues longer than its Nature uſually permits it to do; as a Peſtilential Fever, *&c.*

MALLEABLE, that which will bear being hammered, and ſpread, being beaten. This Quality belongs in the higheſt Degree to Gold, which is the moſt *ductile* or *malleable* of any Metal whatever. Mr. *Boyle* reckons the Qualifications requiſite to Malleableneſs, to be, Having the Corpuſcles, or Particles of ſuch an adapted Size, Shape, and Figure, whether hooked, branched, *&c.* that they can take faſt hold of one another, and ſtick ſo cloſe, as to make the Body ſpread eaſily under the Hammer, and not break nor crack.

MALLEUS, is one of the Four little Bones in the Ear.

MALLEOLUS, or *Malleus Pedis*, is Twofold: *External*, which is the lower Proceſs at the Foot of the Bone of the Leg, called *Fibula*; or *Internal*, which is the lower Proceſs of the Bone of the Leg, called *Tibia*: Theſe make up or form the Ancle.

Malleolus is alſo uſed as a Term in Botany, for a Sprout that grows out of a Branch which grew out its ſelf but the Year before. *Columella.*

MALTHACODE, is a Medicine ſoftened with Wax. *Blanchard.*

MALUM *Mortuum*, the Dead Diſeaſe, is a ſort of Scab; ſo called, becauſe it makes the Body appear black and mortified. It is in Colour black, and inclining to blue, and appears with a Cruſty ſort of Pimples, unſeemly, and filthy, but without ſending out Matter, or giving the Patient Pain. It infects the Hips and Legs eſpecially. *Blanchard.*

MAMILLARY *Artery*, or the *Mammaria*, is a Branch of the Arteries which ſupplies the Breaſts, and iſſues out of the adjoyning Trunk of the *Aorta*, as ſome ſay; but more properly it ought to be ſaid to come from the ſuperior Part of the Subclavian Branch of the Aſcending Trunk of the *Aorta.*

MAMMA, *Mammilla*, *Uber*, the Breaſts, Dugs, *&c.* The *Grammarians* call the inner Part *Ubera*, and the outward Protuberances *Mammæ.* The Subſtance of the Breaſts is a white and ſoft Body, conſiſting internally of a Congeries of Conglomerated Glandules, by the means whereof the Milk is ſeparated from the Arterious Blood, and is conveyed out by very little Pipes, which paſs thro' the Nipples.

MAMMARY *Veſſels*, are the Arteries and Veins that run through the Muſcles and Glands of the Breaſts.

MAMMIFORMES *Proceſſus*, are the two Apophyſes of the Bone of the back-part of the Skull.

MANDAMUS, is a Writ that lieth after the Year and Day; whereas in the mean Time the Writ called *Diem clauſit extremum* hath not been ſent out to the Eſcheator for the ſame Purpoſe to which it ſhould have been ſent forth. See *Diem clauſit extremum.*

Mandamus is alſo a Charge to the Sheriff, to take into the King's Hands all the Lands and Tenements of the King's Widow, that againſt her Oath formerly given, marryeth without the King's Conſent.

MANDATE, is a Commandment of the King, or his Juſtices, to have any thing done for Diſpatch of Juſtice; whereof you ſhall ſee Diverſity in the Table of the *Regiſter Judicial verbo Mandatum.*

MANDATARY, in Law, is he to whom a Charge or Commandment is given: Alſo he that obtains a Benefice by *Mandamus.*

MANDIBULA, or rather *Maxilla*, the Jaw; is either *Upper* or *Lower.* The *Upper* Mandible conſiſts of Twelve Bones, on each Side Six. The Firſt is at the external Corner of the Eye, which joyned with the Fore-proceſs of the Bone of the Temples, produces the *Jugal Bone.* The Second conſtitutes

conſtitutes the inner Corner of the Eye, has a large Paſſage in it, by which the ſuper-abundant Moiſture of the Eye deſcends to the Noſtrils. The Third is within the Circle of the Eye, interpoſed betwixt the other two. The Fourth, the greateſt of all, forms the greateſt Part of the Cheeks and the Palate, and is elaborately contrived with proper Cavities for the Reception of the Teeth. The Fifth helps to make the Noſe. The Sixth, with another Bone along with it, terminates the Extremity of the Palate. And all thoſe are joyned rather by a plain Line, than by Sutures. The *Lower* Jaw, at riper Years, grows into one continued Bone, extreme hard and thick, and conſequently very ſtrong: It has two Proceſſes, one Acute, called *Corone*; the other in the Form of a little Head, called *Condylus*. It has two Holes within, and as many without, which make way for the Nerves: The Under Teeth are implanted in it, and is joynted with the inner ſide of the Bone of the Temples, called *Os petroſum*. To theſe Twelve Bones, *Columbus* and *Laurentius* are for adding a Thirteenth, which, they ſay, lies between the innermoſt Space and the *Os ſphæroides*, dividing the moſt inward Part of the Noſtrils into two Parts, like a *Septum*; and therefore they call it *Vomer*. To theſe *B. Veſalius* would have the *Oſſa ſpongioſa*, which are in the innermoſt Cavity of the Noſe, to be added alſo.

MANGER in a Ship, is a Circular Place made with Planks faſtened on the Deck, right under the *Hawſes*, being about a Foot and half in Height: The Uſe of which is to catch and receive the Sea-water, beating in at the *Hawſes* in a Streſs of Weather.

MANIA, a ſort of Madneſs, is a Deprivation of Imagination and Judgment, with great Rage and Anger, but without a Fever; altho' a Fever may be joyned with a *Mania* proceeding from ſome other Cauſe.

MANICA *Hypocratis*, or *Hypocrates his Sleeve*, is a Woollen Sack or Bag, in Form of a Pyramid; wherewith *Aromatick* Wines, Medicines, and many other Liquors are ſtreined. 'Tis ſo called by the Chymiſts.

MANIPULUS, is a Dry Meaſure, uſual with Phyſicians in their Preſcriptions: For it is a determinate Quantity, to wit, as much as can be held in one Hand, meant for the moſt part of Herbs.

Faſciculus is a different Quantity from *Manipulus*, an Handful; for it properly ſignifies an Armful.

MANNER, a Word now much in Uſe, which we have borrowed from the French *Maniere*. In Painting, it ſignifies the Uſage, Way, *Mode*, or *Manner* any Painter hath acquired, not only in the Management of his Hand or Pencil, but alſo as to his Obſervance of the Three principal Parts of Painting, *Invention*, *Deſign*, and *Colour*: And according as any one hath gotten a Habit or peculiar Way of Painting, we ſay, He has ſuch a *Manner*. If it be agreeable to the Rules of this Art, Natural, Strong, Eaſie, and Duly Proportioned, we ſay, 'Tis a *Good manner*; and if the contrary, A *Bad manner*. If he imitate any famous Ancient Painter, as *Mich. Angelo*, *Raphael*, &c. we ſay, *He paints after their manner*. So 'tis alſo in Sculpture; and now adays in *Singing*, or *Playing* on any Inſtrument: When we would expreſs our Approbation of any one's Way of *Singing* or *Playing*, we ſay, *He hath a very Good manner*,

MANNOPUS, a Term in the Common Law, ſignifying Goods taken in the Hand of an apprehended Thief.

MANOR, was a Noble ſort of Fee granted partly to Tenants for certain Services to be performed, and partly reſerved to the Uſe of the Family, with Juriſdiction over his Tenants for their Farms: The whole Fee was termed a *Lordſhip*, of Old a *Barony*; from whence the Court, that is always an Appendant to the *Manor*, is called, The *Court-Baron*. Now a *Manor* rather ſignifies the Juriſdiction and Royalty incorporeal, than the Land or Site: For a Man may have a *Manor in groſs*, that is, the Right and Intereſt of a Court-Baron, with the Perquiſites thereunto belonging; and another, or others, have every Foot of the Land. But at this Day a *Manor* cannot be made, becauſe a *Court-Baron* cannot now be made, and a *Manor* cannot be without a *Court-Baron*.

MAN-SLAUGHTER, is the unlawful Killing of a Man, without prepenſed Malice: As when Two, that formerly meant no Harm one to another, meet together, and upon ſome ſudden Occaſion falling out, the one killeth the other. It differeth from *Murther*, becauſe it is not done with foregoing Malice; and from *Chance-medley*, becauſe it hath a preſent Inrent to kill. And this is Felony, but admitted to the Benefit of the Clergy for the firſt Time.

MANTELETS, in Fortification, are a kind of movable Pent-houſes, and are made of Pieces of Timber ſaw'd into Planks; which being about three Inches thick, are nail'd one over another to the Height of almoſt ſix Foot. They are generally caſed with Tin, and ſet upon little Wheels, ſo that in a Siege they may be driven before the Pioneers, and ſerve as Blinds, to ſhelter them from the Enemies Small-ſhot. There are alſo other Sorts of *Mantelets*, cover'd on the Top, whereof the Miners make uſe to approach the Walls of a Town or Caſtle.

MANTLE, in *Heraldry*, is that Appearance of the Foldings of Cloth, Flouriſhing or Drapery, that is, in any Atchievement, drawn about a Coat of Arms; 'Tis ſuppoſed to have formerly been the Repreſentation of a Mantle of State in Blazon; 'tis always ſaid to be doubled, *i. e.* Lined throughout with one of the Furs, as Ermin, Pean, Verry, *&c.*

MANUCAPTIO, is a Writ that lies for a Man, who taken upon Suſpicion of Felony, and offering ſufficient Bail for his Appearance, cannot be admitted thereto by the Sheriff, or other having Power to let to *Mainprize*.

MANUS *Chriſti*, is a ſort of Refined Sugar, ſo called, becauſe it is put into Cordials for very weak People. *Blanchard*.

MANUTENENTIA, is a Writ uſed in caſe of Maintenance. See *Maintenance*.

MAP, is a Deſcription of the Earth, or ſome particular Part thereof, projected upon a plain Superficies; deſcribing the Form of Countries, Rivers, Situation of Cities, Hills, Woods, and other Remarks.

MARASMODES, is the Term for a Fever, which at laſt ends in a Conſumption.

MARCHASITE, is the General Term for a *Mineral Body*, having in it ſome Metalline Parts; tho' many of them hold but a very little Quantity of Metal. See *Foſſils*.

MARINE *Barometer*. See *Barometer*.

MARISCA, the ſame that *Ficus*.

MARITAGIO *amiſſo per defaltam*, is a Writ for the Tenant in *Frank-marriage*, to recover Lands, *&c.* whereof he is divorced by another.

MARITAGIO *Forisfacto.* See *Forfeiture of Marriage.*

MARLINE, is a ſmall Line made of Hemp untwiſted, that it may be the more gentle and pliable; its uſe is to *ſeize* the ends of Ropes from *farcing out*: They uſe it alſo to ſeize the Straps at the Arſe (as they call it) or lower end of the Block. *Marling a Sail*; is, when being ſo ript out of the *Bolt Rope*, that it cannot be ſewed in again, the Sail is faſten'd by *Marline*, put thro' the Eye-let Holes made in it for that Purpoſe unto the *Bolt Rope.*

MARLINE *Spikes*, are ſmall Spikes of Iron made for the Splicing together of ſmall Ropes; and alſo to open the Bolt Ropes when the Sails are ſewed into them. They are only a kind of ſmall *Fidd*; which ſee.

MARMORATA *Aurium*, Ear-wax, is a certain Excrement of the Ear, laid there in the Auditory Paſſage from the Openings of the Arteries, or Sweat out from the Cartilages.

MARROW. See *Medulla.*

MARSHAL: There be with us divers Officers of this Name; as *Lord* or *Earl Marſhal of England*, whoſe Office conſiſts chiefly in Matters of War and Arms, as well with us as in other Countries. Alſo, the *Marſhal* of the King's Houſe, whoſe ſpecial Authority is in the King's Palace to hear and determine all Pleas of the Crown, and to puniſh Faults committed within the Verge, and to hear and judge of Suits between thoſe of the King's Houſhold, *&c.* There be ſeveral other Officers of this Name, as *Marſhal of the Juſtices in Eyre*; *Marſhal of the King's-Bench*, who hath the Cuſtody of the *King's-Bench* Priſon in *Southwark*: *Marſhal* of the King's-Hall, whoſe Office is, when the Tables are prepared, to call out both thoſe of the Houſhold, and Strangers, according to their Worth, and decently to place them, *&c.* Alſo *Marſhal* of the Exchequer, to whom the Court committeth the Cuſtody of the King's Debtors during the Term-time, for ſecuring the Debts: He alſo aſſigneth Sheriffs, Eſcheators, Cuſtomers, and Collectors their Auditors, before whom they ſhall account.

MARSHALSEA, is the Court or Seat of the *Marſhal* of the King's Houſhold, who formerly perhaps uſed to ſit there in Judgment, or keep his Priſon; and is now allowed for the Priſon in *Southwark.*

MARSUPIALIS *ſeu Burſalis*, is a Muſcle of the Thigh, ſo called from its Tendons running through (as it were) a ſecond fleſhy Beginning of it ſelf, which Duplication repreſents a Purſe: It is alſo called *Obturator Internus*; it ariſeth broad and fleſhy, from that part of the *Os Ilium*, *Iſchium*, *Pubis*, and Ligament that is extended in the Great *Foramen* of the two laſt named Bones internally, and marches tranſverſly in the *Sinus* of the *Iſchium*, (fenced on each ſide by two Proceſſes, the one Acute and the other Obtuſe) where it is externally fleſhy, but internally it hath three, ſometimes four Tendons paſſing in ſo many diſtinct Furrows in the ſaid *Sinus*, like ſo many Cords in a Quadruple Pulley, where it meets with the other fleſhy beginning, commonly called its *Marſupium*, ariſing from the above-mentioned Acute and Obtuſe Proceſſes, which joyning with the ſaid Tendons at their united Inſertion to the Superior part of the Root of the great *Trochanter*, near the Implantation of the *Pyriformis*: When this Muſcle acteth, its Inſertion is directed towards that part of the *Iſchium*, over which its Tendons run after the manner of a Pulley, and the *Os Femoris* is thereby turned outwards.

MARTIAL *Regulus* of *Antimony.* See *Regulus.* When any Particles are ſaid to be of a *Martial Nature* in Chymiſtry or Natural Philoſophy, 'tis meant, that they partake of the Nature of Iron or Steel. The Chymiſts calling Iron, *Mars.*

MARTIAL *Law*, is the Law of War, depending upon the King's Pleaſure, or his Lieutenant: For the King in time of Peace, never makes any Laws, but by common Conſent in Parliament, yet in War he uſeth abſolute Power, inſomuch, that his Word is a Law; but even this Power hath of late Years been inveſted in the King, or his Generals of the Army by Act of Parliament, and under particular Reſtrictions too. Read the new Acts of Parliament for puniſhing Mutineers and Deſerters, *&c.*

MARTLET, the Term in Heraldry for a Pidgeon, with its Feet eraſed or torn off; 'tis alſo the Difference, or mark of Diſtinction in an Eſcutcheon for the fourth Brother or Family.

MARTNETS in a Ship, are ſmall Lines faſtened to the *Leetch* of the Sail, being *Reeved* thro' a Block on the Topmaſt-head, and ſo they come down by the Maſt to the Deck. Thoſe *Martnets* which belong to the Top-ſails are faſtened (after the ſame way) to the Heads of the Top-gallant Maſts, but their *Fall* comes down no farther than the Top, when it is haled: The Word is *Top the Martnets*; *i. e.* Hale them up. Their deſign is, in furling the Sail, to bring that part of the *Leetch* which is next the *Yard Arm*, cloſe up to the Yard, that ſo the Sail may furle up the Cloſer.

MARS, the Name of one of the Planets which moves round the Sun in an Orbit between that of the Earth and *Jupiter.*

To view this Planet, there requires a good Teleſcope, with ſmall Apertures on the Object-glaſs, or elſe his Glairy Light makes but a confuſed Appearance.

This Planet as (well as the reſt) borrows its Light from the *Sun*; and has its Increaſe and Decreaſe of Light like the *Moon*; and it may be ſeen almoſt biſſected when in his Quadratures with the *Sun*, or in his *Perigæon*, but never corniculated or falcated as the other Inferiors.

March 10. 1665. Dr. *Hook* obſerved this Planet, with a 36 Foot Tube, and ſaw its Body as large very near as the *Moon* at Full; and in it he obſerved ſeveral Spots, and particularly a Triangular one; which having a Motion, he concluded the Planet to have a turbinated Motion round its Centre.

In the Year 1666, *February* the 6th in the Morning, Mr. *Caſſini* with a 16 Foot Teleſcope, obſerved two dark Spots in the firſt Face of *Mars*, moving from 11 at Night until break of Day.

February the 24th in the Evening, he ſaw two other Spots in the other Face of this Planet, like thoſe of the firſt, but much bigger: And continuing the Obſervations, he found the Spots of theſe two Faces to turn by little and little from Eaſt to Weſt, and to return at the Space of 24 Hours, 40 Minutes, to the ſame ſituation, wherein they were ſeen at firſt.

Whence he concluded, That the Revolution of this Planet round its Axis, is perform'd in the

ſpace

ſpace of 24 Hours, 40 Minutes, or thereabouts.

The Diſtance of *Mars* from the Sun, is about one and an half of that of the Earth from the Sun; and therefore to an Eye placed in *Mars*, the Diameter of the Sun would appear by one and an half leſs than it doth to us, and conſequently his Light and Heat will be but half of what it is here on our Earth; but this admits of a ſenſible Variation, becauſe of the great Eccentricity of *Mars* his Orbit, yet not ſo great as in *Mercury*.

Mars his Year is almoſt twice as long as ours, and his *Natural Day* a little greater than ours; but his *Artificial Day*, or the Time in which the Sun appears above his Horizon (beſides the Twilight before Sun-riſe, and after Sun-ſet, according to the daily Height of the Atmoſphere) is almoſt every where equal to his Night; and conſequently, in one and the ſame place on his Surface, there can be but little Variety of Seaſons as to Summer and Winter, *&c.* the Reaſon of which is, That the Axis of the Diurnal Revolution of this Planet, is nearly at Right Angles with the Plane of the Orbit. But Places ſituate in divers Latitudes, or at divers Diſtances from his Equator, will have very different Degrees of Heat, by reaſon of the different Inclination of the Sun's Rays to the Horizon; as is the Caſe of our Earth when the Sun is in the Equinoxes.

And from hence the Learned Dr. *Gregory*, in his *Aſtronom. Phyſ. & Geometr.* p. 473. conjectures very probably, That the *Faſciæ* of this Planet do ariſe: which are certain *Swathes* or *Fillets* which appear in *Mars*, and are poſited parallel to his Equator. For ſince there is always in the ſame Climate (*here*) nearly the ſame Degree of Heat, 'tis likely, that theſe Spots in *Mars* owing their Original to Heat and Cold, (as in our Earth Clouds and Snow do) may be extended in the ſaid Climates in Parallels to the Equator, or to the Circle of *Mars* his Diurnal Revolution, and ſo form the *Faſciæ*. And the ſame is true of *Jupiter*, which, as well as *Mars*, hath a perpetual Equinox.

That *Mars* hath an Atmoſphere, like ours, is argued from the Phænomena of the Fixed Star's appearing obſcur'd, and, as it were, extinct. when they are ſeen juſt by the Body of *Mars*: And if ſo, a Spectator in *Mars* will hardly ever ſee *Mercury*, unleſs it may be in the *Sun*, when that Planet paſſes over his Disk like a Spot, as he doth ſometimes to us.

To an Eye in *Mars*, *Venus* will appear about as far from the *Sun*, as *Mercury* doth from him with us; and the Earth, as far as *Venus* appears to us, to be from the *Sun*. And when the Earth, being ſeen from *Mars*, appears in Conjunction with, and very near to the Sun, the *Martial* Spectator will ſee that which *Caſſini* once or twice ſaw in *Venus*, *viz.* the lower Planet (or the Earth) appear horned or falcated; and its Satellite, the *Moon* of the ſame Figure, and at its greateſt Diſtance, not above 15 minutes of a Degree from the Earth. *Greg. Aſtronom.*

MARSHALLING a Coat of Arms (in Heraldry) ſignifies the due and proper joining of ſeveral Coats of Arms in one and the ſame Shield or Eſcutcheon, together with their Ornaments, Parts and Appurtenances.

MASCLE, a Term in Heraldry for a Bearing of this Figure: Gules a Chevron Ermin between three *Maſcles* Argent, by the Name of Bellgrave. *Guillim* ſaith, the *Maſcle* repreſents the Maſh of a Net, and is an honourable Bearing. A *Maſcle* differs from a *Lozenge*, only by being *voided*.

MASSE: This Word is uſed by the Natural Philoſophers to expreſs the Quantity of Matter in any Body, and this Sir *Iſaac Newton* ſaith, he found by moſt accurate Experiments on *Pendulums*, to be always proportionable to the Weight of Bodies, which is a good Argument to prove the Neceſſity of allowing a Diſſeminate Vacuum.

MASSETERS, in Anatomy, are ſhort, thick Tendinous Muſcles of the Lower Jaw, produced forwards from the *Os Primum* of the Upper Jaw, and backwards from the *Jugal Bone*; they are connected to the Lower Jaw. They aſſiſt the *Temporales* to move it to the Right-ſide, Left-ſide, and forward, according to the various Diſpoſition of the *Fibres*.

MASTER *of the Rolls*, is an Aſſiſtant to the *Lord Chancellor*, or *Lord Keeper* of the Great Seal of *England*, in the High Court of *Chancery*, and in his Abſence, hears the Cauſes there, and giveth Orders. He is by ſome called *Clerk of the Rolls*. And he has the diſpoſing of the Offices of the Six Clerks, Clerks of the Petty Bag, Examiners of the Court, and Clerks of the Chapel.

MASTERS *of the Chancery*, are Aſſiſtants in *Chancery* to the *Lord Chancellor*, or *Lord Keeper* of the Great Seal, in Matters of Judgment. Of theſe there are ſome Ordinary, ſome Extraordinary; of Ordinary there are Twelve, (whereof the *Maſter of the Rolls* is accounted one) whereof ſome ſit in Court every Day in each Term, and have referred to them (at the Lord Chancellor, Lord Keeper, or Maſter of the Rolls Diſcretion) Interlocutory Orders for ſtating Accounts, computing Damages, and the like; taking of Oaths, Affidavits, and Acknowledgments of Deeds and Recognizances. The Extraordinary do act in all the Country Ten Miles from *London*, by taking Recognizances and Affidavits, Acknowledgment of Deeds, *&c.* for the Eaſe of the Subject.

MASTICATION, or Chewing, is an Action, whereby we break and divide the Meat into ſmall Pieces with our Teeth, and mix it with the Spittle or *Saliva*, in order to its being the more eaſily fermented, digeſted, and turned into Chyle in the Stomach.

MASTICATORIES, are Medicines which are deſigned to provoke Spitting. By ſome they are called *Apophlegmations*.

MASTOIDEI, in Anatomy, is the ſame with *Mammillares*, and are ſuch Proceſſes any where, as are like Breaſts or Dugs, which from a broad Baſis, end in an obtuſe Top, and are ſhaped like the Tears in a Cows-Udder.

This Name is given by ſome Writers to thoſe *Muſcles* which bend the Head proceeding from the Neck-bone and the Breaſt-bone, terminating in the Proceſs *Mammiformis*. Theſe *Muſcles* ariſe partly tendinous, and partly fleſhy, from the Upper Part of the *Os Pectoris*, near half the Clavicle;

vicle; with two ſeemingly diſtinct Originations. Mr. *Cowper* ſaith, When either of theſe Muſcles act, they turn the Face to the contrary ſide. The *Proceſs*, or *Apophyſis* of the *Os Temporale*, which is in Shape ſomething like the Teats of a Cow, is called by this Name; and ſo are the Proceſſes of the *Olfactory Nerves*.

MASTS of a Ship, are the Main-maſt, Main-top-maſt, Main-top-gallant-maſt, Fore-maſt, Fore-top-maſt, Fore-top-gallant-maſt, Mizen-maſt, and Mizen-top-maſt; amongſt which, may alſo be reckoned her Boltſprit; all which ſee.

For the Proportion of Maſts, Sir *H. Manwaring* gives theſe Rules. Whatever the Breadth of a Ship be in Feet, multiply $\frac{4}{5}$ of that Breadth by 30, the Product is the Length of her *Main-maſt* in Yards. Thus if a Ship be 30 Foot at the *Midſhip-Beam*, $\frac{4}{5}$ of 30 is 24: Therefore that Ship's *Main-maſt* muſt be 24 Yards, or 72 Feet in Length. Then for its Bigneſs, he allows an Inch to every Yard in Length; and therefore this *Main-maſt* muſt be 24 Inches thro' or thick.

The *Fore-maſt* of a Ship muſt be $\frac{4}{5}$ of the Length of the *Main-maſt*, that is in this caſe, 19 Yards $\frac{1}{5}$, or 57 Feet $\frac{3}{5}$. Thick or through, it muſt be near 20 Inches.

The *Boltſprit* or *Bowſprit*, is always the ſame Length and Bigneſs with the *Fore-maſt*. And the *Mizen-maſt* muſt be juſt half the Length of the *Main-maſt*, and half as thick.

MATER *Dura*, called alſo *Dura Meninx*, is a Membrane which ſticks cloſe to the Skull within, in ſome places, and mediately covers both the Brain and *Cerebellum*; it has four Cavities, which ſupply the Place of the Veins, and come together betwixt the Brain and *Cerebellum*, which Conjunction is called *Torcular*.

MATER *Tenuis*, or *Pia Meninx*, is a Membrane which immediately cloaths the Brain and *Cerebellum*; is extremely full of Sanguinary Veſſels, and is deſign'd, as ſome think, to keep in the Spirits generated in the Brain and *Cerebellum*, that they fly not away.

MATERIA *Medica*, is whatever is uſed in the Art of Medicine for the Prevention or Cure of Diſeaſes, whether collected or prepared from Plants, Animals, Minerals, *&c.* by Chymiſtry or Pharmacy.

MATHEMATICKS, originally ſignifies any Diſcipline or Learning (μαθησις) but now, 'tis properly that Science which teaches or contemplates whatever is capable of being numbered or meaſured, as it is computable or meaſurable.

And that Part of *Mathematicks* which relates to Number only, is call'd *Arithmetick*: That which relates to Meaſure in general, whether Length, Breadth, Motion, Force, *&c.* is called *Geometry*.

Mathematicks may be reckon'd either,

1. *Pure, Simple*, or *Abſtracted*, which conſiders abſtracted Quantity, without any relation to Matter, or Senſible Objects. Or,

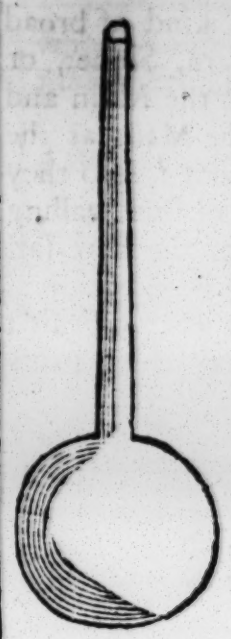
2. *Mixt Mathematicks*, which is interwoven every where with Phyſical Conſiderations.

Mathematicks alſo are divided into

Speculative, which propoſes only the ſimple Knowledge of the Thing propoſed, and the bare Contemplation of Truth or Falſhood: And

Practical, which teaches how to demonſtrate ſomething uſeful, or to perform ſomething that ſhall be propoſed for the Benefit and Advantage of Mankind.

MATHEMATICAL *Horizon*, is the ſame with *True Horizon*. See *Horizon*.



MATRASS, or *Bolt-head*, is a long ſtrait-necked Veſſel of Glaſs, frequently uſed by the Chymiſts in Diſtillations; and when they are fitted to the Noſe of an Alembick, they are called *Receivers*, becauſe they Receive the Matter which the Fire forces over the Helm or Head of the Still. They are of this Figure. And when one of theſe is by its Neck luted well into the Neck of another, they call it a Double Veſſel, which is uſed for the Circulation of Spirits, and for the Opening or Subtilizing of any Body by a long Digeſtion.

MATRIX, the ſame that *Uterus*.

MATRIX of a Tree or Plant, is the ſame with what the Botaniſts call *Cor*; which ſee.

MATTER, or *Body*, is an impenetrable, diviſible, and paſſive Subſtance, extending into Length, Breadth and Thickneſs. This, when conſider'd in general, remains the ſame in all the various Motions, Configurations and Changes of Natural Bodies, being capable of putting on all manner of Forms, and of moving according to all manner of Directions and Degrees of Velocity.

The Quantity of Matter in any Body, is its Meaſure, ariſing from the joint Conſideration of the *Magnitude* and *Denſity* of that Body: As if any Body be twice as *denſe* as another, and take up *twice the Space*, 'twill be four times as great. This Quantity of Matter is beſt diſcoverable by *Weight*, to which 'tis always proportionable; as the Excellent Sir *Iſaac Newton*, by moſt accurate Obſervations on Pendulums, found true by Experience.

Dr. *Woodward*, in his *Eſſay towards a Natural Hiſtory of the Earth*, Part 5. aſſerts *Matter* to be originally and really very different; being at its firſt Creation divided into ſeveral *Ranks*, *Sets* or *Kinds* of *Corpuſcles*: That all the *Corpuſcles* which are of the ſame *Kind* or *Set*, agree in every thing, and are moſt exactly like unto one another in all reſpects. But thoſe that are of *different Kinds*, differ from one another every way, as well in *Matter* or *Subſtance*, in *Specifick Gravity*, in *Hardneſs*, in *Flexibility*, and in ſeveral other ways, as in *Bigneſs* and *Figure*. And he ſuppoſes, that from the various *Compoſures* and *Combinations* of theſe Corpuſcles together, happen all the Varieties of the Bodies formed out of them; and all their Differences in Colour and outward Appearance, in Taſte, in Smell, in Hardneſs, in Specifick Gravity, and in all other reſpects.

MATTER *in Deed*, and *Matter of Record*, are Terms in Law, which are ſaid to differ thus: *Matter in Deed*, ſeems to be nothing elſe but a Truth to be proved, tho' not by any Record; and *Matter of Record* is that which may be proved by ſome Record. For Example: If a Man be ſued to an *Exigent*, during the Time he was in the King's Wars; this is *Matter in Deed*, and not *Matter of Record*: And therefore he that will alledge this for himſelf, muſt come before the *ſcire facias*, before Execution be awarded againſt him; for after that, nothing will ſerve but *Matter of Record*; that is, ſome Error in the Proceſs appearing upon Record.

MATTS *on Board a Ship*, are a kind of broad thick Clouts, wove out of ſpun Yarn, Sinner, or Thrums; and are uſed to preſerve the Main and Fore-Yards from galling againſt the Maſts at the Tyes, and at the Gunnel of the Loof: Alſo they ſerve to keep the Clew of the Sail from galling there; as alſo to ſave the Clews of the Fore-ſail from doing ſo at the Beak-head and Boltſprit.

MATURITY, the juſt Ripeneſs of any Fruit; and by Analogy, the Arrival of any thing to its juſt Degree of Perfection.

MATURATION, is the Action of growing Ripe, or the Tendency of any Fruits towards Maturity or Ripeneſs.

MAUNCH: The Figure of an Ancient Sleeve of a Coat, is ſo called by the Heralds, and is born in many Gentlemens Eſcutcheons; as in the Earl of *Huntington*'s, in thoſe of the *Coniers*, &c.

MAXILLA *Superior*, the Upper Jaw-bone: This conſtitutes the inferior and lateral Parts of the Orbit of the Eye, and comprehends alſo the Bones of the Noſtrils, Palate, and Upper Row of Teeth. It hath, according to *Diemerbrook*, Twelve Bones belonging to it, Six on each ſide. The Firſt is called the *Os Jugale*, and is of a Triangular Form, and poſited at the External Angle of the Eye. The Second is called the *Foramen lacrymale*, and is a thin pellucid ſmall Bone, placed in the Internal Angle of the Eye, and gives a Paſſage to that Liquor which makes the Tears. 'Tis near this *Foramen* that the *Abſceſſe*, which the *Greeks* call *Ægilops*, and we *Fiſtula lacrymalis*, uſually happens. The Third is a thin pellucid Bone, placed between the two former, and within the Orbit of the Eye, and which is continued with the fungous Bones of the Noſtrils. The Fourth is a large Bone, conſtituting the greateſt Part of the Cheek and Palate, and receiving into it the Upper Teeth by their proper Caverns: It hath an eminent conſpicuous *Foramen*, or Hole, placed under the Orbit of the Eye, and tranſmitting to the Face a Branch of the Third Pair of Nerves. It hath alſo another *Foramen* at the hinder part of the *Dentes inciſorii*; and then there go up two *Foramina*, with a Bony Partition between them, one to each Noſtril. The Fifth is a thin, hard, ſmall, oblong Bone, approaching to a ſquare Figure; and this, with its Partner on the other ſide, conſtitutes the Bridge, or protuberant Bone of the Noſe. The Sixth Bone forms, with its Fellow, the Bony Part of the Palate, or Roof of the Mouth. *Fallopius*, *Columbus*, and ſome others, add to theſe a Thirteenth Bone, which they call *Vomer*, and place it between the Palate and *Os ſphæroides*; and will have it like a kind of *Septum*, to divide the Lower Parts of the Noſtrils. And *Veſalius* reckons the Two *Oſſa ſpongioſa* among theſe Bones of the *Superior Maxilla*.

MAXILLA *Inferior*, is the Lower or Moveable Jaw: This contains all the Lower Teeth. It hath two Proceſſes on each ſide; of which, the Foremoſt is thin and large, and ends in a kind of Point, to which the Tendon of the Temporal Muſcle is firmly knit, and this is called *Corona*: The other is obtuſe, and lies more backwards, and is join'd by a Cartilage to the Neck; and its Part, by which it adheres, they call *Condylus*: It hath Four *Foramina* deſign'd to tranſmit the aforeſaid Proceſſes.

MAXIMIS and *Minimis*. The Mathematicians call that Method whereby a Problem is reſolved, which requires the greateſt or leaſt Quantity attainable in that Caſe, *Methodus de Maximis & Minimis*.

Of this ſee *Hon. Faber*. at the End of his *Synopſis Geometrica*, where you have a great Variety of Problems of this kind. See alſo *Ozanam*'s Preface to his *Dictionaire Mathematique*; the Marqueſs *d' Hoſpital* his *Analyſe des Infiniment Petits*, Sect. 3, *&c.* In the *Acta Erud. Lipſ. A. D.* 1683. p. 122. there is alſo a Method of determining *Maxima & Minima*, by one *D. T.* chiefly applicable to the Drawing of Tangents to Curves: And in the ſame Book, and for the Year 1684. p. 467. you have a Method of the famous Mr. *Leibnitz*, for the ſame Purpoſe, according to his *Calculus Differentialis*. See alſo the Seventh Book of M. *De La Hire*'s *Conick Sections*, in Latin; and Chap. 7. of *Niewentiit*'s *Analyſis Infinitorum*. There is alſo printed in the Firſt Volume of *Des Cartes*'s *Geometry*, a Method of *Huddes*, for finding the *Maxima & Minima*, p. 137.

The following Account of this Method, was communicated to me by Mr. *Humphrey Ditton*, a Perſon very Skilful in theſe Matters; and now Maſter of the New Mathematical School in *Chriſt's Hoſpital*.

PROBLEM.

To determine any Flowing Quantity in an Equation propos'd, to an Extreme Value.

Tho' there are various excellent Methods for the doing of this, yet there is nothing that ſeems ſo clear and natural, and is really ſo general, ſo quick and eaſie, as that which the Doctrine of *Fluxions* furniſhes us withal.

To ſolve the Problem in any Caſe that can be propos'd, is only to make a juſt Application of this General Rule, *viz.*

Having put the Equation into Fluxions, *let the* Fluxion *of that Quantity (whoſe Extreme Value is ſought) be ſuppos'd* $= o$; *by which means all thoſe Members of the Equation in which it is found, will vaniſh, and the remaining ones will give the Determination of the* Maximum *or* Minimum *deſired.*

DEMONSTRATION.

Every *Maximum* or *Minimum* is in its own Nature a *Stable Quantity*: To determine therefore any Flowing Quantity to a *Maximum* or *Minimum*, is to make it (inſtead of a Flowing) a Permanent one; but the *Fluxion* of a Permanent Quantity is equal to Nothing. From whence the Reaſon of the Rule is ſufficiently clear.

Let us illuſtrate this by ſome Examples. *Ex. gr.*

Suppoſe $b\,b\,x - y\,y\,x + c\,y\,x - d^3 = o$, where y and x are Flowing Quantities, and y is to be determined to an Extreme Value. Then

$$b\,b\,\dot{x} - 2\,y\,\dot{y}\,x - y\,y\,\dot{x} + c\,\dot{y}\,x + c\,x\,\dot{y} = o,$$

and making $\dot{y} = o$, $b\,b\,\dot{x} - y\,y\,\dot{x} + c\,y\,\dot{x} = o$, and $y\,y - c\,y = b\,b$, from which Quadratick Equation y may be determin'd.

Let

Let $r\,x - \frac{r\,x\,x}{q} - y\,y = 0$, which is the Equation of an Ellipſe, where the *Latus Rectum* $= r$, the *Latus Tranſverſum* $= q$; the Abſciſſe $= x$, and the Ordinate $= y$; then we have

$\dot{r}\,\dot{x} - \frac{2\,r\,x\,\dot{x}}{q} = 2\,y\,\dot{y} = 0$, from whence $q\,r = 2\,r\,x$, and $x = \frac{q}{2}$; which Value of x ſubſtituted in the Equation of the Curve, gives $\frac{r\,q}{4} = y\,y$, and ſo $y = \sqrt{:\frac{r\,q}{4}}$ = the *Semi-Conjugate.*

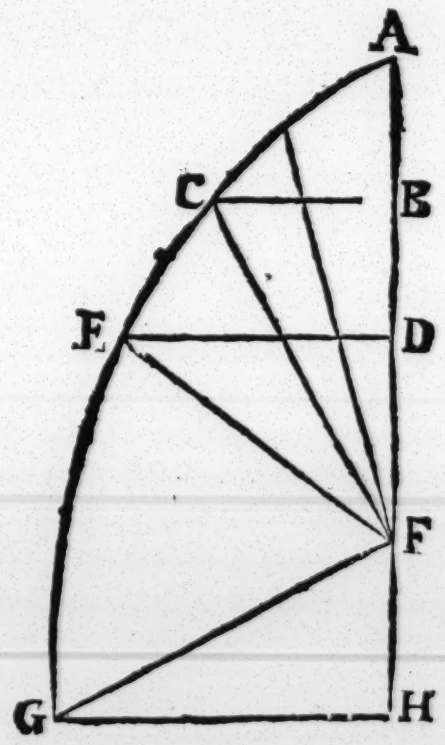
Again, Suppoſe $y\,y\,u - d\,y\,z - c\,c\,d = 0$, where y, z, u, are all Flowing Quantities; and y is to be determin'd to an *Extremum.* Now in all ſuch Caſes, where the Equation will involve the Fluxions of ſo many different Flowing Quantities, we muſt endeavour by convenient Subſtitutions to expunge ſome of them, that we may have no more than one ſort of Fluxions left to deal with; of which the Equation may be clear'd by ordinary Diviſion. And I think this Method, which I'll propoſe in the firſt place, to be a very eaſie and general one in order to this End. The Equation is $y\,y\,u - d\,y\,z - c\,c\,d = 0$, from whence $2\,y\,\dot{y}\,u + y\,y\,\dot{u} - d\,\dot{y}\,z - d\,\dot{z}\,y = 0$, and putting $\dot{y} = 0$, $y\,y\,\dot{u} - d\,y\,\dot{z} = 0$. Now to throw out theſe Fluxions in the laſt Equation, we need only ſubſtitute the Value of either of them from the Second Equation, where we find $\dot{u}$ (*ex gr.*) $= \frac{d\,\dot{y}\,z + d\,\dot{z}\,y - 2\,y\,\dot{y}\,u}{y\,y}$ wherefore $y\,y\,\dot{u} - d\,y\,\dot{z} = d\,\dot{y}\,z + d\,\dot{z}\,y - 2\,y\,\dot{y}\,u - d\,y\,\dot{z} = d\,\dot{y}\,z - 2\,y\,\dot{y}\,v = 0$, wheref. $d\,z - 2\,y\,u = 0$, which is the Equation deſired.

Suppoſe $y\,y\,x - z\,y\,x - m = 0$, and y to be determined to an *Extremum.* Then $2\,y\,\dot{y}\,x + y\,y\,\dot{x} - \dot{z}\,y\,x - z\,\dot{y}\,x - z\,y\,\dot{x} = 0$, and making $\dot{y} = 0$, $y\,y\,\dot{x} - x\,y\,\dot{z} - z\,y\,\dot{x} = 0$, but $\dot{z} = \frac{2\,y\,\dot{y}\,x + y\,y\,\dot{x} - z\,\dot{y}\,x - z\,y\,\dot{x}}{y\,x}$, wherefore ſubſtituting this in the Room of $\dot{z}$ in the former Equation, we have $y\,y\,\dot{x} - 2\,y\,\dot{y}\,x - y\,y\,\dot{x} + z\,\dot{y}\,x + z\,y\,\dot{x} - z\,y\,\dot{x} = 0$; that is, $z\,\dot{y}\,x - 2\,y\,\dot{y}\,x = 0$, and $z\,x - 2\,y\,x = 0$.

But Mr. *Niewentiit* furniſhes an Expedient for this Purpoſe alſo in the 7th Chap. of his *Analyſis Infinitorum*: He conſiders the Flowing Quantities in the Equation, as the Ordinates of ſo many ſeveral Curves, which have one common *Abſciſſa*; then ſubſtituting the Values of the Fluxions of theſe Ordinates (gotten by the general Property of all Curves) he brings all the Fluxions to one Expreſſion. *Ex. gr.* In the Equation above, $y\,y\,u - d\,y\,z - c\,c\,d = 0$, where we had $y\,y\,\dot{u} - d\,y\,\dot{z} = 0$, let y, u, z be conceiv'd to be the Ordinates of three ſeveral Curves, whoſe common *Abſciſſe* let $= x$, and let the *Subtangent* belonging to u be $= n$, and that for z be $= l$; then $\dot{v} = \frac{v\,\dot{x}}{n}$ and $\dot{z} = \frac{z\,\dot{x}}{l}$, wherefore $\frac{y\,y\,u\,\dot{x}}{n} - \frac{d\,y\,z\,\dot{x}}{l} = 0$, that is $l\,y\,u - d\,z\,n = 0$, the Equation for y determined to an *Extremum.* 'Tis true, this Equation appears ſomething different from that which was deduced by the former Proceſs: There the Equation was $d\,z - 2\,y\,u = 0$, and here 'tis $l\,y\,u - d\,z\,n = 0$; but that theſe Equations are exactly the ſame, is thus eaſily diſcovered. Becauſe $\dot{u} = \frac{v\,\dot{x}}{n}$, and $\dot{z} = \frac{z\,\dot{x}}{l}$ theref. $\dot{u} : \dot{z} :: \frac{u}{n} : \frac{z}{l}$; from whence $l : n :: z\,\dot{u} : u\,\dot{z}$, but (by what went before) $\dot{u} = \frac{d\,\dot{y}\,z + d\,\dot{z}\,y - 2\,y\,\dot{y}\,u}{y\,y}$, wheref. $l : n :: \frac{d\,\dot{y}\,z\,z + d\,\dot{z}\,z\,y - 2\,y\,\dot{y}\,z\,v}{y\,y} : v\,\dot{z}$; from hence in Mr. *Neiwentiit*'s Equation, *viz.* $l\,y\,u - d\,z\,n = 0$, ſubſtituting theſe Quantities in the Room of l and n, to which they are proportional, we have $\frac{y\,u\,z\,z\,d\,\dot{y} + u\,z\,y\,y\,\dot{z} - u\,u\,z\,2\,y\,\dot{y}}{y\,y}\,y - d\,u\,z\,\dot{z} = 0$, or dividing all by $u\,z$, and multiplying by $y\,y$, and rejecting Contradictories, we have $d\,z\,y\,\dot{y} - 2\,y\,y\,\dot{y}\,u = 0$, that is, $d\,z - 2\,y\,u = 0$. *Q. E. D.*

Theſe Examples may ſerve to illuſtrate a Rule which is in it ſelf very plain and obvious.

As for the Uſe and Application of the Doctrine *de Maximis & Minimis*, perhaps it may be as Uſeful and Noble a one as any, to ſhew how from hence all ſorts of Curves may be cut at Right Angles, and conſequently the Invention of the Tangents is to be performed.



Let A C G be any Curve whoſe Vertex is A, Axe A H, its Ordinates E D, C B, G H: Let any Point, as F, be taken in the Axe at Liberty, and

from thence the Lines F C, F E, F G be drawn to the Curve.

Let A F $= n$, A B, A D, A H $= x$, H F $= n + x$, B F, F D $= n - x$, E D, B C, G H $= y$, F C, F E, F G $= z$. The Point F being taken any where at liberty, 'tis evident, that when any Line, as F C, F G, *&c.* is coincident with F E, which I imagine to be a *Normal* to the Curve in the Point E, from the same Point F; that then the intercepted Line, F B, F H, *&c.* is coincident with the *Subnormal* F D, and consequently upon the determining of an *Extremum*, the Invention of a Tangent naturally follows.

To form the General Equation that is to serve in this Business, we have, from the Rectangular Triangle F B C, $z z = n n - 2 n x + x x + y y$; or on the other side F, from the Triangle G H F, $z z = x x - 2 n x + n n + y y$; or for an *Extremum*, $2 x x - 2 n x + 2 y y = 0$:

In which Equation, if in the room of $2 y y$ we substitute its Value from the Equation of the Curve, the *Subnormal* will be discovered.

Ex. gr. Suppose the Curve were an *Hyperbola*, then $2 y y = r \dot{x} + \frac{2 r x \dot{x}}{q}$: Therefore $2 x \dot{x} - 2 n \dot{x} + r \dot{x} + \frac{2 r x \dot{x}}{q} = 0$, and $2 n \dot{x} = 2 x \dot{x} + r \dot{x} + \frac{2 r x \dot{x}}{q}$ and $n = x + \frac{r}{2} \frac{r x}{q} =$ F A, wherefore F D (the *Subnormal*) $= \frac{r}{2} \frac{r x}{q}$ Q. E. I.

Suppose the Curve a Circle, in which Case $2 y \dot{y} = 2 r \dot{x} - 2 x \dot{x}$; then proceeding as before, we have $2 n \dot{x} = 2 r \dot{x}$, and $n = r$, and therefore F D $= r - x$; which shews that F is ever in this Curve, the Centre it self. In the Common *Parabola*, $r \dot{x} = 2 y \dot{y}$, and therefore $n = \frac{r}{2} + x$, and so F D $= \frac{r}{2}$. But 'tis not only in these Conick Sections, but in any other Curve whatsoever, that from this general Equation by a due Substitution of the Value of $2 y \dot{y}$, the Tangent, or (which is all one in effect) the Subnormal will be discover'd.

MEAN *Axis*, in *Opticks*. See *Axis*.

MEAN *Diameter*, in *Gauging*, is a *Geometrical Mean* between the Diameters at Head and Bung in any close Cask.

MEAN *and Extream Proportion*. See *Extream and Mean Proportion*.

MEAN in *Law*, signifies the Middle between two Extreams, and that either in Time or in Dignity. As in the First, His Action was *Mean* betwixt the Disseisin made to him and his Recovery, that is in the *Interim*, (or, as we say, in the *mean* time.) Of the Second, there is *Lord-mean* or *mesne*, and *Tenant-mean*. See *Mesne*.

MEAN *Motion*, or *mean Longitude of the Sun*, in the *Ptolemaick Hypothesis*, is an Ark of the Ecliptick, reckon'd from the Beginning of *Aries* to the Line of the Sun's Mean Motion, accounting according to the Order of the Signs. And 'tis also not unusual to call the

MEAN *Motion of the Sun*, in the Old Astronomy, the Distance (accounted on in the Ecliptick, from the Beginning of *Aries*) of the *Sun* from the Line of his *Mean Motion*. See *Line of the Sun's Mean Motion*.

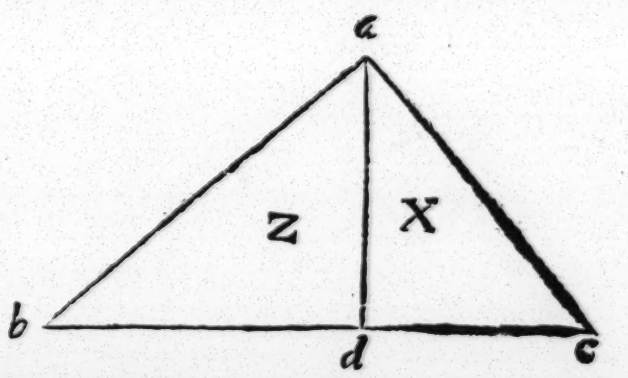
MEAN or *middle Proportional*, between any two Lines or Numbers, is that which hath the same *Proportion* to a third Term that the first bears to it.

Thus 8 is a *mean Proportional*, between 2 and 32, because 2 : 8 :: 8 32. And the three Numbers in this Case are thus expressed 2. 8. 32 :: That is, Two, Eight, and Thirty two, are in *Continual Proportion*; for the same *Proportion* is continued from the Middle or Second Term to the Third, as was between the First and Second: Therefore 'tis the very same thing as if the middle Term had been put down twice. Now, because when Four Numbers are *Proportional*, the Rectangle of the middle Terms is equal to that of the Extreams, it must be so here: But here the two middle Terms being the same Number, they will make a Square; so that when Three Numbers are in *continual Proportion*, the Square of the middle Term is equal to the Rectangle of the Extreams; and that middle Term is call'd a *mean Proportional* between the other two.

PROPOSITION.

In a Right angled Triangle

The Perpendicular (*a d*) is a *mean Proportional* between the Segments of the Hypothenuse (*b d* and *c d.*)

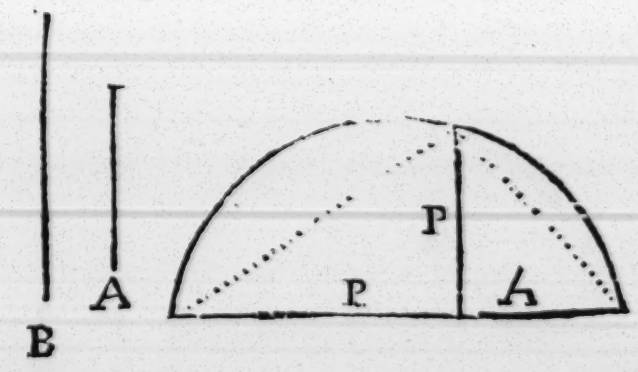


That is, as *b d* : *a d* :: *a d* : *d c*; and therefore the Square of *a d* is equal to the Rectangle between *b d* and *d c*.

For the Triangles *c d a* and *a d b*, being similar, 'twill be as *c d* : *d a* :: *d a* : *d b*; and consequently $\square\, d\, a = \square\, b\, d\, c$.

PROBLEM.

To find a Mean Proportional *to Two Given Lines*, A *and* B.



Put A and B both into one Line, then bisect the whole Line; make the Point of Bisection the Centre of a Semi-circle, and then erect the Line P perpendicular to the Two given Lines, at their Point

Point of Union: I ſay, the Line P is the *Mean Proportional* ſought.

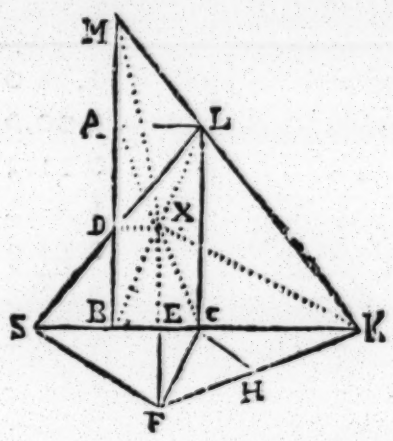
For B: P :: P: A, by the laſt Propoſition.

To find a Mean Proportional, *between any Two Numbers,*

Multiply the Numbers into one another, and extract the Square Root of the Product: Of which ſee more under *Logarithms*, and the *Uſe of Logarithms*, Numb, 11. and 12.

To find Two Mean Proportionals *between Two Given Lines,* A B *and* B C.

This famous Problem (which is the ſame as the *Duplication of the Cube*) may be reſolved and demonſtrated by means of the Conchoid of *Nicomedes*; and would be Geometrical, if that were a Geometrical Curve.



Join the given Lines A B and B C together at Right Angles, and biſſect each in the Points D and E: Compleat the Rectangle ALBC, and draw L D till it meet with C B produced to S. Then will S B. = A L or to B C. From E let fall a Perpendicular, which produce till C F be equal to A D, which will cut off the Part E F. Draw then F S, and parallel to it C H. Then (by *Cor.* 1. *Prop.* 2. of the *Conchoid*) through the Legs of the Angle K C H draw the Right Line F H K, ſo that H K be equal to C F. Draw alſo the Right Line K L M, producing it till it meet with B A alſo produced in M. So will C K and A M be the Two *Mean Proportionals* ſought.

DEMONSTRATION.

Let M A be called b. L C or A B = eb and B C = c. Then becauſe of the Similar Triangles M A L and L C K,

A M. L C or A B :: A L or A C. C K

$b \;.\; eb \quad :: \quad c. \quad \frac{ebc}{b}$ or ec

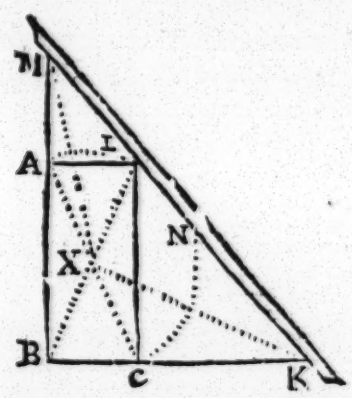
Wherefore ec = CK. Alſo MA. A D :: S C. CK

$b.\frac{cb}{2} :: 2c.ec.$

(Becauſe if you halve one Conſequent, you muſt double the other Antecedent.) And S C. C K :: F H. H K (becauſe C H is parallel to S F) Wherefore M A. A D :: F H. H K. H K is equal to A D or $\frac{1}{2}eb$ (as was taken above) wherefore F H muſt be equal to M A or b. And conſequently M D = F K (for both in this Notation are $b + \frac{1}{2}eb$.) And the Square of each will be $bb + ebb + \frac{1}{4}eebb$, that is = F E + □ E K, (by 47 *e* 1. *Eucl.*) And to theſe Equal Quantities adding the Squares of D X and E C, each of which is $\frac{1}{4}cc$. Their Sum, *viz.* □ M D + □ D X (*i. e.* □ M X) will be $bb + ebb + \frac{1}{4}eebb + \frac{1}{4}cc$; which alſo is equal to the Sum of theſe □ E F + □ E C (*i. e.* □ F C, which was = to A D = X E by the Conſtruction + □ E K = $\frac{1}{4}eebb + \frac{1}{4}cc + ecc + eecc$; that is equal to □ X K. Wherefore ſince the Squares are equal, the Roots or Line M X and X K muſt be equal to each other.

Now if from thoſe equal Sums $bb + ebb + \frac{1}{4}eebb + \frac{1}{4}cc$, and $\frac{1}{4}eebb + \frac{1}{4}cc + ecc + eecc$, you take away what is common to both, *viz.* $\frac{1}{4}eebb + \frac{1}{4}cc$, there will remain $bb + ebb = ecc + eecc$: Which will be found to be alſo, ſingly taken, equal to each other; becauſe the Part taken away bb, will be to the other Part taken away ecc:: as the Remainder ebb, is to the Remainder $eecc$; and both muſt be as their Wholes were, *i. e.* equal: Wherefore $bb = ecc$, and $ebb = eecc$. Which latter Equation reſolved into Proportionals will ſtand thus, as $cb.ec::ec.b$; or as A B. C K :: C K. M A. And if you reſolve the former Equation, it will be as $ec.b::b.c$. That is C K. M A :: M A. B C. Which is in plain Words the Propoſition, *viz.* that C K and M A are Two Mean Proportionals between A B and B C, *Q. E. D.*

On which *Demonſtration* is founded the Mechanical Way of *Eutocius*, *Lib.* 2. *De Sph.* and *Cylind.* for finding Two Mean Proportionals; which is thus:



Join the Given Lines A B and B C in a Right Angle, as before, and compleat the Rectangle, drawing the Diagonal to find the Point X, and producing B A and B C both ways towards M and K; for then fix a Ruler on the Centre L, and then return it forward and backward, till you find by the Compaſſes M X and X K are equal; and then A M and C K are the Lines ſought.

Another Method for which, *Eutecius* alſo mentions, which ſeems more practical; which is, To make a Semi-circle on A C the Diagonal of the Rectangle, then the Moveable Ruler is placed forwards and backwards till L M (by the Compaſſes) be found equal to N K, and that will give the Points M and K, and conſequently the Lines A M and C K required.

How to find Two *Mean Proportionals* by help of the *Ciſſoid* of *Diocles*, and by Two Parabola's, (which was *Menechmus* his way) ſee *Sturmius Matheſis Enucleata*, Book 2. Prop. 21. *Conſect. & Scholium.* *Des Cartes* doth the ſame Thing by help of One Parabola only, ſee his *Geometry*, p. 91. and as many as you pleaſe by help of a Curve Line generated after a peculiar way, which ſee in *p* 67, 68. of his *Geometry*. Much more of this Nature you have in *Sluſius's Meſolabium*.

MEASURE, in Muſick, is a Quantity of the Length and Shortneſs of Time, either with reſpect to Natural Sounds, pronounced by the Voice; or Artificial, drawn out of Muſical Inſtruments: Which

Which Measure is adjusted in Variety of Notes, by a constant Motion of the Hand or Foot, *down* or *up*, successively and equally divided; so that every *Down* and *Up* is called a *Time* or *Measure*, whereby the Length of a *Semi-breve* is measured, which is therefore termed, The *Measure-Note*, or *Time-Note*.

MEASURES. I thought it would be a very Acceptable Thing to the Reader, to see in one View, an Account of the Ancient and Present Measures of several Parts of the World: Which therefore I have here given him, as I occasionally collected them from the Best Authors.

A TABLE of the *Foreign Measures*, Carefully Compared with the *English*.

	Suppose an *English* Foot divided into 1000 Equal Parts, those here mentioned are in Proportion to it, as follows.	The *English* Foot divided into Inches and Decimal Parts of an Inch.
London —— Foot	1000	0.12.0
Paris —— the Royal Foot	1.068	1.00.8
Amsterdam —— Foot	.942	0.11.3
Brill —— Foot	1.103	1.01.2
Antwerp —— Foot	.946	0.11.3
Dort —— Foot	1.184	0.02.2
Rynland or *Leyden* —— Foot	1.033	1.00.4
Lorain —— Foot	.958	0.11.4
Mechlin —— Foot	.919	0.11.0
Middleburg —— Foot	.991	0 11.9
Stratsbourg —— Foot	.920	0.11.0
Bremen —— Foot	.964	0.11.6
Cologn —— Foot	.954	0.11.4
Frankford ad Manam —— Foot	.948	0.11.4
Spanish —— Foot	1.001	1.00.0
Toledo —— Foot	.899	0.10.7
Roman —— Foot	.967	0.11.6
On the Monument of { *Cestucius* / *Statilius* } ——	.972	0.11.7
Bononia —— Foot	1.204	1.02.4
Mantua —— Foot	1.569	1.06.8
Venice —— Foot	1.162	1.01.9
Dantzick —— Foot	.944	0.11.3
Copenhagen —— Foot	.965	0.11.6
Prague —— Foot	1.026	1.00.3
Riga —— Foot	1.831	1.09.9
Turin —— Foot	1.062	1.00.7
The *Greek* —— Foot	1.007	1.00.1
Paris Foot, according to Dr. *Bernard* ——	1.066	
Universal —— Foot	1.089	
Old *Roman* —— Foot	.970	
Bononian Foot of M. *Auzout* ——	1.140	
Lyon —— Ell	3.976	3.11.7
Bologn —— Ell	2.056	2.00.8
Amsterdam —— Ell	2.269	2.03.2
Antwerp —— Ell	2.273	2.00.2
Rynland or *Leyden* —— Ell	2.260	2.03.1
Frankford —— Ell	1.826	1.09.9
Hambourg —— Ell	1.905	1.10.8

To which add the *Syrian Metretes*, or *Congius Romanus*	207.06		7	$\frac{1}{8}$

The *Grecian Long Measures*.

Schoenes. This ſome will have to contain 60, ſome 30, others 32, and others 40 Furlongs.

Paraſang, is the ſame with the Hebrew Paraſang.

Dolich. This ſome will have to contain 24 Furlongs; but the common Account is 12.

Hippicon, containing 4 Furlongs.

Diaulus, Two Furlongs.

Plethron. This ſome make an Acre, as *Plutarch*; others $\frac{1}{4}$ of a Furlong, or 100 Feet, as *Suidas*; others 10000 Feet, as *Heſychius*; and ſome make it 100 Furlongs. But *Suidas* ſeems righteſt in ſtating it 100 Foot.

Pygon. This *Heſychius* ſuppoſes the Length from the Elbow to the Fingers Bent, which ſome call *Palmipes*; that is, a Foot and a Palm, or 20 Fingers Breadth.

Pygme, is the Length from the Elbow to the End of the Hand, when the Fiſt is cloſed, and is two Inches ſhorter than the Pygon.

Orthodoron. Some make this a Palm, others a Span; but 'tis ſhorter by a Finger's Breadth than the Span, or Greater Palm.

Lichas, is uſually reckon'd the Length or Span between the End of the Thumb and of the Fore-finger, when both are ſeparated and extended; and therefore is leſs than the Orthodoron by a Finger's Breadth. Some will have it the ſame with *Dichas*, which *Cowper*, in his Dictionary, ſays, is but 8 Fingers Breadth; but the former Account ſeems trueſt.

Paleſt, the ſame with *Doron*, is the Leſſer Palm; being 4 Fingers Breadth, or 3 Inches *Engliſh*.

But there is great Uncertainty in theſe Accounts.

The *Meaſures* of *Capacity*, were,

1. The *Kypſele.* This *Scapula* reckons a Corn-meaſure, and is ſuppoſed to contain 6 Attick Medimnoi.

2. *Medimnos*, both Attick and Georgick, contained 48 Chænices, or 72 Sextaries. But becauſe the Georgick Chænix was larger than the Attick, there muſt be ſome Difference between them.

3. *Metretes.* Some render this by *Cadus*, and ſome by *Amphora*; the latter is wrong, for the *Amphora* is another Meaſure. This *Legat*, and ſome others, will have equal to the Attick Medimnos. This was not the Syrian Metretes, mentioned *John* 2. 6. for that was the ſame with the *Congius Romanus*.

4. *Amphora*, or *Amphoreus.* This was a Georgick Meaſure, and was half the Medimnos or *Metretes Georgicus*, as ſay ſome; others (as *Schrevelius*) will have it an Attick Meaſure, and to contain 3 Urns.

5. *Modion* was not what we call a Buſhel, but a Meaſure much leſs. *Alſted* computes it to contain 8 Attick Chænices, or 12 Sextaries: Others make it hold 16 Sextaries; and others a Pint leſs than our Peck.

6. *Chous*, *Chus* and *Choas*, was of two ſorts: the Attick held 6 Attick Sextaries, and the Georgick Chous 9 Georgick Sextaries.

7. *Chænix.* This ſome take for the Meaſure of Servants Food for one Day. The Attick Chænix, 'tis probable, held about one Attick Sextary and an half; and the Georgick 2 and $\frac{1}{4}$ of ſuch. Others ſay, that the latter held but barely 2 Attick Sextaries. Some alſo mention a *Bilibral*, *Quadrilibral*, and *Quinquelibral Chænix*. So that 'tis hard to determine any thing certain, as to theſe Matters.

8. *Sextarius*, or *Xeſta.* This ſome make 2 Kotyles, or $\frac{1}{2}$ of the Attick Chous. This Meaſure, ſay ſome Authors, would hold 20 Ounces of Water, others 24: Others are ſo exact as to tell you, that it held exactly 13 Ounces 7 Pennyweights and 18 Grains, *Troy*: Some ſay it held a Pint and an half of our Meaſure; and others will have it but half a Pint.

9. *Kotyle Attick*, is the Half Sextary. Some make this equal to the Roman *Hemina*; and then the Roman and the Attick Sextaries will be the ſame. This the *Romans* wrote *Cotyle*.

10. *Tetaction.*

10. *Tetacton.* This was a Liquid Measure, being a fourth Part of the Attick Sextary, and therefore called also *Quartarius.* But the Georgick Sextary contained 2 $\frac{1}{3}$ of the Georgick Tetacton.

11. *Oxybaph.* This in the Attick Measure was the Twelfth Part of the *Chœnix*; but in the Georgick the Eighth.

12. *Kyath*, in Latin *Cyathus*: One and half of this was an *Oxybaph.*

13. *Coucha* was the Half of a Kyath.

14. *Myſtrum*, the Half of the Coucha.

15. *Cheme.* One *Myſtrum* contained 2 $\frac{1}{2}$ of the Cheme.

A TABLE of *Grecian Exotick Meaſures*, compared with the *Attick.*

1. *Achana Perſica.* This, according to *Heſychius*, was a Corn-meaſure, and contained 7 Kypſeles, and 3 *Medimni.*

2. The *Syrian Metretes*: Which our very learned Dr. *Cumberland*, Biſhop of *Peterburgh*, hath proved to be the ſame with the *Congius Romanus*, and holds of our Meaſure 7 Pints, and $\frac{1}{8}$ or 207.06 ſolid Inches. This is what we tranſlate (but wrongly) a Firkin, *John* 2. 6.

3. *Artaba Perſica.* This, from the Authority of *Herodotus*, *Lib.* 1. *Pag.* 49, may be concluded to hold 3 Chœnices more than the Attick Medimnus. St. *Jerom*, on *Iſaiah*, *Chap.* 5. ſaith, that this Meaſure held 20 *Modii.*

4. *Kyprus*, or *Cyprus*, was the ſame with the Attick Medimnus.

5. *Artaba Ægyptica.* This *Epiphanius* makes the ſame with the Attick Medimnus; as alſo was, ſaith he, the Median Artaba: But *Fannius* and *Legat* make it but 3 $\frac{1}{3}$ *Modii.*

Medimnus Kyprius, { *Salaminca*, *Papho*, } contained { 5 *Modii.* 4 *Modii*, and 1 *Chous.*

7. *Collathum Syrium*, was the ſame Meaſure with the Pontick Modius, and was double to the Common Modius. And the like Quantity did the

8. *Ponticus Cyprus* contain alſo, as *Epiphanius* ſaith.

9. *Subitha Syria*, held 22 Attick Sextaries.

10. *Mares Ponticus*, held (according to *Epiphanius*) 20 Alexandrian Sextaries; which how much different from the Attick I know not.

11. *Kophinus.* This was a Boetick, both Liquid and Dry; and *Legat* ſaith it held 3 *Congii.*

12. *Modius Cyprius*, is a Meaſure containing 17 Attick Sextaries.

13. { *Kamſaces*, *Tetarpe Laconices*, } each a Meaſure of twelve Sextaries.

14. *Dadix*, a Boetick Meaſure, containing ſix Chœnices.

15. *Aphin*, an Ægyptian Meaſure of 4 Chœnices: And of the ſame Meaſure doth *Heſychius* make the *Topium* to be; but he tells us not where the *Topium* was uſed.

16. *Caphita*, a Perſian Meaſure of two Attick Chœnices. To this was the *Mares* equal; and ſome ſay was a Meaſure uſed in *Boetia.*

17. *Irion.* This with the *Ægyptians*, ſaith *Legat*, was the Word for the Sextary; and, according to *Epiphanius*, held juſt two Pound of Oyl.

18. *Elenius*, the ſame with the *Tetarton*, or one Quarter of a Sextary.

19. *Gabenon*, the ſame with the *Oxybath* or *Aretabule.*

20. *Alabaſtron* was a Meaſure containing a Pound of Oyl.

A TABLE of *Engliſh Long Meaſures.*

A *Degree*, or $\frac{1}{360}$ part of the Circuit of the Earth, according to

Dr. *Bernard*, is { $73\frac{14}{10}$ *Engliſh* Miles, of 5000 Foot in a Mile. / $67\frac{4}{10}$ *Catholick* Miles. / $66\frac{2}{3}$ *Arabick* Miles.

Mr. *Norwood*, $69\frac{1}{2}$ *Engliſh* Miles, or 367200 Feet.

Mr. *Picard*, ——————— 365184 Feet.

MEATUS *Auditorius*, the Auditory Paſſage, begins from the *Concha* and winds towards the inward part of the Ear, and is cloathed with a thin Skin as far as the brim of the *Tympanum*, or Drum of the Ear: Its uſe is to receive the Sound, and to convey it eaſily, but yet truly and ſo effectually to the *Tympanum*; within this Cavity is the *Ear-wax*, or *Cerumen*.

MEATUS *Urinarius*. See *Urethra*.

MECHANICKS, Dr. *Wallis* defines to be the Geometry of Motion; and is a Mathematical Science which ſhews the Effects of *Powers*, or moving Forces, ſo far as they are applied to Engines; and demonſtrates the Laws of Motion, *&c.* 'Tis alſo commonly taken for thoſe *Handy-crafts*, which require as well the Labour of the Hands, as the Study of the Brain.

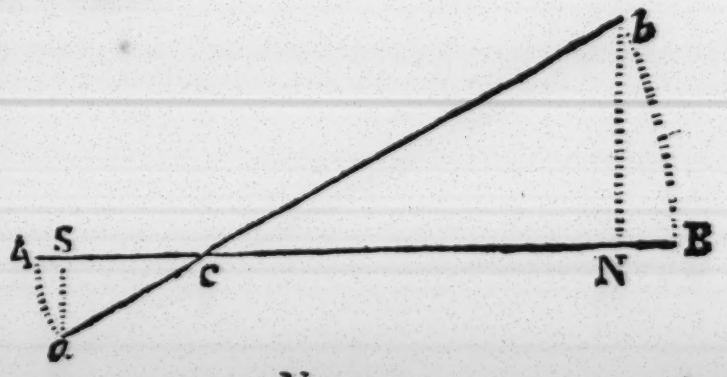
The Principle on which all Mechanick Power depends, will be eaſily underſtood by the Reſolution of this Problem.

Any Body as A, *with its Celerity* C, *being given; and alſo another Body as* B: *'Tis required to find the Velocity neceſſary, to make the* Moment, *or quantity of Motion in* B, *to be equal to the Moment of* A, *the given Body.*

Now ſince the *Moment of any Body is equal to the Rectangle under the Celerity and the Quantity of Matter*; as you will find in the *Laws of Motion*, (ſee the Word *Motion*:) You need only make as B to A : : ſo is C to a fourth Term, which will be *c*, the Celerity proper to B, ſo that its Moment ſhall be equal to that of A.

And from hence it follows, That any Body, though never ſo ſmall, may have a *Moment* equal to that of any other Body, tho' never ſo great, which ſhall be moved with any given Celerity.

Wherefore in any *Machine* or *Engine*, if the Velocity of the *Power*, be made to the Velocity of the *Weight* : : reciprocally as the *Weight* is to the *Power*; then ſhall the Power always ſuſtain or move the weight.



Let A B be a *Vectis*, or *Leaver*, whoſe *Fulcrum* is at *c*, and let it be moved into the Poſition *a c b*.

I ſay, that the Velocity of any Point in the Leaver is as its Diſtance from the Centre. Let the Point A deſcribe the Ark A *a* ; and the Point B, the Ark B *b* : Then theſe Arks will be the Spaces deſcribed by the two Motions : But ſince the Motions are both made in the ſame Time, the Spaces will be as the Velocities. (See Mr. *Keil*'s Laws of Motion, under the Word *Motion*, *Theorem* 6.) But 'tis plain, the Arks A *a*, and B *b*, will be to one another as their *Radii* A C, and A B, becauſe the Sectors A C *a*, and B *c b*, are Similar: Wherefore the Velocities of the Points A and B are as their Diſtances from the Centre C. *Q. E. D.*

Now if any Powers are applied to the Ends of the Leaver A and B, in order to raiſe its Arms up and down, their force will be expounded by the Perpendiculars S *a* and *b* N ; which being as the Right Sines of the former Arks *b* B and *a* A, will be to one another alſo as the *Radii* A *c* and *c* B: Wherefore the *Velocities of the Powers are alſo as the Diſtances from the Centre.*

And ſince the Moment of any Body is as its Weight, or gravitating Force and its Velocity conjunctly ; if different Powers or Weights are applied to the Leaver, their Moments will always be, as the Weights (or Powers) and their Diſtances from the Centre conjunctly.

Wherefore if to the ſame Leaver there be two Powers or Weights applied reciprocally proportional to their Diſtances from the Centre, their Moments will be equal ; and if they act contrarily, as in the Caſe of the *Statera* or *Stilliard*, the Leaver will remain in an Horizontal Poſition, or the Balance will hang in *Æquilibrio.*

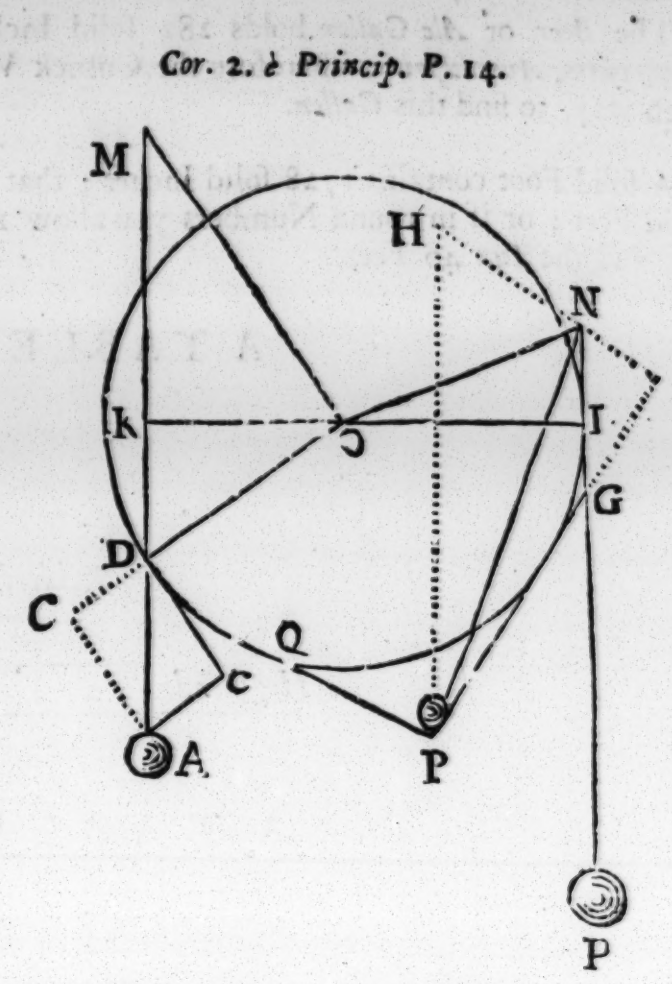
And thus 'tis eaſie to conceive how the Weight of one Pound may be made to Equi-balance a thouſand, *&c.*

And from hence 'tis plain, That the Force of the Power is not at all encreaſed by Engines, but only the Velocity of the Weight in either Lifting or Drawing, is ſo diminiſhed by the Application of the Inſtrument, that the Moment of the Weight may not be greater than the Force of the Power.

Thus for Inſtance : If any Force can elevate a Pound weight with a given Velocity ; 'tis impoſſible, by any Engine, to effect that the ſame Power ſhall raiſe two Pound weight with the ſame Velocity : But you may by an Engine raiſe two Pound weight with half the Velocity ; or 10000 times the weight with one 10000th part of the former Velocity.

The Admirable Sir *Iſaac Newton* accounts for all the Mechanick Powers by this following Diagram.

Cor. 2. *è Princip. P.* 14.



From O the Centre of any Wheel, let there be drawn the unequal *Radii* M O and O N, by the Threads M A, and N P ſuſtaining the Weights A and P ; and let the Forces of the Weights for the moving of the Wheel be required.

Thro' the Centre O, draw K O L Perpendicular to the Threads, then with the longer Radius O L, deſcribe a Circle cutting the Threads in D and L : Draw D O, and Parallel to it A c ; draw alſo the Perpendicular D C : Becauſe it matters not whether the Points of the Threads K, L, D, be fixed or not to the Plane of the Wheel, ſince the Weight, will weigh the ſame as if they were ſuſpended by the Points K and L, or D and L : For the whole Power of the Weight A is expreſſed by the Line D A : And this Diagonal is reſolvable into the two Forces, D C and A C, (by *Cor.* 2.) Now A C being Parallel to D O, and drawing the Radius D O directly from the Centre ſignifies nothing towards turning the Wheel. But the other Force D C drawing the Radius D O Perpendicularly, doth the ſame as if it drew the Radius O L Perpendicularly downwards, for O D = O L: That is, it doth what the Weight P doth. Now, let the Weight P, be in the ſame Proportion to A : : as D C is to D A: That is, by Reaſon of the Similar Triangles A D C and D O K :: as O K is to O D, or to O L. Then I ſay the Wheel cannot move at all, becauſe the Weights A and P, are reciprocally as their *Radii* O K and O L placed in the ſame Right Line ; and therefore there will be an *Æquilibrium.* Which is the known Property of the *Balance*, *Lever*, *Wheel*, *Windlace*, &c. But if the Weights be in any other *Ratio* but this, of K O to O L, the Wheel will turn that way, in which the Proportion exceeds.

Let there be another Weight *p* = to the former Weight P, which let be partly ſuſpended by the Thread N P, and partly ſuſtained by the Inclined Plane *p* G : To which Plane draw H N Perpendicular, and H *p*, Perpendicular to the Horizon. Now, 'tis plain, by *Cor.* 1. That if the Tendency of the Weight downwards be expounded by the Line H *p*, it is then Reſolvable into the Forces *p* N. and H N. If

If Q *p* be drawn Perpendicular to the Thread N *p*, ſo as to cut the Plane *p* G, in a Line Parallel to the Horizon: And if the Weight *p* be ſuppoſed to lie only on the two Planes *p* Q, and *p* G, the Weight will preſs theſe Planes Perpendicularly with the Forces *p* H, and H N: That is, it will preſs the Plane *p* Q, with N *p*; and the Plane *p* G, with H N.

Wherefore, if Q *p* be ſuppoſed to be taken away, ſo that the Weight *p* may ſtretch the Thread N *p*; then, becauſe the Thread now ſuſtaining the Weight, ſupplies the Place of the Plane Q *p*, the Thread will be ſtretch'd by the Force N *p*, which before preſſed on the Plane *p* Q.

Wherefore the Tenſion of this Oblique String, to the Tenſion of the other Perpendicular one N *p*:: is as *p* N is to *p* H.

And conſequently, if the Weight *p*, be to the Weight A:: in a *Ratio*, compounded of the reciprocal *Ratio* of the leaſt Diſtances of the Threads A M, and *p* N, from the Centre of the Wheel, and of the direct *Ratio* of *p* H, to *p* N, the Weight will be in *Æquilibrio*, as any one may ſoon try.

Hence 'tis plain, that the Weight *p* lying on thoſe two Oblique Planes, is in the Nature of a Wedge within the Parts of a Cloven Body; and conſequently the Forces of the Wedge and Beetle may from hence alſo be known.

For the Force with which the Weight *p* preſſes the Plane *p* Q, is to the force with which either by its own Gravity, or by the ſtroak of the Beetle it is impelled according to the Line H *p* in that Plane, :: as *p* N, is to *p* H, and to the Force with which it preſſes the other Plane *p* G:: as *p* N. N H.

And ſince the Screw is nothing but a Wedge forced by a Leaver, its Power or Force may by this Method be eaſily calculated.

Wherefore (adds the Excellent Author:) This Corollary is of moſt Extenſive Uſe, ſince all Mechanicks depend upon it.

MECHANICK *Powers*, (as they call them) are Six, viz. The *Balance*, *the Leaver*, the *Wheel*, the *Pulley*, the *Wedge*, and the *Screw*; to ſome or other of which, the force of all *Mechanical* Inventions, muſt neceſſarily be reduced. See thoſe words.

MECHANICAL *Philoſophy*, is the ſame with the *Corpuſcular*, which endeavours to explicate the *Phænomena* of Nature from *Mechanical Principles*; *i. e.* from the *Motion*, *Reſt*, *Figure*, *Poſition*, *Magnitude*, &c. of the Minute Particles of Matter. And theſe Principles are frequently called

MECHANICAL *Cauſes*: And alſo the

MECHANICAL *Affections* of Matter.

MECHANICAL *Solution* of a Problem in Mathematicks, is either when the Thing is done by repeated Tryals, or when the Lines made uſe of to ſolve it are not truly Geometrical. Thus the Method of *Nicomedes*, *Eratoſthenes*, *Pappus* and *Vieta*, for finding two mean Proportionals; and that of *Nicodemus* and *Dinoſtratus*, for dividing an Angle into any Parts aſſigned, by means of the *Quadratrix*, is *Mechanical*: Becauſe the former is done by repeated Tryals, and the latter by the means of a Curve that is not truly Geometrical.

MECONIUM, properly is an Opiate, or the condenſed Juice of Poppies. Alſo the Excrements of a *Fœtus*, which ſtick to the Inteſtines after the Birth, are improperly ſo called, from the Blackneſs of their Colour, like to that of Poppy Juice.

The *Opium* which we have in *England*, *France*, &c. is only a *Meconium* made by expreſſing the Juice of the Oriental Poppies, which is thickened a little by Evaporation, and then wraps up in Leaves to be ſold here: But the *Turks*, &c. keep the Tears of their Poppies, or the true *Opium* to themſelves, and will not vend them abroad.

MEDALLIONS, are large Medals Coined, not as Current Money, but on ſome ſpecial extraordinary Occaſion.

MEDALS, are Pieces of Metal like Money, Stamp'd or Coined upon ſome Extraordinary Occaſion, to perpetuate the Memory of ſome great and Eminent Perſon, or of ſome conſiderable Victory, or other Publick Benefit to a Nation, or People.

They divide *Medals* into *Ancient* and *Modern*; and they account Ancient, all ſuch as were Coined between the Third and Ninth Age of Chriſt. The Modern are ſuch as have been made within theſe laſt 3 or 400 Years.

Of the Ancient Medals, the moſt Ancient are the *Greek*; and the *Conſular Medals*, are the moſt Ancient of the *Latin* ones.

MEDIANA *Vena*, is the Middle Vein in the bending of the Cubit, betwixt the Cephalick and Baſilick; it is ſafely opened, becauſe there's neither Nerve nor Artery under it.

MEDIAL *Alligation*. See *Alligation Medial*.

MEDIASTINUM, is a doubling of the *Pleura*, or Membrane clothing the internal Parts of the *Thorax*, Ribs, *&c.* and it divides the Lungs and other *Viſcera* of the Breaſt, into two parts. It proceeds from the *Vertebres* of the Back, and going on forward, reaches the Breaſt-bone, and there makes an eminent Partition in the very middle of the *Thorax*.

MEDIASTINA, is a Branch of the *Subclavial* Veins, which ordinarily comes from the Trunk of the *Cava*; it goes to the *Mediaſtinum* and *Thymus*.

MEDIATION, according to ſome Writers of Arithmetick, is Diviſion by 2, or taking the half of any Number or Quantity. This is called alſo *Bipartition*; and in Reference to Lines, uſually *Biſſection*.

MEDIATUS *Linguæ*, or *Party-Jury*, is a Jury Impanelled upon any Cauſe, wherein a Stranger is Party, whereof the one half conſiſts of Denizens, the other of Strangers, and is uſed in Pleas, where one Party is a Denizen, and the other a Stranger.

MEDICINE, or as 'tis commonly called *Phyſick*, is an Art aſſiſtant to Nature, and deſigned for the preſerving of Health in Humane Bodies, as much as is poſſible, by the Uſe of convenient Remedies. *Sennertus* and others, divide it into five parts.

1. *Phyſiologia*, which treats of an Human Conſtitution, as it is ſound and well; to which belongs *Anatomy* too.

2. *Pathologia*, which treats of the Preternatural Conſtitution of our Bodies.

3. *Semiotica*, which treats of the Signs of Health and Diſeaſes.

4. *Hygicina*, which delivers Rules for the *Regimen* to be obſerved in the Preſervation of Health.

5. *Therapeutica*, which teaches the Management of

of *Diet*; and comprehends *Chirurgery*, and the Art of *Medicine*, properly ſo called.

The general Diviſion of Phyſick is only into two Parts; the *Theory* and the *Practick*: An accurate Skill in both which, are neceſſary to make a Man a good Phyſician.

MEDIO *Acquittando*, is a Writ Judicial, to diſtrain a Lord for the *acquitting* a *Mean* Lord from a Rent which he formerly acknowledged in Court, not to belong to him.

MEDIUM in Natural Philoſophy, ſignifies that peculiar Conſtitution of any Space or Region through which Bodies move. Thus the *Æther* is ſuppoſed by ſome to be the *Medium* in which the Planets and Heavenly Bodies move. The *Air* is the *Medium* in which all *Meteors* are generated and move; and by the means of which it is that all Land Animals, as Inſects, Birds, Beaſts, and Men, can Breath and Live. But water is the *Medium* in which Fiſhes Live and Move. And whatever Denſity, or Tenacity there is in the Parts of this *Fluid Medium*, whereby Bodies moving in it are hindred or ſtopped, ſo that the Motion becomes ſlower, or is made in part to ceaſe, is called the *Reſiſtance of the Medium*. And Sir *Iſaac Newton* hath proved, That this Reſiſtance of the *Medium* to the Motion of Bodies, is always as the Square of the Velocity of the moving Body. *Princip. Philoſ. Math.* p. 245. See *Reſiſtance of the Medium*.

MEDIUS *Venter*. See *Thorax*.

MEDULLA *Cerebri* is the white ſoft part of the Brain, covered on the outſide with the Cortical Subſtance, which is of a more dark or aſhy-colour: It is called alſo the *Corpus calloſum*, and is an Union or Conjunction of both ſides of the Brain into one. *Willis* obſerved, That this Part conſiſted of an Innumerable Number of *Striæ*, or *Fibræ*, tending length-wiſe: And *Malpighius* aſſerts, That by the help of a Microſcope they appear ſo viſible as to look ſomething like the Teeth of an Ivory Comb.

MEDULA *oblongata*, is that part of the Brain within the Skull, which is the beginning of the Spinal Marrow; it is about 3 or 4 Inches in length within the Scull, and then it deſcends to the *Os Sacrum*, thro' the Hole of the hinder part of the Head and the Vertebræ: It ſends out ten pair of Nerves to the Cheſt, the Abdomen, and the Limbs. It is call'd alſo the *Common Senſory*, becauſe the Original of the Nerves being there, it is the common Place or Receptacle of all that comes to the Brain by the external Senſes.

MEDULLA *Oſſium*, Marrow in the Bones, is a ſoft fat ſubſtance plac'd in the Cavities, or Poroſities of the Bones; it is kept in a Membrane, and is quite deſtitute of all Senſe; it is red in the greater Cavities, white in the leſs, and ſoft and ſucculent in ſpungy Bones.

MEDULLA *Spinalis*, or the Spinal Marrow, is the Continuation of the *Medulla Oblongata* without the Scull; and which paſſing thro' all the *Vertebræ* of the Back, ends at laſt at the *Os Sacrum*; it is a kind of Coagmentation of Nerves, ſending out thirty pair of Nerves on each ſide, to the Limbs, to the great Cavities, and other parts of the Body. If it be waſh'd with a convenient Liquor, it will ſever into a great many little Fibres, which alſo are very conſpicuous in its Original, the *Medulla Oblongata*.

MEDULLA of a Plant, or rather Tree, is the ſame with *Cor*; which ſee.

MEDULLARY *Oil*, is the finer and more ſubtile part of the Marrow of the Bones; which paſſes into them not by Ducts (ſaith Dr. *Havers*) but by ſmall Pores formed into the Veſicles or Glandules (which are conglomerated into diſtinct Lobules contained in ſeveral Membranes, or Bags, and theſe Bags are contained in one common Membrane Inveſting the whole Marrow: And all theſe Veſicles, Bags, and Coat or Membrane are propagated from the outward Coat of the Arteries) by which it paſſes from one to another, till it arrives at the ſides or extream parts of the Bone.

That part of it which is ſupplied to the Interſtices of the Joints, paſſes into them by Paſſages, penetrating thro' the Bone into thoſe Cavities, and formed for this end.

The Uſe of this Oil is either common to all the Bones, whoſe Temper it preſerves and keeps them from being too brittle: Or more peculiar for the Joints; where it is very ſerviceable,

1. To lubricate the Extremities of the Bones, that they may move the more eaſily and freely.

2. To keep the ends of the Articulated Bones from too great an Incaleſcence or Heat.

3. It preſerves the Joints alſo from wearing by Attrition, or grating one againſt another. And

4. It preſerves the Ligaments of the Joints from Drineſs and Rigidity; and lubricates thoſe parts of them alſo that ſlide upon the Bones, and it keeps the Cartilages which are join'd to any of the Bones in a flexible Condition.

MELA is a Chirurgeons Inſtrument, called alſo *Speculum*, the Vulgar call it *Tenta*, a *Tent*, from trying. It is made for the moſt part of Silver, or Ivory, and its Uſe is to probe Ulcers, or to draw a Stone out of the Yard, *&c.* It is of different Shapes, according as it is differently deſigned to be uſed.

MELANAGOGUES are Medicines that expel black Choler, or Melancholy, as the Ancients us'd to expreſs themſelves.

MELANCHOLY, is a Doating, without a Fever or Raving; or a *Delirium* proceeding from a kind of Sadneſs of the Patient, whereby the Animal Spirits ſeem to be moved more ſlowly than they were wont. *Blanchard.*

MELICERIA, called alſo *Hydarthrus*, and *Ichor*, and ſometimes *Hydrops Articularis*, is a Tumor ſhut up within a Tunick, proceeding from Matter like Honey, without Pain, round, yielding if preſſed, but quickly returning again. It ſeems to proceed from the Lymphatick Particles which do not circulate right; and which, when the Moiſture is evaporated, leave a honeyiſh kind of Subſtance. *Blanchard.*

MELICRATUM, is a Drink made one part of Honey, and eight parts of Rain Water.

MELIUS *inquirendo*, is a Writ that lieth for a ſecond Inquiry of what Lands and Tenements a Man died ſeized, where Partiality was ſuſpected upon the Writ of *Diem clauſit extremum*.

MELOPES, *Vibices*, *Enchymoma*, *Sugillationes*, all ſignifie the ſame thing; and are red Spots (like thoſe which remain in the Skin after beating) in Malignant and Peſtilential Fevers. *Blanchard.*

MELOS, a Diſeaſe of the Eye, when there is ſo great an Irruption of the *Uvea* Tunicle; that it ſeems like an Apple. *Blanchard.*

MEMBRANA, is a nervous, fibrous, broad, plain, white, and dilatable Subſtance, which covers

vers the Bowels, the great Cavities of the Body, the Muſcles, &c. and is endowed with an exquiſite Senſe.

MEMBRANA *Muſculorum Communis*, the Common Membrane, or Covering of the Muſcles, is ſpread over all the Body, except the Skull, and is knit by Fibres ſomething looſely to the *Membrana Carnoſa*, lying above it; and to the proper Membrane of each Muſcle which lies under it; it is very thin, but ſtrong, of a whitiſh Colour, and almoſt tranſparent. It ſerves not only as a common Bag to the Muſcles, and helps to keep them in their proper Places; but alſo to moiſten them, and to beſmear their Tendons with a Mucilaginous Liquor, which lubricates them, and forwards their Motion and Action.

MEMBRANA *Adipoſa*. See *Adipoſa Membrana*.

MEMBRANA *Carnoſa*, the ſame that *Panniculus Carnoſus*.

MEMBRANA *Nictitans*. See *Nictitans*.

MEMBRANA *Urinaria*, the ſame with *Allantois*.

MEMBRANOSUS, is a Muſcle of the Leg, ſo called from the large Membranous Expanſion it is Continuous with, incloſing all the Muſcles of the *Tibia* and *Tarſus*; whence it is alſo called *Faſcia lata*: It hath an acute fleſhy Beginning from the Fore-part of the Spine of the *Os Ilium*, between the Origination of the *Sartorius* and Tendinous Beginning of the *Glutæus Magnus*; and being dilated to a fleſhy Belly, which fills the Interſtice made by the firſt of the two laſt-named Muſcles and Upper part of the *Rectus* and Fore-part of the *Glutæus Medius*, in its Oblique Deſcent becomes Tendinous, four Fingers Breadth below the great *Trochanter*, whence it paſſes directly over the *Vaſtus Externus* to its proper Termination, at the ſuperior *Appendix* of the *Fibula*; but in its Progreſs thither, it is conjoined with the Tendinous Expanſion of the *Glutæus Magnus*, which ariſeth from the Spine of the *Ilium*, covering the external Part of the *Glutæus Medius*, and all the external Muſcles of the *Tibia*, as well as thoſe of the Thigh-bone; and deſcending over the *Patella*, comprehends the Muſcles of the *Tarſus*, and joins with the *Ligamentum Annulare*, which retains the Tendons of the Toes and Feet: When this Muſcle acteth, the Leg and Thigh are drawn outwards.

MEMBRED: In Heraldry thoſe Birds which are either whole-footed, or which have no Tallons, are termed by this Word *Membred*.

MEMORY, is that Faculty of the Soul, which repeats Things perceived by former Senſations; or is the calling to mind of known and paſt Things; as when we conceive Heat or Light, Yellow or Sweet, &c. the Object being removed; and is as it were the Store houſe of our *Idæa's*.

MENDOSA *Sutura*, or *Squammea*, is a ſcaly Connexion of the Bones of the Skull; as may be ſeen in the Bone of the Temples, and the Bone of the Fore-part of the Head.

MENINGES, are the thin Skins that inwrap the Brain, and which are called *Matres* by the *Arabians*; as if all the Membranes of the Body were propagated by and from them. They lie immediately within the Skull, and are Two in Number; *viz.* the *Dura mater*, or *Craſſa meninx*; and the *Pia mater*, or *Tenuis meninx*; which ſee.

MENINGOPHYLAX, is that which preſerves the Meninx or Membrane of the Head, as thin Gold or Silver Plates, which are applied when the Skull is opened. *Blanchard.*

MENINX, ſee *Mater dura & tenuis*.

MENISCUS *Glaſſes*, are thoſe which are Convex on one ſide, and Concave on the other.

For finding the *Focus* of a *Meniſcus*, the Rule is this:

As the Difference of the Semi-diameters of the Convexity and Concavity, to the Semi-diameter of the Concavity; ſo is the Diameter of the Convexity to the Focal Length.

MENOPEGIA, is a ſharp Pain in the Head, affecting one ſingle Place.

MENSTRUUM, the Chymical Word for a Diſſolving Liquor. They gave it this Name, becauſe ſome Chymiſts pretend that the complete Diſſolution of a Mixt cannot be done in leſs Time than 40 Days; which Period they call the *Philoſophical Month*.

And from hence the Word *Monſtruum* hath come to be the general Term for any Diſſolvent; and any Liquor which will exactly diſſolve all the Parts of any Body, is called a proper *Menſtruum* for that Body: As *Aqua Regalis* is for Gold; *Aqua Fortis*, or Spirit of Nitre, for moſt other Metals; *Common Water* for Salt, or Sugar, &c.

And here it may not be amiſs to give a Solution of one Difficulty, *viz.* Why great Lumps or Fragments of Gold, &c. will readily deſcend to the Bottom of the Glaſs, and yet when they come to be cut or divided into very ſmall Particles or Atoms, tho' of the ſame ſpecifick Gravity with thoſe greater Lumps, yet theſe ſhall ſwim, and be ſuſpended in the *Menſtruum*.

In order to the accounting for which, we may firſt conſider, That the Parts of no Fluid can be ſo eaſily ſeparable, but that they will a little reſiſt or retard the Deſcent of any heavy Body through them; and this Reſiſtance is *(cæteris paribus)* ſtill proportionable to the Surface of the deſcending Bodies. But the Surfaces of Bodies do by no means increaſe or decreaſe in the ſame Proportion as their Solidities do: For the Solidity increaſes as the Cube, but the Surface only as the Square of the Diameter. Wherefore 'tis plain very ſmall Bodies will have much larger Surfaces, in Proportion to their Solid Content, than larger Bodies will; and conſequently, when they grow exceeding ſmall, may eaſily be conceived to be buoyed up by the Fluid.

Indeed it doth ſometimes happen that a *Menſtruum* will diſſolve and keep ſuſpended in it, without letting them emerge to the Top, the Parts of a Body lighter in *Specie* than it; as when Camphire is diſſolved into a Liquor, and that Liquor well mingled with Oyl of Vitriol; which is an Effect not agreeable to the Laws of *Hydroſtaticks*: But then it may be conſider'd, that there may be ſome ſuch peculiar Texture in the Parts of the Camphire, as may make them ſo joyn or adhere to the Parts of the Oyl, as that, tho' heavier, yet they ſhall not be impelled up to the Surface, at leaſt for a Time: Which we ſee is the Caſe, in ſome meaſure, of an accurate and well-proportioned Mixture of Oyl and Water.

Mr. *Boyle* mentions a *Menſtruum* which he extracted from Bread alone, that would work on Bodies more compact than many hard Minerals, nay, even on Glaſs it ſelf, and do many things that *Aqua Fortis* could not do. It was thus made: Cut Brown Houſhold-Bread, either of Wheat or Rye,

Rye, (though the Rye is beſt) into Slices; and when they are a little dried, fill with them a Glaſs Retort, and draw off in a Sand-Furnace by Degrees of Fire, what will come over. Separate the Oyl from the Liquor in the Receiver by a Tunnel, or a Filtre, and in a gentle Heat free the Spirit from ſome of its Phlegm, (though this is not always neceſſary). With this, he ſaith, he drew Tinctures not only from Crude Corals, but even from the *Lapis Hæmatites*, and *Granates*, unpowdered; nay, alſo from Diamonds and Rubies. Yet by no means was this ſo Corroſive a Liquor as *Aqua Fortis*, or as the other Acid Menſtruums.

From hence therefore we may learn to ſuſpend our Aſſent as to that bold Aſſertion of ſome Phyſicians and Naturaliſts, That 'tis impoſſible any Medicine can be found out, that ſhall diſſolve the Stone in the Bladder or Kidneys, but what muſt alſo corrode and deſtroy the Veſſels through which it paſſes in the Body. For there are many Menſtruums effectually Corroſive, that will not work at all on ſome Bodies; which yet other Things, though of no ſuch Corroſive Nature to the Tongue or the Touch, will readily diſſolve. Thus Quickſilver will diſſolve Gold, though there be no ſenſible Appearance of any Corroſiveneſs in the Mercury, either to the Finger, or even to the Tongue; and yet neither *Aqua Fortis*, nor Oyl of Vitriol, nor Spirit of Nitre, will touch this Metal, though they are ſome of the moſt Corroſive Menſtruums in Nature. Cold Water will diſſolve the White of an Egg; which the pureſt Spirit of Wine will not divide, but coagulate; as will alſo the Acid Liquors, Spirit of Salt, and Oyl of Vitriol. Thus alſo Common Oyl will diſſolve Brimſtone, though it appear ſo ſoft and ſmooth upon the Tongue, and will not diſſolve ſo much as an Egg-ſhell; and yet that General Diſſolvent, *Aqua Fortis*, will not touch Brimſtone. Many more Inſtances of this Nature might be given; by which it appears, that Menſtruums do not operate by virtue of any manifeſt Quality, ſuch as Heat, Moiſture, or even Acidity it ſelf, but rather by ſome mechanical and peculiar Fitneſs that there is between the Shape, Bulk, Solidity, *&c* of the Corpuſcles both of it and the Body to be diſſolved.

MENSTRUUM *Peracutum*, is a Menſtruum mentioned by Mr. *Boyle*, and made by drawing off Spirit of Nitre ſeveral times from Butter of Antimony. He ſaith, That by the Help of this, he was able, without a very violent Fire, and in a few Hours, to elevate a good Quantity of Crude Gold.

MENSURABILITY, is an Aptitude in a Body, whereby it may be apply'd or conform'd to a certain Meaſure.

MENSURATION, or *Meaſuring*, is to find the Superficial Area, or Solid Content, of all Surfaces and Bodies. The Rules to do which, as exactly as is poſſible, you will find under the Names of the ſeveral *Figures* and *Solids*.

MEPHITICAL *Exhalations*, are poiſonous or noxious ones, iſſuing out of the Earth. Theſe the *Latins* uſed to call *Mephites*; whence comes the *Italian Moſeta*, which is the Term they have for the famous *Grotta de Cani*, near *Puzzoli*, about two Miles from *Naples*, which is ſo called, becauſe its poiſonous Steams will kill Dogs, (and no doubt any other Animals) if held long over, and within the Stench of the Steams.

MERCATOR's *Chart*, or *Projection*, is a Projection of the Face of the Earth in *Plano*; wherein the Degrees upon the Meridian increaſe towards the Poles in the ſame Proportion that the parallel Circles decreaſe towards them.

'Tis called *Mercator's Chart*, or *Projection*, becauſe *Mercator* was the firſt that publiſhed *Charts* ſo made: Tho' our Country-man Mr. *Wright* was really the firſt that made the Tables for this *Projection*.

Though the *Plain Chart* be very eaſie and uſeful in ſhort Voyages, and will ſerve in the longeſt Voyages, if you ſail Home in or near the oppoſite Rhumb you went by; as the Ancients, who being Coaſters, did before the Uſe of the Compaſs: Yet foraſmuch as few Places, or indeed none but ſuch as lie under the ſame Meridian, or under the Equinoctial, can therein be expreſſed according to their true Situation and Diſtance one from another; but if they be laid down true by the Courſe and Diſtance, the Difference of Longitude will be falſe; if they be laid down by the Courſe and Difference of Longitude, then will the Diſtance and Difference be more than it ſhould be; and if they be laid down by their Diſtance and Difference of Longitude, (which in many Caſes is impoſſible) then the Difference of Latitude will always be too little, and the Rhumb too wide from the Meridian; and if they be laid down by their Latitudes and Separation, then the Courſe will be wide, and the Diſtance too much, *&c*.

And ſince that the Places in particular *Maps* or *Charts* being laid down in ſome, one way, and in others another, and theſe Pieces many times tack'd together, without due Conſideration of the differing Methods, Places have been laid down by: This, I ſay, being ſo, the *Geography* and *Hydrography* of the World is ſo corrupted, that too many Deſcriptions of the Whole, or of the large Parts of it, are enormouſly Erroneous, and the Shape of the Land much diſtorted. It were to be wiſhed therefore, that the World would not put over-much Value on, but wean it ſelf from the Uſe of the *Plain Chart*; and by making the *True Chart* Eaſie and Familiar, bring it in Reſpect and Uſe.

It was the great Study of our Predeceſſors, to contrive ſuch a *Chart in Plano*, with ſtrait Lines, on which all or any Parts of the World might be truly ſet down, according to their Longitudes, Latitudes, Bearings or Diſtances.

A Way was hinted for this near Two thouſand Years ſince by *Ptolemy*, and a General Map according thereto, made in the preceding Age by one *Mercator*; but the Thing demonſtrated, and a Ready Way ſhew'd of deſcribing it, was not 'till Mr. *Wright* taught to inlarge the *Meridian Line* by the continual Addition of Secants; ſo that all the Degrees of Longitude might be proportional to thoſe of Latitude, as on the Globe: Which he has done after ſuch an Excellent Manner, that in many Reſpects, it is far more convenient for the Navigator's Uſe, than the Globe it ſelf; and will truly ſhew the Courſe and Diſtance from Place to Place, which way ſoever a Ship ſail forth, or return.

PROBLEMS.

1. *To find the Meridional Miles, answering to any Difference of Latitude.*

First, By the *Table of Meridional Parts*, which are printed in most Books of Navigation,

Find the Degrees of either Latitude over-head, and the Minutes in the Left-hand Column downwards; and in the Angle of meeting are the Parts for that Latitude.

Thus also find out the Parts for the other; then, if both Latitudes be of the *same Name*, that is, both North, or both South, subtract these one from the other; and that Remainder contains the *Meridional Miles* sought. If of *different Name*, add them together; as in *Example* 2.

Example.

Required to find the *Meridional Miles* between Latitude 43° 15' North, and 50° 20' N.

Latitude 50° 20' ——— 35057 } Mer. Pt.
Latitude 43 15 ——— 28837 }

Merid. Difference of Lat.—6220

Example 2.

Let one Lat. be 20° 19' S. —12423 } Mer. Pt.
The other Lat. 18 53 N.—11541 }

Merid. Difference of Lat. — 23963 Sum.

PROBLEM II.

2. *To find the Meridional Difference of Latitude by the Table of Artificial Tangents.*

The *Logarithmick Tangents* above 45 Degrees, accounting every 30 Minutes to be one Degree, and every Minute to be two Minutes of the *Meridian Line*, are in the same *Ratio* with the *Meridional Parts*, made by the continual Addition of *Natural Secants*.

Therefore, Take half of each of the Given Latitudes, and to each half add 45°, looking the Tangents of their Arches in the Table of *Logarithmick Tangents*; the Difference of these Tangents divide by 1263, the Quotient will be the Meridional Miles or Minutes.

Example 1.

Lat. 50° 20', its ½ = 25° 10'; which added to 45°, makes 70° 10', whose Tangent is - - - - - - - - - } 4428786

½ *Lat.* 43° 14', is 21° 37' ½; which added to 45°, makes 66° 37' ½, whose Tangent is, omitting the Index, - - } 3642940

785846

1263) 785846 (622 = Merid. Diff.
280
278
260

Example 2.

The ½ of *Lat.* 20° 17' S. is 10° 18 ½, which added to 45°, make 55° 8' ½, whose Tangent is - - - - - - } 1570607

½ *Lat.* 18° 53', N. is 9° 26' ½, which added to 45°, makes 54° 26' ½, its Tangent is - - - } 1457970 / 3028577 Sum.

1263) 3028577 (2397 = Mer. Diff. Lat.
50260

100
1166

PROBLEM III.

3. *The Latitudes and Difference of Longitudes of Two Places given, to find the Course and Distance between them.*

Admit the *Course* and *Distance* between the *Lyzard*, in Latitude 50° 10' N. and *Antego* in Latitude 17° 25 N. whose Difference of Longitude is 54° 15' W. be required.

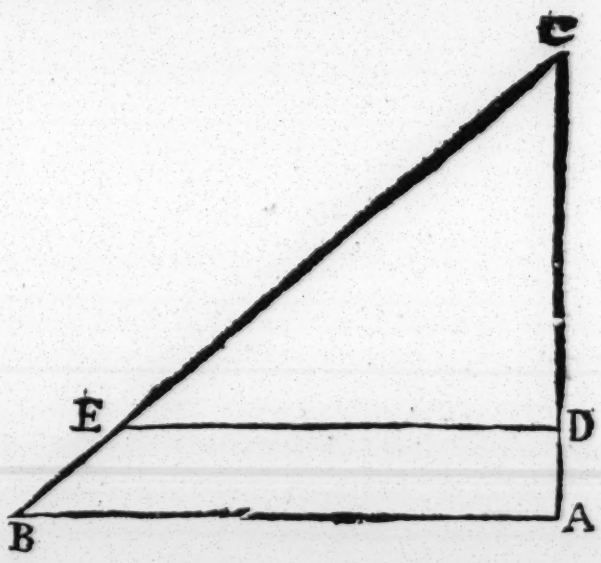
From 50° 10' } N. *Lat.* { *Lyzard* } M. Pt. { 3490
Subtr. 17 25 } { *Antego* } { 1061

32 45 — 2429 = to
60 — (Merid. Diff. Lat.

1965 = Diff. Lat. — Diff. Long. = 54° 15'
(= 3255 Miles W.

Geometrically.

Draw the Meridian C A, which make equal to 2429, the *Merid. Diff. Lat.* Erect the Perpendicular A B, which let be equal to the *Diff. of Longit.* 3255; draw C B; make C D equal to the proper *Diff. of Lat.* 1965; and erect the Perpendicular D E.



In the Triangle A B C — Given { C A = Mer. Diff. Lat. = 2429; B A = Differ. Longit. = 3255 } Required { ∠ C = Course. ∠ B = Compl. Course.

In the Triangle C D E — Given { C D = Proper Diff. Lat. = 1965 and ∠ C = Course. } Required { C E = Dist. of the Places.

For the *Course*, say,

As Mer. Diff. Lat.: Rad. : : Diff. Long. : T. Course
2429 min. : T. 55° : : 3255 min. : T. 53° 16′.

Operation by the *Logarithms*.

To the Arithmetical Complement of the Log. Mer. Diff. Lat.	2429	— 6.614573
Add the Log. of the Diff. Long.	3255	— 3.512551
Sum is the T. of the Course, 53° 16′		—10.127124

By Gunter's *Scale*.

The Extent from . .	2429	on the Line of
to	3255	Numbers.
Will reach from T. 45° 00′		on the Line of
to the T. of the Course . . .	53 16	Tangents.

For the *Distance*, say,

As the Co-Sine of the Course : Rad. : : D. L.: Dist.
S. 36° 44′ : S. 90° 00′ : : 1965 : 3285.

Operation by the *Logarithms*.

To the Arithmetical Complement of the Co. S. Course - - - - - -	36° 44′	— 0.22323
Add the Log. of the Diff. Lat.	1965	— 3.29336
Sum is the Log. of the Distance,	3285	— 3.51659

By Gunter's *Scale*.

The Extent from	S. 36° 44′	on the Line of
to the - - -	S. 90 00	Sines.
Reaches from ——	S. 1965 ——	on the Line of
to - - - - - -	1965 ——	Numbers.

PROBLEM IV.

4. *The Latitude and Course given, the Distance, Difference of Longitude and Departure, required.*

Example.

Sailing from the *Lyzard*, Lat. 50° 10′ N. and the Course being 53° 16′ S. Westerly (Variation and Leeward-way, *&c.* allow'd for) or S. W. $\frac{3}{4}$ W. near; and finding by Observation the Ship to be in Latitude 17° 25′ North; What's the *Distance run*, *Departure*, and *Difference of Longitude*?

From	50° 10′ N.	Lat.	*Lyzard*	M.Pt	3490
Subst.	17 25 N.		observ'd		1061
Rem.	32 45 = 1965 = Diff. Lat.			M. Diff. Lat.	2429

Distance, what?

As the Sine of the Course : Rad : : Diff. Lat : Dist.
and 36° 44′ : S. 90° 00′ : : 1965 : 3285.

Departure, what?

Radius : Mer. Diff. Lat. : : T. Course : Diff. Long.
T. 45 ; 2429 min : : T. 53° 16′ : 3255. min.

Operation by the *Logarithms*.

To the Log. Mer. Diff. Lat.	2429	—3.38542
Add the Tangt. of the Course,	53° 16	—10.12712
Sum = Log. Diff. Longitude,	3255.	3.51254

By Gunter's *Scale*.

The Extent from T.	45°	on the Line of
to the Tangent of	53° 16′	Tangents.
Reaches from - -	2429	on the Line of
to - - - - -	3255	Numbers.

PROBLEM V.

5. *The Latitude and Distance being given, Course, Departure, and Difference of Longitude are required?*

Example.

Sailing North-Eastward from *Antego* 3285 min. and by Observation finding my Latitude to be 50 deg. 10 min. North; What's the *Course*, *Departure* and *Difference of Longitude*?

From	50° 10′ N.	Lat.	observ.	M. Pt	3490
Subst.	17 25 N.		*Antego*		1061
	32 45 = 1965 = Dif. Lat.			M. Dif. Lt.	2429

Course, what?

Distance : Diff. Lat. : : Radius : Co-Sine Course,
3285 : 1965 : : S. 90° 00′ : S. 36° 44′

Operation by *Logarithms*.

To the Arithmetical Complement of the Log. of the Distance - - - -	3285	—6.48341
Add the Log. of the Diff. Lat.	1965	—3.29336
Sum = Co-Sine of the Course,	36° 44′	—9.77677

By Gunter's *Scale*.

The Extent from Distance	3285	on Line of
to the Diff. Lat. - - -	1965	Numbers.
Reaches from S. of Radius,	90° 00′	on Line of
to the S. Compl. of Course	36 44	Sines.

Then the { Departure / Diff. Longit. } is found by *Prob.* I. II.

PROBLEM VI.

6. *The Latitude and Departure given, Required the Course, Distance, and Difference of Longitude.*

Example.

A Ship from Latitude 50° 10′ N. and Longitude 00° 00′ runs South-Westerly 'till her Departure be 2633 Miles, and the observed Latitude 17° 25′ North; I demand the *Course*, *Distance* and *Difference* of *Longitude*?

Diff. Lat. : Departure : : Radius : T. Course. 1965
: 2633 : : T. 45° 00′ : T. 53° 16′.

Operation

Operation of the Logarithms.

To Ar. Co. Log. of Diff. Lat. 1965—6.70664
Add the Log. of Departure 2633—3.42048

Sum = T. of the Course — 53° 16--10.12712

By Gunter's *Scale.*

The Extent from Diff. Lat. 1965 } On Line of
to the Departure · · · 2633 } Numbers.
Reach. from T. of Radius, 45° 00′ } On Line of
To the T. of the Course 53 16 } Tangents.

Then {Distance / Differ. Longit.} is found by *Prob.* I. II.

PROBLEM VII.

7. *One Latitude, Course and Distance given; the Difference of Latitude, and Difference of Longitude required.*

Example.

A Ship from 50° 10′ N. Latitude, and 00° 00′ Longitude, runs with a Course 16° 32′ S. westerly 3285 Miles: What is the Difference of Latitude, and Difference of Longitude?

For the *Difference of Latitude*, say,

Radius: Co-Sine Course:: Distance: Differ. Lat.
S. 90° 00′: S. 36° 44′:: 3284 m: 1965.

Operation by the *Logarithms.*

To the 7, of the Course 53° 16′—9.77676
And the Logar. Distance 32 85—3.51659

Run = Log. Diff. Lat. 19 65—3.29335

By Gunter's *Scale.*

The Extent from S. Radius, 90° 00′ } On Line of
To the S. Compli. Course 36 44 } Sines.
Reaches from the Distance 32 85 } On Line of
To the *Differen. Latitude* 19 65 } Numbers.
From 50° 10′ = Departed } Lat. Mer. Pts. {3490 / 1061
Subst. 32. 45 = Differen.
Rem. 17. 25 = Present } Mer. Diff. Lat. = 2429

Diff. Long. find by *Prob*, 2. in 3255 = 54° 15′ W.
From 54° 15′ = Difference } Longitude.
Subst. 00 00 = Departed }
Rem = 54° 15′ W. Present

PROBLEM VIII.

8. *One Latitude, Departure and Course given: Required Distance, Difference of Latitude, and Difference of Longitude.*

Example.

Sailing South 53° 16′ West, from Latitude 5° 10′ North, Longitude 00° 00′, till my Departure be 2633 Miles: What's my Distance, Latitude and Longitude?

Distance / Diff. Lat. } by C. 6. of *Plain Sail.* is { 3285 / 1965 = 3245

From 50° 10′ N. = Departed } L.M.P. {3490 / 1061
Subst. 32 45 N. = Difference }
Rem. = 17 25 = 1985 X Pres. } M.D.Lat. 2429

For the *Difference of Longitudes*, say,

Proper Diff. Lat: M.R. Diff. Lat:: Depart: D. Long.
1965 m : 2429 m :: 2633 : 3255

Operation by *Logarithms.*

To Ar. co. Log. Diff. Lat. 1965——6.70663
Add the Log. { Mer. Diff. Lat. 2429—3.38542 / Departure 2632——3.42049

Sum = Log. Diff. Long. 3255 = 54° 15′ 3.51254

By Gunter's *Scale.*

The Extent from Diff. Lat. 1965 }
To the Mer. Differ. Latit. 2429 } on Line of Num.
Reaches from Departure 2633 }
To the Differ. of Long. 3255 }

From 00° 00′ = Departed }
Substract 54 15 = Difference } Longitude.
Rem. = 54 15 W. = Present. }

PROBLEM IX.

9. *One Latitude, Distance and Departure given: The Course, Difference of Latitude, and Difference of Longitude required.*

Example.

From Latitude 50° 10′ N. and Longitude 00° 00′, Sailing South Westward 3285 m. until the Departure be 2633 m: I demand the Course sail'd, Latitude and Longitude.

By C. 4. of *Plain Sailing* { Course = 53° 16′ W. / Diff. L. = 1965

By *Prob.* 6. Present Latitude = 17° 45′ N.
And Meridian Differ. Latitude = 2429

Difference } Long. by *Prob.* 6. is { 3255 = 54° 15′ / —— 54 16
Present }

PROBLEM X.

10. *One Latitude, Course and Difference of Longitude given: The Difference, Latitude, Distance and Departure required.*

Example.

From Latitude 53° 10′ N. sailing South 53° 16′ Westerly, till I am in the Longitude 54° 45′ W. What's my Distance, Departure and Difference of Latitude?

From 00° 00′ N. Departed }
Sustract 54 15 W. Present } Longitude.
Rem. = 54 15 = 3255 = Differ. }

For the *Course*, say,

As Mer. Diff. Lat.: Rad. :: Diff. Long.: T. Course
2429 min. : T. 55° :: 3255 min. : T. 53° 16′.

Operation by the *Logarithms*.

To the Arithmetical Complement of the Log. Mer. Diff. Lat.	2429 —	6.614573
Add the Log. of the Diff. Long.	3255 —	3.512551
Sum is the T. of the Course, 53° 16′ —		10.127124

By Gunter's *Scale*.

The Extent from . .	2429	on the Line of Numbers.
to	3255	
Will reach from T.	45° 00′	on the Line of Tangents.
to the T. of the Course . . .	53 16	

For the *Distance*, say,

As the Co-Sine of the Course : Rad. :: D. L.: Dist.
S. 36° 44′ : S. 90° 00′ :: 1965 : 3285.

Operation by the *Logarithms*.

To the Arithmetical Complement of the Co. S. Course - - - - - -	36° 44′ —	0.22323
Add the Log. of the Diff. Lat.	1965 —	3.29336
Sum is the Log. of the Distance,	3285 —	3.51659

By Gunter's *Scale*.

The Extent from	S. 36° 44′	on the Line of Sines.
to the - - -	S. 90 00	
Reaches from —	S. 1965 —	on the Line of Numbers.
to - - - - -	1965 —	

PROBLEM IV.

4. *The Latitude and Course given, the Distance, Difference of Longitude and Departure, required.*

Example.

Sailing from the *Lyzard*, Lat. 50° 10′ N. and the Course being 53° 16′ S. Westerly (Variation and Leeward-way, &c. allow'd for) or S. W. ¾ W. near; and finding by Observation the Ship to be in Latitude 17° 25′ North; What's the *Distance run*, *Departure*, and *Difference of Longitude*?

From	50° 10′ N.	Lat.	*Lyzard*	M.Pt	3490
Subst.	17 25 N.		observ'd		1061
Rem.	32 45 = 1965 = Diff. Lat.			M. Diff. Lat.	2429

Distance, what?

As the Sine of the Course : Rad :: Diff. Lat : Dist.
and 36° 44′ : S. 90° 00′ :: 1965 : 3285.

Departure, what?

Radius : Mer. Diff. Lat. : : T. Course : Diff. Long.
T. 45 : 2429 min : : T. 53° 16′ : 3255. min.

Operation by the *Logarithms*.

To the Log. Mer. Diff. Lat.	2429 —	3.385 42
Add the Tangt. of the Course,	53° 16 —	10.127 12
Sum = Log. Diff. Longitude,	3255.	3.512 54

By Gunter's *Scale*.

The Extent from T.	45°	on the Line of Tangents.
to the Tangent of	53° 16′	
Reaches from - -	2429	on the Line of Numbers.
to - - - - -	3255	

PROBLEM V.

5. *The Latitude and Distance being given, Course, Departure, and Difference of Longitude are required?*

Example.

Sailing North-Eastward from *Antego* 3285 min. and by Observation finding my Latitude to be 50 deg. 10 min. North; What's the *Course*, *Departure* and *Difference of Longitude*?

From	50° 10′ N.	Lat.	observ.	M. Pt	3490
Subst.	17 25 N.		*Antego*		1061
	32 45 = 1965 = Dif. Lat.			M. Dif. Lt.	2429

Course, what?

Distance : Diff. Lat. : : Radius : Co-Sine Course,
3285 : 1965 :: S. 90° 00′ : S. 36° 44′

Operation by *Logarithms*.

To the Arithmetical Complement of the Log. of the Distance - - - -	3285 —	6.48341
Add the Log. of the Diff. Lat.	1965 —	3.29336
Sum = Co-Sine of the Course,	36° 44′ —	9.77677

By Gunter's *Scale*.

The Extent from Distance	3285	on Line of Numbers.
to the Diff. Lat. - - -	1965	
Reaches from S. of Radius,	90° 00′	on Line of Sines.
to the S. Compl. of Course	36 44	

Then the { Departure / Diff. Longit. } is found by *Prob.* I. II.

PROBLEM VI.

6. *The Latitude and Departure given, Required the Course, Distance, and Difference of Longitude.*

Example.

A Ship from Latitude 50° 10′ N. and Longitude 00° 00′ runs South-Westerly 'till her Departure be 2633 Miles, and the observed Latitude 17° 25′ North; I demand the *Course*, *Distance* and *Difference of Longitude*?

Diff. Lat. : Departure : : Radius : T. Course. 1965
: 2633 : : T. 45° 00′ : T. 53° 16′.

Operation

Operation of the Logarithms.

To Ar. Co. Log. of Diff. Lat. 1965—6.70664
Add the Log. of Departure 2633—3.42048

Sum = T. of the Course — 53° 16--10.12712

By Gunter's *Scale.*

The Extent from Diff. Lat. 1965 { On Line of
to the Departure . . . 2633 { Numbers.
Reach. from T. of Radius, 45° 00' { On Line of
To the T. of the Course 53 16 { Tangents.

Then {Distance / Differ. Longit.} is found by *Prob.* I. II.

PROBLEM VII.

7. *One Latitude, Course and Distance given; the Difference of Latitude, and Difference of Longitude required.*

Example.

A Ship from 50° 10' N. Latitude, and 00° 00' Longitude, runs with a Course 16° 32' S. westerly 3285 Miles: What is the Difference of Latitude, and Difference of Longitude?

For the *Difference of Latitude*, say,

Radius: Co-Sine Course:: Distance: Differ. Lat.
S. 90° 00': S. 36° 44' :: 3284 m: 1965.

Operation by the *Logarithms.*

To the 7, of the Course 53° 16'—9.77676
And the Logar. Distance 32 85—3.51659

Run = Log. Diff. Lat. 19 65—3.29335

By Gunter's *Scale.*

The Extent from S. Radius, 90° 00' } On Line of
To the S. Compli. Course 36 44 } Sines.
Reaches from the Distance 32 85 } On Line of
To the *Differen. Latitude* 19 65 } Numbers.
From 50° 10' = Departed } Lat. Mer. Pts. {3490 / 1061
Subst. 32. 45 = Differen. }
Rem. 17. 25 = Present } Mer. Diff. Lat. = 2429

Diff. Long. find by *Prob*, 2. in 3255 = 54° 15' W.
From 54° 15' = Difference } Longitude.
Subst. 00 00 = Departed }
Rem = 54° 15' W. Present }

PROBLEM VIII.

8. *One Latitude, Departure and Course given: Required Distance, Difference of Latitude, and Difference of Longitude.*

Example.

Sailing South 53° 16' West, from Latitude 5° 10' North, Longitude 00° 00', till my Departure be 2633 Miles: What's my Distance, Latitude and Longitude?

Distance } by C. 6. of *Plain Sail.* is { 3285
Diff. Lat. } { 1965 = 3245

From 50° 10' N. = Departed } L.M.P. {3490
Subst. 32 45 N. = Difference } {1061
Rem. = 17 25 = 1985 X Pref. } M.D.Lat. 2429

For the *Difference of Longitudes*, say,

Proper Diff. Lat: M.R. Diff. Lat:: Depart: D. Long.
1965 m : 2429 m :: 2633 : 3255

Operation by *Logarithms.*

To Ar. co. Log. Diff. Lat. 1965——6.70663
Add the Log. { Mer. Diff. Lat. 2429—3.38542
{ Departure 2632 ——3.42049

Sum = Log. Diff. Long. 3255 = 54° 15' 3.51254

By Gunter's *Scale.*

The Extent from Diff. Lat. 1965 }
To the Mer. Differ. Latit. 2429 } on Line of Num.
Reaches from Departure 2633 }
To the Differ. of Long. 3255 }

From 00° 00' = Departed }
Substract 54 15 = Difference } Longitude.
Rem. = 54 15 W. = Present. }

PROBLEM IX.

9. *One Latitude, Distance and Departure given: The Course, Difference of Latitude, and Difference of Longitude required.*

Example.

From Latitude 50° 10' N. and Longitude 00° 00', Sailing South Westward 3285 m. until the Departure be 2633 m: I demand the Course sail'd, Latitude and Longitude.

By C. 4. of *Plain Sailing* { Course = 53° 16' W.
{ Diff. L. = 1965

By *Prob.* 6. Present Latitude = 17° 45' N.
And Meridian Differ. Latitude = 2429

Difference } Long. by *Prob.* 6. is { 3255 = 54° 15'
Present } { ——54 16

PROBLEM X.

10. *One Latitude, Course and Difference of Longitude given: The Difference, Latitude, Distance and Departure required.*

Example.

From Latitude 53° 10' N. sailing South 53° 16' Westerly, till I am in the Longitude 54° 45' W. What's my Distance, Departure and Difference of Latitude?

From 00° 00' N. Departed }
Sustract 54 15 W. Present } Longitude.
Rem. = 54 15 = 3255 = Differ. }

For the Meridian Difference of Latitude, ſay,

Radius : c T. Courſe :: Diff. Long : Mer. Diff. Lat.
T. 45° : T. 36° 44′ :: 3255 : 2429 m.

Operation by the *Logarithms.*

To the c T. Courſe —— 36° 44′ —— 9.87290
Add Log. Diff. Longit. 3255 m. —— 3.51255

Sum Rad. = Log. Mer. Diff. Lat. 2529 m. 3.38545

By Gunter's *Scale.*

The Extent from T. Radius 45° } on Line of Tan.
To T. Compl. Courſe — 36° 44′ }
Reaches from Diff. Long. 3255 } on Line of Num.
To Merid. Differ. Latit. 2429 }

From 3490 } Mer. { Parts in Dep. } Lat. { 50° 10′
Subſt. 2429 } { Difference } { North.
Rem. 1061 } { Parts in preſ. } { 17 25

Then find the Diſtance and Departure, by *Caſe* 2. *Plain Sailing.*

PROBLEM XI.

11. *The Difference, Longitude and Diſtance of two Places in the ſame Latitude being given, to find the Latitude.*

Example.

Two Ships in the Equator 400 Miles from one another ; one ſails North, the other South alike Diſtances, till they are 150 Miles aſunder : What Latitude are they in ?

Proportion.

Differ. Long. : Radius : : Diſtance : S. Latit.
400 : S. 90° 00 : : 150 *M.* : S. 22° 01′

Operation by the *Logarithms.*

To the Ar. co. Log. Diff. Long. 400 —— 7.39794
Add Logarith. of the Diſtance 150 —— 2.17600

Sum = S. Latitude —— 67° 59′ —— 9.57394

By Gunter's *Scale.*

The Extent from Differ. Long. 400 } on Line of
To the —— Diſtance 150 } Numbers.
Reaches from S. Radius 90° 00′ } on Line of
To S. Compleat Latitude 67 59 } Sines.

PROBLEM. XII.

12. *The Differences of Longitude between two Places of the ſame Latitude, being given : To find their Diſtance.*

Example.

The Diſtance between *Martinico,* and *Cape Verde,* is required.

From 54° 50′ } = Long. { *Martin.* } L. 14° 50′
Subſt. 11 30 } { *C. Verde.* } North.

Rem. = 43 20 = 2600 Miles = Differ. Long.

Radius : Diff. Long. : : S. Latit. : Diſtance.

Operation by the *Logarithms.*

To Log. Differ. Longitude 2600 —— 3.41497
Add the S. Latitude 14° 50′ —— 9.91528

Sum — Rad = Log. Diſtance 2513 —— 2.40025

By Gunter's *Scale.*

The Extent from S. Rad. 90° 00′ } on Line of
To the S. Com. Latitude 75 10 } Sines.
Reaches from Differ. Longit. 2600 } on Line of
To the Diſtance —— 2513 } Numbers.

PROBLEM XIII.

13. *The Diſtance between two Places in the ſame Parallel given : Required, To find the Difference of Longitude.*

Example.

Sailing from *Cape Verde,* in Latitude 14° 50′ North to an Iſland 2513 Miles Weſt : I demand the Longitude of the Iſland.

c S. Lat : Diſtance : : Radius : Diff. Long.
S. 75° 10 : 2513 : : S. 90° 00′ : 2600 Miles

Operation by the *Logarithms.*

To ar. co. S. Latitude 14° 50′ —— 0.01472
Add Log. of the Diſtance 2513 —— 3.40025

Sum = Log. Diſt. Long. 2600 Miles —— 3.41797

By Gunter's *Scale.*

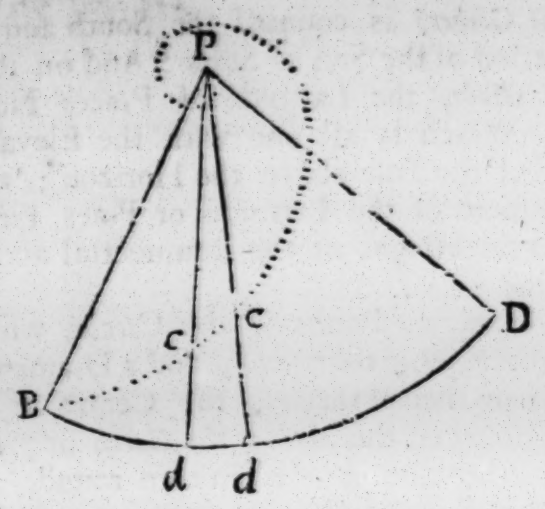
The Ext. from S. Compl. Lat 75° 10′ } on Line of
To the Sine of the Radius — 90 00 } Sines.
Reaches from Diſtance —— 2513 } on Line of
To the Difference of Longitude - 2600 } Numbers.

To 2600 | = 43° 20′ = Diff. Long. in D. and M.
Add 60 | 11 30 = Long of *Cape Verde.*

Sum = 54. 50 = Longitude of the Place the Ship is in.

That the *Meridian Line* in *Mercator's Chart,* is a Scale of Logarithmick Tangents of the half Complements of the Latitude : The incomparable Mr. *Halley* demonſtrates thus.

Suppoſing P the *Pole.*
B D the *Equinoctial.*
P C, P *c*, &c. *Co-Latitudes.*
B *c c*, C P a *Rhumb Line.*



1. The Lines P B, P *c*, P C, are the Tangents of half the Co-Latitudes in the *Stereographick Projection*, (by *Prob.* 1. in *Spherick Projection.*)

2. The Difference of Longitudes, or Angles at the Pole (B P C, *&c.*) between them, are Logarithms of the *Rationes* of thoſe Tangents one to another, (by the known Property of *Proportional Spirals.*) But the *Nautical Meridian Line*, is no other than a Table of Longitudes, anſwering to each Minute of Latitude on the Rhumb Line, making an Angle of 45 Degrees with the Meridian: Wherefore the Meridian Line is no other than a Scale of Logarithmick Tangents, of the half Complements of the Latitudes. *Q. E. D.*

Whence he deduces the following

COROLLARIES.

1. Becauſe that in every Point of any Rhumb Line, the Difference of Latitude is to the Departure as the Radius to the Tangent of the Angle that Rhumb Line makes with the Meridian; and thoſe equal Departures are every where to the Difference of Longitude, as the Radius to the Secant of the Latitude: It follows, that the Differences of Longitude are on any Rhumb, Logarithms of the ſame Tangents, but of a different Species; being proportioned to one another, as are the Tangents of the Angles made with the Meridian.

2. Hence any Scale of Logarithmick Tangents is a Table of the Differences of Longitude, to ſeveral Latitudes, upon ſome determinate Rhumb or other: And therefore, as the Tangent of the Angle of ſuch Rhumb, to the Tangent of any other Rhumb; ſo the Differences of the Logarithms of any two Tangents, to the Difference of Longitude on the propoſed Rhumb, intercepted between the two Latitudes, of whoſe half Complements you took the Logarithmick Tangents.

MERCATOR's *Sailing*, is the Art of finding on a Plane the Motion of a Ship upon any aſſign'd Courſe, true in Longitude, Latitude and Diſtance; the Meridians being all parallel, and the Parallels of Latitude Strait Lines. The Way to do this, you have before in *Mercator*'s *Chart*.

MERCURY, according to the Chymiſts, is the Third of their *Hypoſtatical Principles*; and is the ſame with what we call Spirit; which ſee.

MERCURIES *of Metals*, are Things much boaſted of by the Chymiſts; but they deliver the Proceſſes of making them ſo obſcurely, that we have juſt Reaſon to believe they had no Mind to be diſproved by being underſtood.

Yet Mr. *Boyle* tells us expreſly, that he ſhewed a certain Chymiſt of his Acquaintance a Way to draw a true Running Mercury, or Quick-ſilver, from Antimony; and that it ſucceeded well.

MERCURIUS *Dulcis*, or Sweet Sublimate of Mercury, by the Chymiſts ſometimes called *Aquila alba*, is thus made. Sixteen Ounces of Sublimate Corroſive being powder'd in a Glaſs, or Marble Mortar, for it muſt never be done in a Metalline one) is mixed by little and little with Twelve Ounces of Mercury revived from Cinnabar, (or pure Mercury): The Mixture is ſtirred about with a Wooden Peſtle, till all the Crude Mercury diſappear; then it is put into a Matraſs, two Thirds of which remain empty: The Veſſel is heated in Sand, gently at firſt, but afterward the Fire is encreaſed to the Third Degree. In four or five Hours the Sublimate will ſtick to the Top and Neck of the Glaſs: Fling away all that is not White, and then powder that, and ſublimate it again, and a Third time, if you would have it very white. Thus is the ſtrongeſt Poiſon, perhaps in Nature, corrected into a very gentle and uſeful Medicine, by adding more Mercury to it. The Reaſon of which ſeems to be, That by theſe New Sublimations, the Corroding Acids of the Sublimate have their Points broken, and perhaps ſome of them loaded with the Addition of more Mercury, and ſo can't act with the ſame deleterious Force as they did before.

MERCURIUS *Vitæ*. See *Algorot*.

MERCURY. According to M. *Caſſini*, the greateſt Diſtance of *Mercury* from the Earth is 32704, the mean Diſtance 22000, and the leaſt Diſtance 11296 Semi-diameters of the Earth: Therefore his mean Diſtance will be about 88000000 Engliſh Miles; and the Diameter of *Mercury* is $\frac{3}{4}$ of the Diameter of the Earth, and therefore the Globe of *Mercury* muſt be $\frac{3}{7}$ of that of the Earth.

Mr. *Azout* pretends to prove, That tho' *Mercury* be ſo near the Sun, the Light there is not capable of burning any Objects. But Sir *Iſaac Newton* makes the Heat of *Mercury* ſo great, as to be Seven times as much as the Heat of our Summer Sun; which he found by Experiments deſignedly made by the Thermoſcope, is enough to make Water boil. And therefore if Bodies will not be there enkindled by ſuch a Degree of Heat, it muſt be becauſe their Degree of Denſity is proportionably greater than that of ſuch kinds of Bodies on our Earth: Wherefore undoubtedly this Fiery Planet is uninhabitable by ſuch Creatures as live on our Earth.

Capt. *Halley*, in his Obſervation of *Mercury* ſeen in the Sun, *A. D.* 1677, at St. *Helena*, ſaith, That this Planet may be ſeen Nine times in the Sun, near the Aſcending Node, *A. D.* 1710, 1723, 1736, 1743, 1756, 1769, 1776, 1782, 1789, in *October*; and Four times near the other Node, in the Month of *April*, *A. D.* 1707, 1753, 1786, 1799; all within this Century.

Dr. *Gregory*, in his Comparative Aſtronomy, at the End of his *Aſtron. Phyſ. & Geom. Elementa*, conſiders what *Phænomena* in the Heavens would appear to an Eye placed in this Planet *Mercury*, *viz.*

2. That the Diameter of the Sun ſeen from thence, would be trebble of what it is ſeen from the Earth, becauſe that Planet is thrice as near to it as we are; and conſequently the Sun's Disk to an Eye there, will be Seven times as great as what

it appears to us; and all other things conſider'd, the Light and Heat in *Mercury* will be ſeptuple of ours, at ſome times: But theſe Qualities will be much *intended* and *remitted*, according to the diverſe Diſtance of *Mercury* from the Sun; for his Orbit is the moſt Excentrick of any of the Planets.

2. The Gravity of *Mercury* towards the Sun will be ſeven times greater than in the Earth. The Denſity of *Mercury*, and conſequently the Gravity of Bodies placed on its Surface, towards its Centre, cannot ſo accurately be determin'd, as the Gravity of the Planet towards the Sun: But however, in *Prop.* 49. *Lib.* 3. *Schol.* he ſhews a Way to gueſs Analogically at it. And no doubt this Planet is much denſer than the Earth, becauſe of the Over-proportion of Heat there.

3. It doth not yet appear by Obſervations, whether *Mercury* revolves round his Axis, or not, and conſequently what the Length of his Day is; but 'tis probable he hath ſuch a Motion as well as the other Planets, but his Year is ſcarce equal to a Quarter of ours. What Variety of Seaſons and Weather *Mercury* is ſubject to, is uncertain; becauſe the Inclination of his Axis, on which he revolves about himſelf, to the Plane of the Orbit, which he deſcribes round the Sun, is unknown.

4. To an Eye placed in *Mercury*, and looking towards the Sun, the Solar Spots (if at any time ſuch there are) will appear to traverſe his Disk ſometimes in a Right-Line, from Eaſt to Weſt; and ſometimes their Path will appear Elliptical, bending ſometimes one way, and ſometimes another. And the whole Variety of this Appearance will be abſolved in a Year's Time, in which the Path of the Solar Spots will appear to be twice Rectilinear: But indeed the Path of theſe Spots will be almoſt continually in a Right Line, becauſe *Mercury* never much declines from the Plane of the Sun's Equator.

5. The other Five Planets being above *Mercury*, their *Phænomena* will be much the ſame as to an Eye at the Earth: So that *Venus* and our Earth, when in Oppoſition to the Sun, will ſhine with a full Orb, and conſequently afford a great Light to this Planet at Night. But the Superior Planets will not afford him ſo much Light as they do us.

6. The Sun's and the other Planets Places, and the *Phænomena* of Comets are found the ſame Way in *Mercury*, and after the ſame manner, and will appear as they do to us on the Earth.

MERIDIAN, is a great Circle paſſing through the *Poles of the World*, and both *Zenith* and *Nadir*, croſſeth the Equinoctial at Right Angles, and divideth the Sphere into two equal Parts, one Eaſt, the other Weſt; and has its Poles in the Eaſt and Weſt Points of the Horizon. 'Tis call'd *Meridian*, becauſe when the Sun cometh to the South Part of this Circle, 'tis then *Meridies*, *Mid-day*, or *High-noon*; and then the Sun hath his greateſt Altitude for that Day, which therefore is called the *Meridian Altitude*.

Theſe *Meridians* are various, and change according to the Longitudes of Places; ſo that they may be ſaid to be infinite in Number, for that all Places from Eaſt to Weſt have their ſeveral *Meridians*: But there is (or ſhould be) one *Fix'd*, which is called the *Firſt Meridian*.

MERIDIAN on the *Globe* or *Sphere*, is repreſented by the Brazen Circle, in which the Globe hangs and turns. 'Tis divided into Four 90's or 360 Degrees, beginning at the Equinoctial.

On it, each way from the Equinoctial, on the *Celeſtial Globes*, is counted the South and North Declination of the Sun or Stars: And on the *Terreſtrial Globe*, the Latitude of Places North or South. Which is all one with the Elevation or Height of the Pole above the Horizon; and the Complement of the Latitude or Poles Height is equal to the Height of the Equinoctial above the Horizon.

There are two Points of this Circle, which are called the *Poles of the World*; and a Diameter continu'd from thence through the Centre of either Globes, is called the *Axis of the Earth* or *Heavens*, on which they are ſuppoſed to turn round.

On the *Terreſtrial Globes* there are uſually 36 *Meridians* drawn, one through every Tenth Degree of the Equator, or through every Tenth Degree of Longitude.

The Uſes of this Circle, are,

1. To ſet the Globes to any particular Latitude.
2. To ſhew the Sun's or a Star's Declination, Right Aſcenſion, or greateſt Altitude, *&c.*

PROBLEM.

To find the Sun's Meridian Altitude *or* Depreſſion *at Night by the Globes.*

Bring the Sun's Place to the *Meridian* above the Horizon, for his *Noon-Altitude*; which will ſhew the Degrees of it, counted from the Horizon. For his *Midnight-Depreſſion* below the North Point of the Horizon, you muſt bring the oppoſite Point to the Sun's preſent Place, as before to the *Meridian*; and the Degrees there intercepted between that Point and the Horizon, are his *Midnight-Depreſſion*.

MERIDIAN *Line*, on a Dyal, is a Right Line ariſing from the Interſection of the Meridian of the Place with the Plane of the Dyal. This is the Line of 12 a Clock, and from hence the Diviſion of the Hour Lines begins.

To draw a True Meridian Line *upon an Horizontal Plane.*

Firſt, Get a plain thick Board, of a Foot Square, or more; then upon one of the Edges or Corners, as near as may be, faſten a ſtrong Iron Pin, about 10 or 11 Inches long, and make it ſo faſt, that it will not ſhake or yield in the leaſt: It matters not whether it be perpendicular or not.

Set this Board horizontally in your Garden with Earth or Sand upon the Ground, or elſewhere about 9 a Clock; (the beſt Time is, when the Sun is near the Solſtice, ſuppoſe about the 10th of *June*) ſee where the Head of this Iron Pin (which muſt be ſharp at the top) giveth its Shadow upon the Board, mark that Place: Then take a Wooden Ruler, ſharp alſo at one end, and lay it ſo upon the ſharp end of the Iron Pin, that the ſharp end of the Ruler may touch the Mark; then carrying it ſteady, make the Segment of a Circle towards the North. Come again about 3 a Clock in the Afternoon, and mark where the Shadow of the top of the Iron Pin is, in that Segment again. Then draw a Line from thoſe two Marks, which will be Eaſt and Weſt, and the Perpendicular to that Line will be a *Meridian*; and if you halve that Line, the Perpendicular will go through the Centre of the whole Circle: For that Segment is

part

part of the Basis of a Cone, whose Vertex is the Top of the Iron Pin.

But because the Sun may be under a Cloud, when you come at Three a Clock, you may make three or four more Segments, and use them as you used this.

This Method would be very exact, if the Sun moved as the Fixed-Stars do; but because the Sun hath a proper Motion, as a Planet, there will be some inconsiderable Error, which yet may be corrected; For seeing the Sun in one Minute of an Hour moveth as much by his daily Motion, as he loseth in 6 Hours by his proper Motion; you shall add as much in the way which the Shadow goes in the last Mark, as that Shadow moveth in one Minute, which you may measure by your Pulse or Pendulum; so the last Point will not be taken just in the Segment, but a little without it.

Under the Word *Pole-Star*, you have another good Method for drawing a true *Meridian Line*.

Mr. *Stephen Gray*, in *Philos. Transact.* N° 260, gives a *New Method of drawing a True Meridian Line by the Pole-Star*; as also, *How to find the Hour by the same*. Thus,

Take the Gnomon of an Horizontal Dyal for the Latitude of the Place, and to the Hypothenuse fix two Sights, whose Centres may be parallel to the same: Let the Eye-sight be a small Hole; but the other's Diameter must be equal to the Tangent of the double Distance of the North-Star from the Pole, the Distance of the Sights being made *Radius*. Let the Stile be rivetted to the End of a straight Ruler; then when you would make use of it, lay the Ruler on an Horizontal Plane, so that the End to which the Ruler is fix'd, may hang over: Then look through the Eye-sight, moving the Instrument 'till you see the North Star appear to touch the Circumference of the Hole in the other Sight, on the same Hand with the Girdle of *Cassiopeia*; or on the opposite side to that, whereon the Star in the Great Bear's Rump is at that Time: Then draw a Line by the Edge of the Ruler, and 'twill be a True *Meridian Line*, as is very easie to demonstrate.

In *Philos. Trans.* N° 270, he improves this Method, and describes an Instrument, whereby he not only draws a True *Meridian*, but finds the Hour and Minute of the Day or Night, by the Help of the Pole-Star, exactly. His Instrument he thus describes:

Let there be taken a Telescope, of about 16 Foot, or longer, if you please; in the Plane of its *Focus*, place a Ring of Brass at Right Angles to the Glass, the Diameter of the inward Circle being equal to the double Tangent of the Pole-Star's Distance from the Pole; the Focal Length of the Object-Glass being made *Radius*, as was said in the Description of the *Meridian Instrument*. Let the Ring be divided into 24 Hours, with their Minutes, numbred from the Right Hand towards the Left, as in our common Nocturnals: The Eye-Glass must be equal in its Diameter to the Horary Ring. But this perhaps will be thought too chargeable, especially for such large Telescopes as he speaks of; wherefore he gives this Contrivance: The Eye-Glass must lie in a broad Index, towards one End; this is to turn on a Centre-pin that lies in the Centre of the Glass, and consequently over the Centre of the Horary Ring, from which it must be equal to the Distance of the Focus of the Eye-Glass; then let the Tube be elevated to the Height of the Pole, and directed to the Pole-star; 'till by turning the Index about, you can perceive the Star to touch the Horary Ring on that side the Star in which the *Great Bear*'s Rump lies, or on the opposite to that in the Hip of *Cassiopeia*: But on the contrary, had not the Glass inverted the Object, then bring one of the Twelves to be in a Perpendicular to the other, by a plain Line; so will the Star stand at its Horary Distance from the *Meridian*: Or if the Latitude of the Place be unknown, by the Right Ascension of the Sun and Star, the Time of its coming to the *Meridian* will be easily obtain'd, then the Hour of the Night found, will as easily give the Star's Horary Distance from the *Meridian*. Then elevate the Tube towards the Star, bringing the *Meridian*, or 12 and 12, into the Plane of the Perpendicular; turn the Glass about, 'till you see the Pole-star stand at its Horary Distance from the *Meridian*; so will the Instrument, when fix'd, shew the Horary Distance throughout the whole Day, or as long as it remains in this Position, by the apparent Motion of the Star in the Ring.

The best Time to fix the Instrument, will be when this, or any of the other two Stars above-mention'd, are about 6 Hours from the *Meridian*.

Note, That the Latitude of the Place is now given with the utmost Preciseness; for the Axis of the Glass lies now in the Axis of the World; and if one of the sides of the Tubes be parallel thereto, as it ought to be, at the upper End hang a Line or Plummet, from the Point of Suspension; find another Point equal in Distance to the Length of the Line, or a Knot towards the lower End, the Distance from this Knot to the former Point will be but the Chord of the Latitude; and if from the same Edge of the Index another Line and Plummet be hung towards the lower End of the Tube, these two Lines, when at rest, will be in the Plane of the *Meridian*.

This Instrument may be made to shew the Hour with as much Facility as a Clock or Sun-Dial, if the Horary Ring be made to move within a larger fixed one; and the outward Circle of the former be divided into the Days of the Month, respect being had to the Right Ascension of the Sun and Star: Then bringing the two opposite Points in the fixed Circle, to the Perpendicular, which is done at the fixing of the Instrument, move the Circle 'till the Day of the Month come to any of these, and the Ring is rectified for that Day; and if the Air be clear, you'll see the Star stand at the true Time of the Day or Night.

It may be objected, That in few Years, by the Annual Increase of its Declination, the Pole-star will, by moving in a lesser Circle, be brought too far from the Edge of the Ring, that the exact Hour and Minute cannot well be distinguished. But this Inconveniency, when it is one, may be remedied several ways; either by making a lesser Ring, or by extending a fine Thread of Silk cross the Ring, 'till it cuts the Star, and at the same time it gives the Hour; or, which will yet make this Instrument commodious for other Purposes, there may be made an Index to move on the Centre of the Hour-wheel, which being brought to cut the Star with the Edge that proceeds from the Centre, it will at the same time cut the Hour. And you need not be sollicitous about the exact Diameter of the Ring, provided

it

it do but a little exceed the Diſtance of the Pole-Star from the Pole, the Focal Length of the Glaſs being made Radius.

Our moſt Accurate and Judicious Aſtronomer, Mr. *John Flamſteed*, has diſcovered, That there is a Parallax of the Earth's Annual Orbit at the Pole-ſtar, of about 40 or 45 Seconds; whereby the Diameter of the Star's Parallel is greater in *June* than in *December*, by about one Minute two Seconds; which he has evinced from 7 Years ſucceſſive Obſervations: Whereby the Earth's Annual Motion is indubitably demonſtrated, as appears from his Learned Letter to Dr. *Wallis* on that Subject.

Now if on the Edge of this Index there be drawn a Scale of Degrees, Minutes and Seconds, to the Radius of the Glaſs, we ſhall not only have a very Accurate Inſtrument for the Hour, but be furniſh'd with one whereby we ſhall ſee the Truth of the Earth's Motion confirmed by the Acceſs and Receſs of our Star towards and from the Pole, according to the Earth's Place in the Ecliptick, as that learned Perſon above-mentioned has diſcover'd; and that not only when the Star tranſits the *Meridian*, but in a clear Air at any Time of the Day: One ſhall likewiſe obſerve that Annual Increaſe of the Pole-ſtars Declination, cauſed by the Proceſſion of the Equinox.

Moreover, he, from his own Obſervation, aſſures us, That the Pole-ſtar may be ſeen in the Day-time with a Teleſcope of 16 Foot; of which he gives particular Inſtances: As, On the 26th of *April*, 1701, with ſuch a Teleſcope he ſaw the Pole-ſtar from four a Clock in the Morning, 'till ſeven; and could have ſeen it longer, had not Clouds interpos'd. Alſo, On the 1ſt of *May*, he did not look for the Star 'till the Sun had been up more than half an Hour, *viz.* at Five in the Morning, yet ſoon found it; and ſaw it afterwards at Pleaſure, 'till half an Hour after Nine the ſame Morning. So that 'tis not to be doubted, but this Star may be ſeen in a Clear Day throughout the Year.

The Declination of the Pole-ſtar for the Year 1700, is 87° 42′ 51″ by *Ricciolus* his Catalogue of Fixed Stars, in the *Appendix* to Mr. *Edward Sherbourn's Sphere* of *Manilius*, &c. Hence its Diſtance from the Pole at that Time might be aſſumed 2° 17′ the Focal Length of the Object-glaſs being 15 Foot 6 Inches; ſo that the Diameter ſhould be 14 Inches and $\frac{84}{100}$ Parts of an Inch, which is the natural Tangent of the former Ark 2° 17′ doubled; a Circle large enough to be divided into Minutes and Halves, which will be ſo magnified by the Eye-glaſs, that 'twill be eaſie to diſtinguiſh the Time to a few Seconds.

'Tis true, there is ſome Difficulty in fixing up this Inſtrument; and when it is ſo, to keep it from varying from its due Poſition; but yet 'tis not inſuperable. And for ſmall Inſtruments, of about 2 or 3 Foot long, there cannot be a more accurate, facile, and expeditious Way than this for drawing a *Meridian Line*.

Now whether the many Benefits that may accrue to Aſtronomy, do not make the larger one worthy of the Charge and Trouble that may be in compleating it, he leaves to the Conſideration of the Learned.

MERIDIAN *Magnetical*, is a great Circle paſſing thro' or by the magnetical Poles; to which Meridians, the Compaſs (if not otherwiſe hindred) hath reſpect.

MERIDIONAL *Diſtance*, in Navigation, is the ſame with the Departure, Eaſting or Weſting, or the Difference of Longitude between the Meridian under which the Ship now is, and any other Meridian ſhe was before under.

MERIDIONAL *Parts*, *Miles*, or *Minutes*, in Navigation, are the Parts by which the Meridians in Mr. *Wright's* Chart (commonly, though falſely, called *Mercator's*) do increaſe as the Parallels of Latitude decreaſe: And the Co-ſine of the Latitude of any Place being equal to the Radius or Semi-diameter of that Parallel, therefore in the True Sea Chart, or Nautical Planiſphere, this Radius being the Radius of the Equinoctial, or whole Sine of 90°; the *Meridional Parts* at each Degree of Latitude muſt increaſe, as the Secants of the Ark contained between that Latitude and the Equinoctial do decreaſe. The Tables therefore of *Meridional Parts*, which you have in Books of Navigation, are made by a continual Addition of Secants: They are calculated in ſome Books (as in Sir *Jonas Moor's* Tables) for every Degree and Minute of Latitude; and theſe will ſerve either to make or graduate a *Mercator's Chart*, or to work the *Mercator's Sailing*. To uſe them, you muſt enter the Table with the Degree of Latitude at the Head, and with the Minute on the firſt Column towards the Left Hand; and in the Angle of Meeting you will have the *Meridional Parts*.

Having the Latitudes of two Places, to find the Meridional Miles or Minutes between them, conſider whether the Places be one under the Equinoctial and the other wide thereof; or the one on the one ſide of the Equinoctial, and the other on the other; or whether they both lie on the ſame ſide: For, according to theſe Poſitions, there's a Threefold Caſe.

1. When one Place lieth under the Equinoctial, then the Meridional Minutes that are found next under the Degree of Latitude the other Place lieth in, is the Meridional Difference of Latitude, or Latitude enlarged.

2. When one Place hath North Latitude, and the other South, add the Meridional Minutes belonging to each Latitude together, and the Sum is the Meridional Minutes between them.

3. When both Places are towards one Pole, then ſubſtract the Meridional Parts anſwering to the leſſer Latitude, out of thoſe for the greater, and the Remainder will be the Meridional Minutes required.

Examples of theſe Caſes will make them more plain, which ſhall be theſe:

Example I.

To find the Meridional Parts *or* Minutes *between the Equinoctial and Latitude* 43° 11′.

In the Column under 43, and right againſt 11 Minutes in the Left Hand Column ſtands 2878.2, the Meridional Parts required.

Example

Example II.

Let it be required to find the Meridional Parts *between* 25° 13′ *South Latitude, and* 51° 30′ *North.*

Under 51° and againſt 30′ is——3616.8
Under 25° and againſt 13′ is——1564.3

The Merid. Parts between the two, are----5181.1

Example III.

To find the Meridional Minutes *between the Latitudes* 32° 15′ *North, and* 53° 23′ *North.*

Under 53° and againſt 23′ is——3802.2
Under 32° and againſt 15′ is——2046.1

The Meridional Parts between the Latitudes propoſed, are——1756.1

MERLON, in Fortification, is that Part of the Parapet which lies betwixt two Embraſures, being from 8 to 9 Foot long on the ſide of the Cannon, and 6 on the ſide of the Field; as alſo 6 Foot high, and 18 thick.

MESARAICK *Veins*, ariſe from, or are rather encloſed in the *Meſentry*, being Branches of the *Vena Porta*.

MESARÆUM, the ſame with *Meſenterium*; whence its Veſſels are called as well *Meſaraick* as *Meſenterick*.

MESENTERY, is the Membrane of the *Peritonæum* doubled, enriched with Glandules, Nerves, Arteries, Veins, Chyliferous and Lymphatick Veſſels: It is in the middle of the *Abdomen*, and contains the Inteſtines in a wonderful manner. It has a great Glanduſe in the middle, called *Pancreas Aſellis*; about which are ſeveral other leſs Glandules, to which the Milky Veſſels of the firſt Rank tend, from the Inteſtines and Lymphatick Veſſels, from the Liver and other Parts: From theſe Glandules again the Milky Veſſels of the ſecond Rank aſcend to the Veſſel that carries the Maſs of Chyle, and diſcharge themſelves into it. *Blanchard*.

MESENTERICK *Arteries*: The Upper of which is ſaid to diſtribute it ſelf among the ſmall Guts; and the Under one to go to the lower Part of the *Meſentery*.

MESN, or *Meaſn*, a Term in Law, ſignifying him that is Lord of a *Manor*, and ſo hath Tenants holding of him; yet himſelf holds of a Superiour Lord. It ſignifies alſo a Writ, which lieth where there is *Lord*, *Meſn* and *Tenant*: The *Tenant* holdeth of the *Meſn* by the ſame Services whereby the *Meſn* holdeth of the *Lord*; and the *Tenant* of the *Meſn* is diſtrain'd by the Superior *Lord*, for that his Service or Rent which is due to the *Meſn*.

MESOCOLON, is that Part of the *Meſentery* which is continued to the Great Guts, lying in the midſt of the Gut *Colon*, whereto it is joined in its whole Courſe, and in its loweſt Border ſticks to a Part of the *Rectum*.

MESOLABIUM, in Mathematicks, is an Inſtrument for finding Mean Proportionals.

MESOPLEURII, are the Intercoſtal Muſcles, Twenty two on each ſide; Eleven External, and as many Internal.

METACARPUS, and *Metacarpium*, is the Back of the Hand, made of Four oblong little Bones, which expand the Palm of the Hand, and they are called *Poſt-brachialia*.

METACARPUS, is a Bone of the Arm, made up of Four Bones which are annexed to the Four Fingers; that which ſuſtains the Fore-finger is the biggeſt and longeſt. They are round and long, a little convex and round towards the Back of the Hand, and concave and plain towards the Palm: They are hollow in the middle, and full of Marrow; they touch one another only at their Extremities, leaving Spaces in their middle, in which lie the *Muſculi interoſſei*. In the upper end there is a *Sinus*, which receives the Bones of the Wriſt, and their lower Extremity is round, and is received into the *Sinus* of the firſt Bones of the Fingers.

METACONDYLI, are the utmoſt Bones of the Fingers.

METALS and *Minerals*. The Excellent Promoter of all uſeful Learning, Biſhop *Wilkins*, in his Real Character, gives the following Table of Metals.

Metal *is a* Mineral, *for the moſt part of a Hard Conſiſtence, Cloſe,* Ductile, *and* Fuſil; *and may be diſtinguiſhed into*

I. *Perfect.*

And this is either, { *Natural*, or *Factitious.*

II. *Imperfect.*

With Reference to { *Metalline Kinds*, or, *Recrementitious* Parts.

Firſt, *Natural Metals* are ſuch as of themſelves grow in the Earth, without any kind of Mixture or other help by the Art of Men. And theſe are either,

1. More Rare and Precious: Of a

Yellowiſh Colour, moſt *heavy*; not growing in particular Mines, where it is debaſed with any droſſie Mixture, but found pure either in ſmall Sands, or rocky Branches; and this is *Gold*.
Whitiſh Colour, next in Value to Gold, not ſubject to Ruſt, yielding (when ſtruck) a pleaſant Sound; as *Silver*.

2. Of a Middle Value, and of a

Whitiſh Colour, and more ſoft Conſiſtence, as *Tin*: Or of a
Reddiſh Colour, as *Copper*.

3. Of a Baſer Value, and more Common,

are

Lead, which is of a yet ſofter Conſiſtence, a *darkiſh* Colour, and not *Sonorous*.
Iron, which is of an hard Conſiſtence, and of a ruſty dark Colour too.

Secondly, Factitious *Metals*, are ſuch as are made by the Art of Man: Of which ſome are made of

Copper, and *Lapis Calaminaris*, as *Braſs*. Some of
Tin, *Lead*, and *Tin-Glaſs*, as *Pewter*. Or of
Iron depurated, by frequent heating, and beating, and boiling with Salts; as *Steel*.

Thirdly, *Imperfect Kinds* of Metal, are either

Fluid, as *Mercury* or *Quick ſilver*: Or,
Solid and Conſiſtent. And ſome of theſe are uſed for
Purging, and chiefly upwards, as *Antimony*. Some are uſed for making of
Pewter, being of a ſhining brittle Subſtance, as *Biſmuth* or *Tin-Glaſs*. Others are uſed for making of
Solder, as *Spelter*, *Zink*, or *Spalt*. And ſome are made uſe for
Painting, as *Cinnabar*, *Vermilion*, and *Black Lead*.

Fourthly, *Recrementitious Parts* of Metals, are ſuch as are caſt off either in the *Preparation* of them by

Melting; as *Litharge*, which is a kind of Scum ariſing from the Purification of Silver from Lead; and *Spodium* and *Pompholix*, which fly out from Copper when it is in Fuſion, and either fall down again to the Ground, as the former, or adhere to the Roof or Walls, as the latter: Or elſe they come from the Metal by
Beating or Hammering, as the *Scoria*, or Scales; or ariſe from
Corruption either in the general way, as *Ruſt*, or after a particular manner, as in the making of *Verdigreaſe* and *Ceruſe*; one from Copper, or Braſs, and the other from Lead.

But notwithſtanding this Scheme be a good general Summary; yet a good Diſcourſe on this Subject is very much wanting; and indeed, to do it well, will be a very difficult Task: Becauſe in the *Mineral Kingdom* (as Dr. *Woodward* obſerves in his Excellent Natural Hiſtory of the Earth, *Part* 4.) there is nothing *Regular*, *Conſtant*, or *Certain*: Neither *Colour*, *Figure*, nor their *Place* or Situation in the Earth, are to be truſted to, or relied upon, ſo as poſitively to make any Judgment from thence.

A common *Marchaſite*, or *Pyrites*, ſhall have the Colour and Brightneſs of Gold or Silver, and yet afford nothing but a little Sulphur and Vitriol; whilſt another Body, having only the Reſemblance of a Pebble or a Stone, ſhall have a plentiful Admixture of a valuable Metal in it.

Nothing is more common than to find the ſame Metal ſhot alſo into very different Forms and Figures; as well as to find different kinds of Metal of the ſame Form and Figure: And a Body which hath the ſhape and appearance of a Diamond, may prove upon Examination, to be nothing but Chryſtals or *Selenites*; nay, perhaps only common Salt, or Alum, naturally Chryſtalliz'd, or ſhot into that Form.

So alſo as to their Place in the Earth, there is the ſame Uncertainty: Sometimes we find them in the Perpendicular Fiſſures, or Intervals of the *Strata*; ſometimes interſperſed in the Bodies of the *Strata*, and ſometimes in both: Only indeed in the Gems there is this Difference, That the *Topazes*, *Amethiſts*, *Emeralds*, &c. which grow in the Fiſſures, are ordinarily Chryſtallized or ſhot into Angular Figures, whereas thoſe found in the *Strata*, are in rude Lumps, only like ſo many Yellow, Purple, or Green Pebbles; not but that even theſe that are thus lodged in the *Strata* are alſo ſometimes found Chryſtallized, and in the Forms of *Cubes*, *Rhombs*, &c. but then thoſe found in the *Strata*, are eaſily diſtinguiſhed from the other, becauſe they are without their *Root*, (as the Jewellers call it) or the Abruptneſs at their Ends, whereby the others adhere to the Stone or Sides of the Intervals, which Abruptneſs is occaſioned by their being broken off from thence: And thoſe which are found incloſed in ſolid Stone, Marble, &c. being difficultly ſeparable from the Stony Matter which adheres to them on all ſides, have commonly ſome of that Matter ſticking to them on all their ſides; whereby they are diſtinguiſhed from thoſe found in the *Perpendicular Intervals*, they adhering only by one End, as was above obſerved.

The ſame *Metals* are alſo placed indifferently in all kind of Terreſtrial Matter, or in *Strata* of very different Natures. They are frequently alſo variouſly intermixed one with another; ſo that 'tis a rare thing to find any of them Pure and Simple, but Copper and Iron ſhall be in the ſame *Maſs*, Gold and Copper, Silver and Lead, Tin and Lead; yea, ſometimes all the Six together in one and the ſame Lump.

'Tis the ſame thing with *Minerals*; and Minerals and Metals are very often Blended and Intermixed together.

Now the Knowledge of this may be of good uſe to undeceive thoſe, who by reading of ſome Authors, are perſuaded, That all things relating to Metals and Minerals, are tranſacted by Nature, in a moſt regular and Accurate Order, whereas indeed there is nothing like that; and the only ſtanding Teſt, and diſtinguiſhing Characteriſtick of any Metal or Mineral, muſt be ſought for in the Conſtituent Matter of it, and it muſt firſt be brought down to that, before any certain Judgment can be given of it.

Thoſe Metals and Minerals which are repoſited in the Bodies of the *Strata*, are either found there in Grains, or ſmall Particles, or elſe amaſſed into Balls, Lumps, or Nodules; which Nodules are either of an irregular and uncertain Figure; as the common *Pyritæ*, *Flints*, *Agates*, *Onyxes*, *Pebbles*, *Cornelians*, *Jaſpers*, &c. or elſe they are of a Figure ſomewhat regular and obſervable; as the *Belemnites*, the ſeveral ſorts of *Mineral Coral*, the *Stelechites*, the *Lapis Mucetoides*, vulgarly called, *Fungites*: The *Aſtroites*, or *Starry Stone*; as well that ſort with the *prominent*, as that with the Concave Stars: The *Selenites*, the Echinated Chryſtalline Balls, with many more Analogous Bodies.

Thoſe which are contained in the Perpendicular Intervals of the *Strata*, are either ſuch as are there gathered into a Rude Heap, without any particular Form or Order, lying included within the two oppoſite Walls or Sides of the ſaid Intervals,

vals, which, according to their Quantity, they wholly, or partly fill.

In ſuch manner is *Sparr*, and other Minerals uſually found; as alſo the common Ores of Lead, Tin, Iron, and other Metals: or elſe ſuch as are diſtinguiſhable by being of ſome obſervable Figure; as the *Sparry Stiriæ* or *Iceycles*, called *Stalactitæ*, or rather *Stagonitæ*; the Native *Saline Iceycles*, or *Sal Stalactitum*; the *Vitriolum Stalactitum Nativum*; the *Vitriolum Capillare*; the *Alumen Stalactitum* and *Capillare*; *Minera Ferri Stalactica*, which when ſeveral of the Cylindrick *Stiriæ* are contiguous, growing together, as it were, in one Sheaf, is called *Bruſh Iron Ore*; the *Argentum Arboreſcens* and *Capillare*. To theſe add alſo the cryſtallized Ores and Minerals, *viz.* the Tin, and mundick Grains, the Iron Rhombs, cryſtallized Nitre, Salt, Alum, Vitriol and Sulphur: Of which ſort alſo are the Gems or Stones that are here ſhut into Cubes, into Pyramidical Forms, or into Angulated Columns, conſiſting of ſix Sides, and mucronated or terminating in a Point; being either *Opake* or *Pellucid*, or but partly ſo, and coloured Black, White, Grey, Red, Purple, Blue, Yellow or Green; *v. gr. Chryſtal*, the *Pſeudo-Adamantes*, the *Corniſh* and *Briſtol-Stones*, *Cryſtallized Sparrs*, the *Iris*, the *Amethyſt*, the *Sapphire*, the *Topaz*, the *Emerald*, &c.

As to the Origin and Production of Metals and Minerals, the Doctor from the Light his Obſervations have given him, comes to theſe Concluſions.

1. That the far greateſt Part of our Metals and Minerals, *viz.* all ſuch as are now found in the *Strata*, do owe their preſent Frame and Order to the *Univerſal Deluge*, when the *Strata* of Stone, Earth, Marble, &c. themſelves were alſo formed. At which Time alſo were all metallick and mineral Nodules whatſoever formed; as well thoſe in rude Lumps, ſuch as the common *Pyritæ*, *Flints*, *Pebbles*, *Agates*, *Onyxes*, *Jaſpers*, *Cornelions*, &c. as thoſe of a more obſervable Figure and regular Shape; as the *Selenites*, *Belemnites*, *Stelechites*, mineral Coral.

2. That the metallick and mineral Matter, now found in the perpendicular Intervals or Fiſſures of the ſeveral *Strata*, of which the Body of the Earth is compoſed, was all of it originally, and at the Time of the Deluge, lodged in the Bodies of thoſe *Strata*, that it was educed thence, and tranſmitted into theſe Intervals ſince that Time; the Intervals themſelves not exiſting 'till the *Strata* were formed, and afterwards broken, to let the Water from off the Earth. See *Part* 2. *Conſect.* 3, 6. and *Part* 3. *Sect.* 2. of his *Natural Hiſtory of the Earth*.

But he ſuppoſes, that the Water which is continually aſcending from the Abyſs, towards the Surface of the Globe (ſee *Abyſs*, and the Word *Springs*) continually pervading the Bodies of the *Strata*, detaches out of their Pores and Interſtices, ſuch metallick and mineral Corpuſcles, as lie looſe in its way (and which are withal ſo ſmall as to be capable of paſſing thro' thoſe Interſtices) forcing them along with it to the perpendicular Intervals; where having more Room, and a freer Paſſage than before, it deſerts them and leaves them in thoſe Intervals; and that this way all the mineral and metallick Metals now found in thoſe Places, were brought thither, and there do ſtill grow and increaſe.

But that theſe in the *Strata* do not, nor cannot grow, but on the contrary, are continually leſſened and diminiſhed, by ſo much as hath been conveyed into their perpendicular Intervals, and hath been brought forth on the Surface of the Earth by Springs, Rivers, and Exhalations from the Abyſs, ever ſince the Deluge.

The Doctor ſuppoſes alſo, That the *Bitumen*, which is found in Lumps, or coagulated Maſſes, in *ſome Springs*; and which in others is found floating on the Surface of the Water in the Form of an Oyl (called by Naturaliſts, *Naphtha* and *Petroleum*): That the Salt wherewith the *Salinæ* or Salt Springs abound, the Vitriol, Alum, Nitre, Sulphur, Sparr, and other Minerals, wherewith the *Acidulæ*, or medicinal Springs are impregnated; all theſe Minerals, he ſaith, were firſt lodged in the *Strata* of Stone, Coal, Earth, &c. and have ſince been educed thence, and conveyed into thoſe Springs, by the Water pervading thoſe *Strata* in its Paſſage from the Abyſs towards the ſaid Springs. See a much larger Account of this Matter under the Word *Foſſils*.

METAL, a Word frequently uſed about a Piece of Ordnance, or great Gun: The Outſide or Surface of her is called, The *Superficies of her Metals*: When the Mouth of a great Gun lies lower than her Breech, they ſay, She *lies under Metal*; but if ſhe lies truly level, point-blank, or right with the Mark, they ſay, She *lies right with her Metal*.

METALLURGY, is the Working or Operation upon Metals, in order to render them moſt fine, hard, bright, beautiful, ſerviceable or uſeful to Mankind.

METAPEDIUM, the ſame in the Foot that *Metacarpus* is in the Hand.

METAPHOR, a Trope in *Rhetorick*, by which we put a ſtrange and remote Word for a proper Word, by reaſon of its Reſemblance with the Thing of which we ſpeak: As a King is called the Head of his Kingdom, becauſe he commands the Members of the Politick Body, as the Head does the Natural Body.

METAPHRENUM, is that Part of the Back, which comes after the *Diaphragm*. *Blanchard*.

METAPTOSIS, is the degenerating of one Diſeaſe into another, as of a *Quartan Ague*, into a *Tertian*; and on the contrary, of an *Apoplexy* into a *Palſie*, &c.

METASTASIS, is when a Diſeaſe goes from one Part to another; which happens to Apoplectick People, when the Matter which affects the Brain is tranſlated to the Nerves.

METATARSUS, is compoſed of five little Bones, connected to thoſe of the firſt Part of the Foot, which immediately ſucceeds the Leg.

METEORS, (according to the *Carteſians*) are certain various Impreſſions made upon the Elements, exhibiting them in different Forms, and are called *Meteors* from their Elevation; becauſe for the moſt part, they appear to be high in the Air; and they are either Fiery, Airy, or Watery.

Fiery Meteors, are ſuch as conſiſt of a fat, ſulphurous kindled Smoke, whereof there are ſeveral Kinds; as *Ignis Fatuus*, *Trabs*, *Ignis Pyramidalis*, *Draco Volans*, *Capra Saltans*, *Thunder* and *Lightning*, &c.

Airy Meteors, are ſuch as conſiſt of flatuous and ſpirituous Exhalations, as *Winds*, &c.

Watery Meteors conſiſt of Vapours, or Watery Particles, by the Action of Heat ſeparated from each other, and variouſly modified, as *Rain*, *Dew*, &c.

Dr. *Woodward*, in his *Natural Hiſtory of the Earth*, p. 208. ſuppoſes the Matter of *Meteors* to be in good meaſure of a mineral Nature; and that the mineral Particles contained in the *Strata* of the Earth, are raiſed up by the Subterranean Heat or Fire, along with the Vapours aſcending from the Abyſs, and pervading thoſe *Strata*, and eſpecially at ſuch times as the Sun's Power is ſo great, as to penetrate the exterior Parts of the Earth, and therefore help to mount them up into the Atmoſphere. Theſe Sulphureous, Nitrous, and other light and active mineral Particles do form Meteors in the Air, and particularly are the Cauſe of *Thunder* and *Lightning*, &c. and other Fiery Compoſitions there.

METHOD, or *Diſpoſition*, is that Action of the Mind, by which we range various Ideas, Judgments and Ratiocinations upon one and the ſame Subject, in that Order which is moſt proper for its Explanation; and a right Method of Enquiry after Truth, or the Proſecution of any Demonſtration, will be found to conſiſt alſo in a regular Train of Arguments and Conſequences rightly diſpoſed in their juſt and natural Order. If you will believe *Des Cartes*, he ſaith, in his Book *De Methodo*, That he was able to maſter the greateſt Depths in *Geometry*, by only obſerving conſtantly theſe four following Rules in his Studies.

Firſt, Never to admit any thing for Truth, and to treaſure it up in the Mind as ſuch, unleſs we be demonſtratively aſſured, that it is ſuch.

Secondly, To divide the Difficulties of the Problem, or Matter inquired after, into ſuch a proper Number of Parts, as is moſt convenient for its Reſolution.

Thirdly, To obſerve exact Order and Method in our Thoughts and Inquiries, ſo as to begin with the plaineſt and eaſieſt Things firſt, and then to proceed on gradually to Things more and more difficult.

Fourthly, To be ſure not to ſlip, over-look, or omit any thing, either in the Difficulties to be ſolved, or in the means of Inquiry.

Theſe are indeed very good Rules, and I queſtion not were very ſerviceable to him in his *Geometrical Inquiries*; but the Sight of our Country-man *Harriot's Algebra*, did him as much Service as all of them.

In *Mathematical Inquiries*, there are Two general Methods commonly made uſe of, the *Analytical*, and the *Synthetical*; which ſee: And to which may be added, the *Zetical* and *Poriſtical* Methods; which you will find under thoſe Words.

METONICK *Year*, or *Period*, is the Space of 19 Years; in which time, the *Lunations* return, and happen as they were before; 'tis ſometimes called, *The Great Metonick Year*, and is the ſame with the *Cycle of the Moon*.

METONYMY, or *Tranſnomination*, (a Figure or Trope in *Rhetorick*) is the putting of one Name for another, or expreſſing a Thing by another Name, than which properly belongs to it; as if we ſhould ſay, *All the World reads* Cicero; Cæſar *ravaged the* Gauls; it would be plain, what we intended, *viz.* That *the World reads* Cicero's *Works*; Cæſar's *Army ravaged the* Gauls.

METOPA, in Architecture, is the Interval or Space between every Triglyph in the Frize of the *Dorick* Order. The Ancients uſed to adorn theſe Parts with Carved Works or Paintings, repreſenting the Heads of Oxen, Veſſels, Baſons, and divers other Inſtruments that were uſed in their Sacrifices.

METRENCHYTA, is an Inſtrument wherewith Liquors are injected into the Womb.

MIASMA, is a contagious Infection in the Blood and Spirits, as in the *Plague*, &c.

MICROCOUSTICKS, the ſame with *Microphones*.

MICROCOSM; The Body of a Man is called the *Little World*, as a kind of Compendium of the Greater.

MICROMETER, is an Inſtrument made of Braſs, being a Movement with a Plate, or Face, divided like a Clock or Watch, with an Index or Hand, which (being turned) moves two ſliding Plates of Braſs with Hairs, and counts on the Plate the Revolves or Turns of the endleſs Screw. This Inſtrument is fitted to a large Teleſcope, and uſed in *Aſtronomy*, to find the Diameters of the Stars, or Planets.

The Deſcription of this Inſtrument of Mr. *Townley*, improved by Dr. *Hook*, you may ſee more at large in *Philoſ. Tranſact.* N. 29. and the Uſes in N. 25. See Vol. II.

MICROPHONES, are Inſtruments contrived to magnifie ſmall Sounds, as *Microſcopes* do ſmall Objects.

MICROSCOPE, is an Optical Inſtrument, which by extremely magnifying (as they ſay) any Object, helps us to diſcover the minute Particles of which Bodies are compoſed, and the curious Frame and Contexture of them.

To make very ſmall ſingle Eye-glaſſes for Microſcopes.

Get ſome very ſmall Silver-wire, and double it up and down like a Skein of Thread, in order to make a Wick (for a Lamp) of a moderate ſize; then fill a Lamp with *Spirit of Wine*, well dephlegmated, and uſe the Silver-wire inſtead of a Cotton-wick: Then having ready ſome fine Glaſs beaten, powdered, and ſifted very ſmall, and well waſhed and dried, take ſome of it on the Point of a Silver Needle filed very ſmall, and wetted a little with Spittle, and holding it in the Flame of the Lamp, turn it about 'till it melt, (as it will ſoon do) into a fine round Globule: You muſt hold it in the Flame no longer than 'till it come to its *round Figure*, leſt you burn it: The only Difficulty is in giving it that Roundneſs exactly, but Practice will ſoon learn you the Knack of it; they muſt be cleanſed afterwards by rubbing them a while on ſoft Leather. *Philoſ. Tranſact.* N. 141.

Thoſe *Microſcopes* that are made with ſingle Convex Glaſſes, muſt have the Object placed in one *Focus* of the Glaſs (or rather a little nearer), and the Eye muſt be in the other *Focus* on the other ſide.

Theſe

Place this under y^e word Microscope

JOHN MARSHALL'S
New Invented
DOUBLE MICROSCOPE,
For Viewing the
CIRCULATION of the BLOOD

Made & Sold by him at the Archimedes &
Golden Spectacles in Ludgate Street.

B. Lens delin: I. Sturt sculp:

These kind of *Microscopes*, when the Glasses are well made, do magnifie exceedingly: Such are our very Famous Mr. *Mellen*'s Glasses, which, I believe, are the best of any in the World of this kind: And such are those of Mr. *Lewenhoeck* of *Delft* in *Holland*, by which so many great Discoveries have been made.

But there is more than one great Inconvenience in these Glasses, *viz.* To magnifie much, the Object must be so near, that it must almost touch the Glass; 'tis also very difficult to fit the Object true to the Glass, and when fitted, to fix it so; and but a very small Part of the Object can be seen at a time. But then they being contrived to carry in the Pocket, are very ready, and will be of vast Use on many Occasions.

The best Glasses of this kind that ever I saw, are made by the above-mentioned Mr. *Mellen*, who formerly lived in *Abchurch-Lane*.

In *Philos. Transact.* N. 42. is an Account of a *Microscope* of *Eustach. Divini* (which is also treated of by *Faber* in his Opticks, (*Prop.* 46.) and which I have in some measure experimented my self to be a very good Method of disposing the Glasses. He uses, instead of a common double Convex Eye-glass, two Plane Convex ones, which are so placed as to touch one another in the middle of their Convex Surface; by which means the Glass will take in more of any Object, will represent it flat, and not crooked, and will magnifie also (as they call it) very much. This Glass had four several Lengths (made by Draws); at the least Length, which was 16 Inches, it magnified Lines 41 times bigger than they appear to the naked Eye; at the second Length 90 times; at the third Length 111 times; at the fourth Length 143.

As to the Method of making the same Glass magnifie differently, at different Lengths, Mr. *Marshall* hath brought it to bear very well in his small Pocket *Microscopes*; and this I take to be a good Improvement, which he hath added to the Glasses of *Campani*, which are made after that manner, but with only one Degree of magnifying with one and the same Glass.

In *Philos. Transact.* N. 221. there is an Account of several Microscopical Experiments, by one Mr. *Stephen Gray*; where he speaks of making *Microscopes* with a Globule of Water only, put into an Hole made in a small Brass Plate, which I my self have often tried; and were it not for the trembling Motion of the Fluid, it would do very well.

He saith also, That by applying a small Globule of Pepper-water, &c. to his bare Eye, (*i. e.* by fixing it on the Surface of his Eye) he could in a darkened Room, by Candle-light or Moon-light, or by looking thro' a small Hole in a piece of Paper, discern the *Animalcula* which were in it, exceedingly magnified; and oftentimes, when the Drop of the Fluid was round and well defined, very distinct and plain.

In N. 232. Mr. *Gray* gives a farther Improvement of his *Water Microscope*.

A Description of Mr. Marshall's Double Microscope.

This Microscope *consists of Three Glasses*;

The Eye-Glass *W.*
The Middle-Glass *A.*
And the Object-Glass *C.*

B. Is the Cover or Lid, to keep out Dust from the Eye-glass *W.*

X. Is the Place for the Eye.

W. A Screw where the Eye-glass lies.

A 1. A Screw where the Middle-Glass lies.

A 2. The Draw.

C. The Object-Glass fix'd in a Brass Button, to screw on or off, as Occasion serves.

Z. The Frame or Basis on which the *Microscope* stands firm.

T. A small Drawer in the Frame or Basis, with a Ledge or Till in it, having six Partitions to hold so many several Object-Glasses, one magnifying more than another, and fixed in Brass Cells ready to screw on at *C*, and marked 1, 2, 3, 4, 5, 6. These Partitions are also marked

1, 2, 3, 4, 5, 6. The other part of the Drawer serves to hold the Object-plate (a); a Pair of small Nippers (b), to take up or handle any Object conveniently; another Object-plate (d), having one side White, and the other Black, to fix your Objects upon, as Black upon White, and White Objects on Black.

L. M. A Brass Ball and Socket, on which the whole Body of the *Microscope* is moveable, so as to lie in any Position for the Light.

K. O. A square Brass Pillar on which the *Microscope* is moveable up and down, by means of the Collar *E*, into which the Arm *D* (holding the *Microscope*) is continued.

G. Another Brass Collar sliding up and down on the Pillar *K. O.* having a small Screw *H.* by which it is, as Occasion serves, fix'd fast to the said Pillar, at any Height.

I. A large Brass Nut, in whose Centre is a Female Screw, fitted to the Male Screw *F*, which is fix'd in the Collar *E*: By the turning of which Nut *I*, (the Collar *G* being first fix'd to the Pillar by the Screw *H*) the *Microscope* is rais'd up or down on the Pillar, and made to come nearer, or go farther from the Object: And which is also a very great Advantage, the Axis of the *Microscope* is always kept perpendicular to that Point of the Object, over which it was first placed; so that here is not the Inconvenience which occurrs in other Glasses, of often losing the Sight of the Object, by screwing the Glass higher or lower.

Q. A Glass Object-Plate fix'd in a Brass Frame, whose Arm *N. N.* is fix'd to the Pillar by means of the Nut *O.* The Arm *N. N.* hath in it a Slit, by which 'tis easily put on, or taken off the Pillar, and by which it may be fix'd upon it at any Distance.

P. A small Fish lying on the Glass-Plate, that the Circulation of the Blood may be seen in part of the Tail-fin, at (c).

R. A Convex-Glass, by whose Help a bright Spot of Light is brought from a Candle at S. standing on the Ground while the *Microscope* stands on the Edge of a Table or Stool; which Spot of Light (c) serves to render the Circulation more conspicuous.

V. A Lead Coffin to be put on the Fish, to hinder it from springing away, and moving his Tail out of the Light.

1, 2, 3, 4, 5, 6, Are Marks on the Pillar *K. O.* which shew you the Distance that the Object-Glass must be from the Object you look upon, according

according as the Object Glaſſes you make uſe of, magnifie more or leſs. Thus, for Inſtance, If you uſe the Object-Glaſs, 5 or 6, (either of which will ſhew the Circulation of the Blood) you muſt fix the upper Edge of the Collar *E*, at the Mark 5 or 6 on the Pillar. And then will the *Microſcope* be very near its exact Diſtance from the Object; ſo that by a ſmall Turn or two of the Nut *I*, either way, you may ſoon exactly fit it to your own Eye, and place the Object in its true diſtinct Baſis.

By this *Microſcope*, Liquors alſo may be very commodiouſly examined; for if you place a ſmall Drop of any Liquor on the Glaſs-plate juſt in the middle of the Spot of Light (c), the Parts of it will become very viſible, and its *Animalcula*, if it have any, will be diſcovered. And thus may the Eels in Vinegar, the ſmall Creatures in Black Pepper-water, or in Waters where Wheat, Barley, *&c.* have been infuſed, the Eels and other ſmall living Creatures in Puddle-water, be as plainly ſeen as by almoſt any other *Microſcope*.

And one Thing I ought not to omit to ſpeak on this Occaſion; which is, That I have often with this Glaſs, ſeen the Circulation of the Blood in the Fins of the Tail of Tadpoles; and indeed more conſpicuouſly here than in any other Creature: For the Fins growing all round the Tail, and coming but a little way out beyond the Body of it, both the Ejaculation of the Blood out by the Arteries, and its Return again by the Veins, is much quicker than in the Tails of Fiſhes; and abundance more Streams, Turns and Windings of the moving Blood are here viſible, than I could ever ſee in any other Animal. To which I may add, That the Creature will live a good while out of the Water, and will lie very ſtill.

The Object and the Image in the diſtinct Baſe being reciprocal (as Mr. *Molineux* ſhews, *p.* 102. of his *Dioptricks*), the Image there may be formed larger than the Object, on which depends the Doctrine of the *Double Microſcope*.

Which Inſtrument I believe, was firſt contrived, at leaſt fitted for Uſe and Obſervation by Dr. *Hook*, F. R. S. and a Deſcription of it is publiſhed in his *Micrographia*.

Since that, Mr *John Marſhal*, at the *Archimedes* in *Ludgate-ſtreet*, hath brought it to a very good Degree of Perfection: And I take his *Double Microſcope* here deſcribed, in all Reſpects, to be the moſt uſeful, handy, and ready Inſtrument of this kind.

I have had *Mellen*'s Glaſſes, and ſeen *Lewenhoeck*'s and *Campani*'s, but I would ſooner have the *Double Microſcope* than any of them, and the Price is much eaſier.

MILIARIS *Herpes*. See *Herpes*.

MILKY WAY, or *Via Lactea*, the *Galaxy*, is a broad white Path or Track, encompaſſing the whole Heavens, and extending it ſelf in ſome Places with a double Path, but for the moſt Part with a ſingle one. Some of the Antients, as *Ariſtotle*, &c. imagin'd that this Path conſiſted only of a certain Exhalation hanging in the Air; but by the Teleſcopical Obſervations of this Age, it hath been diſcovered to conſiſt of an innumerable Quantity of Fixed Stars, different in Situation and Magnitude; from the confuſed Mixture of whoſe Light, its white Colour is ſuppoſed to be occaſioned. It paſſes through the Conſtellations of *Caſſiopeia*, *Cygnus*, *Aquila*, *Perſeus*, *Andromeda*, Part of *Ophiucus*, and *Gemini*, in the Northern Hemiſphere; and in the Southern, it takes in Part of *Scorpio*, *Sagittarius*, *Centaurus*, the *Argo Navis*, and the *Ara*.

Metrodorus, and ſome *Pythagoreans*, thought the Sun had once gone in this Track, inſtead of the Ecliptick; and conſequently, that its Whiteneſs proceeds from the Remains of his Light. As the *Galaxy* is compoſed of an Infinity of ſmall Stars, ſo it hath uſually been the Region in which new Stars have appeared: As the new Star in *Caſſiopeia*, which was firſt ſeen *A. D.* 1572. that in the Breaſt of the *Swan*, and another in the Knee of *Serpentarius*; and ſeveral others, which have appeared for a while, and then become inviſible again.

MILITARY *Architecture*, the ſame with *Fortification*.

MILITARY *Execution*, is delivering a Country up to be ravaged and deſtroyed by the Soldiers, when it refuſes to pay Contribution, *&c.*

MIMOSÆ *Plantæ*, the ſame with *Senſitive*; which ſee.

MINE, in Fortification, is a Hole dug or made by a Pioneer under the Rampart, or under the Face of the Baſtion, whereto there are ſeveral oblique and winding Paſſages: When it is finiſhed, divers Barrels of Powder are placed therein, together with a Train or *Saucidge*; and the Quantity of Powder is proportioned to the Height and Weight of the Body which is to be blown up. There are alſo *Mines* ſprung in the Field, which are called *Fougades*.

The Ally or Paſſage of a *Mine* is uſually about four Foot ſquare; at the end of which is the *Chamber of the Mine*, as they call it. The farther it is carried on, the more it is ſubject to be diſcovered by the Enemy; therefore 'tis beſt not to aim at Mining too far, and to make a new one where the former takes no Effect.

MINE-*Dyal*. is a Box and Needle, with a Braſs Ring divided into 360 Degrees, with ſeveral *Dyals* graduated thereon; generally thus made for the Uſe of Miners.

MINERALS, are hard Bodies dug out of the Earth or Mines (whence the Name) being in part of a Metalline, and in part of a Stony Subſtance, and ſometimes with ſome Salt and Sulphur intermixed with the other. Of theſe ſee a large Account under the more general Word *Foſſils*. See alſo *Stones* and *Minerals*.

MINIM, a Term in Muſick; ſee *Notes* and *Time*.

MINIMA *Naturalia*, are ſuch Particles of Matter, which tho' they have each a determinate Shape and Bulk, yet are too minute to be ſingly ſenſible. Theſe are ſuppoſed to be intire, and undivided, and to be perfectly ſolid; and are the ſame with what in another Word are called *Atoms*, becauſe of their ſuppoſed Indiviſibility.

MINIMENTS, or rather *Muniments*, in Law, are the Evidences or Writings, whereby a Man is enabled to defend the Title of his Eſtate. And ſome ſay this Word *Miniments* includes all manner of Evidences.

MINION, a ſort of Cannon, is either *Large* or *Ordinary*.

The

The *Large Minion*, or one of the longeſt Size, has its Bore 3 ¼ Inch Diameter, and is 1000 Pound weight: its Load is 3 ¼ Pound of Powder; its Shot 3 Inches Diameter, and 3 ¼ Pound weight; its Length is 8 Foot, and its level Range 125 Paces.

The *Ordinary Minion*, its Bore is 3 Inches in Diameter, and weighs about 800 or 750 Pound weight: It's 7 Foot long; its Load 2 Pound and a half of Powder; its Shot near 3 Inches Diameter, and weighs 3 Pounds 4 Ounces; and it ſhoots point-black 120 Paces.

MINIUM, or *Red-lead*, is the common Calx of Lead calcined for 3 or 4 Hours in a Reverberatory Furnace, till it turn to a Red Colour.

MINOR, a Term in Law, ſignifying one in Nonage, Minority, or under Age: But more properly an Heir Male or Female, before they come to the Age of One and twenty; during which Minority their Actions are invalid, &c. Yet a *Minor* may preſent, as Patron to an Eccleſiaſtical Benefice.

MINUTE, is the 60th Part of a *Degree* or *Hour*; ſo that every Hour, or Degree of any great Circle, is divided into 60 Minutes, every Minute into 60 Seconds, each Second into 60 Thirds, &c.

MISADVENTURE, or *Miſaventure*, in Law, has a ſpecial Signification, for the killing of a Man, partly by Negligence, and partly by Chance. As if a Man, thinking no Harm, careleſly throws a Stone, or ſhooteth an Arrow, &c. wherewith he killeth another: In this Caſe he commits not Felony, but only loſeth his Goods, and hath Pardon of Courſe for his Life. Some between *Aventure* and *Miſaventure* make this Diſtinction, That *Aventure* is meer Chance: As if a Man, being upon or near the Water, be taken with ſome ſudden Sickneſs, and ſo falls in, and is drown'd; or into the Fire, and be burn'd to Death. *Miſaventure*, they ſay, is where a Man cometh to his Death by ſome untoward Violence; as the Fall of a Tree, the Running of a Cart-wheel, the Stroke of a Horſe, or the like.

MISE, in Law, hath ſeveral Significations: As firſt, a Gift or Cuſtomary Preſent which the People of *Wales* give to every new King or Prince at their Entrance into that Principality. Sometimes *Miſes* are taken for Taxes or Tollages, *Anno* 25. *E.* 1. 5. Sometimes for Coſts and Expences; as *pro Miſis & Cuſtagiis*, for Coſts and Charges ordinarily uſed in the Entries of Judgment in Perſonal Actions.

Miſe is alſo a Term of Art, appropriated to a *Writ of Right*; ſo called, becauſe both Parties have put themſelves upon the meer Right, to be tried by the *Grand Aſſiſe*, or by *Battel*. So that which in all other Actions is called an *Iſſue*, in a *Writ of Right* is called a *Miſe*; unleſs a Collateral Point be tried, and there it is called an *Iſſue*. To *join the Miſe upon the Meer*, ſignifies, to join the *Miſe* upon the *Clear Right*; which is to join upon this Point, Whether hath more Right, the Tenant or Demandant?

MISERERE *Mei*, or *Chordapſus*, is a moſt vehement Pain in the Guts, proceeding from an Inflammation of them, or Involution, and the Periſtaltick Motion inverted; whence the Excrements are diſcharged by the Mouth. It is called alſo *Volvulus*.

MISERICORDIA in Law, is uſed for an Arbitrary Amerciament impoſed on any for an Offence; for where the Plaintiff or Defendant in any Action is amerced, the Entry is *Ideo in Miſericordia*. It is called *Miſericordia*, becauſe it ought to be very moderate, and rather leſs than the Offence. Therefore if a Man be unreaſonably amerc'd in a Court, not of Record, as in the *Court-Baron*, &c. there is a Writ called *Moderata Miſericordia*, directed to the Lord or his Bailiff, commanding them that they take moderate Amerciaments. Sometimes *Miſericordia* is to be quit and diſcharged of all manner of Amerciaments, that a Man may fall into in the Foreſt.

MISPRISION, a Term in Law, ſignifying Neglect or Overſight. As for Example:

Miſpriſion of Treaſon or Felony, is a Neglect or Light account ſhewed of *Treaſon* or *Felony* committed, by not revealing it when we know it to be committed; or by letting any Perſon committed for Treaſon or Felony, or Suſpicion of either, to go, before he be Indicted. *Miſpriſion of Treaſon*, is the Concealment, or not diſcloſing of known Treaſon: For which, the Offenders are to ſuffer Impriſonment during the King's Pleaſure; loſe their Goods, and the Profits of their Lands, during their Lives. *Miſpriſion of Felony*, is only Finable by the Juſtices before whom the Party is attainted: But Juſtices of the *Common-Pleas* have Power to aſſeſs Fines and Amerciaments upon Perſons offending by *Miſpriſions*, Contempts, or Neglects, for not doing, or miſdoing any thing in or concerning Fines. *Miſpriſon of Clerks*, is a Neglect of Clerks in writing, or keeping Records. By the *Miſpriſion of Clerks*, no Proceſs ſhall be annulled or diſcontinued: And *Juſtices of Aſſize* ſhall amend the Defaults of Clerks *miſpriſing* of a Syllable, or Letter, in writing.

MISSEN-*Maſt* of a Ship is a round and long piece of Timber, ſtanding in her Stern or ſternmoſt Part. Some great Ships require two; then the next the Main-maſt, is the *Main-miſſen*; and that next the Poop, the *Bonaventure-miſſen*. But when at Sea, they uſe the Word *Miſſen* alone, they always mean the Sail, and not the Maſt. And to the Sail theſe ſeveral Terms of Art following belong: *Set the Miſſen*; *i. e.* Set the *Miſſen-ſail* right, as ſhe ought to ſtand. *Change the Miſſen*; *i. e.* Bring the *Miſſen-yard* over to the other ſide of the Maſt. *Peek the Miſſen*; *i. e.* Put the *Miſſen-yard* right up and down the Maſt. *Spell the Miſſen*, *i. e.* Let go the Sheet; and withal, *Peek up the Yard*. The Uſe of this *Miſſen* is to keep a Ship cloſe to a Wind: Wherefore, if a Ship be apt to *Gripe* too much (as they call it) they uſe no *Miſſen*. A *Miſſen* is made uſe of often when a Ship rides at Anchor, *to back her a-Stern*, ſo that ſhe may not foul her Anchor on the turning of the Tide. Sometimes alſo they *Lie a-Try* with their *Miſſen* only. The Length of the *Miſſen* is the ſame with the Height of the Main-top-maſt from the Quarter-deck, and the Miſſen-top-maſt half that.

MISSES. See *Miſe*.

MITTELLA, is the Surgeons Term for the Swath that holds up the Arm when it is hurt or wounded.

MITTENDO *manuſcriptum pedis finis*, is a Writ Judicial, directed to the Treaſurer and Chamberlain of the *Exchequer*, to ſearch and tranſmit the Foot of a Fine, acknowledged before *Juſtices in Eyre*, into the *Common-Pleas*, &c.

MITTIMUS, is a Writ by which Records are transferred from one Court to another, ſometimes immediately:

immediately: As, out of the *King's-Bench* into the *Exchequer*; and ſometimes by a *Certiorari*, into the *Chancery*; and from thence, by a *Mittimus*, into another Court. This Word is alſo uſed for the Precept that is directed by a Juſtice of Peace to a Gaoler, for the receiving and ſafe-keeping a Felon, or other Offender, by him committed to the Gaol.

MITRALES, are two Valves at the Orifice of the *Vena pulmonaris*, in the Left Ventricle of the Heart; and are ſo called, becauſe, when they are joined together, they ſomething reſemble a Mitre: They are broader than the other Valves; they are ſituated ſo as to look inwards, and do very little differ in Bigneſs and Form from the *Tricuſpides* in the right Ventricle. Their Uſe is to hinder the Reflux of the Blood brought into the Left Ventricle of the Heart by the *Vena pulmonaris*, back towards the Lungs again.

MIVA, in Pharmacy, is the Fleſh or Pulp of a Quince boiled up with Sugar into a thick Conſiſtence.

MIXT, *i. e.* a *Mixt Body*: By which in Chymiſtry and Natural Philoſophy, is underſtood a Body not mixt or compounded by Art, but by Nature; ſuch as Minerals, Vegetables and Animals, from whom by Chymiſtry different Subſtances can be ſeparated.

MIXT *Figures in Geometry.* ſee *Figures.*

MIXT *Number*, is one that is part Integer or whole Number, and part Fraction; as, $4\frac{3}{5}$, $10\frac{1}{2}$, *&c.*

MIXT *Reaſon* or *Proportion*, is when the Sum of the Antecedent and Conſequent is compared with the Difference between Antecedent and Conſequent: As, if $\overset{3}{a} : \overset{4}{b} :: \overset{12}{c} : \overset{16}{d}$. Then $\overset{7}{a+b} \cdot \overset{1}{a} \circ\circ \overset{28}{b} \cdot\cdot \overset{4}{c+d} \cdot c \circ d$.

MOAT, in Fortification, is a hollow Space or Ditch dug round a Town or Fortreſs which is to be defended; whereof the Length and Breadth often depends upon the Nature of the Soil, according as it is Marſhy or Rocky. But *Moats* in general may be from 16 to 22 Fathom broad, and from 15 to 25 Foot deep.

Dry Moat, is that which is deſtitute of Water, and ought to be deeper than one that is full of Water.

Lined Moat, is that whoſe Scarp and Counterſcarp are cas'd with a Wall of Maſons-Work lying in *Talus* or a-ſloap.

Flat-bottom'd Moat, is that which hath no ſloaping, its Corners being ſomewhat rounded. All Moats muſt be well flanked, and in general ſo wide, as that no Ladder, Tree, *&c.* can reach acroſs it. If the Ditch be dry, or has but little Water, there is uſually another ſmall Trench cut quite along the middle of it.

MODEL *in Architecture.* See *Module.*

MODERATA *Miſericordia*, is a Writ for him that is amerced in a *Court Baron*, or other being not of Record, for any Tranſgreſſion or Offence beyond the Quality of a Fault. It is directed to the Lord of the Court, or his Bayliff, commanding them to take a *moderate Amerciament* of the Party, and is founded upon *Magna Charta*, cap. 14. *Quod nullus liber homo amercietur niſi ſecundum qualitatem delicti*, &c.

MODES *in Muſick.* See *Mood.*

MODILLONS, or *Modillions*, in Architecture, are little Brackets which are often ſet under the Cornices, more-eſpecially in the *Corinthian* and *Compoſit* Order, and ſerve to ſupport the Projecture of the *Larmier* or *Drip*. The Word comes from the Italian *Modiglion*, ſignifying a little Model or Meaſure; but this Part muſt be diſtinguiſhed from the great Model, which is the Diameter of the Pillar: For as the Proportion of an Edifice in general depends on the Diameter of the Pillar, ſo the Size and Number of the *Modillons*, as alſo the Interval between them ought to have due Relation to the whole Fabrick.

MODIOLUS, *Trepanum*, or *Anabaptiſton*, is an Inſtrument which they uſe in profound Corruptions, Contuſions, Cuts, and Fractures of the Bones of the Head, not to be applied; unleſs, 1. The Chips and Prominences of the Bones prick. 2. When the Upper Table is entire, but depreſs'd; and the Lower broken. 3. When the extravaſated Blood would choak a Man with Corruption. The manner of *Trepanning*, or opening the Skull, is thus: When the Hairs are ſhaven off, the Skin is to be cut to the *Pericranium*, avoiding, as carefully as may be, the Muſcles of the Temples, and the Sutures of the Skull; and for this time the Wound is to be bound up, unleſs there be ſo little Blood ſpilt, that the Membrane, called *Pericranium*, may at the ſame time be pulled off from the Skull. Then after a few Hours you may ſtop the Ears of the Patient, take one of theſe Inſtruments, called a *Maſculine Modiolus*, whoſe Point is to be fixed in the Skull, but ſo far off the Fracture, that it touch it not, much leſs the Suture, with its Teeth; tho' ſome Surgeons never avoid the Sutures, and aſſure us that they have perforated them as ſucceſsfully as any other Part: Then hold the Inſtrument faſt with the Left Hand, and turn it round with the Right, 'till you have cut a pretty deep Hole: After this take a *Feminine Modiolus*, (which has no Point in the middle) and turn it round, as before. In the mean time take away the Duſt or Chips that proceed from the Perforation, and moiſten the Inſtrument in Oyl and Water, to make it cool and ſlippery. The Blood that appears, will ſhew that you are now gone as deep as the ſecond Table, *i. e.* beyond the Skull, to the *Meninx*; and then you muſt preſs very gently, leſt the Membrane of the Brain be unadviſedly hurt. When the Bone begins to wag, put ſomething in betwixt the ſides of the Wound; looſen it, and take it out with a pair of Surgeon's Pincers. *Blanchard.*

MODO *&* *Forma*, are Words of Art in Proceſs and Pleadings; and namely, in the Anſwer of the Defendant; whereby he denieth himſelf to have done the Thing laid to his Charge, *Modo & forma declarata*: It ſignifies as much as that Clauſe in the Civil Law, *negat allegata prout allegantur, eſſe vera*; where *modo & forma* are of the Subſtance of the Iſſue, and were but Words of courſe.

MODULE, or *Model*, in Architecture, is a certain Meaſure invented by *Vignola*, and made uſe of to regulate the Proportion of the whole Building. It is generally half the Diameter of a Pillar at the lower end, in the *Tuſcan* and in the *Dorick* Order; but in others, the whole Diameter. This Diameter is divided into 12 equal Parts; and into 18 for the *Ionick*, *Corinthian*, and *Compoſit* Orders. And this *Module* or *Model* is a kind of Univerſal Meaſure, which helps us

to

to get rid of the great Uncertainties there are in the Feet and Inches of divers Nations, and at divers Times.

MODUS *Decimandi*, is when either Land, a Sum of Money, or Yearly Penſion, is given to the Parſon, *&c.* by Compoſition, as Satisfaction for his Tythes in kind.

MOINEAU, is a Name the *French*, and ſome Modern Writers of Fortification, give to a little *Plat-Baſtion*, which is raiſed before a Curtain that is too long, and which hath two other Baſtions at the ends of it; for they being out of Musket-ſhot one of the other, muſt be defended by ſome ſuch thing as this *Moineau* or *Plat-Baſtion*. Sometimes the *Moineau* joins to the Curtain, and ſometimes is disjoined from it by a Moat.

MOLA *Genu*, *Patella*, or *Rotula*, is a round and broad Bone, placed at the jointing of the Thigh and Leg, to preſerve the Knee from ſlipping out, and to defend the Juncture from External Injuries.

MOLA *Carnea*, is a Fleſhy and ſometimes a Spongy Subſtance, without Bones or Bowels: It is often black, like concreted Blood; and ſometimes extream hard; preternaturally brought into the World inſtead of a *Fœtus*.

MOLARES, or *Maxillares Dentes*. See *Dentes*.

MOLINE. The Heralds Term for one of their Croſſes of this Figure. The *Field Azure*, a *Croſs Moline*, or, by the Name of *Molineux*. *Guillim* ſaith this Croſs repreſenteth a Mill-Rind, or the Form of the Ink of a Mill.

MOLOSSUS, is the Foot of a Latin Verſe, conſiſting of Three Syllables, when they are all long.

MOMENTS, are ſometimes taken for the leaſt and moſt inſenſible Parts of Time; as when we ſay, ſuch a thing was done in a Moment.

In Mathematicks, *Moments* are ſuch indeterminate and inſtable Parts of Quantity, as are ſuppoſed to be in perpetual Flux, *i. e.* either continually decreaſing or increaſing; which latter are taken for Affirmative and Poſitive Moments, and the former for Negative or Subtractible ones; And theſe continually increaſing or decreaſing Particles are ſuppoſed to be infinitely ſmall; for as ſoon as ever they come to be of any finite Magnitude, they ceaſe to be *Moments*. *Moments* therefore are to be look'd upon as the generative Principles of finite Magnitudes; and are here ſuppoſed to have no Magnitude, but to be *Inceptive* only of it, to uſe Dr. *Wallis* his Word.

And becauſe 'tis the ſame thing, if in the room of theſe Moments, the Velocities of their Increaſes or Decreaſes be made uſe of, or the finite Quantities proportionable to ſuch Velocities; this Method of proceeding, which conſiders the Motions, Changings, or Fluxions of Quantities, hath come to be called *Fluxions*.

Moments alſo in a Phyſical Senſe, as they are uſed in reference to the Laws of Motion, ſignifie the *Quantities of Motion* in any moving Bodies; and ſometimes, ſimply, the Motion it ſelf; and they define it to be the *Vis inſita*, or *Power* by which any moving Bodies do continually change their Places.

And in comparing the Motions of Bodies, the *Ratio* of theſe Moments is always compounded of the Quantity of Matter in, and the Celerity of the moving Body: So that the *Moment* of any moving Body may be conſidered as a *Rectangle under the Quantity of Matter into the Celerity*. And ſince 'tis certain that all equal Rectangles have their Sides reciprocally proportionable, (14. *è*. 6. *Eucl.*) therefore if the *Moments* of any Moveables are equal, the Quantity of Matter in one, to that of the other, will be reciprocally : : as the Celerity of the Latter to the Celerity of the Former: And *vice verſa*, if the Quantities of Matter are reciprocally proportionable to the Celerities, the *Moments* or Quantities of Motion in each will be equal.

The *Moment* of any moving Body may be conſidered alſo as the Aggregate or Sum of all the Moments of the Parts of that Body; and therefore where the Magnitudes and Number of any Particles are the ſame, and where they are moved with the ſame Celerity, there will be the ſame *Moments* of the Wholes.

MONADES. See *Digits*.

MONKS-*Seam*. So the Sailors call ſewing the Edges or Selvedges of the Sails together, one over another; and 'tis ſew'd on both ſides, to make it the ſtronger.

MONOCHORD, a kind of Inſtrument anciently of ſingular Uſe for the Regulating of Sounds; but ſome appropriate the Name of *Monochord* to an Inſtrument that hath only one ſingle String, as the *Trumpet Marine*.

The Ancients made uſe of the *Monochord* to determine the Proportion of Sounds to one another: When the *Chord* was divided into two equal Parts, ſo that the Terms were as 1 and 1, they called them *Uniſons*; but if they were as 2 to 1, they called them *Octaves* or *Diapaſons*; when they were as 3 to 2, they called them *Fifths*, or *Diapentes*; if they were as 4 to 3, they called them *Fourths*, or *Diateſſerons*; if the Terms were as 5 to 4, they call it *Diton*, or a *Tierce major*; but if the Terms were as 6 to 5, then they called it a *Demi-diton*, or a *Tierce minor*; and laſtly, if the Terms were as 24 to 25, they called it a *Demiton* or *Dieze*.

The *Monochord* being thus divided, was properly that which they called a *Syſtem*, of which there were many kinds, according to the different Diviſions of the *Monochord*.

MONOCOLUM, is the Gut *Cæcum*.

MONOPETALOUS *Flowers*, (in Botany) are ſuch, as, tho' they may be ſeemingly cut into four or five ſmall *Petala* or Leaves, are yet all of one piece, and which falling off all together, have their Flower in one piece. See *Petala*.

MONOPOLY, in Law, is a Grant to any Perſon or Perſons, of or for the ſole buying, ſelling, making, working, or uſing any Commodity.

MONOTRIGLYPH, a Term in Architecture, ſignifying the Space of one *Triglyph* between two *Pilaſters*, or two *Columns*.

MONSTRANS *De droit*, in a Legal Senſe, ſignifies a Suit in *Chancery*, for the Subject to be reſtored to Lands and Tenements, which he ſhews to be his Right, tho' by Office found to be in the Poſſeſſion of another lately dead; by which Office the King is entituled to a Chattel, Free-hold, or Inheritance in the ſaid Lands.

MONSTRANS *De faitt ou Records, ſhewing of Deeds or Records*, is thus: Upon an Action of Debt brought upon an Obligation, after the Plaintiff hath declared, he ought to ſhew his Obligation; and ſo it is of *Records*. And the Difference between *Monſtrans de faits* and *Oyer de faits*, is this: He that pleads the *Deed* or *Records*, or declares upon it, ought to ſhew the ſame; and the other, againſt whom ſuch *Deed* or *Record* is pleaded, may demand *Oyer* of the ſame.

MONSTRAVERUNT, is a Writ that lies for the Tenants in *Ancient Demeſne*, being diſtrained for the Payment of any Toll or Impoſition, contrary to their Liberty which they do or ſhould enjoy.

MONT *Pagnote*, or the *Poſt of the Invulnerable*, is an Eminence choſen out of Cannon-ſhot of a Place beſieged; where curious and wary Perſons place themſelves to ſee the Attack and the manner of the Siege.

MONTH, properly ſpeaking, is the Time in which the Moon runs through the Zodiack, and therefore is accounted by the Motion of the Moon; and therefore the Lunar Month is either *Periodical*, which is the Time of the Moon's Motion from any one Point of the Zodiack to the ſame again, and is ſomething leſs than 27 Days and 8 Hours; or elſe *Synodical*, which is the Time between New Moon and New Moon, and is ſomething more than 29 Days and an half.

There is alſo a *Solar Month*, which is the Time that the Sun takes up in running through one of the Signs of the Zodiack, and is almoſt 30 Days and half.

And both theſe *Solar* and *Lunar Months* are either *Aſtronomical*, like thoſe above-mentioned; or *Civil*, which are various, according to the Uſage of accounting in different Places, Cities and Nations.

The *Egyptians* accounted by *Solar Months*, each of 30 Days; and to compleat their Year, after 12 ſuch Months, they added 5 Days, which the odd Hours made up.

But moſt of the Ancient Nations accounted by the *Lunar Synodical Month*; as the *Jews*, *Greeks*, and the *Romans*, 'till *J. Cæſar*'s Time; and as the *Mahometans* do to this Day. And becauſe theſe Months did not contain an exact Number of Days, to adapt them to *Civil* Computation, they accounted alternately one Month to have 30, and the next 31 Days; and by this means they made two ſuch *Civil* Months to be equal to two *Lunar* ones of 29 Days and half; and they brought it to paſs, that the New Month, for a Run of many Years, did not much deviate from the Firſt Day of the *Civil* Month.

MOODS in *Grammar*, determine the Signification of *Verbs*, as to the Manner and Circumſtances of the Affirmation; and are in Number Six, *viz.* The *Indicative*, the *Imperative*, the *Optative*, the *Subjunctive*, and the *Infinitive Mood*; which ſee.

MOOD in *Muſick*, ſignifies certain Proportions of the *Time*, or Meaſure of Notes. Theſe *Moods* or *Modes* of meaſuring Notes, were formerly Four in Number, *viz.*

1. *The Perfect of the More*, in which a *Large* contain'd three *Longs*, a *Long* three *Breves*, a *Breve* three *Semi-breves*, and a *Semi-breve* three *Minims*.

2. *The Perfect of the Leſs*, wherein a *Large* comprehended two *Longs*, a *Long* two *Breves*, a *Breve* three *Semi-breves*, and a *Semi-breve* two *Minims*.

3. *The Imperfect of the More*, in which a *Large* contained two *Longs*, a *Long* two *Breves*, a *Breve* two *Semi-breves*, and a *Semi-breve* three *Minims*.

4. *The Imperfect of the Leſs*, is the ſame with that which we call the *Common Mood*, the other three being now altogether out of Uſe; altho' the Meaſure of our *Common Triple-time* is the ſame with the *Mood Imperfect of the More*, except that we reckon but two *Minims* to a *Semi-breve*, which in that *Mood* comprehend three.

In our *Common Mood*, two *Longs* make one *Large*, two *Breves* a *Long*, two *Semi-breves* a *Breve*, &c. proceeding in the ſame Order to the laſt or ſhorteſt Note: So that a *Large* contains two *Longs*, four *Breves*, eight *Semi-breves*, ſixteen *Minims*, thirty two *Crotchets*, ſixty four *Quavers*, &c.

Beſides theſe *Moods of Time*, Five others relating to Tune, were in Uſe among the Ancient *Grecians*, which were termed *Tones* or *Tunes* by the *Latins*; the Deſign of either being to ſhew in what Key a Song was ſet, and how the different Keys had relation one to another.

Theſe ſorts of *Moods* were diſtinguiſh'd by the Names of the ſeveral Provinces of *Greece*, where they were firſt invented; as the *Dorick*, *Lydian*, *Ionick*, *Phrygian*, and *Æolick*.

Dorick Mood conſiſted of ſlow-run'd Notes, and was proper for the exciting Perſons to Sobriety and Piety.

Lydian Mood was likewiſe uſed in Solemn Grave Muſick; and the Deſcant or Compoſition was of ſlow Time, adapted to Sacred Hymns or Anthems.

Ionick Mood was for more light and ſoft Muſick; ſuch as pleaſant amorous Songs, Sarabands, Corants, Jiggs, &c.

Phrygian Mood was a Warlike kind of Muſick, fit for Trumpets, Hautboys, and other Inſtruments of the like Nature; whereby the Minds of Men were animated to undertake Military Atchievements, or Martial Exerciſes.

Æolick Mood, being of a more airy, ſoft, and delightful Sound, ſuch as our *Madrigals*, ſerved to allay the Paſſions by the means of its grateful Variety and melodious Harmony.

Theſe *Moods* or *Tones* were diſtinguiſhed into *Authentick* and *Plagal*, with reſpect to the dividing of the *Octave* into its Fifth and Fourth: The Former was when the Fifth Poſſeſſed the Lower Place, according to the Harmonical Diviſion of an *Octave*; and the other was when it ſtood in the Upper Place, according to the Arithmetical Diviſion of the ſame *Octave*.

MOON. The Periodical Revolution of the Moon, in reference to the Fixed Stars, is 27 Days, 7 Hours, 43 Minutes: And in the ſame Space of Time, by a ſtrange Correſpondence and Harmony of the two Motions, it revolves the ſame way about its own Axis; whereby (one Motion as much converting it to, as the other turns it from the Earth) the ſame ſide is always expoſed to our Sight. See Vol. II.

The Librations of the Moon's Body, which occaſion that the ſame Hemiſphere exactly is not always expoſed to our Sight, ariſe from the Eccentricity of the Moon's Orbit, from the Perturbations by the Sun's Attraction, and from the Obliquity of the Axis of the Diurnal Rotation of the Moon's own Orbit; without the Knowledge of which Circumſtances, her *Phænomena* were inexplicable, but by the Conſideration of them are very demonſtrable.

The mean Horary Motion of the Moon, in reſpect of the Fixed Stars, is 32 minutes, 56 ſeconds, 27 thirds, 12 fourths and an half.

The Moon is diſtant from the Earth, according to moſt Aſtronomers, 59; according to *Vindeline*, 60; *Copernicus* 60 $\frac{1}{3}$; *Kircher*, 62 $\frac{1}{2}$; and according to *Tycho*, 56 $\frac{1}{2}$ Semi-diameters of the Earth. Sir *Iſaac Newton* thinks the Diſtance ought to be eſteemed about 61: Therefore the mean Diſtance may be reckoned 60. But if the Earth and Moon move both round the Sun, with their common Centre of Gravity, that admirable Aſtronomer demonſtrates, that the Diſtance between the Centres of the Earth and Moon, will be 60 $\frac{1}{2}$ of the Earth's Semi-diameter, *Prop.* 60. *Lib.* 1. *Princip.*

She is nearer the Earth at her *Syzygy*, than in the Quadrature, by $\frac{1}{87}$ Part of the Diſtance.

According to M. *Caſſini*, the Moon's greateſt Diſtance from the Earth is 61, the mean Diſtance 56, and the leaſt Diſtance 52 Semi-diameters of the Earth.

The Power of the Moon's Influence as to the Tides, is to that of the Sun as 6 $\frac{1}{3}$ to one. Sir *Iſaac Newton.*

As to the Inequality of the Moon's Motion, (which proceeds from the Action of the Sun, diſturbing the Motion of the Secondary Planets) ſhe moves ſwifter, and deſcribes (by a Radius drawn from it to the Earth) a greater Area in proportion to the Time, hath an Orbit leſs curved, and by that means comes nearer to the Earth in her *Syzygies* or Conjunctions, than in the Quadratures, unleſs the Motion of her Eccentricity hinder it: Which Eccentricity is greateſt, when the Apogeum of the Moon happens in the Conjunctions; and is leaſt, when the Apogeum happens at the Quadratures. And therefore the Moon is ſwifter as well as nearer to us in her Perigeum, and more remote and ſlower in her Apogeum at the Conjunctions, than at the Quadratures; and her Motion is ſwifter alſo in the Earth's Aphelion, than in its Perihelion. The Apogeum alſo goes forward ſwifter in the Conjunctions, and goes ſlower at the Quadratures: But her Nodes are at reſt in the Conjunctions, and do recede moſt ſwiftly in the Quadratures.

The Moon alſo perpetually changes the Figure of her Orbit, or the Species of the Ellipſe ſhe moves in.

There are alſo ſome other Inequalities in the Motions of this Planet, which cant hardly be reduced to any certain Rule: As, That the Velocities or Horary Motions of the Apogeum and Nodes, and their Equations, and the Difference between the greateſt Eccentricity in the Conjunctions, and the leaſt in the Quadratures; and that Inequality which is called the *Variation of the Moon:* All theſe do increaſe and decreaſe annually, in a triplicate Ratio of the apparent Diameter of the Sun: And this *Variation* is increaſed and diminiſhed in a duplicate Ratio of the Time between the Quadratures; as Sir *Iſaac Newton* proves in many places of his *Principia.*

That Curious Perſon found the Apogeum in the Moon's *Syzygies* to go forward 23 min. each Day, in reſpect of the Fixed Stars; and to go backward 16 min. $\frac{1}{3}$ each Day in the Quadratures: And therefore the middle Annual Motions he eſtimates at 40 deg.

This differs ſomething from Mr. *Flamſteed*'s Aſtronomical Tables; where the Diurnal Progreſſion of the Moon's Apogeum is 24 min. 28 ſeconds in the *Syzygies*, and the Receſſion 20 min. 12 ſeconds in the Quadratures. See the Words *Secondary Planets.*

That the Cauſe of the *Secondary Light of the Moon*, as they call it; that is, the obſcure Part of her, appearing like kindled Aſhes, juſt before and after the Change or New Moon, is the Sun's Rays reflected from the bright Hemiſphere of the Earth to thoſe dark Parts of the Moon, and thence again reflected to the Earth deſtitute of the Sun's Light; ſee proved in *Zucchius Philoſoph. Optic. Nov.* from p. 247, to p. 260. And alſo in *Tacquet*'s *Opera Geometrica.*

The Excellent Sir *Iſaac Newton* makes it a Propoſition to inquire into the Figure of the Moon; and ſuppoſing it, at its firſt Original, to have been a Fluid, like to our Sea, he calculates, that the Attraction of our Earth would raiſe the Water there to near 90 Foot high, as the Attraction of the Moon raiſeth our Water to 12 Foot: Whence the Figure of the Moon muſt be a *Spheroid*, whoſe greateſt Diameter extended, will paſs through the Centre of our Earth; and will be longer than the other Diameter perpendicular to it, by 180 Feet. And from hence it comes to paſs, that we ſee always the ſame Face of the Moon: For ſhe cannot reſt in any other Poſition, but will continually endeavour to conform her ſelf to this Situation. *Prop.* 38. *Lib.* 3.

The Moon hath properly no Atmoſphere, ſuch as our Earth hath, abounding with Clouds, Winds, Thunder or Lightning; becauſe her Face always, when our Air is clear, appears diſtinct and clear; and by our Teleſcopes we can ſee the Sun's Light paſs regularly and uniformly from one mountainous Place to another.

Mr. *Flamſteed* in *Philoſoph Tranſact.* N. 154. ſaith, That the beſt Tables of the Moon's Motions do err 12 minutes, or more, in her apparent Place; which cauſes a Fault of Half an Hour, or 7 $\frac{1}{2}$ Degrees of the Longitude of Places endeavoured to be found out by her.

M. *Azout* ſays, That this Planet's Diameter never appear'd to him above 33 min. and never leſs than 24 min. 45 ſeconds.

Sir *Iſaac Newton* reckons the mean Diameter of the Moon to be 32 minutes, 12 ſeconds, as the Sun's is 31 minutes, 27 ſeconds.

The Denſity of the Moon he concludes to be to that of the Earth, as 9 to 5 nearly: And that

the Mass or Quantity of Matter in the Moon to that of the Earth, is as 1 to 26 nearly.

The famous Dr. *Wallis* agrees with *Des Cartes* in the Solution of that Difficulty, Why the Moon appears to our common Sight so much bigger when near the Horizon, than she doth when near the Meridian; though she be (nearly) one Semidiameter of the Earth nigher to us in the latter Case, than in the former: Which is, That the Horizontal Moon is capable of being compared with many intervening Objects, interposed Hills, &c. but the Meridional Moon hath nothing to be compared withal; and therefore the Distance between us and her, is judged to be vastly greater, than when she is in the Horizon. He says, It cannot be at all from the Refraction of Vapours near the Horizon, because that can only increase the Altitude of her, but not her Azimuth or Breadth; for the Horizon, in the whole, will always be but a Circle. *Philos. Transf.* N 187.

The Plane of the Moon's Orbit is inclined to that of the Ecliptick, and makes with it an Angle of about 5 Degrees. *Greg. Astron.* And this Declination varies; and is greatest when the Moon is in the Quadratures, and least when she is in her Syzygies.

By means of the Spots in the Moon (which *Hevelius*, *Grimaldus* and *Ricciolus* gave Names to) the *Lunar Eclipses* are more accurately observed than formerly, to the great Advancement of *Geography* and *Navigation*, in settling the Longitudes of Places: For the Immersions and Emersions of these Spots from the Shadow of the Earth, are most nicely determined.

Although the Moon's Period round the Earth be in 27 Days, 7 Hours, $\frac{3}{4}$ of an Hour, (which is the *Periodical Month*) yet because in the Space of a Periodical Month, the Earth also with its Satellite, the Moon, is moved on almost an intire Sign, *in Consequentia*; therefore the Point of the Moon's Orbit, in the last Conjunction, or New Moon, will be gotten too far to the Westward: And therefore the Moon cannot come yet to a new Conjunction with the Sun, but wants of it 2 Days and 5 Hours; which must be past before the intire Lunation will be over, and before the Moon hath exhibited all her *Phases*. These 2 Days and 5 Hours therefore being added to the Periodical Month, make the Synodical one, which consists of 29 Days, 12 Hours, and $\frac{3}{4}$ of an Hour.

Mr. *Flamsteed* makes the Lunar Periodical Month to be 27 days, 7 hours, 43 minutes, 7 seconds; as, on Enquiry, he assured me.

The other secondary Planets move swifter round their Axes than the Moon; for her (as the Earth's) uniform Revolution round her Axis, is just the Time of her Periodical Month above-mentioned: Which is the Reason that she always obverts the same Face towards us, allowing a little for that Motion of hers which they call her *Libration*. See *Evection* and *Libration*.

The Axis of this Motion is always parallel to its self, and therefore cannot be at Right Angles with the Plane of the Moon's Orbit, (for this, by reason of the Sun's Perturbation of her Motion, is continually changing) but is inclined to it, and is almost at Right Angles with the unchangeable Plane of the Ecliptick.

Tho' the Moon, as well as the Earth, and probably all the Planets, be of a Figure *Oblately Spheroidical*, (that is, having its Diameter at the Equator longer than its Axis) yet the Excess of the Equatorial Diameter in her, is so inconsiderable, that she may well enough pass for a Globe; and perhaps this nearly Spherical Figure of the Moon, may be the Result of her slow Motion round her Axis: For *Jupiter*, which moves the swiftest of any round its Axis, is of a Figure more *Oblate* than any other Planet.

If an Eye were placed in the Moon, it would judge, that the Sun, the Earth, and the other Planets, together with the Fixed Stars, did move from East to West on the Poles of the Ecliptick in a Periodical Month, because in that Space of Time, the Moon turns round her Axis; and these Poles of the Ecliptick would be very remarkable and conspicuous; for the North Pole would be near a Star of the fourth Light, in the third Flexure of *Draco*, which would be but three Degrees distance from the true Pole of the Ecliptick, and the *Southern* would be distinguished by the four Stars in *Xiphia Pisces*, one of which is nearer that Pole of the Ecliptick, than the Pole-star is to the Arctick Pole: And it would be yet more remarkable by the Nearness of the *Nubecula major*.

The apparent Revolution of the Sun (to a Lunar Spectator) about the Moon seemingly at rest, would seem longer than really it is, because of the Moon's being carried along with the Earth round the Sun *in Consequentia*: So that the Natural Day in the Moon would be an intire Synodical Month; wherefore there the Sun will appear to rise but 12 times, but the Fixed Stars 13. And more exactly, in 19 Years the Sun will rise 235 times, and the Fixed Stars 254: And the rising Sun will always be almost an whole Sign forwarder than he was the Day before.

The Lunar Natural Day would appear to be near equally divided into Light and Darkness, because the Axis of the Moon's Revolution is nearly at Right Angles with the Plane of her Orbit round the Sun; so that she enjoys a perpetual Equinox: And there can be no *Twilight*, because this Planet hath no Atmosphere. In one half of the Moon's Surface (except just near the Edge of the other Hemisphere) the Earth cannot be seen by our Spectator; whereas in the other half it will be always visible, and seem fix'd in the Heavens like a Star.

The Famous Sir ISAAC NEWTON's Theory *of the* MOON.

This *Theory* hath been long expected by all the true Lovers of *Astronomy*, was communicated from Sir *Isaac Newton*, to Dr. *Gregory*, *Astron. Professor* at *Oxford*, and by him published in his *Astron. Elem. Philos. & Geomet.* p. 336. From whence, as it was lately translated into *English*, I thought fit to insert it here.

By this Theory, what by all Astronomers was thought most difficult and almost impossible to be done, the Excellent Sir *Isaac Newton* hath now effected; *viz.* To determine the Moon's Place even in her Quadratures, and all other Parts of her Orbit, besides the Syzygies, so accurately by Calculation, that the Difference between that and her true Place in the Heavens, shall scarce be two Minutes, and is usually so small, that it may well enough

enough be reckon'd only as a Defect in the Obſervation. And this Sir *Iſ. Newton* experienced by comparing it with very many Places of the Moon, obſerv'd by Mr. *Flamſteed*, and communicated to him.

The Royal Obſervatory at *Greenwich*, is to the Weſtof the Meridian of *Paris* 2 deg. 19 min. Of *Urainburgh* 12 deg. 51 min. 30 ſeconds. And of *Gedanum* 18 deg. 48 minutes.

The mean Motions of the Sun and Moon, accounted from the Vernal Equinox at the Meridian of *Greenwich*, I make to be as followeth.

The laſt Day of *December* 1680, at Noon *(Old Stile)* the mean Motion of the Sun was 9 Signs 20 deg. 34 min. 46 ſeconds. Of the Sun's Apogeum, was 3 S. 7 deg. 23. min. 30 ſec.

The mean Motion of the Moon at that time, was 6 S. 1 deg. 35 min. 45 ſeconds. And of her Apogee, 8 S. 4 deg. 28 min. 5 ſeconds. Of the Aſcending Node of the Moon's Orbit, 5 S. 24 deg. 14 min. 35 ſeconds, *&c.*

And on the laſt Day of *December* 1700, at Noon, the mean Motion of the Sun, was 9 S. 20 deg. 43. min. 50 ſeconds. Of the Sun's Apogee, 3 S. 7 deg. 44 min. 30 ſeconds. The mean Motion of the Moon was 10 S. 15 deg. 19 min. 50 ſeconds. Of the Moon's Apogee, 11 S. 8 deg. 18 min. 20 ſeconds. And of her Aſcending Node, 4 S. 27 deg. 24 min. 20 ſeconds. For in 20 *Julian* Years, or 7305 Days, the Sun's Motion is 20 Revolut. 0 S. 0 deg. 9 min. 4 ſeconds. And the Motion of the Sun's Apogee, 21 min. 0 ſeconds.

The Motion of the Moon in the ſame time, is 247 Revolut. 4 S. 13 deg. 34 min. 5 ſeconds. And the Motion of the Lunar Apogee, is 2 Revolut. 3 S. 3 deg. 50 min. 15 ſeconds. And the Motion of her Node, 1 Revolut. 0 S. 26 deg. 50 min, 15 ſeconds.

All which Motions are accounted from the Vernal Equinox: Wherefore if from them there be ſubſtracted the Receſſion or Motion of the Equinoctial Point, *in Antecedentia*, during that ſpace, which is 16 min. 0 ſec. there will remain the Motions in reference to the Fix'd Stars in 20 *Julian* Years, *viz.* the Sun's 19 Revol. 11 S. 29 deg. 52 min. 24 ſeconds. Of his Apogee, 4 min. 20 ſeconds. And the Moon's 247 Revol. 4 S. 13 deg. 17 min. 25 ſeconds. Of her Apogee, 2 Revol. 3 S. 3 deg. 33 min. 35 ſeconds. And of the Node of the Moon, 1 Revol. 0 S. 27 deg. 6 min. 55 ſeconds.

According to this Computation the *Tropical Year* is 365 Days, 5 Hours, 48 Minutes, 57 Seconds. And the *Syderal Year* is 365 Days, 6 Hours, 9 Minutes, 14 ſeconds.

Theſe mean Motions of the Luminaries are affected with various Inequalities: Of which,

1. There are the Annual Equations of the aforeſaid mean Motions of the Sun and Moon, and of the Apogee, and Node of the Moon.

The Annual Equation of the mean Motion of the Sun, depends on the Eccentricity of the Earth's Orbit round the Sun, which is $16\frac{11}{12}$ of ſuch Parts, as that the Earth's mean Diſtance from the Sun ſhall be 1000: Whence 'tis called the *Equation of the Centre*; and is when greateſt 1 deg. 56 min. 20 ſeconds.

The greateſt Annual Equation of the Moon's mean Motion, is 11 deg. 49 ſeconds; of her Apogee, 20 min. and of her Node 9 minutes 30 ſeconds.

And theſe four Annual Equations are always mutually proportional one to another: Wherefore when any of them is at the greateſt, the other three will alſo be greateſt; and when any one leſſens, the other three will alſo be diminiſhed in the ſame *Ratio*.

The Annual Equation of the Sun's Centre being given, the three other correſponding Annual Equations will be alſo given; and therefore a Table of *that* will ſerve for all. For if the Annual Equation of the Sun's Centre be taken from thence, for any Time, and be called P, and let $\frac{1}{10}$ P = Q, Q + $\frac{1}{20}$ Q = R, $\frac{1}{2}$ P = D, D + $\frac{1}{30}$ D = E, and D − $\frac{1}{30}$ D = 2 F; then ſhall the Annual Equation of the Moon's mean Motion for that time be R, that of the Apogee of the Moon will be E, and that of the Node F.

Only obſerve here, That if the Equation of the Sun's Centre be required to be added; then the Equation of the Moon's mean Motion muſt be ſubſtracted, that of her Apogee muſt be added, and that of the Node ſubducted. And on the contrary, if the Equation of the Sun's Centre were to be ſubducted, the Moon's Equation muſt be added, the Equation of her Apogee ſubducted, and that of her Node added.

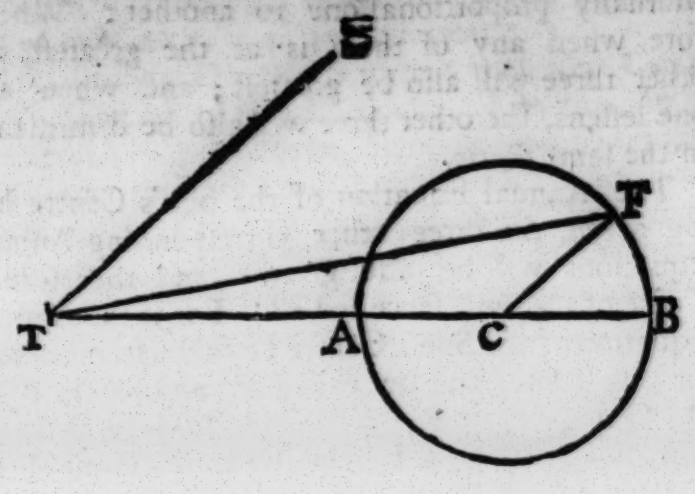
There is alſo an *Equation of the Moon's mean Motion*, depending on the Situation of her Apogee, in reſpect of the Sun; which is greateſt when the Moon's Apogee is in an Octant with the Sun, and is nothing at all when it is in the Quadratures or Syzygies. This Equation, when greateſt, and the Sun in *Perigæo*, is 3 min. 56 ſeconds. But if the Sun be *in Apogæo*, it will never be above 3 min. 34 ſeconds. At other Diſtances of the Sun from the Earth, this Equation, when greateſt, is reciprocally as the Cube of ſuch Diſtance. But when the Moon's Apogee is any where but in the *Octants*, this Equation grows leſs, and is moſtly at the ſame Diſtance between the Earth and Sun, as the Sine of the double Diſtance of the Moon's Apogee, from the next Quadrature or Syzygy, to the Radius.

This is to be added to the Moon's Motion, while her Apogee paſſes from a Quadrature with the Sun to a Syzygy; but this is to be ſubſtracted from it, while the Apogee moves from the Syzygy to the Quadrature.

There is moreover another *Equation of the Moon's Motion*, which depends on the Aſpect of the Nodes of the Moon's Orbit with the Sun: And this is greateſt, when her Nodes are in *Octants* to the Sun, and vaniſhes quite, when they come to their Quadratures or Syzygies. This Equation is proportional to the Sine of the double Diſtance of the Node from the next Syzygy, or Quadrature; and at greateſt, is but 47 ſeconds. This muſt be added to the Moon's mean Motion, while the Nodes are paſſing from their Syzygies with the Sun to their Quadratures with him; but ſubſtracted while they paſs from the Quadratures to the Syzygies.

From the Sun's true Place take the equated mean Motion of the Lunar Apogee, as was above ſhewed, the Remainder will be the Annual Argument of the ſaid Apogee. From whence the *Eccentricity of the Moon*, and the *ſecond Equation* of her Apogee may be compared after the manner following *(which takes place alſo in the Computation of any other Intermediate Equations.)*

For



Let T repreſent the Earth, T S a Right Line joining the Earth and Sun, T A C B a Right Line drawn from the Earth to the middle or mean Place of the Moon's Apogee, equated as above: Let the Angle S T A be the Annual Argument of the aforeſaid Apogee, T A the leaſt Eccentricity of the Moon's Orbit, T B the greateſt. Biſſect A B in C; and on the Centre C, with the Diſtance A C deſcribe a Circle A F B, and make the Angle B C F = to the double of the Annual Argument. Draw the Right Line T F, that ſhall be the Eccentricity of the Moon's Orbit; and the Angle B T F, is the ſecond Equation of the Moon's Apogee required.

In order to whoſe Determination, let the mean Diſtance of the Earth from the Moon, or the Semidiameter of the Moon's Orbit, be 1000000; then ſhall its greateſt Eccentricity T A be 66782 ſuch Parts; and the leaſt T A, 43319. So that the greateſt Equation of the Orbit, *viz.* when the Apogee is in the Syzygies, will be 7 deg. 39 min. 30 ſeconds, or perhaps 7 deg. 40 min. (for I ſuſpect there will be ſome Alteration according to the Poſition of the Apogee in *Cancer* or *Capricorn*). But when it is in Quadrate to the Sun, the greateſt Equation aforeſaid will be 4 deg. 57 min. 56 ſeconds; and the greateſt Equation of the Apogee 12 deg. 15 min. 4 ſeconds.

Having from theſe Principles made a Table of the Equation of the Moon's Apogee, and of the Eccentricities of her Orbit to each Degree of the Annual Argument, from whence the Eccentricity T F, and the Angle B T F (*viz.* the ſecond and principal Equation of the Apogee) may eaſily be had for any Time required; let the Equation thus found be added to the firſt Equated Place of the Moon's Apogee, if the Annual Argument be leſs than 90 Degrees, or greater than 180 Degrees, and leſs than 270; otherwiſe it muſt be ſubducted from it; and the Sum or Difference ſhall be the Place of the Lunar Apogee ſecondarily equated; which being taken from the Moon's Place equated a third time, ſhall leave the mean Anomaly of the Moon correſponding to any given Time. Moreover, from this mean Anomaly of the Moon, and the before-found Eccentricity of her Orbit, may be found (by means of a Table of Equations of the Moon's Centre made to every Degree of the mean Anomaly, and ſome Eccentricities, *viz.* 45000, 50000, 55000, 60000 and 65000) the *Proſtaphæreſis* or Equation of the Moon's Centre, as in the common way: And this being taken from the former Semi-circle of the middle Anomaly, and added in the latter to the Moon's Place thus thrice equated, will produce the Place of the Moon a fourth time equated.

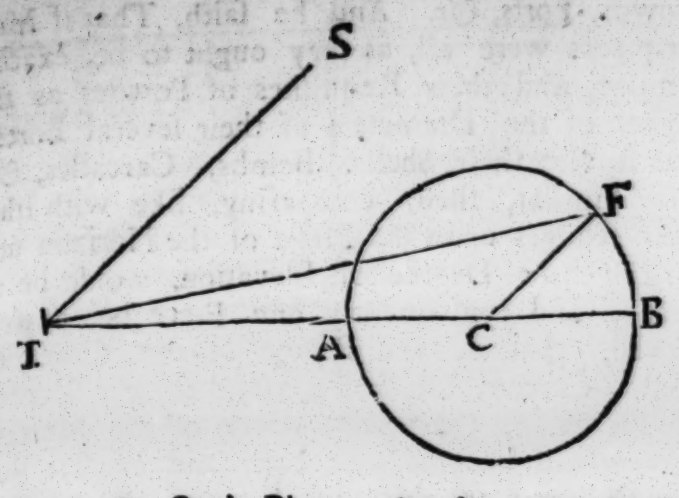
The greateſt Variation of the Moon (*viz.* that which happens when the Moon is in an Octant with the Sun) is nearly, reciprocally as the Cube of the Diſtance of the Sun from the Earth. Let that be taken 37 min. 25 ſeconds, when the Sun is *in Perigæo*, and 33 min. 40 ſeconds, when he is *in Apogæo*: and let the Differences of this Variation in the Octants be made reciprocally as the Cubes of the Diſtances of the Sun from the Earth; and ſo let a Table be made of the aforeſaid Variation of the Moon in her Octants (or its Logarithms) to every Tenth, Sixth or Fifth Diſtance of the mean Anomaly: and for the Variation out of the Octants, make, as Radius to the Sine of the double Diſtance of the Moon from the next Syzygy or Quadrature : : ſo let the afore-found Variation in the Octant be to the Variation congruous to any other Aſpect; and this added to the Moon's Place before-found in the firſt and third Quadrant (accounting from the Sun) or ſubducted from it in the ſecond and fourth, will give the Moon's Place equated a fifth time.

Again, as Radius to the Sine of the Sum of the Diſtances of the Moon from the Sun, and of her Apogee from the Sun's Apogee (or the Sine of the Exceſs of that Sum above 360 deg) : : ſo is 2 min. 10 ſeconds, to a ſixth Equation of the Moon's Place, which muſt be ſubtracted, if the aforeſaid Sum or Exceſs be leſs than a Semi-Circle, but added, if it be greater. Let it be made alſo, as Radius to the Sine of the Moon's Diſtance from the Sun : : ſo 2 deg. 20 ſeconds to a ſeventh Equation: which, when the Moon's Light is increaſing, add; but when decreaſing, ſubtract; and the Moon's Place will be equated a ſeventh time, and this is her Place *in her proper Orbit*.

Note here, The Equation thus produced by the mean Quantity 2 degrees 20 ſeconds, is not always of the ſame Magnitude, but is increaſed and diminiſhed according to the Poſition of the Lunar Apogee. For if the Moon's Apogee be in Conjunction with the Sun's, the aforeſaid Equation is about 54 ſeconds greater: But when the Apogees are in Oppoſition, 'tis about as much leſs; and it librates between its greateſt Quantity 3 minutes 14 ſeconds, and its leaſt 1 minute 26 ſeconds. And this is when the Lunar Apogee is in Conjunction or Oppoſition with the Sun's: But in the Quadratures, the aforeſaid Equation is to be leſſen'd about 50 ſeconds, or one minute, when the Apogees of the Sun and Moon are in Conjunction; but if they are in Oppoſition, for want of a ſufficient Number of Obſervations, I cannot determine whether it is to be leſſen'd or increas'd. And even as to the Augment or Decrement of the Equation, 2 minutes 20 ſeconds above mentioned, I dare determine nothing certain, for the ſame Reaſon, *viz.* the want of Obſervation accurately made.

If the ſixth and ſeventh Equations are augmented or diminiſhed in a reciprocal *Ratio* of the Diſtance of the Moon from the Earth, *i. e.* in a direct *Ratio* of the Moon's Horizontal Parallax; they will become more accurate: And this may readily be done, if Tables are firſt made to each Minute of the ſaid Parallax, and to every ſixth or fifth Degree of the Augment of the ſixth Equation for the ſixth, as of the Diſtance of the Moon from the Sun, for the ſeventh Equation.

From



From the Sun's Place, take the mean Motion of the Moon's aſcending Node, equated as above; the Remainder ſhall be the Annual Argument of the Node, whence its ſecond Equation may be computed after the following manner in the preceding Figure.

Let T, as before, repreſent the Earth; T S a Right Line conjoining the Earth and Sun: Let alſo the Line T A C B, be drawn to the Place of the Aſcending Node of the Moon, as above equated; and let S T A be the Annual Argument of the Node. Take T A from a Scale, and let it be to A B :: as 56 to 3, or as 11 $\frac{2}{3}$ to 1. Then biſſect B A in C, and on C as a Centre, with the Diſtance C A, deſcribe a Circle as A F B, and make the Angle B C F, equal to double the Annual Argument of the Node before found: So ſhall the Angle B T F, be the ſecond Equation of the Aſcending Node: Which muſt be added when the Node is paſſing from the Quadrature to a Syzygy with the Sun, and ſubducted when the Node moves from a Syzygy towards a Quadrature. By which means the true Place of the Node of the Lunar Orbit will be gained: Whence from Tables made after the common way, the *Moon's Latitude, and the Reduction of her Orbit to the Ecliptick*, may be computed, ſuppoſing the Inclination of the Moon's Orbit to the Ecliptick, to be 4 deg. 59 min. 35 ſeconds, when the Nodes are in Quadrature with the Sun; and 5 deg. 17 min. 20 ſeconds, when they are in the Syzygies.

And from the Longitude and Latitude thus found, and the given Obliquity of the Ecliptick, 23 degrees 29 minutes, to the Right Aſcenſion and Declination of the Moon will be found.

The Horizontal Parallax of the Moon, when ſhe is in the Syzygies at a mean Diſtance from the Earth, I make to be 57 min. 30 ſeconds, and her Horary Motion 33 min. 32 ſeconds, 32 thirds; and her apparent Diameter 31 min. 30 ſeconds. But in her Quadratures, at a mean Diſtance from the Earth, I make the Horizontal Parallax of the Moon to be 59 min. 40 ſeconds, her Horary Motion 32 min. 12 ſeconds, 2 thirds, and her apparent Diameter 31 min. 3 ſeconds. The Moon in an Octant to the Sun, and at a mean Diſtance, hath her Centre diſtant from the Centre of the Earth about 60 $\frac{1}{2}$. of the Earth's Semidiameters.

The Sun's Horizontal Parallax I make to be 10 ſeconds, and its apparent Diameter at a mean Diſtance from the Earth, I make 32 minutes, 15 ſeconds.

The Atmoſphere of the Earth, by diſperſing and refracting the Sun's Light, caſts a Shadow as if it were an Opake Body, at leaſt to the height of 40 or 50 Geographical Miles (by a Geographical Mile, I mean the ſixtieth part of a Degree of a great Circle, on the Earth's Surface.) This Shadow falling upon the Moon in a Lunar Eclipſe, makes the Earth's Shadow be the larger or broader. And to each Mile of the Earth's Atmoſphere, is correſpondent a Second in the Moon's Disk, ſo that the Semi-diameter of the Earth's Shadow projected upon the Disk of the Moon, is to be encreaſed about 50 ſeconds: Or which is all one, in a Lunar Eclipſe, the Horizontal Parallax of the Moon is to be encreaſed in the Ratio of about 70 to 69.

Thus far the Theory of this Incomparable Mathematician. And if we had many Places of the Moon accurately obſerved, eſpecially about her Quadratures, and theſe well compared with her Places at the ſame time calculated according to this Theory; it would then appear whether there yet remain any other ſenſible Equations, which, when accounted for, might ſerve to improve and enlarge this Theory.

Dr. *Greg. Aſtr. Elem. Phyſ. & Geom. pag.* 336.

MOOR at Sea, ſignifies the laying out the Anchors of a Ship ſo, as is beſt and ſafeſt for her Riding. There are ſeveral ways of *Mooring* a Ship. Sometimes they *Moor her a Thwart*, by laying one Anchor on one ſide of a River, and another right againſt it on the other ſide; in order to make both the Cables bear together, as well at Tide of Ebb, as at Flood.

To Moor Alongſt, is to lay one Anchor right in the middle of the Stream, and another right a head of the Ship, which is done when they are in danger of driving aſhoar; for by this Means both her Anchors do bear together, and ſo will ſave her from falling on either Shore.

To Moor Water-ſhot, is to Moor a Ship in the middle between the two former ways, quartering as it were, neither acroſs the Tide, nor alongſt it, but between both. When a Ship comes into a Place of Riding, the Maſter and his Mates obſerve on what Point of the Compaſs the Wind is likelieſt to endanger the Ship, and there they lay out an Anchor; and this is called *Mooring for Eaſt, North*, &c. according to the Point ſhe is Moored upon. They don't ſay a Ship is *Moored*, unleſs ſhe have at leaſt two Anchor's out; except in one Caſe, and that is, when, tho' ſhe have but one Anchor out, yet there is a Hawſer aſhoar; and then they ſay ſhe is Moored with her Head to the Shoar.

MOORSHEAD, is the Head of a Copper, or Glaſs-Still, or Alembick, which is luted on to the Body, or Cucurbit; and hath a Beak, Noſe, or Pipe, to let the raiſed Spirit run down into the Receiver.

MOOT, is a Term well underſtood in the Inns of Court, to be that Exerciſe or Arguing of Caſes, which young Students perform at appointed times, the better to enable them for Practice, and Defence of Clients Cauſes. In the Inns of Court, there is a *Bayliff*, or *Surveyor of the Inns*, yearly choſen by the Bench, to appoint the *Mootmen* for the Inns of *Chancery*, and to keep account of Performance of Exerciſes, both there and in the Houſe.

MOOT-MEN, are thoſe that argue Reader's Caſes (or Moot-Caſes) in the Houſes of *Chancery*, both in Term-time, and alſo in Vacations.

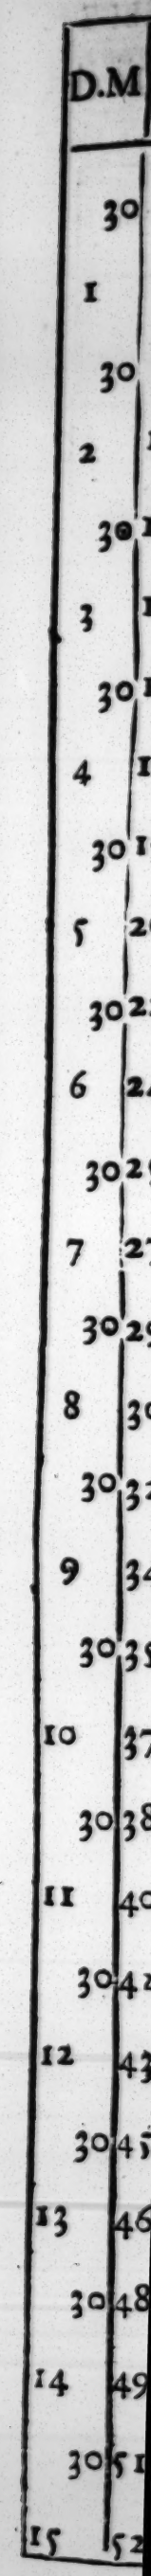
MORAL *Quantity*. See *Quantity*.

MORATUR or *Demoratur in Lege*, ſignifies as much as *He demurs*, becauſe the Party goes not forward in Pleading, but reſts upon the Judgment of the Court in the Point, who deliberate, and take time to argue and adviſe thereupon.

MORBUS *Regius*, the ſame that *Iterus*.

MORTAR-PIECE, is a kind of very ſhort piece of Cannon, or Ordnance, thick and wide, proper for the diſcharging of Bombs, Carcaſſes, Stones, *&c.* It is uſually mounted on a Carriage, the Wheels whereof are very low. Mr. *Anderſon*, in his Book of the Gun, ſaith, That 70 or 80 Degrees of Elevation, is the beſt for rendring Mortars ſerviceable, to caſt Shells into Towns, Forts, *&c.* And he ſaith, That if Mortar-pieces were all, as they ought to be, exactly Similar, and their Requiſites of Powder as the Cubes of the Diameters of their ſeveral Bores; and if alſo their Shells, Bombs, Carcaſſes, *&c.* were Similar, then, comparing, like with like, their Ranges upon the Plane of the Horizon under the ſame Degree of Elevation, would be equal; and conſequently one Piece being well proved, that is, the Range of the Granado, Bomb, Carcaſs, *&c.* being found to any Degree of Elevation, the whole Work of the Mortar-piece would become very eaſie and exact: But ſince Mortars are not thus Similar, there is required the Range of the Piece at any convenient degree of Elevation, with its requiſite of Powder; and then you muſt work by the Tables.

A TABLE



A TABLE of Horizontal DISTANCES.

The Uſe of which Table of Horizontal Diſtances, *is this, in* Anderſon's *Words.*

I. Any degree of Elevation under 45 degrees, being given; What degree above 45 degrees, will hit the ſame Horizontal Diſtance? Suppoſe 12 degrees: I look againſt 12 in the Table, and find 4361, which I look for beyond 45 degrees, and find it againſt 76 degrees 57 minutes. So I conclude, a Piece charged with the ſame quantity of the ſame Powder, and the ſame Ball put to either 12 degrees, or 76 degrees 57 minutes of Elevation, will range the Shot to the ſame Horizontal Diſtance.

Here Note, Suppoſe a Piece be charged with 1, 2, 3, and 4 Parts of Powder, and the ſame Ball, and put to thoſe degrees of Elevation, if the upper and lower Ranges be equal, there is no ſenſible Reſiſtance of the Medium.

II. *June* the 5th. 1677. on *Wimbleton-Heath*, I charged the Mortar-piece with 4 Ounces of Powder, and put it to 15 degrees of Elevation; it ranged the Ball to the Horizontal Diſtance of 659 Paces; with that, I would hit a Mark with the ſame Piece, Ball, and quantity of Powder, at the Horizontal Diſtance of 1000 Paces: Then as 659 is to 1000, ſo is 5261 the Tabular Number of 15 degrees to 7983, which gives in the Table 25 degrees 47 minutes, and 63 degrees 16 minutes, to hit a Mark at the Horizontal Diſtance of 1000 Paces.

III. *Feb.* the 12th. $167\frac{7}{8}$. on *Wimbleton-Heath*, a Piece whoſe Length of its Chaſe is 18 Inches, and Diameter of Bore 3 Inches, charged with 8 Ounces of Powder, and laid to 10 degrees of Elevation, ranged its Shot to the Horizontal Diſtance of 805 Paces: With that I would hit a Mark at the Horizontal Diſtance of 2112 Paces; that is, 2 *Engliſh* Miles. Then as 805 is to 2112, ſo is 3734, the Tabular Number at 10 degrees, to 9797, which gives in the Table 38 degrees 41 minutes, and 50 degrees 25 minutes, to hit a Mark at the Horizontal Diſtance of 2112 Paces, *viz.* 2 *Engliſh* Miles.

N. B. Since this, our Excellent Mathematical Inſtrument-maker, Mr. *John Rowley*, (whoſe Shop is by St. *Dunſtan*'s Church in *Fleet-ſtreet*) hath contrived this Table on a Scale of Box, where, by ſliding only a fiducial Edge of Braſs over the Diagonals of the Diſtance required, both the Elevations, upper and lower, are ſhewn at the ſame time.

Mr. *Anderſon* gives us alſo the following TABLE *of the Requiſite Weight of Powder for all Mortars, from 6 to 20 Inches Diameter.*

The Uſe of this TABLE *is Plain and Eaſie.*

If you would know the Quantity of Powder requiſite to load a Mortar of 15 Inches Diameter; againſt 15 Inches you have 13 Pounds 3 Ounces, and that is the true Weight of Powder required.

MORTGAGE, in Law, ſignifies a Pawn of Land, or Tenements, or any thing moveable, laid or bound for Money borrowed, to be the Creditors for ever, if the Money be not paid at the Day agreed upon: And the Creditor holding Land, or Tenement upon this Bargain, is called Tenant in Mortgage. He that pledgeth this Pawn or Gage, is called the Mortgager, and he that taketh it, the Mortgagee.

MORTIFY. The Chymiſts ſay a Thing is Mortify'd, when its outward Form is altered or deſtroyed, as particularly when *Mercury*, or any other Metal is diſſolved in an *Acid Menſtruum*. Sometimes they ſay alſo, that Spirits are Mortified, when they are mix'd with ſuch Things as deſtroy their Strength, and hinder their Operation.

MORT-

MORTMAINE, a Term in Law, ſignifying an Alienation of Lands and Tenements to any Guild, Corporation, or Fraternity, their Succeſſors, as Biſhops, Parſons, Vicars, &c. which may not be done without the King's Licence, and the Lord of the Manor, or of the King alone, if it be immediately holden of him.

MORTUARY, is a Gift left by a Man at his Death, to his Pariſh-Church, for the recompence of his Perſonal Tythes and Offerings, not duly paid in his Life-time. A *Mortuary* is not properly and originally due to an Eccleſiaſtical Incumbent from any, but thoſe only of his own Pariſh. But by Cuſtom in ſome Places of this Kingdom, they are paid to the Parſons of other Pariſhes, as the Corps paſſes through them.

MOSAICK *Work*, was anciently uſed only in Pavements, and began in *Rome* about *Sylla*'s time; who made a Pavement of *Moſaick* Work at *Preneſte* in the Temple of *Fortune*, about 170 Years before Chriſt. It was called *Lithoſtrcton*, in *Greek* only a Stone Pavement; but it is underſtood of Figures made or repreſented by inlaying of ſmall Stones, or rather pieces of Stone of different Colours; by the variety of which, many Curious Figures may be wrought. Afterward it came to be in Faſhion for the Inſides of the Walls of Rooms; and now adays they work it with Shells, or ſmall Pieces of Glaſs variouſly Colour'd and Figured: 'Tis a very pleaſant and a laſting Ornament, when 'tis curiouſly and excellently done.

MOTHER *Tongues*, in *Latin*, *Matrices Linguæ*, are ſuch Languages as ſeem to have no Dependance upon, Derivation from, or Affinity with one another. 'Tis a Conjecture commonly received, That at the Confuſion of Languages at the Tower of *Babel*, there were formed 70, or 72 ſeverally diſtinct Languages: But Biſhop *Wilkins* thinks 'tis probable there were not ſo many, and that at the firſt Diſperſion, Men did not divide into ſo many Colonies. But now the Languages uſed in the World, do far exceed that Number: If you will believe *Pliny* and *Strabo*, there was a Town in *Colchos* called *Dioſcuria*, to which Men of three hundred Nations, and as many ſeveral Languages, did reſort for Trading. Some of the *American* Hiſtorians relate, That in every 80 Miles of that vaſt Country, and alſo in almoſt every particular Valley of *Peru*, the Inhabitants had a diſtinct Language or Mother-Tongue by themſelves. And *Purchas* tells us, *Pilgr.* Lib. 8. Sect. 4. Cap. 1. That by Converſe and Enquiry, in the Northern Parts of *America*, about *Florida*, he found more than 1000 different Languages amongſt the Inhabitants of thoſe Places.

Joſeph Scaliger affirms there are no more than Eleven Mother-Tongues uſed in *Europe*; of which Four are of more general and large Extent, and the other Seven of a narrower Compaſs and Uſe.

1. The *Greek*, which was anciently of very great Extent, not only in *Europe*, but in *Aſia* and *Africk* too, where ſeveral Colonies of that Nation were planted; by which Diſperſion, and Mixture with other People, it did degenerate into ſeveral *Dialects*. Beſides thoſe Four that are commonly noted, the *Doric*, *Ionic*, *Æolic*, *Attic*, *Herodotus* doth mention Four ſeveral Dialects of the *Ionic*. The Inhabitants of *Rhodes*, *Cyprus*, *Crete* had each of them ſome Peculiarity in their Language: And the preſent *Coptic* or *Ægyptian* ſeems, both from the *Words* and the *Character*, to be a Branch of this Family, and was probably ſpread amongſt that People in the Days of *Alexander the Great*, upon his conquering of them; tho' ſome conceive that there were at leaſt 30000 Families of *Greeks* planted in that Country long before his Time.

2. The *Latin*, tho' this be much of it a Derivation from the *Greek*, (of which the now *French*, *Spaniſh*, and *Italian*, are ſeveral Off-ſprings and Derivations) had anciently Four ſeveral Dialects, as *Petrus Crinitus* ſhews out of *Varro*.

3. The *Teutonic* or *German*, is now diſtinguiſhed into *Upper* and *Lower*. The *Upper* hath two notable Dialects: 1. The *Daniſh*, *Scandian*, or perhaps the *Gothic*; to which belongs the Language uſed in *Denmark*, *Norway*, *Swedeland*, and *Iſland*. 2. The *Saxon*, to which appertain the ſeveral Languages of the *Engliſh*, the *Scotch*, the *Friſians*, and thoſe on the North of *Elve*.

4. The *Sclavonic* is extended, tho' with ſome Variation, through many large Territories, *Muſcovia*, *Poland*, *Bohemia*, *Vandalia*, *Croatia*, *Lithuania*, *Dalmatia*; and is ſaid to be the Vulgar Language uſed amongſt Sixty ſeveral Nations.

The Languages of leſſer Extent, are,

1. The *Albaneſe*, or Old *Epirotic*, now uſed in the Mountainous Parts of *Epirus*.

2. The *Europæan Tartar*, or *Scythian*, from which ſome conceive our *Iriſh* to have had its Original.

As for the *Turkiſh* Tongue, that is originally no other but the *Aſiatick Tartar* mixed with *Armenian* and *Perſian*, ſome *Greek*, and much *Arabic*.

3. The *Hungarian*, uſed in the greateſt Part of that Kingdom.

4. The *Finnic* uſed in *Finland* and *Lapland*.

5. The *Cantabrian*, uſed amongſt the *Biſcainers* who live near the Ocean on the *Pyrene* Hills, bordering both upon *France* and *Spain*.

6. The *Iriſh*, in *Ireland*, and from thence brought over into ſome Parts of *Scotland*; tho' Mr. *Camden* would have this to be a Derivation from the *Welſh*.

7. The Old *Gauliſh* or *Britiſh*, which is yet preſerved in *Wales*, *Cornwal*, and *Britain* in *France*.

To this Number Mr. *Brerewood* doth add Four others, *viz.*

1. The *Arabick*, now uſed in the ſteep Mountains of *Granata*; which yet is a Dialect from the *Hebrew*, and not a Mother-Tongue.

2. The *Cauchian*, in *Eaſt-Frieſland*.

3. The *Illyrian*, in the Iſle of *Veggia*.

4. The *Jazygian*, on the North-ſide of *Hungary*.

MOTION, is a continual and ſucceſſive Mutation or Change of Place. All Motion may be conſider'd either *Abſolutely* or *Relatively*. *Abſolute Motion* is the Change of the *Locus Abſolutus* of any moving Body, and therefore its Celerity will be meaſured by the Quantity of the *Abſolute Space*, which the Moveable hath run through. But *Relative Motion* is a Mutation of the *Relative* or *Vulgar Place* of the moving Body, and ſo hath its Celerity accounted or meaſured by the Quantity of *Relative Space* which the Moveable runs over.

All Motion is of it ſelf rectilinear, or made according to ſtrait Lines, with the ſame conſtant uniform Velocity, if no external Cauſe make any Alteration in its Direction.

If a Body, moving uniformly, and with the ſame Degree of Velocity, paſs over two Spaces, the Times of the Motions will be as the Spaces; as is very plain to him that will conſider it.

If a Body move through two Spaces in equal Times, thoſe Spaces will be to one another as the Velocities of the Motions.

If two Bodies move uniformly, but with unequal Velocities, through the ſame Space, the Times will be as the Velocities.

If two Bodies, moving uniformly, go with unequal Velocities, the Spaces which will be paſt over by them in unequal Times, will be to one another in a Ratio compounded of that of the Velocities and that of the Times. *Galilæus, de Motu Local. Dial.* 3. *Giorn. terza.*

If any Bodies are impelled upwards by different Forces, they will be raiſed to different Heights; which Heights will be to one another as the Squares of their Velocities.

And if Bodies fall from different Altitudes, the Celerities will be to one another as the Squares of ſuch Altitudes.

MOTION; *Its Laws.*

The Incomparable Sir *Iſaac Newton* gives but theſe Three Laws of Motion, which may be truly called *Laws of Nature.*

1. That every Body will continue in its State, either of Reſt, or Motion uniformly forward in a Right Line, unleſs it be made to change that State by ſome Force impreſſed upon it.

2. That the Change of Motion is proportionable to the moving Force impreſſed; and is always according to the Direction of that Right Line in which the Force is impreſſed.

3. That *Reaction* is always equal and contrary to Action; or, which is all one, the mutual Actions of two Bodies one upon another are equal, and directed towards contrary Parts: As when one Body preſſes and draws another, 'tis as much preſſed or drawn by that Body.

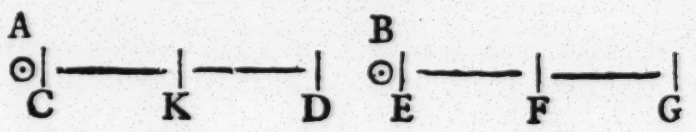
The Quantity of any Motion is diſcoverable by the joint Conſideration of the Quantity of Matter in, and the Velocity of the moving Body: For the Motion of any Whole, is the Sum of the Motions of all the Parts. And conſequently if a Body be twice as great as another, and be moved with an equal Degree of Velocity, the Quantity of the Motion is *double* in the Former; but if the Velocity be alſo double, then the Quantity of the Motion is *Quadruple* of that of the latter. *Newton's Princip.*

The Quantity of Motion, which is found by taking either the Sum of Motions made the ſame way, or the Difference of thoſe which are made contrary ways, is not at all changed by the Action of Bodies one upon another. For Action and Reaction are always equal, (by *Law* 3.) wherefore (by *Law* 2.) they muſt needs produce equal Changes in the Motions towards contrary Parts: Wherefore, if the Motions be both according to the ſame Direction, whatſoever is added to the Body to be moved, or which is forced to give place, is ſubducted from the Body which moves, or drives away the other; ſo that the Sum remains the ſame as before. But if the Bodies meet with contrary Directions, there muſt be an equal Subſtraction of the Motion of each, and conſequently the *Difference* of the Motions made towards the contrary parts, will remain the ſame. Suppoſe the Spherical Body A to be thrice as big as B, and of the like Figure. Let A have two Degrees of Velocity, and B purſue it with ten Degrees of Velocity: Wherefore the Quantity of the Motion of A to B, is as 6 to 10; therefore the Sum of the Motions of both is 16. Suppoſe then B to overtake A, and to give it 3, 4, or 5 Degrees of Velocity; 'tis plain it muſt loſe juſt as much it ſelf: Wherefore A will go on with 9, 10, 11 Parts of Velocity; and B will follow after with 7, 6, or 5. So that the Sum will ſtill be 16; and thus will it always be. *Idem.*

Mr. *Keil*, in his *Lectiones Phyſicæ*, proves this diſtinctly, by branching of it into two Theorems. See *p.* 127.

Which THEOREMS are theſe.

I. *If one Body ſtrike againſt another, whether at reſt, or moving more ſlowly, according to the ſame Direction with the Former; then will the Sum of the Motion in both Bodies towards the ſame Parts, remain the very ſame as before ſuch ſtriking one againſt another.*



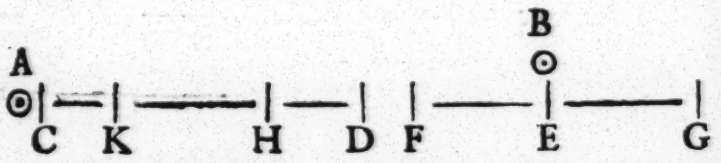
Let the Body A move according to the Direction C D, and in its way ſtrike againſt the Body B; which ſuppoſe to be either at reſt, or moving on more ſlowly than A, and according to the ſame Direction with it: I ſay, the Sum of the Motions in both Bodies, towards the ſame Parts, that is from C towards D, will be the ſame as before. Let C D expreſs the Motion of A from C to D; and if B be in Motion too, let E F expreſs its Motion the ſame way. Then will the Sum of both Motions be expreſſed by C D + E F. But becauſe Action and Reaction are always equal, and towards Contrary Parts; if F G expreſs the Motion impreſſed on B by the Stroak of A; D K, equal to it, muſt expreſs the Motion impreſſed on A by the Stroak of B, with a contrary Direction from D towards C. Wherefore ſince D K = F G, C K will expreſs the Motion of the Body A after the Shock, and E G the Motion of B; and therefore the Sum of

of both will be C K + E G. But ſince F G is ſuppoſed = K D, if you add C K and E F to both, E G + C K muſt be equal to C D + E F. Wherefore the Sum of the Motions of both is the ſame as at firſt.

And if F G be equal to C D, the Points K and C muſt be coincident; that is, C K will be = 0, and conſequently the Body A, after the Occurſe or Shock, will be quite at reſt. But if F G be greater than C D, the Point K muſt be found ſomewhere beyond or to the Left Hand of C; and the Motion of A will become changed towards the contrary Parts, and the Sum of the Motions towards G will be as E G — C K: And becauſe F G = C K, add to both E F — C K, and it will be that E F + F G — C K, (*i. e.*) E G — C K = E F + D K — C K, (*i. e.*) E F + C D. From whence 'tis plain that the Sum of the Motions towards the ſame Parts (which in this Caſe is their Difference towards contrary Parts) continues the ſame after the Shock as before.

COR. After the ſame manner it will appear, if *many Bodies*, moving with the ſame Direction, ſhould ſtrike againſt one another, the Sum of their Motion, after that, will be the ſame as before.

II. *If Two Bodies move towards each other with exactly contrary Directions, the Sum of their Motions towards the ſame Parts (which is all one as the Difference of them towards contrary Parts) will continue the ſame after the Shock as before it.*



Let the Body A move from C towards D, and let C D expreſs its Line of Motion; and let the Body B be moving at the ſame time with a quite contrary Direction from E to F, and let E F expreſs its Motion. Let D H be ſuppoſed equal to E F; ſo ſhall C H, which is the Difference of their Motion towards contrary Parts, expreſs the Sum of the Motions made towards G. I ſay then, that the ſame C H is the Sum of their Motions towards G, as well after the Shock as before it: For after the Shock, ſuppoſe the Motion of B to be changed, and to be now towards G, and let the Line E G repreſent it; wherefore the Force impreſſed upon B after the Shock, and which carries it towards G, will be equal to the Sum of the Motions E F and G F, and conſequently be expreſſed by F G: For in that Right Line, the Motion E F, towards F, is deſtroyed; and the new one, E G, towards G, produced. But now ſince the impulſive Force in both Bodies acts equally towards contrary Parts, if D K be made equal to F G, this ſhall repreſent the Force impreſſed on the Body A, and carry it in a contrary Direction to its former Motion: So that if the Line of Motion D K, be taken from the Line C D, there will remain C K repreſenting the true Motion of A towards G. But becauſe D K = F G, and D H = F E; D K — D H (*i. e.* K H) = F G — F E (*i. e.*) E G: And conſequently ſince K H = E G, K H will repreſent the Motion of the Body B, after the Shock; but C K repreſents the Motion of A after it: Wherefore C A is the Sum of the Motion in both Bodies towards G.

If F G had been equal to C D, then the Points, K and C would be coincident, and the Motion of A will be quite deſtroyed, (*i. e.*) after the Shock A will be perfectly at reſt, and C A will be equal to E G.

But if F G be greater than C D, the Point K will fall to the Left Hand of C, and the Motion of the Body A will be from C towards K. But (becauſe F G = D K, and F E = D H) K H = E G; wherefore taking C K from both, C H muſt be equal to E G — C K; which repreſents the Sum of the Motions made towards the ſame Parts, and their Difference towards contrary ones after the Shock: Wherefore the Sum of the Motions towards the ſame Parts remains the ſame after, as before the Shock.

Our Excellent Mathematician Dr. Wallis, *in a Letter to the Famous Mr.* Oldenburgh, *Secretary of the* Royal Society, *gives the following Short Account of the* Laws of Motion, Nov. 26. 1688. *And intimated, that they were made Publick Eight Months before, at the Meeting of the* Royal Society.

1. If any Agent, as A, produce any Effect, as E; then an Agent, as 2 A, will produce an Effect, as 2 E; 3 A, as 3 E, *&c. cæteris paribus.* And univerſally, if *m* be put for the Exponent of the Power, *m* A, as *m* E.

2. Wherefore if any Force, as V (which ſtands for *Vis*) move any Weight, Maſs, or Body, as P; the Force, which is as *m* V, ſhall move *m* P, *cæteris paribus*; *viz.* with the ſame Celerity, or through the ſame Space in the ſame Time.

3. If the Force in the given Time T, move any Weight thro' the Space or Length L, in the Time *n* T, it ſhall move it thro' the Space *n* L.

4. Wherefore if the Force V, in the Time T, move any Weight, as P thro' the Length or Space L, the Force *m* V in the Time *n* T, ſhall move *m* P thro' the Space *n* L: And conſequently as V T, (the Rectangle under the Force and Time) is to P L the Rectangle under the Weight and Diſtance:: So is *m n* V T, to *m n* P L.

5. Since the Degrees of Celerity are proportionable to the Lengths run over in the ſame Time, or, (which is the ſame thing) are proportionable to the Times taken up in paſſing over ſuch Lengths: Therefore it will be, as $\frac{L}{T}$. C :: $\frac{m}{n}\frac{L}{T}\cdot\frac{m}{n}$C. That is, the Degrees of Celerity will be in a *Ratio* compounded directly of the Lengths, and Reciprocally of the Times.

6. Since as V T. P L :: *m n* V T to *m n* P L, it will be as V. $\frac{P L}{T}$ :: *m* V. $\frac{m n P L}{n T}$. That is,

V. P C

V. P C : : m V. m P C = m P x by C ; or = P x by m C.

7. That is, if the Force V be able to move the Weight P, according to the Celerity C ; then will the Force m V, move the ſame Weight P, in the Celerity m C ; or with the bare Celerity C, the Weight m P : Or, in one word, it will be able to move any Weight with that Celerity, if the Product of the Weight multiplied by the Celerity, be m P C.

8. And on this depends the Reaſon of the Conſtruction of all manner of Engines and Machines, for facilitating of Motion, *viz.* That in whatever Proportion the Weight be encreaſed, the Celerity be decreaſed accordingly : From whence it comes that the Product of the Celerity multiplied by the Weight, for moving the ſame Force, is always the ſame, *viz.* V : P C : : N. m P + $\frac{1}{m}$ C : That is, P C.

9. If the Weight P, by the Force V, carried according to the Celerity C, ſtrike directly againſt the Weight m P ; which, tho' ſuppoſed at reſt, yet is capable of being moved ; both the Bodies after the ſtroak, will be carried with the Celerity $\frac{1 + m}{1}$ C. For, by reaſon the ſame Force is impelled to move the greater Body, the Celerity of it will be leſſened after the ſame *Ratio, viz.* V : P C : : V : $\frac{1 + m}{1}$ P x $\frac{1}{1 + m}$ C = P C. And therefore the Impetus, (or Product of the Weight multiplied by the Celerity) of the other will be $\frac{1}{1 + m}$ P C ; and of the Remaining one $\frac{1}{1 + m}$ m P C.

10. If againſt the Weight P, moved by the Force V, with the Celerity C, another Weight or Body ſhall ſtrike directly, moving the ſame way, but with greater Celerity : As ſuppoſe the Weight m P, with the Celerity n C, (which therefore will be carried forward with the Force m n V :) After this, they will both move forward with the Celerity $\frac{1 + m n}{1 + m}$ C.

For, V : P C : : m n V. m n P C : : V + m n V $\left(\frac{1 + m n \text{ V.}}{1}\right)$ $\frac{1 + m n}{1}$ P C : which is equal to $\frac{1 + m}{1}$ P x by $\frac{1 + m n}{1 + m}$ C.

And therefore the Impetus of the Preceeding Body will be $\frac{1 + m n}{1 + m}$ P C : and of the following, $\frac{1 + m n}{1 + m}$ m P C.

11. If the Weights or Bodies are carried contrary ways, they will meet, and mutually ſtrike againſt each other.

Suppoſe the Weight P, carried by the Force V, with the Celerity C, towards the Right Hand ; and the Weight m P with the Celerity n C, (and conſequently carried by the Force m n V) toward the Left Hand : Then may the Impetus, Direction, and Celerity of each be thus calculated.

The Body which moved towards the Right Hand, if the other had been at reſt, would have given it the Celerity $\frac{1}{1 + m}$ C, (by the 9th ;) and conſequently the Impetus $\frac{1}{1 + m}$ m C P, of moving to the Right Hand ; and would have retained to it ſelf the ſame Celerity, and the Impetus $\frac{1}{1 + m}$ m P C, alſo towards the Right Hand. And the other Body, carried toward the Left Hand, would, if the former had been at reſt, have given it the Celerity $\frac{m n}{1 + m}$ C ; and therefore the Impetus $\frac{m n}{1 + m}$ m P C, towards the Left Hand, by the ſame Reaſon ; and it would have retained to its ſelf the ſame Celerity, and therefore the Impetus $\frac{m n}{1 + m}$ m P C alſo toward the Left Hand.

Wherefore ſince the Motion was made both ways, the Aggregate of the Impetus of the former Body, will ariſe out of the Impetus $\frac{1}{1 + m}$ P C to the Right, and $\frac{m n}{1 + m}$ P C to the Left : And therefore in reality, it will move either to the Right or Left, according as that or this is greater, and by an Impetus, which is the Difference between thoſe 2 Impetus's. That is, Suppoſing + to ſignifie to the Right Hand, and — to the Left, the Impetus will be $\frac{1}{1 + m}$ P C — $\frac{m n}{1 + m}$ P C, which is equal to $\frac{1 - m n}{1 + m}$ P. And the Celerity will be $\frac{1 - m n}{1 + m}$ C, (and towards the Right or Left Hand, according as 1 or m n is the greater Quantity.)

And in like manner the Impetus of the other Body, which firſt moved towards the Left Hand, will be $\frac{1}{1 + m}$ m P C — $\frac{m n}{1 + m}$ m P C = to $\frac{m n}{1 + m}$ m P C. And the Celerity will be $\frac{1 - m n}{1 + m}$ C, and the Direction to the Right or Left Hand, according as 1, or m n, is the greater Quantity.

12. But if the Bodies neither move on in the ſame way directly, nor directly contrary to one another, but do encounter one another Obliquely ; then the preceeding Calculus muſt be moderated, according to the Meaſure of that Obliquity : And the Impetus of the Body ſtriking Obliquely, is to the Impetus it would have had, if it had gone directly : : as the Radius to the Secant of the Angle of the Obliquity.

Which Conſideration duly applied to the former Calculus, will determine with what Impetus, Celerity, and Direction, the Obliquely encountring Bodies ſhall move afterward.

And there is the very ſame *Ratio* of the Gravitation of heavy Bodies, which deſcend Obliquely

ly to their Gravitation, ſuppoſing them to have deſcended perpendicularly; as we elſewhere demonſtrate.

13. If the Bodies, which thus encounter or ſtrike one againſt another, are not infinitely hard (as hath hitherto been ſuppoſed) but do yield ſomething to the Stroke, but yet ſo as that by a Spring, or Elaſtick Force, they can recover their Figure or Poſition again: It may happen from hence, that thoſe Bodies may rebound back from one another mutually, which otherwiſe would have moved on together; (and this more or leſs, according to the Quantity of the Elaſticity) *viz.* if the Elaſtick Force exceed the Progreſſive.

In Motions which are accelerated and retarded, the Impetus in each Moment is to be eſteemed that which agrees to the degree of Celerity then acquired. But when the Motion is made in a Curve Line, that is to be accounted the Line of Direction of the Motion in each Moment, which is truly the Tangent to the Curve in that Point. And if when the Motion, being either accelerated or retarded, is made in a Curve Line (as in the Vibrations of a Pendulum) the Impetus is to be eſtimated in each Point, according to both the Degree of Acceleration, and the Obliquity of the Tangent there. *Philoſoph. Tranſact. N.* 40.

An Account of the Laws of Motion, in Bodies ſtriking one againſt another, you have alſo from the famous Mr. *Hugens*, in *Philoſ. Tranſact. N.* 46.

Mr. John Keil, *late of* Baliol-College *in* Oxon, *in his* Book *called*, Introductio ad veram Phyſicam, *gives the following* Theorems *about the Quantity of* Motion, *and the Spaces paſſed over by the* Moving Body, *and which he there plainly demonſtrates.*

1. In comparing the Motions of Bodies, if the Quantity of Matter be the ſame, the Moments, or Quantities of Motion, will always be as the Velocities, and *vice verſa*, if the Moments are as the Velocities, the Quantity of Matter in the Moving Bodies, is always the ſame.

2. If the Celerities are equal, the Moments, or Quantities of Motion, will be as the Qaantities of Matter; or if the Moving Bodies are Homogeneous, as their Magnitudes.

And if the Moments are as the Quantities of Matter, the Velocities will be equal.

3. In comparing the Motions of any Bodies, the *Ratio* of the Moments is compounded of the *Ratio*'s of the Quantities of Matter, and the Celerities. See the Word *Moment*.

4. In comparing the Motions of any Moving Bodies, the *Ratio* of the Celerities is compounded of the *Ratio* of their Moments directly, and of their Quantity of Matter reciprocally.

5. If the Celerities of any Moving Bodies are equal, the Spaces paſſed over, will be directly as the Times in which the Motions are made.

And conſequently, if the Times are as the Spaces, the Celerities muſt be equal.

6. If the Times are equal, the Spaces paſſed through, will be as the Velocities, and conſequently, if the Spaces are as the Velocities, the Times will be equal.

7. The Diſtances, or Lengths run, are in a *Ratio* compounded of the *Ratio*'s of the Times and Celerities; ſo that Spaces or Diſtances moved thro', may be conſider'd as Rectangles, under the Times and the Celerities.

Wherefore if the Spaces, or Diſtances run, be equal, the Rectangle under the Celerity and Time of one Moveable, will be equal to that under the Celerity and Time of the other: And therefore, becauſe equal Rectangles with unequal Sides, have their Sides reciprocally proportionable (14. *è* 6 *Euclid.*) as Celerity is to Celerity; ſo reciprocally ſhall Time be to Time; and conſequently, when the Spaces are equal, the Times will be reciprocally as the Celerities.

8. The *Ratio* of the Times is always compounded of the *Ratio* of the Spaces paſſed over, directly, and of the Celerities reciprocally.

The Incomparable Sir Isaac Newton, *thus expreſſes theſe Two laſt* Theorems.

When the Celerity is given, the Space paſſed through will be as the Time; and the Time being given, the Space is as the Celerity: Wherefore if neither be given, the Space will be as the Celerity and Time conjunctly.

When the Celerity is given, the Time is directly as the Space moved through; and the Space being given, the Time is reciprocally as the Celerity: Wherefore if neither be given, the Time is as the Space directly, and as the Celerity reciprocally.

Hence 'tis plain, the Motions of all Bodies are as the Rectangles under the Velocities, and the Quantities of Matter: wherefore the Matter and Celerity of Motion being given, the *Momentum* or Quantity of Motion is given: And if the *Moment* and *Matter* be given, the *Celerity* is given by dividing the *Moment* by the Quantity of *Matter*, *v. gr.* Let the Quantity of Matter be a, the Celerity c, and the Moment m: then will $c\,a = m$, and $c = \frac{m}{a}$ and $a = \frac{m}{c}$.

Alſo ſince the Space paſſed over, or through, is always proportional to the Rectangle under the Velocity and the Time; let the Space be $= S$, the Time $= T$, and the Celerity as before $= C$. Then will $S = C\,T$, and $C = \frac{S}{T}$, and $T = \frac{S}{C}$.

And ſince alſo $m = a\,c$, m will be equal to $\frac{a\,S}{T}$: Or, if T be given, $m = a\,S$.

Hence alſo may be concluded, That if two Bodies are moved with equal Velocities, the *Moments* will be as the Quantity of Matter in each; and *vice verſa*, the Quantity of Matter as the *Moments*: Wherefore if Bodies of equal Bulk are found to have unequal *Moments*, or Quantities

of

of Motion, the Quantities of Matter muſt be unequal; and conſequently, that which hath the leaſt *Moment*, muſt have more of *Pores* or *Vacuities* interſperſed than the other.

For Inſtance: If two Globes, one of Lead and the other of Cork, having equal Bulks, are moved with equal Swiftneſs; ſince the Quantity of Motion in the former, or its Force to move other Bodies, will be much greater than in the latter; it's plain there muſt be many more Pores or Vacuities in *this*, than in *that*.

Mr. Varignon's *Laws and Proportions about* Motion.

1. In all kind of *Motions* whatever, *Rowling*, *Sliding*, *Uniform*, *Accelerated*, or *Retarded*, in Right Lines, or in Curves, &c. *The Sum of the Forces which produce the Motion of all Parts of its Duration, is always proportionable to the Sum of the Paths, or Lines, which all the Points of the moving Body deſcribe.*

2. *There is more Force required to make a Body Rowl, or Revolve, (as ſuppoſe a truly Spherick Bowl on a mathematical Plane) than to make it Glide along with the ſame Celerity.*

3. In all Gliding or Sliding Motions, whether *Uniform*, *Accelerated*, or *Retarded*, &c. *The Force in the whole is always proportional to the Product of the Maſs (or Quantity of Matter) multiplied by the Path or Line deſcribed by the Centre of Gravity of the moving Body.*

4. *The Product of the Duration of all Uniform Motions, multiplied by the Force which began the Motion, is always proportionable to the Product made by the Path, or Line of Motion multiplied by the Maſs or Quantity of Matter in the moving Body.*

Let B, *b*. ſtand for the *Body* moved.
M, *m*. for the *Maſs*, or Quantity of Matter in it.
S, *s*. for *Space*, or Diſtance moved through.
T, *t*. for the *Time* in which the Motion is made.
F, *f*, for the *Force* producing the Motion.
C, *c*. for the *Celerity* of the Motion.

Then I ſay, $FT : ft :: MS : ms$. of any two Bodies in Motion. Then

5. $F : f :: MSt : msT.$
$T : t :: MSf : msF.$
$M : m :: FTs : ftS.$
$S : s :: FTm : ftM.$

6. If $F = f$, then ſhall

$T : t :: MS : ms.$
$M : m :: Ts : St.$
$S : s :: Tm : Mt.$

And reciprocally, Whenever Tt, Mm, Ss, are in any of theſe Proportions, *Then are the Forces which move the Bodies equal*; which is the General Principle of all *Des Cartes*'s *Staticks*.

7. If $T = t$, then ſhall

$F : f :: MS : ms$
$M : m :: Fs : fS$
$S : s :: Tm : tM$

And ſo reciprocally, If F, M, or S, be in the Proportions, *The Times will be equal.* And from this may the Laws of all Machines be demonſtrated after *Des Cartes* his manner.

8. If $M = m$, then will

$F : f :: St : sT$
$S : s :: Fm : fM$
$T : t :: Sf : sF$

And reciprocally, If theſe Proportions be diſcovered, *Then the Maſſes are equal.*

9. If $S = s$, then will

$F : f :: Mt : mT$
$M : m :: FT : ft$
$T : t :: Mf : mF$

And reciprocally, If ſuch Proportions are found, *The Spaces are equal.*

10. If $F : f :: \begin{cases} M : m \\ S : s \end{cases}$

Then will

$T : t :: \begin{cases} S : s \\ M : m \end{cases}$

And reciprocally,

If $T : t :: \begin{cases} S : s \\ M : m \end{cases}$

Then will

$F : f :: \begin{cases} M : m \\ S : s \end{cases}$

11. If $F : f :: T : t$. Then

$M : m :: FFs : ffS :: TTs : ttS$
$S : s :: FFm : ffM :: TTm : ttM$
$MS : ms :: FF : ff :: TT : tt$

And reciprocally, If the Maſſes of the Bodies moved, or the Spaces run through, or the Products of the Maſſes, by the Spaces, (that is, the Quantity of Motion in the Bodies B and *b*) are as in theſe Proportions, then are the Forces to one another as the Times.

And this obſerve alſo for a Principle to explain Machines and Engines, as above in Numbers 6 and 7.

12. If $M : m :: S : s$. Then

$F : f :: SSt : ssT :: MMt : mmT$
$T : t :: SSf : ssF :: MMf : mmF$
$FT : ft :: SS : ss :: MM : mm$

And

And Reciprocally, if the Forces, or the Times, or the Product of the Forces by the Times, are as in these Proportions; then the Masses are as the Spaces run thro'.

13. If $F : f :: m : M$. Then

$T : t :: M M S : m m s :: f f S : F F S.$
$S : s :: m m T : M M t :: F F T : f f t.$
$T s : t S :: M M : m m :: f f : F F.$

And Reciprocally, If the Times or the Spaces run thro', or the Products of the Times taken directly, by the Spaces taken Reciprocally, are as in these Proportions; then the Forces shall be to one another in a Reciprocal *Ratio* of the Masses.

14. If $F : f :: s : S$. Then

$T : t :: S S M : s s m :: f f M : s s m.$
$M : m :: F F T : f f t :: s s T : S S t.$
$t M : T m :: F F : f f :: s s : S S.$

And Reciprocally, If the Times, or the Masses, or the Products of the Masses taken directly, by the Times taken Reciprocally, are as in these Proportions; then the Forces shall be to one another in a Reciprocal *Ratio* of the Spaces run thro'.

15. If $T : t :: m : M$. Then

$F : f :: M M S : m m s :: t t S : T T s.$
$S : s :: F m m : f M M :: F T T : f t t.$
$S t : s F :: T T : t t :: m m : M M.$

And Reciprocally, If the moving Forces, or the Spaces run through, or the Product of the Spaces taken reciprocally by the Forces taken reciprocally, are as in these Proportions; the Time of the Motions shall be to one another in a Reciprocal *Ratio* of the Masses of the Bodies moved.

16. If $T : t :: s : S$. Then

$F : f :: S S M : S S m :: t t M : T T m.$
$M : m :: F s s : f S S :: F T T : f t t.$
$M f : m F :: T T : t t :: s s : S S.$

And Reciprocally, If the moving Forces, or the Masses of the Bodies moved, or the Products of the Masses taken reciprocally, by the Forces taken reciprocally, are as in these Proportions; then the Times shall be to one another in a Reciprocal *Ratio* of the Spaces run thro'.

17. If $F : f :: t : T$. Then shall
$M : m :: s : S.$

And Reciprocally,

If $M : m :: s : S$. Then will
$F : f :: t : T.$

So that in all Engines, or Machines, having always $t = T$, you'll have Reciprocally $F = f$. *viz.* An Equilibrium where $M : M :: s : S$, which is the known Property of the Balance.

As to the Celerities, observe the following Rules.

18. In general.

$$C : c :: \frac{S}{T} : \frac{s}{t} :: St : sT :: \frac{t}{s} : \frac{T}{S}.$$

19. Then also in the general.

$T : t :: c S : C s.$
$S : s :: C T : c t.$
$F : f :: M C : m c.$
$M : m :: F c : f C.$
$C : c :: F m : f M.$

20 If $\begin{cases} F = f \\ M = m \\ T = t \\ S = s \end{cases}$

Then shall

$$\left.\begin{matrix} m : M \\ F : f \\ S : s \\ t : T \end{matrix}\right\} :: C : c.$$

And Reciprocally, If these Proportions are true; the preceeding Equalities are so also.

And the Equilibrium will be found always in every Machine, where it is made; as $m : M :: C : c$. And this is that which *Galileus* took for the First Principle of *Staticks*. (See *Syst. Cosm. Dialog.* 2. *Pag.* 298, &c.

21. If $\left.\begin{matrix} M : m \\ T : t \\ f : F \\ s : S \end{matrix}\right\} :: C : c.$

Then

$F : f :: C C : c c.$
$S : s :: T T : t t.$
$M : m :: c c : C C.$
$T : t :: S S : s s.$

And Reciprocally, If these last Propositions are true, the first are so also.

22. If $\left.\begin{matrix} F : f :: M : m \\ \text{or,} \\ T : t :: S : s. \end{matrix}\right\}$ Then will $C = c.$

Or,

If $C = c$: Then shall $\left.\begin{matrix} F : f :: M : m. \\ \text{And} \\ T : t :: S : s. \end{matrix}\right\}$

23. If $\left.\begin{matrix} F : f :: S : s. \\ \text{Or,} \\ M : m :: T : t. \end{matrix}\right\}$

Then will

$C : c :: S m : M S :: F t : f T.$
$M : m :: S c : s C.$
$T : t :: F c : f C.$
$S : s :: M C : m c.$
$F : f :: T C : t c.$

And Reciprocally, If theſe laſt Proportions are true, the firſt are ſo alſo.

24. If F : *f* : : T : *t*. Then ſhall

C : *c* : : *m* T : M *t*.
T : *t* : : M C : *m c*.
M : *m* : : T *c* : *t* C.

And Reciprocally, If the Celerity, or the Maſſes, or the Times, or the Forces, are as in theſe Proportions, then the Forces ſhall be to one another as the Times; which was the Principle of *Galileus*, mentioned before in Number 20.

25. If M : *m* : : S : *s*. Then ſhall

C : *c* : : F *s* : *f* S.
F : *f* : : S C : *s c*.
S : *s* : : F *c* : *f* C.

And Reciprocally, If the Celerities, or the Forces, or the Maſſes, or the Spaces run thro', are as in theſe Proportions; then the Maſſes of the Bodies moved, are to one another as the Spaces run thro'.

26. If F : *f* : : *m* : : M. Then C : *c* : : { *m m* : M M / F F : *f f*.

And Reciprocally, If theſe laſt Proportions are true, the firſt muſt be ſo alſo.

27. If T : *t* : : *s* : S. Then C : *c* : : { S S : *s s*. / *t t* : T T.

And Reciprocally,

If C : *c* : : { S S : *s s* / *t t* : T T } Then ſhall T : *t* : : *s* : S.

28. If F : *f* : : *s* : S. Then

C : *c* : : *s m* : S M.
M : *m* : : *c s* : C S.
s : S : : C M : *c m*.

And Reciprocally, If the Celerities or the Maſſes, or the Forces, or the Spaces, are as in the laſt Proportions; then the Forces ſhall be Reciprocally as the Spaces.

29. If T : *t* : : *m* : M. Then

C : *c* : : F T : *f t*.
F : *f* : : *t* C : T *c*.
T : *t* : : *f* C : F *c*.

And Reciprocally, if the Celerity, or the Forces, or the Times, or the Maſſes, are as in the laſt Proportion; then the Times ſhall be to one another in a Reciprocal *Ratio* of the Maſſes.

30. If { F : *f* : : *t* : T. / Or, / M : *m* : : *s* : S. } Then

C : *c* : : F S : *f s* : : *t m* : M T.
F : *f* : : *s* C : S *c*.
t : T : : M C : *m c*.
M : *m* : : *t c* : T C.
s : S : : F *c* : *f* C.

And Reciprocally, If the Celerities, Forces, Times, Maſſes, or Spaces run thro', are in the laſt Proportions; then the Maſſes ſhall be in a Reciprocal *Ratio* of the Spaces, and the Forces Reciprocally as the Times: Which is alſo the ſame that Dr. *Cartes* took for his firſt Principle of *Staticks*. See the *Memoirs de la Mathematique & de la Phyſique*.

MOTION *of the Apogee*, in the *Ptolemaick* Syſtem, is an Ark of the Zodiack of the *Primum mobile*, contained between the Line of the *Apogee* and the Beginning of *Aries*.

MOTION *Compounded*. See *Compoſition of Motion*.

MOTORII, the Third Pair of Nerves which move the Eye.

MOTRIX *Viz*. See *Vis Motrix*.

MOVEABLE *Feaſts*, are thoſe Feſtivals which, tho' they are Celebrated on the ſame Day of the Week, have no Fixed Seat in the *Calender*, but in ſeveral Years happen on ſeveral Days of the Month; of which kind are *Eaſter* and *Whitſontide*, &c.

MOVEMENT, the ſame with what many do call an *Automaton*, and with us ſignifies all thoſe Parts of a Watch, Clock, or any ſuch Curious Engine which are in *Motion*, and which by that Motion carry on the Deſign, or anſwer the End of the Inſtrument.

The Numbers of the *Wheels*, *Pinions*, *Notches*, &c. in any Piece of Clock or Watch-work, are uſually thus written or expreſs'd: Where the uppermoſt Number above the Line is the Pinion of the Report 4, the Dial-wheel 36, and 9 the Turns of the Pinion of Report. The ſecond Number (under the Line) is 5 the Pinion, 55 is the great Wheel, and 11 the Turns of the Pinion it driveth. The third Numbers are the ſecond Wheel, *&c.* The fourth the Contrate-wheel, *&c.* And the ſingle Number 17, under all, is the Crown-wheel.

4) 36 (9
5) 55 (11
5) 45 (9
5) 40 (8
17

Theſe Numbers, by ſome, are alſo expreſs'd Fraction-wiſe, thus, $\frac{36}{4}$, $\frac{55}{5}$, $\frac{45}{5}$, $\frac{40}{5}$, 17 Notches in the Crown-wheel.

MOULINET, a *French* Term, ſignifying a *Turn-ſtile*: 'Tis uſed in Mechanicks, and ſignifies a *Roller*, which being croſs'd with two *Levers*, is uſually applied to *Cranes*, *Capſtans*, and other ſort of Engines of the like Nature, to draw Cords, and heave up Stones, Timber, *&c.* Alſo a kind of Turn-ſtile or Wooden Croſs, which turns horizontally upon a Stake fix'd in the Ground; and is uſually placed in Paſſages, to keep out Horſes, and to oblige Paſſengers to go or come one by one.

Theſe *Moulinets* are often ſet up near the Outworks of Fortified Places, at the ſide of the Barriers, through which People paſs on Foot.

MOUND. The Term in Heraldry for a Ball or Globe, with a Croſs upon it, ſuch as our Princes are uſually drawn or painted with, holding it in their Left Hand, as they do the Sceptre in their Right. *Mound* alſo ſignifies a Fence or Hedge.

MOYENAU (a *French* Term) in Fortification, is a ſmall flat Baſtion, commonly placed in the middle of an over-long Curtain, by which the Baſtions at the Extremities are not well defended from the Small-ſhot, by reaſon of their Diſtance; ſo that this Work is proper for placing in it a Body of Muſqueteers to fire upon the Enemy from all ſides.

MUCI-

MUCILAGE, in Pharmacy, is a viſcous Extraction made of Seeds, Gums, Roots, &c. with Water.

MUCILAGINOUS *Glands*, are a numerous ſort of Glands ſeated in the Joints, firſt, I think, particularly taken Notice of by Dr. *Havers*, in his *Oſteologia*: He ſaith, theſe are of two ſorts, ſome are ſmall, and in a manner miliary Glands, being Glandules placed all upon the ſame Surface of the Membrane, which lies over the Articulations. The other ſort are conglomerated, or many Glandules collected and planted one upon another, ſo as to make a Bulk, and appear conſpicuouſly, and are conſiderable Glands. In ſome of the Joints there are ſeveral of them; in others there is a ſingle Gland.

For the Structure of theſe large Glands, they conſiſt of ſmall Veſicles, which are not gathered into ſeveral Lobules or Bags of Glandules, but are diſpoſed upon ſeveral Membranes lying one over another; of which Membranes there are ſeveral in every one of theſe Glands, which appear evidently in them that are Hydropical.

They have their Blood-Veſſels, as other Glands, but their Veins have a particular Flexure in their Courſe for retarding the Return of the Blood from the Glands, that the mucilaginous Liquor, which is not ſeparated with the greateſt Expedition, may have Time to penetrate the ſecretory Pores of the Glandules.

The large Mucilaginous Glands are variouſly ſeated; ſome in a *Sinus*, formed in the Joint; others ſtand near or over-againſt the Interſtice, between the Articulated Bones; but in general they are ſo placed, as to be ſqueez'd gently, and lightly preſs'd in the Inflexion or Extenſion of the Joint, ſo as to ſeparate a Quantity of Mucilage proportionate to the Motion of the Part, and the preſent Occaſion, and yet without any Injury.

The Deſign of all theſe Glands is to ſeparate a mucilaginous kind of Liquor that ſerves principally to lubricate the Joints, to make them ſo ſlippery, as to be moved with the greateſt Facility imaginable. It ſerves likewiſe to preſerve the Ends of the Articulated Bones from Attrition, and an immoderate Incaleſcence. But all theſe Things it performs in Conjunction with the medullary Oyl; of which two Ingredients, is made a Compoſition admirably fitted for theſe Ends: For the Mucilage adds to the Lubricity of the Oyl, and the Oyl preſerves the Mucilage from growing too thick and viſcous.

The Doctor obſerves the ſame ſort of Glands to lie between the Muſcles and Tendons, and ſuppoſes that there is the ſame Mixture of an Oyly and Mucilaginous Subſtance; the one being that Fat which is found between the Muſcles, and is ſupply'd by the Adipoſe Glands; the other being ſeparated by the mucilaginous Glandules, of which the common Membrane of the Muſcles is every every where full. This Mixture in the Interſtices of the Muſcles, lubricates them and their Tendons, and preſerves them from ſhrinking, and from growing dry and rigid.

For the Generation of this Mucilage, he ſuppoſes that Nature has deſigned one large *Viſcus*, and that this is the Office of the Spleen; the Glandules of which he makes to have two ſecretory Pores; by one of which ſome Acid, and by the other, ſome Auſtere Particles are ſeparated; which meeting in the ſmall Cavities of the Glandules, they are converted into a Mucilaginous and Gummous Subſtance; he having obſerved, that Spirit of Vitriol mix'd with a Decoction of Galls, will produce a Gum.

After this, he gives an Account of Experiments made with the Mucilage; the moſt of which come to this, That all Acids do coagulate it, as all Auſteres and Auſtere Acids; but with this Difference, that the *Coagulum* or Curd made by Acids only, is tenderer than that which is produced by an Auſtere only, or an Auſtere Acid.

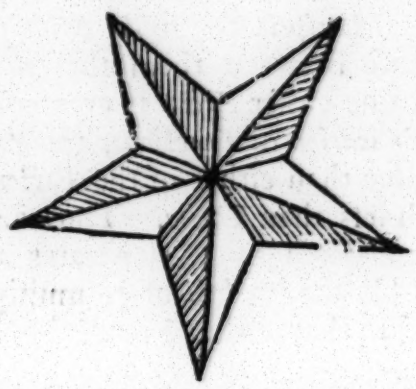
MUCRO *Cordis*, or *Apex*, is the lower pointed End of the Heart.

MUCRONATED, is whatever ends or terminates in a Point, like that of a Sword, &c.

MUCRONATUM *Os*: See *Enſiformis Cartilago*.

MUFFLE, in Chymiſtry, is the Cover of a *Teſt* or *Copper*, which is put over it in the Fire.

MULLET, the Term in Heraldry for a Star of Five Points, of this Figure; and is uſually the Difference or Diſtinguiſhing Mark for the Third Brother, or Houſe.



Though 'tis often alſo born as Coat-Armour; as here:

Ruby on a *Chief Pearl*, Two *Mullets Diamond*; being the Coat of the Famous Lord *Verulam*, firſt Sir *Francis Bacon*. The Heralds ſay, the *Mullet* repreſents a *Falling Star*; 'tis rarely born of Six Points.

MULTA, or *Multura Epiſcopi*, was a Fine given to the King, that the Biſhop might have Power to make his Laſt Will and Teſtament, and to have the Probate of other Mens, and the granting Adminiſtrations

MULTANGULAR *Figure*, is one that has many Sides and Angles.

For its Superficial Content, ſee *Area*.

MULTILATERAL, in Geometry, are thoſe Figures that have more than Four Sides.

MULTINOMIAL *Root*: See *Polynomial*.

MULTIPLE *Proportion*, is when the Antecedent being divided by the Conſequent, the Quotient is more than Unity: And the Reaſon of the Name is, becauſe the Conſequent muſt be multiplied by the Index, or Exponent of the Ratio, to make it equal to the Antecedent. Thus 12 is *multiple* in proportion to 4, becauſe, being divided by 4, the Quotient is 3, which is the Denominator of the Ratio: And the Conſequent 4 being multiplied by 3, makes the Antecedent 12; wherefore 3 is *Sub-multiple* of 12.

MULTIPLE *Super-particular Proportion*, is when one Number or Quantity contains another more than once, and ſuch an Aliquot Part more; of which ſee more under *Proportion*.

MULTIPLE *Super-partient Proportion*, is when one Number or Quantity contains another divers times, and ſome Parts thereof beſides.

MULTIPLICATION, is, in general, the taking or repeating of one Number or Quantity as often as there are ſuppoſed Unites in the other. The Number *multiplied*, is called the *Multiplicand*; the Number *multiplying*, the *Multiplicator*; and that which is found or produced, is called the *Product*.

Multiplication is only a *Compendious Addition*, effecting at once what in the ordinary way of *Addition* would require many Operations: For the *Multiplicand* is only added to it ſelf, or repeated, as often as the Unites of the *Multiplicator* do expreſs. Thus if 6 were to be multiplied by 4, the *Product* is 24, which is the Sum ariſing from the *Addition* of 6 four times to it ſelf.

In all *Multiplication*, as 1 is to the *Multiplicator*, ſo is the *Multiplicand* to the *Product*. Whence 'tis plain, that in *Multiplication* of *Integers*, the *Product* muſt be greater than either of the *Factors*, (for ſo the *Multiplicator* and *Multiplicand* are called, becauſe between them they *make* up the *Product*) becauſe either *Factor* is greater than *Unity*. But in *Multiplication* of *Fractions*, the *Product* muſt be leſs in Value than either of the *Factors*, becauſe they are both leſs than *Unity*. Thus 24, the *Product* of 6, multiplied by 4, is greater than either 6 or 4; but $\frac{12}{20}$, the *Product* of $\frac{3}{4}$, multiplied by $\frac{4}{5}$, is leſs in Value than either $\frac{3}{4}$ or $\frac{4}{5}$.

MULTIPLICATION in *Algebra* or *Species*.

The General Rule is, To conjoin the Quantities propoſed by the Sign (×); which Sign, when the Quantities to be multiplied are expreſs'd by but one or two Letters, is uſually omitted, and the Quantities written down like Letters in a Word. Thus $a\,e$ multiplied by $b\,d$, may be written $a\,e \times b\,d$, or, as is moſt uſual, $a\,e\,b\,d$.

And if the Signs + or —, prefixed before the Quantities to be multiplied, are *like*, the *Product* is +; if *unlike*, the *Product* is —.

N. B. *In* Algebraic Multiplication, *'tis moſt commodious to begin to multiply at the Left-Hand, becauſe we write that way.*

Particular RULES.

I. RULE.

When two or more ſingle Quantities, expreſs'd by Letters, whether like or unlike, are to be multiplied into one another, and have no Numbers prefix'd; join the Quantities together, like Letters in a Word, and 'tis done:

Thus, $\frac{d}{f}$ and $\frac{a\,b}{d\,c}$ and $\frac{m\,n\,o}{p\,q\,r}$

Product $= d\,f \quad a\,b\,d\,c \quad m\,n\,o\,p\,q\,r$

II. RULE.

If two Simple Quantities, whether like or unlike, are to be multiply'd, having Numbers or Co-efficients prefixed before them; firſt multiply the Co-efficients one into another, and to the *Product* annex the Letters of both Quantities; ſo this new Quantity is the *Product* ſought.

Thus 3 *a* multiplied by 4 *b*, produces 12 *a b*.

III. RULE.

The *Multiplication* of Compound Quantities, depends on the preceding Rules: For every Member of the one, muſt be multiplied into every Member of the other; reſpect being had to the Signs, by the Caution given in the General Rule.

Thus, $\begin{matrix} a & d - c \\ g - b & + f \end{matrix}$

$a\,g + g\,d - g\,c - b\,a + b\,c - b\,d \times f\,a + f\,d - f\,c$

IV. RULE.

Sometimes, when Compound Quantities are to be multiplied one by another, it is commodious to omit the Operation, and to ſet only the Word (*into*) or (×) between them; having firſt drawn a Line over each Compound Quantity, to ſhew that every Member of the One is to be multiplied by every Member of the Other.

Thus, To multiply $a\,a\,a + 3\,a\,a - 2\,a\,a + 1$ by $a\,a - 5\,a + 6$,

Write $a\,a\,a + 3\,a\,a - 2\,a\,a + 1$ × or into $a\,a - 5\,a + 6$.

That in *Algebraic Multiplication* Like Signs give +, and Unlike —, in the Product, may be thus demonſtrated:

1. Since *Multiplication* is the ſame thing as adding one *Factor* to it ſelf, or repeating it ſo oft as there are Unites in the other:

2. Therefore, + multiplying +, muſt produce +, ſince Poſitives added, will produce a Poſitive Sum.

3. *A Poſitive multiplying a Negative, muſt produce a Negative*: For 'tis only adding the Negative *Factor* to it ſelf, or repeating it ſo often as there are Unites in the other. Now many Defects added, muſt ſtill be Defects, or muſt have a Negative Sign, thus:

— 6 multiplied by + 2, produces — 12.

4. *Negatives multiplying Poſitives, muſt produce Negatives*: For when the *Multiplicator* is defective, (there being really no Unites in it) it muſt work on the *Multiplicand* by Subtraction; therefore, in this Caſe, the *Multiplicand* muſt be ſubtracted (or made Negative) as often as there are Negative Unites in the *Multiplicator*: But to take away Poſitives, is to add Negatives; therefore the Defect of the *Multiplicand* is to be added or repeated as often as the Caſe requires; and if

it ſo, the Product muſt be Negative (by the laſt) thus:

+6 multiplied by — 2, gives — 12 in the Product.

5. *Negatives multiplying Negatives, muſt produce Poſitives*: For ſince *Multiplication* by a Negative, is the ſame as Subtraction; and ſubtracting a Defect or Negative, the ſame as adding Poſitives, therefore 'tis clear, the Defect of the *Multiplicand* muſt be ſubtracted (that is, the Poſitive *Multiplicand* added) ſo often as there are ſeeming Unites in the *Multiplicator*; which muſt needs produce Poſitive, thus:

— 6 into — 2, produces + 12.

MULTIPLICATION *of* Integers, *in* Common Arithmetick, *is performed thus*:

Suppoſe 365, the Days in a Year, were to be multiplied by 24, the Hours in a Natural Day; write down the *Multiplicator* orderly under the *Multiplicand*, Unites being under Unites, Tens under Tens, *&c.* as you ſee here, and draw a Line under them. Then ſay, 4 times 5 is 20; I ſet down 0, and carry two Tens to the next Rank; therefore 4 times 6 is 24, and 2 I carried is 26: I ſet down 6, and carry 2 (that is 200) to the next Rank. Then I ſay, 4 times 3 is 12, and 2 I carried make 14; (*i. e.* 1400) which 14, becauſe I have now done with the firſt Figure 4, I ſet down as you ſee. Then I begin with 2, the ſecond Figure of the *Multiplicator*, which ſtands in the Place of Tens, and ſay, twice 5 is 10; I ſet down 0 under 6 (which is under 2, the Figure that I multiplied by, for that Rule muſt always be obſerved) and carry 1. Then twice 6 is 12, and 1 I carried is 13; I ſet down 3 on the Left-Hand of the laſt, and carry 1, as before. Laſtly, I ſay, twice 3 is 6, and 1 I carried makes 7; which 7 I ſet down, as you ſee. Then adding the two Products, thus found, together, you will have 8760 for the true Product.

365
24
1460
730
8760

N. B. *When there are Cyphers at the End of either Factor, or after both, multiply the ſignificant Figures one into another, and to the Right Hand affix as many Cyphers as were in both*; v. gr.

466000
4000
1164000000

When Cyphers are intermixed with the ſignificant Figures of the *Multiplicator*, the Operation of them may commodiouſly be omitted, regard being had to the due placing the Figures of the Product, as you ſee in this

Example.

26845
3004
107380
80535
80642380

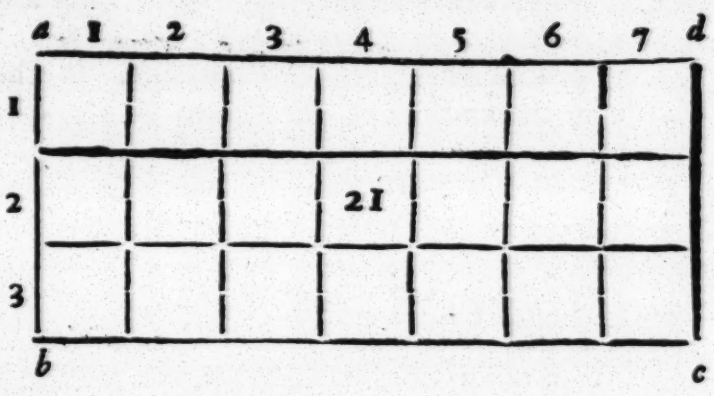
The *Proof of Multiplication* can only certainly be effected by *Diviſion*, the Common Method by caſting out the Nines, being falſe: For if you divide the *Product* by either *Factor*, the *Quotient*, if you have wrought truly, will be the other; for *Diviſion* deſtroys what *Multiplication* builds up. Thus,

If 8760 be divided by 365, it gives 24.

If divided by 24, it gives 365.

MULTIPLICATION *in* Geometry, *or in* Lines,

Is made by ſuppoſing a Right Line, as *a b*, to be moved in a perpendicular Poſture along another, as *b c*; in which Caſe, the Line *a b* is

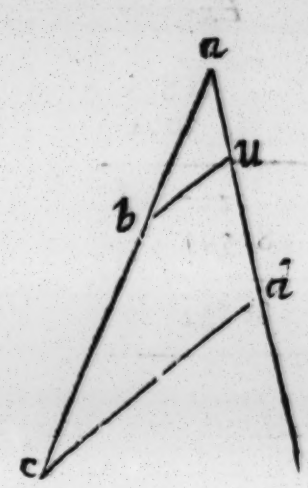


called the *Deſcribent*, and *b c* the *Dirigent*: For by this means the *Deſcribent a b*, will form the Rectangle *a d c b*; and if it be divided, together with the *Dirigent*, into any Number of equal Parts, it will by its Motion deſcribe as many little Rectangles, as the Unites in the *Deſcribent* and *Dirigent* will produce, by being multiplied into one another, *viz.* 21. For when the Line *a b* hath moved over one part of *a d*, it will, by its 3 Parts, have deſcribed the 3 little Rectangles in the firſt Column; when it comes to 2, it will have deſcribed 3 more, *&c.*

And this is the Reaſon why *Multiplication*, in the *Latin* Tongue, is uſually expreſſed by the Word *Ducta*; (and from hence alſo comes *Product*) as if *a b* were multiplied by *b c*; they ſay *a b ducta* in *b c*; becauſe the *Deſcribent* is *led*, as it were, or *carried* along in an erect Poſture upon the *Dirigent*, and by that means deſcribes the Rectangle: So that *Rectangle* and *Product* are all one in *Geometry*.

Since in all *Multiplication*, Unity is to one *Factor*, as the other is to the *Product*; therefore *Multiplication in Lines* may be performed *Geometrically* thus:

Let



Let *a b* be to be multiply'd by *a d*, make any Angle at pleaſure, and then on one of the Legs ſet off *u* = to Unity; and on the ſame Leg ſet off *u d*, the *Multiplicator* (3). Then ſet the *Multiplicand a b* (2) from *a* on the other Leg of the Angle; draw *u b*, and parallel to it, through *d*, draw *d c*. I ſay, *d c*, or 6, is the *Product*: For *a u* : *u d* :: *a b* : *b c*.

MULTIPLICATION of *Decimal Fractions*: See *Decimal*.

MULTIPLICATION of *Fractions*. See in *Fractions*.

MULTIPLICATION of *Logarithms*. See *Logarithms*, N. 6.

MULTIPLICATION by *Logarithms*. See *Logarithms*, N. 8.

MULTIPLICAND, in Arithmetick, is the Number to be *multiplied*. See more in *Multiplication*.

MULTIPLICATOR, in Arithmetick, is the Number by which you *multiply*, or the Number *multiplying*.

MULTIPLIER, the ſame with *Multiplicator*.

A MULTO *fortiori*, or *à Minori ad majus*, is an Argument often uſed by *Littleton*, and is fram'd thus: If it be ſo in a Feoffment paſſing a New Right, much more is it for the Reſtitution of an Ancient Right, *&c.*

MUNIMENTS, among the Lawyers, are taken for ſuch Authentick Deeds and Writings, as a Man can defend the Title to his Land or Eſtate by.

MURAGE, in Law, ſignifies a Toll or Tribute to be levied for building or repairing of Publick Walls; and is due either by Grant or Preſcription. It ſeems alſo to be a Liberty granted to a Town by the King, for the Collecting Money towards the Walling of the ſame.

MURDER, according to our Law, is a Wilful and Felonious Killing of another upon prepenſed Malice, whether ſecretly or openly, and whether *Engliſhman* or *Foreigner*, living under the King's Protection. And this prepenſed Malice is Twofold: 1. *Expreſs*, When it may be evidently proved that there was Ill-will; 2. *Implied*, When one killeth another ſuddenly, having nothing to defend himſelf, as going over a Stile, or ſuch like: For in ſuch a Caſe, or when a Man killeth a meer Stranger, the Law preſumeth that he had Malice againſt him, or elſe he would not do it without any manner of Provocation.

MURDERERS, are ſmall Pieces of Ordnance, either of Braſs or Iron, having *Chambers* (that is, Charges made of Braſs or Iron) put in at their Breeches: They are moſtly uſed at Sea, at the Bulk-heads of the Fore-caſtle, Half-deck, or Steerage, in order to clear the Decks when an Enemy boards the Ship; they are faſtned and traverſed by a Pintle, which is put into a Stock.

MUSCLE, the chief Inſtrument of Voluntary Motion in an Animal Body. The Parts of a *Muſcle* are Three; its *Head*, *Belly*, and *Tail*. The *Head* of a *Muſcle* is its Beginning, and, as it were, the Centre of its Motion; and this is always fixed to the moſt ſtable Part. The *Belly* of a *Muſcle* is its Middle Part, which is tumid, or extended, in all muſcular Motion. The *Tail* is the other End or Extreme, which is faſtned into the Part to be moved.

Muſcular Motion, or which way the Belly of a *Muſcle* comes to be ſwelled, and conſequently its Extremes brought nearer together, in order to move the Part required, is a very great Myſtery; as indeed many other Things are in an Human Body, which is *fearfully and wonderfully made*. There have been many *Hypotheſes* to ſolve this, which whether ſatisfactory or not, muſt be left to every one's Judgment to determine.

Dr. *Willis* ſuppoſes the Animal Spirits, brought by the Nerves, to be lodged in the *Tendons* of the *Muſcles*, and that meeting with other active Particles brought from the Blood, they make an *Effervеſcence*; by which the *Carnous Fibres* of the *Muſcle* are agitated, ſtuffed and ſwelled, and ſo the whole *Muſcle* is contracted in its Length.

Steno imagines the *carnous Fibres* of the *Muſcles*, as alſo the oppoſite *Tendons*, to be in their Conſtructure like to *Parallelograms*; by an Alteration of the Angles of which, the *Muſcle* is contracted, and the Head and Tail brought near together: And this he thinks may be done without the Acceſſion of any New Matter.

Dr. *Mayo* falls nearly in with Dr. *Willis* his Notion: He thinks the Contraction of the *Muſcle* is made by an *Effervеſcence*, ariſing from the Mixture of the *Sulphurous Saline* Particles of the Blood, with the *Nitro-aerious* ones brought by the Nerves, which blow up and diſtend the Belly of the *Muſcle*.

M. *Du Verney* fanſies this Intumeſcence may be made without *Fermentation*, by the Animal Spirits, and a Juice from the Arteries, running into the Tendons and carnous Fibres, and ſo extending themſelves, as Ropes and Cats-gut Strings ſwell in moiſt Weather.

Dr. *Croon* ſuppoſes every carnous Fibre to be made up of ſmall Globules or Bladders, all opening one into another, into which the *nutritious Juice*, and one or two other fine and active Liquors, entring, do, by means of the natural Heat, make an Ebullition or Effervеſcence; by which means the whole Body of the *Muſcle* becomes extended, and its Length contracted, *&c.*

Borelli takes the Fibres of a *Muſcle* to conſiſt of a Chain of divers *Rhombs* or *Lozenges*, whoſe *Areas* are capable of being inlarged or contracted, according as the nervous Juice, together with the *Lympha* and Blood, are let and forced into or out of them, *ad Imperium Animæ*.

The accurate Mr. *Cowper* ſeems to think the Blood to be the true *Pondus*, by which the *Action* of a *Muſcle* is compoſed: and that either by a Turgeſcence begun in the *Parietes* of the Cells of the Fleſhy Fibres, cauſed by the Liquor contained in the Nerves, agitated *ad Imperium Animæ*; or by the Conſtruction of the *Venous Ducts*, there becomes

comes a Repletion of their Cells, whereby the Length of the *Fibrillæ* is contracted.

Dr. *Chirac*, Profeſſor of Medicine at *Montpellier*, ſuppoſes, and thinks he can prove it analytically, That every Muſcle being compoſed of a vaſt Multitude of Fibres, like Threads, folded up all together within one Skin or Membrane, and every Fibre having its proper Vein, Artery, and Nerve, it hath alſo from Space to Space ſeveral little Cavities or Pores which are of an oblong Form, when the Muſcle is ſlack or flaccid; but the Blood circulating through the Muſcle, is continually deſpoſing into thoſe Pores a Sulphurous Recrement, abounding with *Alkali* Salts, which meeting with the Spirits that flow alſo by the Nerves into thoſe oval Pores, their *Nitro-aerial* Particles ferment in a moſt violent manner with the Saline ones of this Sulphurous Recrement, and thereby diſtend the Pores ſo, as to make them change their long oval Figure into a round one; and thus the Muſcle muſt be contracted.

MUSCLE *Vein*. This Vein is Two-fold, the *Superior* and the *Inferior*. The former ariſes from the Muſcles of the Neck, and the latter from the upper Muſcles of the Breaſt; and this ſometimes opens into the External Jugular.

MUSCULUS *Stapidis*, is a Muſcle of the Ear, which lies hid in a Bony Pipe, excavated in the *Os Petroſum*, almoſt at the bottom of the *Tympanum*, whence it takes its Origin. Its Belly is big and fleſhy, and ſuddenly forming a very thin Tendon, which deſcends to its Inſertion at the Head of the *Stapes*: When this acts, it draws the *Stapes* upwards, to the *Foramen Ovale*.

MUSCULUS *Nauticus*. See *Tibialis Poſticus*.

MUSICK is one of the Seven Sciences, commonly called *Liberal*, and comprehended alſo among the *Mathematical*; as having for its Object *Diſcrete Quantity* or *Number*, but not conſidering it in the Abſtract, like *Arithmetick*; but with relation to *Time* and *Sound*, in order to make a delightful Harmony.

This Science is alſo *Theorical*, which examineth the Nature and Properties of Concords and Diſcords, explaining the Proportions between them by Numbers: And *Practical*, which teacheth not only Compoſition, that is to ſay, the manner of Compoſing all ſorts of Tunes or Airs; but alſo the Art of ſinging with the Voice, or playing upon Muſical Inſtruments. See Vol. 2.

MUSKET-*Baskets*, in Fortification, are Baskets of about a Foot and half high, and 8 or 10 Inches Diameter at the Bottom, and a full Foot at the top: They are filled with Earth, and are ſet on low Parapets or Breaſt-works, or on ſuch as are beaten down, that the Muſqueteers may fire between them at the Enemy, and yet be tolerably well ſecured againſt their Fire.

MUTE. (A Term in Law) A Priſoner is ſaid to ſtand *Mute*, when he refuſes to plead to an Indictment.

MUTULE, in Architecture, is a kind of Square *Modillon*, ſet under the Cornice of the *Dorick* Order, and ſo called from the Word *Mutilus*, Maim'd, or Imperfect, becauſe they repreſent the ends of the Rafters which are crooked or bent; in like manner, as the Beams, or Joints are repreſented by the *Triglyphs* in the *Frize* of the ſame *Order*.

MYDRIASIS, is a too great Dilatation of the *Pupil* of the Eye, which makes the Sight Dim, becauſe too much Light is then admitted into the Eye.

MYELOS, the Marrow of the Bones, or of the Brain, or Spinal Marrow.

MYGLOSSUM, is a pair of Muſcles which ariſe about the backſide of the Grinding Teeth, and are inſerted into the Ligament of the Tongue, and are ſaid to turn the Tongue upwards. *Blanchard*.

Theſe from their Uſe, I ſuppoſe are the ſame which our Mr. *Cowper* calls *Styloglosſus*, a Muſcle, which ariſing ſharp and fleſhy from the *Proceſſus Styloides*, deſcends obliquely forward, and is inſerted to the Root of the Tongue immediately below the Implantation of the *Ceratogloſſus*: This puts the Tongue inward, and turns it upwards.

MYLOHOIDEUS, is a Muſcle which *Fallopius* makes double, but Mr. *Cowper* thinks it a ſingle one, not being to be divided without great Violence: It poſſeſſes all that Space which is between the Lower Jaw, and the *Os Hyoides*; ariſing fleſhy from both ſides of the *Mandible* Internally, near the *Dentes Molares*; whence marching with a double Order of fleſhy Fibres, the outwardmoſt of which paſs directly to their Implantation in the *Os Hyoides*; and the middle run Tranſverſely over the following Muſcles, being inſeparably joined to each other with a middle Line, as is well expreſt by *Bidloo*, (*Tab.* 14) Beſides the Uſes commonly aſcribed to this Muſcle in moving the *Os Hyoides*, Tongue, and *Larynx*, upwards, and forwards, and to either ſide; its laſt deſcribed Tranſverſe Order of Fibres, have ſtill a further uſe in Compreſſing the *Glandulæ Sublinguales*, which lie immediately under them on each ſide; whereby they haſten the Egreſs of the Spittle, from the Inferior Salival Ducts in the Mouth. Hence it is we imploy theſe Muſcles (as in the Action of *Deglutition*) when we want *Saliva* to moiſten the Mouth: And in that Action alſo they ſupply it with freſh *Saliva*, to join with thoſe Aliments where Maſtication is not required; which Artifice of Nature deſerves our Admiration. *Cowper*.

MYLPHA, according to ſome, the falling off of the Hairs of the Eye-lids; and with others Medicines againſt the falling off of the Hair. *Blanchard*.

MYOCEPHALON, is the falling off of a ſmall Portion of the *Tunica Uvea*, juſt begun, like the Head of a Fly; whence it has its Name. *Blanchard*.

MYODES *Platyſma*, is a broad Muſculous Expanſion in the Neck, proceeding there from a ſort of a fat Membrane. *Blanchard*.

MYOLOGIA is a Deſcription of the Muſcles of an Animal Body.

MYOPIA, *Purblindneſs*, is a certain Dimneſs or Confuſion of Sight in diſtant Objects, and yet a Perſpicacity in things near at hand: It is occaſioned by the Globe of the Eye's being too Convex, ſo as to unite the Rays before they come to the *Retina*: Wherefore ſince the *Diſtinct Baſe* falls not on the *Retina*, but perhaps in the *Vitreous Humour*, the Viſion in ſuch an Eye cannot be diſtinct, unleſs of Objects very near. But all ſuch Perſons may be helped by *Concave* Glaſſes, or Spectacles.

MYRACH, an *Arabian* Word, ſignifying the ſame with *Epigaſtrium*.

MYRINX, the ſame with *Tympanum*, or the Drum of the Ear.

MYRMECIA, is a ſort of Wart; they are harder and lower than thoſe fleſhy Tumours called *Thymi*, take deeper Root, and occaſion greater Pain; broad below, and ſmall at top, and emit leſs Blood. They are ſcarce ever bigger than a ſort of Pulſe called *Lupines*: They breed in the Palms of the Hand, or the Sole of the Foot. *Blanchard.*

NAAM in Common Law, ſignifies a Diſtreſs, or the taking another Man's Goods, and is either *Lawful*, or *Unlawful*; *Lawful Naam*, is a reaſonable Diſtreſs, proportionable to the Value of the thing Diſtrained for.

NADIR, is that Point of the Heavens ſeemingly under the Earth, which is Diametrically oppoſite to the Point directly over our Head, *viz.* the *Zenith*; ſo that they are both as it were the Poles of the Horizon, and diſtant from it on each ſide 90 Degrees, and conſequently fall upon the *Meridian*, one above, the other under the Earth; and whatever Diſtance one of them has from the Equator, and one of the Poles of the World; the ſame on the contrary, has the other from the oppoſite Pole, and adverſe part of the Equator.

NAIANT, or *Natant*, (*i. e.* Swimming) is the proper Term in Heraldry, to Blazon *Fiſhes* in an Eſcutcheon, when they are drawn in an Horizontal Poſture, *Feſs-wiſe*, or Tranſverſly acroſs the Eſcutcheon; but if they are Erect, 'tis called *Hauriant*.

NAILING *of Cannon*, is the driving of a Nail, or Iron Spike, by force into the Touch-hole of a Piece of Artillery, ſo as to render it uſeleſs to the Enemy.

NAISSANT, *i. e. Naſcent*, juſt new Born; the Herald's Term for a Lyon, or other Beaſt, appearing to be iſſuing or coming out of the *middle* of any *Feſſe*, or other Ordinary; for if it come out from the lower Line of the Ordinary, they call it *Iſſuant*.

NAKED *Fire*, a Term uſed by the Chymiſts, for an open Fire, or one not pent or cloſed up.

NAPIER's Bones. See *Neper's*.

NARCOSIS, is a privation of Senſe, as in a Palſie, &c. or in taking of *Opium*, &c. whence ſtrong Opiate Medicines are frequently called.

NARCOTICKS, or Narcotick Medicines.

NASALIA, the ſame that *Errhina*.

NASCALIA, are little Globular Bodies which on ſome Occaſions, are put into the Neck of the Matrix; they are made of the ſame Subſtance as the *Peſſaria*. See *Peſſaria*.

NASI *Os*, is a thin but ſolid Bone, which makes the upper part of the Noſe; it's upper end is join'd to the *Os Frontis* by the *Sutura Tranſverſalis*: One of its Sides joins its fellow, and its lower is joined to the *Os Maxillare*, upon its lower end the Cartilages of the Noſtrils are faſtned; externally it is ſmooth, but internally it is rough.

NATES *Cerebri*, are two round Prominences in the Brain, behind the Beds of the Optick Nerves, which grow to the upper part of the marrowy Subſtance; they are ſmall in Men, and larger in Brutes.

NATTA, is a great ſoft Tumor, with Pain and Colour, which grows moſt uſually in the Back, but ſometimes in the Shoulders; its Root is ſlender, yet it encreaſes ſo prodigiouſly, that it will grow as big as a Melon, or a Gourd; it is made of fat Matter, and therefore ought to be reckoned amongſt the *Steatomata*. See *Steatomata*. *Blanchard.*

NATURE: This Word has uſually theſe Significations.

Firſt, and more ſtrictly, it is taken for a peculiar Diſpoſition of *Parts* in ſome particular *Body*; as we ſay, it is the *Nature* of *Fiſhes* to live in the *Water*.

Secondly, It is taken more largely for the Univerſal Diſpoſition of all *Bodies*: And in this Senſe 'tis nothing elſe, but *the Divine Providence*; foraſmuch as it governs and directs all things by certain *Rules* and *Laws*, accommodated to the *Natures* of things.

Thirdly, It is taken for the *Eſſence* of any thing, not *Corporeal*, with the *Attributes* belonging to it: Thus we ſay, That it is the *Nature* of *God* to be *Good*, and the *Nature* of the *Soul* to *Think*.

NATURALIZATION, is when an *Alien* born Subject, is made the King's *Natural*; and this muſt be done by Act of Parliament. *Vide Denizons*.

NATURAL *Day*. See *Day*.

NATURAL *Horizon*, the ſame with *Senſible Horizon*. See *Horizon*.

NATURAL *Quantity*. See *Quantity*.

NATURAL *Philoſophy*, is the ſame with what is uſually call'd *Phyſicks*, *viz.* That Science which contemplates the Powers of Nature, the Properties of Natural Bodies, and their mutual Action one upon another.

NAVICULARE *Os*, called alſo *Cymbiforme*, is the third Bone in each Foot, in that Part of it which immediately ſucceeds the Leg.

NAVIGATION, is the Art of *Sailing*, whereby the Mariner is inſtructed how to guide a *Ship* from one Port to another, the ſhorteſt and ſafeſt way, and in the ſhorteſt Time: And this is twofold; either

Improper, Which is called Coaſting, in which the Places are at no great diſtance one from another, and the Ship ſails uſually in ſight of Land, and is within Soundings. Now for the Performance of this, there is required a good Knowledge of the Lands, the Uſe of the Compaſs, the Lead, or Sounding-Line, and ſuch Books as *Rutters*, &c.

Navigation Proper, is where the Voyage is perform'd in the vaſt Ocean, out of ſight of all Land; and here is neceſſary not only the Knowledge of the *Lead*, *Compaſs*, &c. but the Maſter muſt be a thro' *Sailor* or *Artiſt*, and underſtand well *Mercator's Charts*, *Azimuth* and *Amplitude Compaſs*, *Log-Line*,

Log-Line, and all good Inſtruments for *Celeſtial Obſervations* that can be uſed at *Sea*. And how to perform the ſeveral Parts and Caſes of this Art, you will find under the Word *Plain*, and *Mercator's Sailing*.

NAUSEOUSNESS, or *Nauſea*, Loathing, is an earneſt Endeavour to Vomit, with Sickneſs and Uneaſineſs.

NAUTICAL *Chart*. See *Chart*.

NAUTICAL *Compaſs*. See *Compaſs*.

NAUTICAL *Planiſphere*, is a Deſcription of the Terreſtrial Globe upon a Plane, for the Uſe of Mariners; and is either,

1. The *Plane Chart*, as they call it, where the *Parallels of Latitude* are all of the ſame Length with the *Meridians*; and which therefore is very erroneous, except in ſhort Voyages, and near the Equator: Or,

2. *Wright's*, commonly called *Mercator's Chart*, where the Meridians are increaſed in Proportion, as the Parallels ſhorten: That is, as the Secants of the Arks contained between the Point of Latitude, and the Equator.

NE *Admittas*, is a Writ directed to the Biſhop, at the Suit of one who is Patron of any Church, and he doubts that the Biſhop will Collate one his Clerk, or admit another Clerk preſented by another Man to the ſame Benefice: Then he that doubts it, ſhall have this Writ, to forbid the Biſhop to Collate or Admit any to that Church.

NEBULOSE, a Term in Heraldry, when the out-Line of any Bordure, Ordinary, &c. is of this Form, *i. e.* reſembling ſomething of the Figure of Clouds.

NEBULOUS *Stars*, are certain fixed Stars of a dull, pale, and obſcuriſh Light.

NECROSIS, is a black and blue Mark in any part of the Body.

NEEDLE. See *Box* and *Needle*.

NEGATIVE *Pregnant*, is when an Action, Information, or ſuch like, is brought againſt one, and the Defendant Pleads in Bar of the Action; or otherwiſe a *Negative Plea*, which is not ſo ſpecial an Anſwer to the Action, but that it includes alſo an Affirmative: As if a Man being impleaded to have done a thing on ſuch a Day, or in ſuch a Place, denieth that he did it *Modo & forma declamata*; which implieth nevertheleſs, That in ſome ſort he did it: Or, if a Man be ſaid to have alienated Land in Fee, and he ſaith, he hath not alienated in Fee, this is *Negative Pregnant*; for tho' it be true, that he hath not alienated in Fee, yet it may be, he hath made an Eſtate in Taile.

NEGATIVE Quantities in *Algebra*, are ſuch as have before them the

NEGATIVE *Sign* ——, and which are ſuppoſed to be leſs than nothing. Theſe are directly contrary to Poſitive, Affirmative, or Real Quantities.

NE *injuſte vexes*, is a Writ which lies for a Tenant that is Diſtrained by his Lord for other Services than he ought to make, and is a Prohibition to the Lord in it ſelf, commanding him not to Diſtrain.

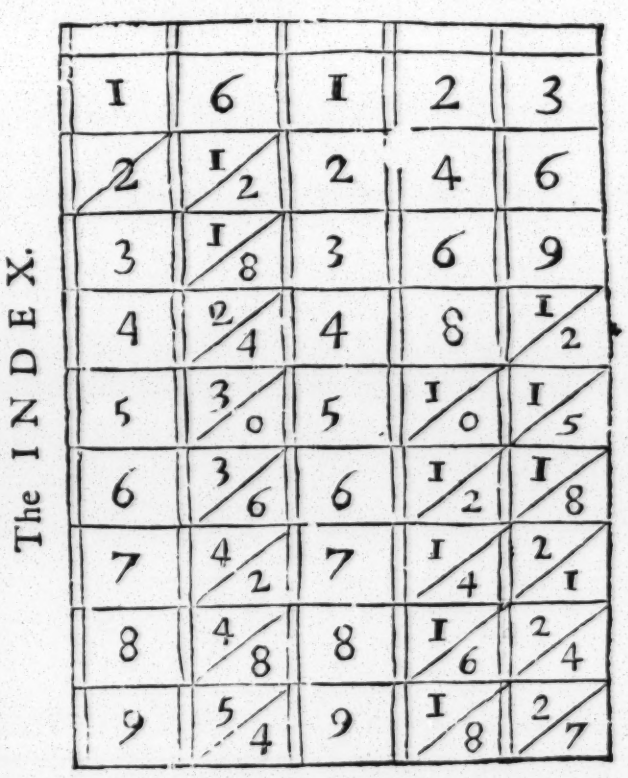
NEIPE TIDES, written alſo *Nepe* or *Neep* are thoſe Tides (when the Moon is in the middle of the ſecond and laſt Quarter) which are oppoſite to the *Spring-Tides*; and as the higheſt of the *Spring-Tides* is three Days after the Full or Change, ſo the loweſt of the *Neep* is four Days before the Full or Change; and then the Seamen ſay, that it is *Deep Neep*: Alſo when a Ship wants Water, ſo that ſhe cannot get out of a Harbour, off from the Ground, or out of the Dock, the Seamen ſay ſhe is *Neiped*.

NEOMENIUM, ſignifies only the *New Moon*, or *Change*.

NEPER's *Bones, or Rods*, are a kind of larger Multiplication Table, contrived by that Excellent Mathematician my Lord *Neper*, Baron of *Merchiſton* in *Scotland*, for the more eaſie multiplying, dividing, and extracting of Roots out of great Numbers.

Their Fabrick is very eaſie, as well as their Uſe: Both which follow.

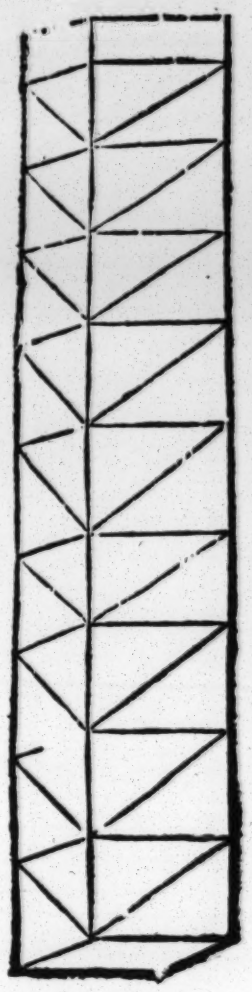
The Rods are beſt made of Wood or Ivory, four Square, having all the Digits on them, and their Multiplication to 9; being only *Pythagoras's* Table cut into pieces; they have an Index prefixed, ſhewing the Value of the Multiples to 9. The Complement. *viz.* Remainder to 9, is on the backſide of each Bone, the other Sides being diſpoſed in the moſt convenient form, the Figures repreſented being ſet on the Ends: But they are ſo common, and ſo well known, that there needs no further Deſcription of them.



Having any given Number to Tabulate, or to be laid down by the Rods: As ſuppoſe 6123.

From your Set of Rods, take as many of them as you have Numbers in your Figures, as here 4 Rods, having at the top of them the given Figures, which ſet in their reſpective Order as above; and the Product of the whole given Number into any of the Digits, you have right againſt that Digit, as the Index directs, taking the Sum of every Diagonal Square, and ſetting them down from the Right to the Left.

To Multiply by the Rods.



A Single ROD.

Set your Multiplicand down, or Tabulate it on the Rods, and take every ſeveral Product anſwering the Figures of your Multiplier; which, all added together, gives the Product: As if 6123 was to be multiplied by 356, having Tabulated the Multiplicand, (as you ſee above) the ſeveral Products thereof into each Figure of the Multiplier, you are directed to by the Index: Which being added together, (reſpect being had to the due placing, their Sum) is 2179788, which is the Product of 6123 by 356.

```

   356
------
 36738
 30615
 18369
------
2179788
```

Diviſion by Neper's *Bones.*

Tabulate your Diviſor, then you have it multiplied by all the Digits; out of which you may chooſe ſuch convenient Diviſors as will be next leſs to the Figures in the Dividend, and ſubſcribe the Index anſwering in the Quotient; and ſo continually, till the Work is done. Thus 2179788, divided by 6123, gives in the Quotient 356.

Having Tabulated the Diviſor 6123, then I ſee that 6123 cannot be had in 2179; therefore I take five Places, and on the Rods find a Number that is equal or next leſs to 21797, which is 18369, that is three times the Diviſor: I ſet 3 in the Quotient, and ſubtract 18369 from the Figures above, there reſts 3428; to which I add 8, the next Figure of the Dividend, and ſeek again on the Rods for it, or the next leſs, which I find to be 5 times; I ſet 5 in the Quotient, and ſubſtract 30615 from 34288, reſts 3673; to which I add 8, the laſt Figure in the Dividend, and finding it to be 6 times the Diviſor, ſet 6 in the Quotient.

```

2. Take the *Rod*, called the *Square Rod*, and ſet it to the Index, and ſeek for the Figures of the firſt Prick (57,) finding 49 the neareſt, ſet 7 in the Quotient, and ſubtract 49 from 57, there reſts 8.

3. To the Remainder (8) add the next two Figures to the next Prick (15) makes 815.

4. Double the Quotient 7, *viz.* 14, which Tabulate between the Index and the Square Rod each time after the Work; ſeek then upon the Rods for the next leſs or equal Number to the Figures 815, which I find to be 725, that is five times; ſet 5 in the Quotient, and after the Diviſor; then multiply and ſubſtract, and to the Remainder add the two Places to the next Point 36.

5. Double the Quotient 75, which is 150; this ſet betwixt the Index and the Square Rod, and work as before, you'll find the Root to be 756.

If your Root be not perfect, but ſomething remains after the laſt Subtraction, add a Cypher to the Square, and proceed.

To Extract the Cube Root by the Rods.

```

1. Point

1. Point every third Figure from the laſt, ſet the Cube Rod to the Index; ſeek the next leſs Cube on the Rod, which in the foregoing Example is 64, that is 4 times; ſet 4 in the Quote, and ſubſtract, reſt 27; to which add the three Figures to the next Point, the Sum is 27733.

2. Square the Figure found in the Quotient, and triple that Square, (and this muſt be done each time for a Diviſor) which ſet betwixt the Index and the Cube Rod: Thus here the 4 in the Quote, ſquar'd, gives 16; then tripled is 48, which ſet between the Index and the Cube Rod for a Diviſor.

3. Seek a Quotient (5) which ſet down, and the Number anſwering 24125 place as in the Example; but before you ſubtract, you muſt triple the Quote 4, which is 12, and multiply it by the Square of the laſt Figure 5. *viz.* 25; now 25 by 12 = 300, which place under 24125, one place forward to the Left Hand, and ſubſtract, there reſts 608. This Work muſt be repeated for each Figure in the Quotient, *viz.* to 608 and 851 for a Reſolvend; ſquare 45, and triple that Square, it gives 6075 for a new Diviſor, which placed next before the Cube Rod, ſhews it will be but 1 for the Quotient, which anſwers to 607501, which ſet down; and tripling 45, and multiplying it by 1, makes 135: This ſet one ſhort, their Sum will be 608851; ſo that after Subſtraction nothing remains. But if there remains any thing, add three Cyphers to it, for every Decimal Place you would have in the Root, and proceed as before.

NEPHELÆ, are ſmall White Spots upon the Eyes; alſo little Clouds, as it were, that ſwim in the middle of the Urine; likewiſe little white Spots in the Surface of the Nails like little Clouds.

NEPHRITICKS, are Medicines againſt the Diſeaſes of the Reins.

NEPHRITIS, is a Pain in the Reins, proceeding either from an ill Diſpoſition, or an Inflammation, or from the Stone and Gravel, accompanied with Vomiting and Stretching of the Thigh. *Blanchard.*

NEPHROS, is a Kidney, one on each ſide of the *Abdomen*, placed about the Loins under the Liver and Spleen; it is ſhaped like a Kidney-Bean: Its Subſtance is made up of a great Company of little Pipes. On both ſides it receives the *Serum* from the Glandules which border upon the Arteries, and carries it to the little Bodies in the Reins called *Carunculæ Papillares*, (which ſee) that ſo it may be diſcharged by the *Pelvis*, the *Ureters*, the *Bladder*, &c. See *Renes.*

NERVE, is an Organical Similar Part of an Human Body, being alſo of a fibrous round, long, white porous Subſtance, and whoſe Uſe is to convey the Animal Spirits ſo, as to make the Parts of the Body moveable and ſenſible.

The Nerves are ſuppoſed to contain a Threefold Subſtance; the Innermoſt of which is white and medullary, and is thought to proceed from the *Medulla Cerebri*; the other two are ſuppoſed to ariſe from the *Meninges* of the Brain: Of which the middle and ſofter comes from the *Pia mater*, and the outer and harder from the *Dura mater.*

All the Nerves take their Riſe from the *Medulla oblongata cerebri*, either within the Skull, or from its Continuation, when it becomes the *Medulla ſpinalis. Diemerbroeck* reckons 39 *Pairs* or *Conjugations of Nerves*, beſides the *Nervus ſine pari*; and he reckons that Nine Pair of theſe ariſe within the Skull, and the other 30 he ſaith come from the *Medulla ſpinalis*, through the Perforations of the *Vertebræ*; which he ſubdivides into the Eight *Cervical Pairs*, the Twelve *Thoracical*, the Five that come from the Region of the Loins, and the other Five which come from the *Os ſacrum*; to which the *Nervus ſine pari* is to be added, which ariſes from the End of the Spinal Marrow, and which ſome have taken for a kind of Ligament.

The Nerves do ordinarily accompany the Arteries thro' all the Body, that by the Pulſe of the Arteries, the Animal Spirits may be kept warm and moving.

The Nerves have alſo Blood-Veſſels attending them, which are ſpread uſually on their Coats; and do alſo ſometimes run in among the Medullary Fibres, as may be ſeen in thoſe of the *Retina.*

Where-ever a Nerve ſends out a Branch, or receives one from another, there is commonly a *Ganglio* or *Plexus*, as you may ſee at the Origin of all the Nerves in the *Medulla ſpinalis*, and in many Places of the Body.

NERVUS, in Botanicks, ſignifies a long Filament or rigid String, which runs a-croſs or length ways in the Leaf of a Plant. And thus, becauſe there are Five ſuch Nerves or Filaments running long ways in the Leaves of one kind of *Plantane*, that Plant hath been called *Quinque nerva.*

NETTINGS, in a Ship, are a ſort of Grate made with ſmall Ropes, and ſeized together with Rope-yarn; and are laid in the Waſt of a Ship ſometimes, to ſerve inſtead of *Gratings.*

NEURODES, is a ſort of lingering Fever, ſo called by the Learned Dr. *Willis*; becauſe that the Nervous Juice, departing from its own right and natural Craſis, becomes the Occaſion of an *Atrophy.*

NEUROLOGY, is an accurate Deſcription of, or Diſcourſe on, the Nerves of an Human Body.

NEUROTICKS, are Remedies againſt the Diſeaſes of the Nerves.

NEUROTOMY, is an Anatomical Section of the Nerves, for the Benefit of the Patient; and ſometimes alſo a pricking of the Nerves by unskilful Bleeding, &c.

NEUTRAL. Mr. *Boyle* calls ſome kind of Spirits which he could diſtil from Tartar, and ſome ponderous Woods, by this Name of *Neutral Spirits*, as alſo *Adiaphorous* and *Anonymous*; becauſe he found them very different in Quality and Nature from either the *Acid*, *Vinous*, or *Urinous* Spirits. For the Way of making it, ſee *Adiaphorous.*

NICHE, in Architecture, is a Cavity left deſignedly in the Wall of a Building, to place a Statue in.

NICTITANS *Membrana*, is a thin Purpliſh or Reddiſh Membrane or Film, which ſeveral Beaſts and Birds have to cover or ſhield their Eyes from Duſt, &c. they can draw it over their Eyes at pleaſure, and 'tis ſo very much thinner

than the Eye-lid, that they can ſee pretty well thro' it.

NIENT *compriſe*, is an Exception taken to a Petition, as unjuſt, becauſe the thing deſired is not contained in that Act or Deed, whereon the Petition is grounded. For Example, One deſireth of the Court to be put into Poſſeſſion of a Houſe, formerly amongſt other Lands, *&c.* adjudged unto him: The adverſe Party pleadeth, That this Petition is not to be granted, becauſe tho' he had a Judgment for certain Lands and Houſes, yet the Houſe, into the Poſſeſſion whereof he deſireth to be put, is not contained amongſt thoſe for which he had Judgment.

NIHIL, or *Nichil*, is a Word which the Sheriff anſwers, that is oppoſed concerning Debts illeviable, and that are nothing worth, by reaſon of the inſufficiency of the Parties from whom they are due.

NIHIL *dicit*, is a failing to put in Anſwer to the Plea of the Plaintiff by the Day aſſigned, which if a Man omit, Judgment paſſeth againſt him of Courſe by *Nihil dicit*; that is, becauſe he ſays nothing in his own Defence, why it ſhould not.

Nihil capiat per Breve, is the Judgment given againſt the Plantiff, either in Bar of his Action, or in Abatement of his Writ.

Nihil capiat per Billam, the ſame with *Nihil capiat per Breve*.

NIPPERS, are ſmall Ropes in a Ship about a Fathom or two long, with a little Truck at one End, and ſometimes only a Wale-knot; their Uſe is to help *hold off* the Cable from the Main or Jeer Capſtan, when the Cable is ſo ſlimy, ſo wet, or ſo great, that they cannot ſtrain it to *hold it off* with their bare Hands.

NISI *Prius*, is a Writ Judicial, which lieth in Caſe, where the Jury is Impannell'd, and return'd before the Juſtices, the one Party or the other requeſting to have this Writ for the eaſe of the Country, whereby the Sheriff is willed to cauſe the Inqueſt to come before the Juſtices in the ſame County at their coming; and it is called a Writ of the *Niſi prius*, of theſe two Words, whereby the Sheriff is commanded to bring to *Weſtminſter* the Men Impannell'd at a certain Day, or before the Juſtices of the next Aſſizes, *Niſi die Lunæ apud talem locum* prius *venerint*, &c.

NITRE, the ſame with Salt Petre. Some are mighty fond of the Notion of a *Volatile Nitre*, which abounds in the Air; and they attribute abundance of *Phænomena* to the Operation of the Nitrous Particles in the Air.

That the Air abounds with Saline Particles, is moſt certain; for being filled continually with *Effluvia* from the Earth and Sea, it muſt needs have from both a great Quantity of Saline Corpuſcles; and theſe will be of different Kinds according to the Variety of thoſe Salts from whence they are derived. But why theſe ſhould be moſtly ſuppoſed of a *Nitrous Nature*, is not ſo eaſie to prove; for Salt Petre is by no means found in a greater Quantity than the other Salts (eſpecially common Salt; nor is it of a much more Volatile Nature than they, nor capable of being raiſed more eaſily, or by a leſſer heat. But ſince Soot, and that which produces it, Smoak, is found to abound very much with a truly Volatile Salt; and ſince ſuch a kind of Salt is produced frequently by the Putrefaction of Animal and Vegetable Bodies, there is good reaſon to ſuppoſe the Air may abound with Salts of this kind: As alſo with many decompounded ones, of very different Kinds and Natures, and to which no proper name can well be aſſigned; and therefore they have been called *Anonymous*, by Mr. *Boyle*, and many others.

NOCTAMBULO, or *Noctambulus*, is one who walks in his Sleep.

NOCTURNAL, is an Inſtrument made of Box, Ivory or Braſs, divided on both ſides, to take the Altitude or Depreſſion of the Pole-Star, in reſpect to the Pole it ſelf, in order to find the Latitude and nearly the Hour of the Night.

NOCTURNAL *Ark*, is that Space in the Heavens which the Sun, Moon, or Stars, run thro' from their Riſing to their Setting.

NOCTURNLABE, is an Inſtrument uſed to find how much the *North Star* is higher or lower than the *Pole* at all Hours of the Night.

NOCTILUCA, is one of the two kinds of *Phoſphorus*; the former of which, ſuch as the *Bolonian Stone*, *Hermetick Phoſphorus Balduini*, &c. will not ſhine, except firſt expoſed to the Sunbeams, but this kind of *Noctiluca*, is a ſelf-ſhining Subſtance, which requires the being expoſed to no Light to render it Luminous: As the *Phoſphorus* made of Urine, *&c.* which ſee in *Phoſphorus*.

Mr. *Boyle* in his Book of the *Aerial Noctiluca*, reckons three of theſe *Noctilucæ*.

1. The *Gummous*, Conſiſtent or Conſtant one, (as ſome *Germans* call it) which is in the Form of a Conſiſtent Body.

2. The *Liquid Noctiluca*, which probably is only the former diſſolved in a proper Liquor.

The *Aerial Noctiluca*, becauſe it would immediately begin to ſhine, on being expoſed to the open Air. See the Proceſs for this laſt, P. 105. of the afore-mentioned Book, which being much the ſame with that of the *Phoſphorus*, commonly made out of Humane Urine, I have omitted. See *Phoſphorus*.

NODES, in *Aſtronomy*, ſignifie the Points of Interſection of the Orbit of the Sun, or any Planet, with the Ecliptick, ſo that the Point where a Planet paſſes over the Ecliptick, out of Southern into Northern Latitude, is called the North *Node*: And where it deſcends from North to South, 'tis the South *Node*; which *Nodes* (according to ſome) change their Places in the Zodiack, like the Planets: But Sir *Iſ. Newton* proves *Prop.* 14. *Lib.* 3. that the *Nodes* of all the Planets Orbits (as well as their *Aphelia*) are at Reſt.

NODULUS, *Nodus*, is a Bag of ſuch ſuitable Ingredients as the Diſeaſe requires, put into Beer or Wine, the Tincture whereof the Patient is to drink.

NODUS or *Node*, in *Dialing*, in a certain Point in the Axis or Cock of the *Dial*, by the Shadow of which, either the Hour of the Day in Dials without Furniture, or the *Parallels of the Sun's Declination*, his *Place in the Ecliptick*, the *Italian* or *Babyloniſh Hours*, &c. are ſhown, in ſuch Dials as have Furniture.

'Tis an eaſie thing, and ſometimes of good Uſe, to make Dials which ſhall ſhew the Hour of the Day by an Hole or

NODUS. One Method of which, Mr. *Collins* at the End of his Sector on a Quadrant, gives as follows.

Firſt, Draw an Horizontal Dial for the Latitude propoſed: Then by the Help of the Sun's Azimuth (which may be found by a Quadrant) or by knowing the Hour of the Day by that Horizontal Dial, draw a true Meridian from the *Hole* or *Nodus* propoſed, both above in the Ceiling, and below on the Walls and Floor of the Room; ſo that if a Right Line were extended from the ſaid *Hole* or *Nodus* to any Point in any of thoſe Lines, it would be in the Meridian Circle of the World.

Next, Fix the End of a Thread in the Centre of the *Hole* or *Nodus*, and move the other End thereof up or down in the ſaid Meridian drawn on the Ceiling or Wall, until by applying the ſide of a Quadrant to that Thread, it is found to be elevated equal to the Latitude of the Place, then that Thread is directly ſituated parallel to the Axis of the World, and the Point where the End of that Thread toucheth the Meridian either on the Ceiling or Wall, is that Point in the direct Axis ſought for; wherein fix one End of the Thread, which Thread will be of preſent Uſe in projecting the Hour-Points in any place propoſed.

Then place the Centre of the Horizontal Dial in the Centre of the *Hole* or *Nodus*, and ſituate it exactly parallel to the Horizon, and its Meridian in the Meridian of the World, (which may eaſily be done, if at the Inſtant you know the true Hour of the Day) then take the Thread, whoſe End is fixed in a Point in the direct Axe, and move it to and fro, until the Thread doth interpoſe between your Eye, and the Hour Line on the Horizontal Dial, and keeping your Eye in that Poſition, make a Point or Mark where you pleaſe, ſo that the Thread may interpoſe between that Point and your Eye; which Point ſo found, will ſhew the true Time of the Day at that Hour all the Year long, the Sun ſhining thereon, ſo will the Point and the ſaid Thread ſerve to ſhew the Hour inſtead of an Hour-Line.

In like manner, the Thread fixed in the Axis, may be again moved to and fro, until the Thread doth interpoſe between the Eye and any other Hour-Line deſired on the Horizontal Dial, and then (as before) make another Point or Mark in any Place at pleaſure, by projecting a Point from the Eye, ſo that the Thread interpoſe between that Point to be made, and the Eye, ſo will that Point ſo found ſhew the true Time of the Day for the ſame Hour that the Hour-Line did on the Horizontal-Dial, which was ſhadow'd by the Thread.

Thus you may proceed (by the help of that Thread and the ſeveral Hour-Lines on the Horizontal Dial) to find the other Hour-Points, which muſt have the ſame Numbers ſet to them, as the Hour-Lines on the Horizontal Dial have.

Otherwiſe, to make a Dyal from a Hole in any Pane of Glaſs in the Window, and to graduate the Hour-Lines on the Ceiling, Floor, &c. that Hole is ſuppoſed to be the Centre of the Horizontal Dial, and being true placed, the Stile thereof, if ſuppoſed continued, will run into the Point in the Meridian of the Ceiling before found, where a Thread is to be fixed; then let one extend a Thread faſtened in the Centre of the Horizontal Dial, parallel to the Horizon over each reſpective Hour-Line, and holding it ſteady, let another extend the Thread faſtned in the Meridian in the Ceiling, along by the Edges of the Horizontal Thread, which will find divers Points on the Ground, thro' which, if Hour-Lines be drawn, the Sun ſhining thro' the Hole in the Pane of Glaſs, will ſhew the Time of the Day.

For the Points that will be thus found on the Beam or Tranſome, the Thread fixed in the Ceiling, or inſtead of it a piece of Tape there fixed muſt be moved ſo up and down, that the Spot of the Sun may ſhine upon it; and being extended to the Tranſome or Beam, graduated with the Hour-Lines, it there ſhews the Time of the Day.

Note, That 'twill be convenient to have that Pane of Glaſs darkned, through which that Spot is to ſhine.

In like manner may a Dial be made from a Nail-head, a Knot in a String tied any where acroſs, or from any Pin driven into the Bar of the Window, and the Hour-Lines graduated upon the Tranſome or Board underneath.

To make a Reflected Dial on the Ceiling of the Room, is only the contrary of this, by ſuppoſing the Horizontal Dial, with its Stile, to be turned downwards, and run into the true Meridian on the Ground, where the Thread is to be fixed, and to be extended along the former Horizontal Thread (held over the reſpective Hours) upward, to find divers Points in the Ceiling.

NOLI *me tangere*, is a ſort of Canker in the Face, eſpecially above the Chin; there ariſes a Tumour or Ulcer about the Mouth and Noſe, like an exulcerated Canker, which grows ſlowly at the beginning, like a little Pimple; it remains a whole Year, otherwiſe is leſs troubleſome than a Canker, which gnaws and eats more in one Day, than a *Noli me tangere*, doth in a Month.

NOMBRIL or Navel-*Point* in an Eſcutcheon: See the Word *Eſcutcheon*.

NOMÆ, are deep and putrid Ulcers in the Mouth. *Blanchard*.

NOME, in *Algebra*, is any Quantity with a Sign prefixed to it, and by which 'tis uſually connected with ſome other Quantity, and then the whole is called a *Binomial*, or *Trinomial*, &c. Thus $a+b$ is called a *Binomial*, whoſe Names are a and b; and $a+b+c$ is a *Trinomial*, whoſe Names are a, b, and c, &c.

NON-ABILITY, in Law is an Exception taken againſt the Plaintiff or Defendant, upon ſome Cauſe why he cannot commence Suit in Law, as *Præmunire*, *Outlawry*, *Profeſt in Religion*, *Excommunicate*, or a *Stranger born*, which laſt holds only in Actions real and mix'd, and not in Perſonal, except he be a Stranger and an Enemy. The *Civilians* ſay, That ſuch a Man hath not *Perſonam ſtandi in judicio*.

NON *admittas*. See *Ne admittas*.

NONAGE, a Term in Law, ſignifying all that Time of a Man's Age, under One and twenty Years in ſome Caſes, and Fourteen in others, as Marriage.

NONAGESIMAL *Degree*, is the higheſt Point, or 90th Degree of the Meridian.

NON-

NON-CLAIM, a Term in Law, ſignifying the Omiſſion or Neglect, of him that ought to challenge his Right within a time limited, by which Neglect he is either barr'd of his Right, as at this Day upon *Non-claim* within five Years after a Fine, and Right to him accrued; or of his *Entry* by his Deſcent, for want of *Claim*, within five Years after the *Diſſeiſin*.

NON *compos mentis*; That is, not of ſound Memory or Underſtanding; of ſuch in Common Law they reckon:

Firſt, An Ideot Born.

Secondly, He that by Accident wholly loſeth his Memory and Underſtanding.

Thirdly, A Lunatick, that hath *Lucida intervalla*; ſometimes has Underſtanding, and ſometimes not.

4. He that by his own Act for a Time depriveth himſelf of his right Senſes, as a Drunkard; but this laſt kind ſhall give no Privilege to him or his Heirs.

NON *diſtringendo*, is a Writ compriſing under it divers Particulars, according to divers Caſes. See Tab. of *Orig. Reg.* Verb. *non diſtringendo*.

NONES of a Month, are the next Days after the Kalends, which is the firſt Day. In *March*, *May*, *June* and *October*, the *Romans* accounted ſix Days of the *Nones*, but in all the reſt of the Months but four. They had this Name probably becauſe they were always 9 Days incluſively, from the firſt of the *Nones* to the *Ides*; *i. e.* reckoning incluſively both thoſe Days.

NON *eſt Culpabilis*, in Law, ſignifies the general Plea to an Action of Treſpaſs, whereby the Defendant doth abſolutely deny the Fact imputed to him by the Plaintiff; whereas in other Special Caſes the Defendant but alledgeth ſome reaſon in his own Defence.

NON *eſt factum*, is an Anſwer to a Declaration, whereby a Man denieth that to be his Deed, whereupon he is Impleaded.

NON *Implacitando aliquem de libero tenemento ſine brevi*, is a Writ to inhibit Bayliffs, *&c.* from diſtraining any Man without the King's Writ, touching his Free-hold.

NON *Intromittendo, quando breve de Præcipe in Capite ſubdole impetratur*, is a Writ directed to the Juſtices of the Bench, or in *Eyre*, willing them not to give one that hath, under colour of Intitling the King to Land, *&c.* as holding of him *in Capite*, deceitfully obtained the Writ called *Præcipe in Capite*, but to put him to his Writ of Right, if he think good to uſe it.

NON *Mercandizanda Victualia*, is a Writ directed to the *Juſtices of Aſſize*, commanding them to enquire, Whether the Officers of ſuch Towns do ſell Victuals in Groſs, or by Retail, during their Office, contrary to the Statute, and to puniſh them if they find it true.

NON *Moleſtando*, is a Writ that lieth for him which is *Moleſted*, contrary to the King's Protection granted him.

NON-*Natural Things*, or the *Non-Natural Cauſes of Diſeaſes*, as the Phyſicians reckon them are ſix, *viz.* The Air, Meat and Drink, Sleep and want of Sleep, the Motions and Repoſe of the Body, the Retention, or Evacuation of the Excrements and Recrements of it, and the Paſſions of the Mind.

NON-*Organical Part* of an Animal, is that whereto ſome Uſe is only appropriated, but no Action, as a Griſtle, Bone, Foot, *&c.*

NON *Obſtante*, is a Clauſe frequent in Statutes and Letters Patent; it ſignifies *Notwithſtanding*, and was firſt brought in by the *Pope*, and in the Reign of *Hen.* 3. was uſed by that King in his Grants, *&c.*

NON *omitt. propt. aliquam libertat.* is a Writ that lies where the Sheriff returns upon a Writ to him directed, that he hath ſent to the Bayliff of ſuch a Franchiſe which hath the return of Writs, and he hath not ſerved the Writ, then the Plaintiff ſhall have this Writ directed to the Sheriff to enter into the Franchiſe, and execute the King's Proceſs himſelf. Alſo the Sheriff ſhall warn the Bayliff, That he be before the Juſtices at the Day mentioned in the Writ, and if he come not, then all the *Judicial Writs*, during the ſame Plea, iſſuing, ſhall be Writs of *Non Omittas*, and the Sheriff ſhall execute the ſame.

NON *Ponendis in Aſſiſis & Juratis*, is a Writ founded upon the *Statute of Weſt.* 2 cap. 38. and *Articuli ſuper Chartas*, cap. 9. which is granted upon divers Cauſes to Men, for the freeing them from *Aſſizes* and *Jurors*.

NON *Procedendo ad Aſſiſam Rege inconſulto*, is a Writ to ſtop the Trial of a Cauſe appertaining unto one that is in the King's Service, *&c.* until the King's Pleaſure be further known.

NON *Reſidentia pro Clericis Regis*, is a Writ directed to the Ordinary, charging him not to moleſt a Clerk employed in the King's Service, by reaſon of his *Non-Reſidence*.

NON-*Reſidence*, in Law, is applied to ſuch Spiritual Perſons as are not Reſident on, but do abſent themſelves for the ſpace of a Month or two, at ſeveral times in one Year from their Benefices, for *Perſonal Reſidence* is required of Eccleſiaſtical Perſons upon their Cures.

NON *Sane Memory*, in Law, is an Exception taken to an Act declared by the Plaintiff or Demandant, to be done by another, whereupon he grounds his Plaint or Demands: And the Effect of it is, That the Party that did that Act was mad, or not well in his Wits when he did it. See *Non compos mentis*.

NON *Solvendo Pecuniam ad quam Clericus mulctatur pro non Reſidentia*, is a Writ prohibiting an Ordinary to take a Pecuniary Mulct impoſed upon a Clerk of the King, for *Non-Reſidence*.

NON-*Suit*, in Law, is Renouncing of the Suit by the Plaintiff or Demandant, moſt commonly upon the Diſcovery of ſome Error or Defect, when the Matter is ſo far proceeded in, as that the Jury is ready at the Bar to deliver their Verdict. The *Civilians* term it, *Litis renunciationem*. And in what Caſes a Man cannot be *Non-Suit*. See the Statute of 2 *H.* 4. *cap.* 7.

NON *Sum Informatus*. See *Informatus non Sum*.

NON *Tenure*, in Law, is an Exception to a Count, by ſaying, That he holdeth not the Land ſpecified in the Count, or at leaſt ſome part of: And 'tis either *Non tenure General*, or *Non tenure Special*: The *Special Tenure*. is an Exception, alledging that he was not Tenant the Day when the Writ was purchaſed. *Non tenure General*, is when one denies himſelf ever to have been Tenant to the Land in Queſtion.

NORMAL, the ſame with Perpendicular, or at Right Angles, and 'tis uſually ſpoken of a Line or a Plane that Interſects another Perpendicularly.

NORTHERN *Signs of the Ecliptick or Zodiack*, are thoſe Six which conſtitute that Semi-circle of the Ecliptick which inclines to the Northward from the Equator, as *Aries*, *Taurus*, *Gemini*, *Cancer*, *Leo*, *Virgo*.

NOSOCOMIUM, is an Hoſpital for Poor Sick People, where they are attended, and cured, if poſſible.

NOTES in Muſick, are certain Terms invented to diſtinguiſh the Degrees of Sound in Tuning, and the Proportion of Time thereto belonging: For in regard that a Voice doth expreſs a ſound beſt, when it pronounceth ſome Syllable or Word with it, ſix ſelect Syllables were formerly uſed to that Purpoſe, aſcending and deſcending in order, *viz. Ut*, *Re*, *Mi*, *Fa*, *Sol*, *La*; but four of them, *viz. Mi*, *Fa*, *Sol*, *La*, being found ſufficient for the right Tuning of all the Degrees or Sound, and leſs burthenſome to the Memory, the other two, *Ut* and *Re*, are generally now laid aſide as ſuperfluous. It is reported, That *Guido Aretinus*, having undertaken to reduce the *Greek* Scale of Muſick to a more regular form about *A. D.* 960, aſſumed for the Names of theſe ſix Notes as many Syllables taken out of the *Sapphick* Hymn of St. *John Baptiſt*, which began thus:

Ut *queant Laxis* RE*ſonare fibris*,
MI*ra Geſtorum* FA*muli tuorum*,
SOL*ve polluti* LA*bii reatum*.

As for other ſort of Notes relating to Time, they are Nine in Number, viz. *Large*, *Long*, *Breve*, *Semi-breve*, *Minim*, *Crotchet*, *Quaver*, *Semi-quaver*, and *Demi-ſemi-quaver*. The four firſt are uſually termed *Notes of Augmention, or Increaſe*, and the five laſt of *Diminution* or *Decreaſe*. The *Semi-breve* being the laſt of Augmentation, is commonly called the *Maſter-Note*, or *Meaſure-Note*, or *Time-Note*, becauſe it is of a certain determinate *Meaſure* or Length of *Time* by it ſelf; and all the other Notes both of *Augmentation* and *Diminution*, are meaſured by, or adjuſted to its value: But it ought to be obſerved, that the *Large* and *Long* are now of little uſe, as being too long for any Voice or Inſtrument (the *Organ* only excepted) to hold out to their full length; altho' their *Reſts* are ſtill very often uſed, more-eſpecially in Grave Muſick, and Songs of many Parts.

NOTHÆ *coſtæ*, are the five loweſt Ribs on each ſide, called Baſtard Ribs; ſo named, becauſe they do not join with the Breaſt-bone as the other Ribs do, nor are they as the others, Boney, but Cartilaginous.

Diſeaſes are likewiſe called *Nothi*, or Baſtard, when they agree not with the Ordinary and Common Rules, as *Tertian*, *Quartan*, and *Quotidian*, Baſtard Agues, *Baſtard Pleuriſies*, &c.

NOTIONAL *Quantity*. See *Quantity*.

NOVACULA, is a Chirurgeon's Knife, the Shape whereof differs according to the Difference of Operations.

NOVAL *Aſſignment*, in Law, is an *Aſſignment* of Time, Place, or the like, otherwiſe than as it was before *aſſigned*. See *Aſſignment*.

NOVEL *Diſſeiſin*. See *Aſſize of Novel Diſſeiſin*.

NOUNS (in *Grammar*) are ſuch Words as ſignifie the ſeveral Objects of our Thoughts.

NUBECULÆ are little light Particles which mutually, but looſely cloſe with one another, and ſwim upon the Urine.

NUCAMENTUM in *Phytology*, or *Botanicks*, is the ſame with *Julus*. Which ſee.

NUCHA is the hinder part, or Nape of the Neck, called alſo *Cervix*.

NUCIOSITAS: the ſame that *Myopia*.

NUCIFEROUS *Plants or Shrubs* are ſuch as bear Nuts.

NUCKIANÆ *Glandulæ*, are a ſort of Glands (firſt taken notice of by Dr. *Nuck*) ſeated in that Orbit of the Skull, wherein the Eye is placed betwixt the abducent Muſcle of the Eye, and the upper part of the *Os jugale*. Their Shape is various, in ſome Oblong, in others flattiſhly Round, in others Oval, and in others ſomewhat Triangular.

NUCLEUS is the Edible part of the Kernel of any Nut, which is contained within the Skin of the Kernel; and in a larger Senſe is by Botaniſts uſed for any Fruit or Seed contained within an Husk or Shell.

NUCLEUS alſo in an Aſtronomical Senſe is by *Hevelius* and others uſed for the Head of a *Comet*, and by others for the Central Parts of any Planets.

NUCLEUS, in Architecture, is the middle part of the Flooring of the Ancients, conſiſting of Cement, which they put betwixt a Lay or Bed of Pebbles cemented with Mortar made of Lime and Sand.

NUDE *Contract*, in Law, is a bare Promiſe of a thing, without any conſideration; and therefore 'tis ſaid, *Ex nudo pacto non oritur actio*.

NUDE *Matter*, in Common Law, is a naked Allegation of a thing done to be proved only by Witneſſes, and not either by Record or other Speciality in Writing under Seal.

NUMBER is Diſcrete Quantity, or a Collection of Unites, and is that which teacheth us to know *how many* any of the Objects of our Knowledge are.

Every Number in *Arithmetick* (which is the Art of Numbering truly) may be conſidered as compoſed of two Parts, of which one may be called the *Denominator*, and the other the *Numerator*.

Thus the Number 9, as it ſignifies the Thing Numbered, as the 9 Muſes, or 9 Men, 9 Pounds, *&c.* is a *Denominator*: But as it expreſſes how many of that thing are taken or accounted, it is a *Numerator*. Therefore when the *Denominator* ſignifies a whole thing, the Number is called an *Integer*; but if it ſignifie or ſtand for the Parts of any thing, then the Number is a *Fraction*.

Thus Nine Shillings, conſidered as diſtinct Things, are an *Integral Number*; but when you conſider them as $\frac{9}{20}$ Parts of a Pound *Sterling*, that Number is a *Fraction*: And the Knowledge of this will facilitate the Underſtanding of the *Doctrine of Fractions*, which appears difficult to Beginners, becauſe they do not conſider that as well *Integer Numbers* as *Fractions* have both Numerators and Denominators: The Difference lying chiefly here, That in *Integers* the *Ratio* of the Denominators is certain, one and the ſame; but in

in *Fractions* 'tis innumerable: For the *Ratio* of the Denominators in *Fractions* is as various as the Nature of the Parts into which any Whole may be divided, which in *Vulgar Fractions* is Infinite. *Well's Arithmetick.*

NUMERATION, in Arithmetick, is the true *Diſtinction, Eſtimation,* and *Pronunciation* of Numbers, or the Rule to read any Number, tho' never ſo great, and to have a diſtinct Idea of each Place or Figure of it; which may eaſily be done by this Method: Beginning at the Right Hand, make a Point or Prick under the Seventh Figure, and over it place the Figure 1, that is the Place of *Millions.* Now Seven Places any one can number or read, but they are apt to be puzled when they go farther; but 'tis as eaſie to read 700 Places as Seven, if you do but go in this Method; accounting in the Seventh Place, over which you put the Figure 1, tell on Seven Places more, and over *that* place the Figure 2. The Number under 2, ſtands in the place of *Millions of Millions,* which is better expreſſed by *Billions,* (i. e. *Bi-millions.*) Including the laſt Figure, tell on again Seven Figures more, and then place over the Seventh the Figure 3; this is the Place of *Trillions*; and the Seventh beyond that will be *Quartillions*; the next Seventh *Quinquillions,* &c. according as the Figures over every Seventh Place do ſhew. Thus, ſuppoſe this Number,

9 8 7 6 5 4
468790356789463250123897654320178960

3 2 1
7345321234567898765432100

After you have *diſtinguiſhed* it, as you ſee, by the Pricks under, and *eſtimated* it by the Figures over it; you will find the firſt Period, beginning at the Left Hand, and reading to the Point, to be 46 *thouſand* 879; and you cannot be ignorant of the Value of Nine, the laſt Figure, when you ſee the 9 ſtanding over it; for that ſhews you 'tis *Nonillions,* or the Place of a *Million* multiplied 9 times by it ſelf. The next Period is 35 *Thouſand* 678 *Octillions*; the next is 46 *Thouſand* 325 *Septillions*; and ſo on till you have read or pronounced them all: Only obſerving to expreſs at every Point the Value of the Figure over it, which the Figure on the top ſhews you readily how to do.

NUMERATOR of a Fraction, is that Part of it which ſhews or numbers how many of thoſe Parts which any Integer is ſuppoſed to be divided into, are expreſſed by the Fraction. Thus in $\frac{6}{8}$, 6 is the Numerator, (which ſtands always above the Line) and ſhews you, that if any Whole be divided into 8 Parts, you number and enumerate, or take 6 of them, *i. e.* Three quarters.

NUMERAL *Algebra,* is that which makes uſe of Numbers inſtead of the Letters of the Alphabet; which latter Method is called *Algebra in Species,* or *Specious Arithmetick.*

NUNCUPATIVE *Will.* See *Will.*

NUPER *Obiit,* is a Writ that lies for a Coheir, being deforced by her Co-parcencer of Lands or Tenements, whereof any of their Anceſtors died ſeized of an Eſtate in Fee-ſimple.

NUSANCE, a Term in Law, ſignifying not only a Thing done, whereby another Man is annoyed in his Free Lands or Tenements, but the Aſſiſe or Writ which lieth for the ſame; and now generally, inſtead of this, is brought in Actions of Treſpaſs.

NUTRITION, is a Natural Increaſe, whereby that which continually decays of any Corporeal Subſtance, is repaired by convenient Nouriſhment.

Dr. *Havers,* in his *Oſteologia,* will not have Nutrition to be any Reparation of the Loſs of the Subſtance of the Solid Parts ordinarily, but only a continual Succeſſion and Supply of Spirits, and of all thoſe Fluid Parts which fill the containing Parts, and keep them diſtended.

NUX, is a ſort of Pain in the Head, which afflicts a Place as big as a Nut; as an *Ovum* or *Clavus* is another ſort, where the Seat of the Pain is larger.

NYCHTHEMERON, is Four and twenty Hours Space, or an entire Day and Night.

NYCTALOPIA is Two-fold: The Firſt is a Dimneſs of the Sight in the Night, or in dark Places, without any Impediment in the Light. The other is Dimneſs in the Light, and clear Sight in the Night, or in ſhady Places.

NYMPHÆ, are little ſoft Pieces of Fleſh, ariſing from the Commiſſure of the *Os pubis* within the *Vagina*; ſo called, becauſe they ſtand near the Paſſage of the Water that comes out of the Bladder.

Alſo the Hollowneſs or void Space in the Nether Lip is ſo called.

NYMPHOMANIA, the ſame with *Furor Uterinus.*

NYMPHOTOMY, is a Cutting off the *Nymphæ,* the too great Protuberance whereof in Marriageable Virgins ſometimes hinders the *Coitus,* or at leaſt renders it difficult. The *Egyptians* cut them frequently, as *Galen* ſaith; but in our Parts of the World ſuch Inſtances have been very rare.

OAK

OAKHAM, (a Term uſed in the Yards for building Ships) is Old Ropes untwiſted and pulled again out fine, into looſe Hemp or Flax, with a Deſign to drive it into the Seams, Trennels, and Rends of a Ship, to ſtop or prevent a Leak.

OAZY, or *Oazie Ground:* So the Seamen call ſoft, ſlimy, muddy Ground. This is not good Anchorage, becauſe the Anchor cannot hold firm, but will *come home* (as they call it) in a Streſs of Weather; beſides it will rot their Cables, if a Ship ride long over ſuch Ground: But then it is good to bring a Ship a-ground upon, becauſe ſhe can there dock herſelf, and lie ſoft; but yet if ſhe lie long, ſhe will rot her Plank, and ſpoil the Oakham in her Seams.

OBELÆ, is the *Sagittalis Sutura* in the Skull, (ſee *Sagittalis*) which touches the *Coronal* Suture forward, and the *Lamdoidal* backward; for it is made of the Mutual Conjunction of the Bones of the Forehead. *Blanchard.*

OBELISK, is a magnificent high Piece of Solid Marble, or other fine Stone; having uſually Four Faces, and leſſening upwards by Degrees, till it ends in a Point like a Pyramid.

OBJECTIVE *Line.* See *Line Objective.*

OBJECT-*Glaſs*, of a Teleſcope or Microſcope, is that Glaſs which is placed at that End of the Tube which is next the Object.

OBLATA, is a Word uſed in the *Exchequer*, ſignifying old Debts brought together from precedent Years, and put to the preſent Sheriff's Charge.

OBLIGATION, is a Bond containing a Penalty, with a Condition annex'd, either for Payment of Money, Performance of Covenants, or the like; and ſo differs from a Bill that hath no Penalty nor Condition; and yet a Bill may be Obligatory.

OBLIGOR, is he that enters into ſuch an Obligation; and *Obligee*, the Perſon to whom it is entred into.

OBLIQUE *Aſcenſion*, is that Degree and Minute of the *Equinoctial* which riſeth with the Centre of the *Sun* or *Star*, or with any Point of the Heavens, in an Oblique Sphere.

To find the Sun's Oblique Aſcenſion *by the Globe.*

Bring the Sun's Place to the Horizon on the Eaſt-ſide; and the Number of Degrees intercepted between that Degree of the Equinoctial which is now come to the Horizon, and the Beginning of *Aries*, is the *Oblique Aſcenſion.*

To find the Oblique Aſcenſion, *having the* Right Aſcenſion *and* Aſcenſional Difference *given.*

1. If the Declination be North, the Difference between the *Right Aſcenſion* and the *Aſcenſional Difference*, is the *Oblique Aſcenſion* required.

2. If the Declination be South, the Sum of the *Right Aſcenſion*, and the *Aſcenſional Difference*, is the *Oblique Aſcenſion.*

OBL

To find the Oblique Deſcenſion.

1. If the Declination be North, the Sum of the *Right Aſcenſion*, and *Aſcenſional Difference*, is the *Oblique Deſcenſion.*

2. If the Declination be South, the Difference between the *Right Aſcenſion*, and the *Aſcenſional Difference*, is the *Oblique Deſcenſion.*

OBLIQUE *Angles.* See *Angles Oblique.*

OBLIQUE *Deſcenſion*, is that part of the *Equinoctial* which ſets with the *Sun* or *Star*, or with any Point of the Heavens, in an Oblique Sphere.

OBLIQUE *Plains*, in Dialing, are ſuch as *recline* from the *Zenith*, or *incline* to the *Horizon*: The Obliquity of which *Inclination* or *Reclination*, is eaſily found by a Quadrant: Being an Ark of ſome Azimuth or Vertical Circle intercepted between the Vertex of the Place and of that Plane; alſo obſerve, this Azimuth or Vertical Circle is always perpendicular to the Plane.

OBLIQUE *Sailing*, is when the Ship runneth upon ſome Rhumb between any of the Four Cardinal Points, making an Oblique Angle with the Meridian; and then ſhe changeth continually both Latitude and Longitude. There are Three kinds of *Oblique Sailing*, viz. *Plain Sailing*, *Mercator's* or *Wright's Sailing*, and *Great Circle Sailing*; which ſee.

The Seamen call alſo the Application of the Method of Calculating the Parts of Oblique Plane Triangles, in order to find the Diſtance of a Ship from any Cape, Head-Land, &c. *Oblique Sailing.*

OBLIQUE *Sphere*, is where the Pole is elevated any Number of Degrees leſs than 90 Degrees, and conſequently the Axis of the World, the Equator, and Parallels of Declination, will cut the Horizon obliquely; whence comes its Name.

OBLIQUUS *Superior*, a Muſcle of the Head, which ariſeth fleſhy from the back-part of the tranſverſe Proceſs of the Firſt *Vertebra* of the Neck, and in its ſomewhat oblique Aſcent becometh a fleſhy Belly, and leſſening it ſelf again, is inſerted to the *Os Occipitis*, laterally. By this together with its Partner, (they never acting ſeparately) the Head is moved backwards on the firſt *Vertebra.*

OBLIQUUS *Inferior*, is a Muſcle of the Head, ariſing fleſhy from the External Part of the Spinal Proceſs of the ſecond *Vertebra* of the Neck, cloſe by the Origination of the *Rectus Major*; and being dilated into a fleſhy Belly, paſſes obliquely to its Inſertion at the tranſverſe Proceſs of the Firſt, where the former Muſcle begins.

When this acts on either ſide, the tranſverſe Proceſs of the Firſt *Vertebra* of the Neck is moved towards the Spine of the Second; wherefore ſome Authors have reckoned it among the Muſcles of the Neck. But ſince the Head is alſo moved thereby, and the Face turned on that ſide on which it acteth, it is not improperly reckoned

amongſt the Muſcles that move the Head; it is aſſiſted by the *Maſtoidæus*.

OBLIQUUS *Superior*, or *Trochlearis*, is a Muſcle of the Eye, which receives its Firſt Denomination from its oblique Poſition and Courſe, in regard of the reſt of its Fellows. The Second, it derives from that Cartilaginous Ring ſuſpended near the Brink of the upper Part of the Orbit towards the Noſe, thro' which its Tendon paſſes, being reflected on it, as a Rope on a Pulley: Beſides which, it is called *Longiſſimus Oculi*, as exceeding the other in Length. Its Uſe is to help roll the Eye up and down.

It ariſes ſharp and fleſhy from the deepeſt part of the Orbit, near the Origination of the *Abducens*, and becoming a fleſhy Belly as it paſſes obliquely cloſe under its Superior Part, makes a round Tendon running thro' the *Trochlea*, (as above-mentioned) from whence reverting back, it is inſerted to the *Tunica Sclerotis*, in the Middle of the Diſtance between the Termination of the *Attollens* and Optick Nerve, towards the back-part of the Bulb of the Eye.

OBLIQUUS *Inferior*, is a Muſcle called alſo *Breviſſimus Oculi*, it being the ſhorteſt Muſcle of the Eye. This ſprings ſharp and fleſhy from immediately within the lower and almoſt outward Part of the *Orbit*, at the Juncture of the Firſt Bone of the upper Jaw, with the Fourth; and becoming thicker, aſcends obliquely over the *Deprimens*, growing tendinous at its Inſertion to the *Tunica Sclerotis*, near the Implantation of the former, directly betwixt the *Abducens* and Optick Nerves.

Its Uſe is to help roll the Eye to and fro, and therefore this and the former are by ſome called *Circumagentes* and *Amatorii*. Some alſo reckon Two other Muſcles belonging to the Eye, which are called by this Name *Oblique*, viz.

OBLIQUUS *Major*, a Muſcle that pulls the Eye forwards and obliquely downwards.

OBLIQUUS *Minor*, is a Muſcle that pulls the Eye forwards and obliquely upwards.

OBLIQUUS *Aſcendens ſive Acclivis*, one of the large Muſcles of the *Abdomen*, ſerving to compreſs the Belly, and by that means to help the Diſcharge of the Ordure and Urine; it alſo compreſſes and ſtraitens the Cavity of the *Thorax* in Exſpiration, and helps to turn the Trunk of our Body to either ſide, when our Feet ſtand ſtill; and ſo is a kind of *Antagoniſt* to the *Obliquus Deſcendens*, which ſee.

It ariſes fleſhy from the whole circular Edge of the *Os Ilium* and *Ligamentum Pubis*; and thence mounting with an Order of Fibres, inclining forwards, it forms a broad membranous thin Tendon, which is implanted into the whole Length of the *Linea Alba*, and the Cartilages of the 8th, 9th, 10th, and 12th Ribs.

OBLIQUUS *Deſcendens ſeu Declivis*, the Name of one of the large *Epigaſtrick Muſcles*, or Muſcles of the *Abdomen*: Beſides its Uſe, in common with the reſt, to compreſs the Inteſtines and Bladder, and to help exclude the *Fœtus*; Mr. *Cowper* aſſigns it another, not obſerved before by any one (except Dr. *Gliſſon*) which is to move our Body round to either ſide when our Feet ſtand ſtill. It ariſes with ſeveral acute Productions, partly fleſhy and partly tendinous, from the lower Margin of the Sixth, Seventh, and Eighth Ribs, where its ſeveral ſeparate Originations lie between the Indentations of the *Major Anticus*: Beſides theſe, it continues to derive more Heads from the Ninth, Tenth, Eleventh, and ſometimes from the Extremity of the loweſt Baſtard-Rib, where it is alſo indented with the *Serratus Inferior Poſticus*; thence its oblique deſcending fleſhy Part expands it ſelf into a broad membranous Tendon, before it marches over the *Rectus* to its Inſertion in the *Linea Alba* and the *Os Pubis*; after this deſcending, it ends partly tendinous in the *Ligamentum Pubis*, but chiefly fleſhy on the upper and fore-part of the circular Edge of the *Os Ilium*.

OBLIQUUS *Auris*, is a Muſcle of the Ear, which may be alſo called *Semi-circularis*, from its Poſition, it lying in the external Parts of the Bony Channel of the *Aquæduct*, whence marching ſomewhat upwards and backwards, it enters the *Tympanum* in a very oblique Sinuoſity excavated immediately above the Bone where the *Tympanum* is inchaſed, and is inſerted to the ſlender Proceſs of the *Malleus*. The Sinuoſity in which this Muſcle paſſes, is that which may be taken notice of in the upper Part of the Bony Circle of the *Fœtus*. This we don't find deſcribed any where, before *Du Verney*.

OBLONG, in Geometry, is the ſame with a Rectangle Parallellogram, whoſe Sides are unequal.

OBSCURA *Camera*, in Opticks, is a Room darkened, all but in one little Hole, in which is placed a Glaſs to tranſmit the Rays of Objects to a piece of Paper or white Cloth: But by it are made many uſeful Experiments in Opticks, ſerving to explain the Nature of Viſion; and among which, the following one deſerves a particular Deſcription.

To repreſent all outward Objects in their proper Colours, Diſtances and Proportions, on a White Wall, a Frame of Paper, or Sheet hung up for that purpoſe in a Darkened Room.

This moſt Wonderful and Glorious Experiment, tho' it be very common, will yet well deſerve to have a clear Account given of it here; for I don't remember to have read a plain and intelligible Deſcription of its *Apparatus* any where; neither is it ſo eaſie to do it with Advantage, as thoſe perhaps who never tried it may imagine; what follows therefore you may relie on as the Reſult of my own repeated Experience.

Procure a good Convex, or Plano-Convex Glaſs, ſuch an one as is made uſe of for the Object Glaſs of a Teleſcope; and if you have a good Teleſcope that draws about 6 Feet, you may unſcrew its Object Glaſs, and it will ſerve your Turn very well: And indeed a Glaſs that draws about that length (tho' 4 or 5 Foot will do pretty well) is the fitteſt on all Accounts to make this Experiment withal; for if you uſe a ſmall Glaſs whoſe Focus is not above a Foot, or thereabouts diſtant from the Hole, the Repreſentation of your Objects will be very ſmall, and the Figures hardly large enough to be diſtinguiſhed: To which likewiſe may be added, that not above one Spectator can come to look on it at a time, and even he not without ſome Trouble.

On the other hand, if you make uſe of a Glaſs which draws 15, 20, or 25 Foot, either your Hole

Hole muſt be very large, and then ſo much Light will come in as will hinder the Objects from being viſible on the Wall, Paper, &c. or if the Hole be but ſmall, ſo little Light will come in, that at the Diſtance of 15 or 20 Foot from the Window, you will have hardly Light enough to ſee the Repreſentation diſtinctly; ſuch large Glaſſes likewiſe are not eaſily had every where, nor are they every one's Money; but a Glaſs that draws about ſix Feet, is very proper to be made uſe on in this Caſe.

Having gotten ſuch a Glaſs, make Choice of ſome Room which hath a North-Window, tho' an Eaſt or Weſt may do well enough (but a South one will not, for a Reaſon to be given below) and let it be well darkened, ſo that no Light can come into it, but at the Hole where your Glaſs is placed, or at leaſt but very little. Then make a Hole in the Shutter of the North-Window of about an Inch, or an Inch and $\frac{1}{4}$ in Diameter, and leave open the Caſement, if there be one, for there muſt be no Glaſs without your Hole. Then faſten the Glaſs with its Centre in the Centre of the Hole, by ſome ſmall Tacks to the Shutter, ſo that no puff of Wind blow it down, and break it; and at the Diſtance that you know your Glaſs draws, hang up a white Sheet; or if you do not know exactly the Focus of the Glaſs, move the Sheet to and fro 'till you find the Objects are repreſented on it very diſtinctly, and then you may faſten it there by Nails to the Ceiling, &c. Then will whatever is without the Hole, and oppoſite to it, be repreſented on that Sheet with ſuch exquiſite Exactneſs, as far ſurpaſſes the utmoſt Skill of any Painter to expreſs. For if the Sun ſhine brightly on the Objects (as indeed this Experiment is never made well when it doth not) you will have the Colours of all Things there in their Natural Paint, and ſuch an admirable proportion of Light and Shadow, as is impoſſible to be imitated by Art; and I yet never ſaw any thing of that kind that comes near this Natural Landſcape. But if the Sun do not ſhine, the Colours will be hardly viſible, and all will look dirty, dark, and confuſed; therefore I adviſed a North-Window, that you may have the Meridian Sun ſhining on your Object in its greateſt Splendor, that ſo the Experiment may be in its greateſt Perfection: But you muſt by no means have the Sun ſhine on or near the Hole, for if it doth, all will be confuſed.

Another Thing in which this Repreſentation exceeds Painting, is, That here you have *Motion* expreſſed on your Cloth. If the Wind move the Trees, Plants or Flowers without, you have it within on your lively Picture; and nothing can be more pleaſant than to ſee how the Colours of the moving Parts will change as they do without, by their being in various Poſitions obverted to, or ſhaded from the Light. The Motion of any Flies or Birds, is painted alſo in the ſame Perfection: And the exact Lineaments of any Perſons walking at a due diſtance without the Glaſs, will be alſo expreſſed to the Life, and all their Motions, Poſtures and Geſtures, will as plainly appear on the Cloth, as they do to any one's Eye without.

In a Word, Nothing is wanring to render it one of the fineſt Sights in the World, but that all things are inverted, and the wrong End upwards. To remedy which, ſeveral Methods have been thought on, as double Convex-Glaſſes, &c. but none, in my Opinion, are ſo well, nor ſo eaſie, as to take a common Looking-Glaſs of about 12 or 14 Inches Square, and hold it under or near the Chin, with an acute Angle to your Breaſt: For if you do ſo, and look down into it, you will ſee all things upon the Sheet inverted in the Glaſs, *i. e.* in this caſe reſtored to their Natural and Erect Poſition; and this Reflection alſo from the Glaſs, gives it a Glaringneſs that is very ſurprizing, and makes it look like ſome Magical Proſpect, and the moving Images, like ſo many Spectrums or Phantaſms. And no doubt but there are many Perſons that might eaſily be impoſed upon with ſuch a Scene, and who would believe it to be no leſs than downright Conjuration.

And I have made uſe of this Experiment to convince ſome credulous Perſons, that thoſe are abuſed and impoſed upon, who ſee Faces in the Glaſſes of ſome cheating Knaves amongſt us, who ſet up for *Cunning-Men*, and Diſcoverers of Stollen Goods, &c. and have ſatisfied them, that much more may be done by this, and ſome other Optical Experiments, and that without the Help of the Devil too, than by any of the Clumſie Methods uſed by theſe Vermin.

If the Glaſs be placed in a Sphere or Globe of Wood (having an Hole as large as the Glaſs bored through it) which like the Eye of an Animal may be turned every way to receive the Rays coming from all Parts of the Objects, it will be of good Advantage to the Experiment; and ſuch, ready fitted, are now commonly ſold by Mr. *Marſhall*, at the *Archimedes* on *Ludgate-hill*, and are called *Scioptricks*.

And as by this Method any Image may be made appear in a darkened Room, Dr. *Hook*, in *Philoſoph. Tranſact.* N. 38. gives a way of doing the ſame thing in an Enlightened one, either by Day or Night. The Experiment I have tried my ſelf, and is as follows.

Oppoſite to the Wall, or Place where the Apparition is to be, let a Hole be made about a Foot in Diameter, or bigger; if there be an high Window that hath a Caſement in it, it will do better.

Without this Hole, or Caſement, ſo that the Company in the Room may not ſee what is done, place the Picture or Object you would repreſent inverted; and by means of Looking-Glaſſes placed behind, if the Picture be *Tranſparent*, reflect the Rays of the Sun, ſo that they may paſs through it towards the Place where it is to appear; and that no Rays may go beſides it, let the Picture be incompaſſed with a Board or Cloth on every ſide. If the Object be a Statue or ſome living Creature, then it muſt be the more inlightened by caſting the Sun-Beams on it by Reflection and Refraction both: Between this Object and the Wall, muſt be placed a broad Convex-Glaſs, ground of ſuch a Convexity, that it may repreſent the Object diſtinct on the Wall: And therefore, *'tis beſt to have a clean Linen Cloth inſtead of the Wall; which may be hung up any where, according to the Diſtance of the Glaſs's Focus.* The nearer the Glaſs is to the Object, the more will the Object be magnified on the Wall or Cloth; and the further off, the leſs; which alſo will depend on the Convexity of the Glaſs.

If the Object cannot be *Inverted* (as 'tis pretty difficult to do with *Living Animals, Candles*, &c.) then there muſt be two large Glaſſes of convenient Sphere, and they placed at their appropriated Diſtances (which are very eaſily found by Trials) ſo as to make the Repreſentation erect as well as the Object.

And if the whole Matter be well managed, ſo that the Spectators ſee nothing of the *Apparatus*, it will be a very ſurprizing thing to them to ſee an Image appear by ſo good a Light on a Plain in the midſt of a Room, where nothing can be diſcovered that ſhould occaſion any ſuch Apparition.

OBTUSE *Angles*. See *Angles*.

OBTUSE *Angular Section of a Cone*: So the Ancient Geometers, called that Conick Section, which ſince, by *Apollonius*, is called the *Hyperbole*, becauſe they conſidered it only in ſuch a Cone, whoſe Section by the Axe is a Triangle Obtuſe-angled at the Vertex.

OBTUSE-*angled Triangle*; ſee *Triangle*.

OBTURATOR *Externus*, is a Muſcle of the Thigh, ſo called from its Situation; and *Rotator Femoris Extrorſum*, from its Uſe: It hath a large fleſhy Beginning from the External Parts of the *Os Iſchium* and *Pubis*, and the Membrane that covers their *Foramen* externally, oppoſite to the Origination of the *Marſupialis* or *Obturator Internus*; and paſſing tranſverſly backwards, leſſens it ſelf, and becomes tendinous at its Inſertion to the Root of the great *Trochanter* of the Thigh-Bone, near the Termination of the laſt named Muſcle. This turns the Thigh outwards.

OBTURATOR *Internus*. See *Marſupialis*.

OBVENTIONS, ſignifies Rents or Revenues, properly of Spiritual Livings; as alſo Offerings.

OCCIDENT, is the Weſt Quarter of the Horizon; or 'tis that part of the Horizon where the Ecliptick, or the Sun therein deſcends into the lower Hemiſphere: In ſome Books you will meet with ſuch Terms as theſe;

OCCIDENT *Eſtival*, is that Point of the *Horizon*, where the Sun ſets at its Entrance into the Sign *Cancer*, when the Days are longeſt.

OCCIDENT *Hybernal*, is that Point of the *Horizon*, where the Sun Sets when it enters into the Sign of *Capricorn*, at which time the Days (with us) are ſhorteſt.

OCCIDENT *Equinoctial*, is that Point of the *Horizon*, where the Sun ſets when it enters *Aries* or *Libra*.

OCCIDENTAL (*i. e.* Weſtward) in *Aſtronomy*, a Planet is ſaid to be *Occidental* when it ſets after the *Sun*.

OCCIPITALIS, and its Partner, are Short, but Broad, Thin, Fleſhy Muſcles, ſituated on the *Occiput*, from whence they derive their Names; when theſe act, they pull the Hairy-Scalp backwards.

OCCIPITIS *Os*, is a Bone of the *Cranium*, that lies in the hind-part of the Head; it is almoſt like a Lozenge with its lower Angle turned inwards; it joins the *Oſſa Parietalia* and *Petroſa*, by the *Sutura Lambdoidalis*: It is thicker than any of the other Bones of the *Cranium*, yet it is very thin where the *Splenius*, *Complexus*, *Trapezius*, are inſerted. Externally it is rough, Internally it has two *Sinus's*, in which lie the Protuberances of the *Cerebellum*, and two large Furrows, in which lie the *Sinus Laterales*.

It has Seven Holes: The 1ſt two are common to it and the *Oſſa Petroſa*; the lateral *Sinus's* and the *Par vagum*, paſs thro' them. The Third is the great Hole thro' which the *Medulla Spinalis* paſſes. The Fourth and Fifth are the Holes thro' which the ninth pair of Nerves paſſes. The Sixth and Seventh are two Holes, thro' which there paſs two Veins, which bring the Blood from the External Teguments to the *Sinus Laterales*; ſometimes there is but one, and ſometimes none of theſe two; there are ſometimes two more thro' which the Vertebral Veins paſs.

This Bone has alſo two *Apophyſes*, one on each ſide of the great Hole; they are lined with a Cartilage, and articulated with the firſt *Vertebra* of the Neck. It has alſo a ſmall Protuberance in its middle, from which there goes a ſmall Ligament, which is inſerted into the firſt *Vertebra* of the Neck. It is longer in Beaſts than in Men.

OCCULTATION, in *Aſtronomy*, is the Time that a Star or Planet is hid from our Sight, when Eclipſed by the Interpoſition of the Body of the Moon, or ſome other Planet between it and us.

OCCUPANT. If Tenant *par terme de auter vie dies*, living *Ceſtuy que vie*; he that firſt enters ſhall hold the Land, during the other Man's Life, and he is in Law called an *Occupant*, becauſe his Title is by his firſt *Occupation*; and ſo if a Tenant for his own Life, grant over his Eſtate to another, if the Grantee dies, there ſhall be an *Occupant*.

OCCUPATION, ſignifies (in Law) the putting a Man out of his Free-hold in time of War, and is all one with the *Diſſeiſin* in time of Peace, only it is not ſo dangerous. 'Tis taken alſo for Uſe or Tenure, as when 'tis ſaid, ſuch Land is in the Tenure or *Occupation* of ſuch a Man, that is, in his Poſſeſſion.

OCCUPAVIT, is a Writ that lieth for him which is ejected out of his Land or Tenement in times of War, as a Writ of Novel *Diſſeiſin* lies for one ejected in time of Peace.

OCEAN, is by Geographers taken for that great Collection of Waters, or large Sea, which compaſſes in the whole Earth, and into which the other leſſer Seas do uſually run.

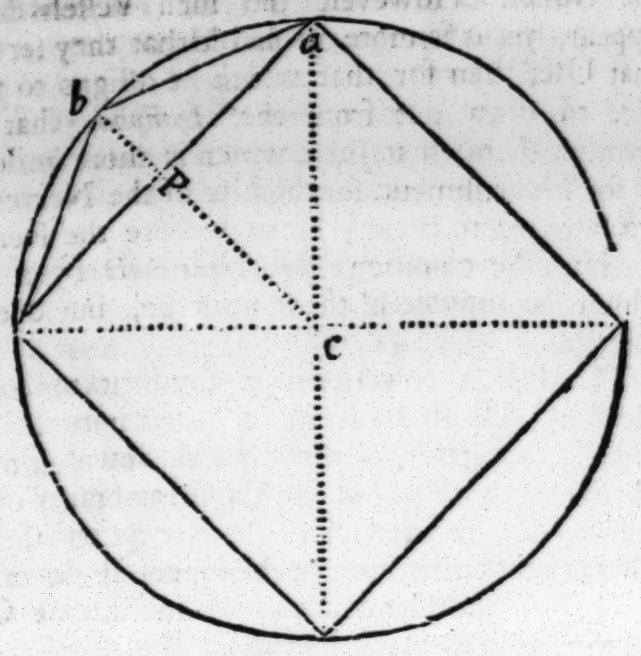
The Surface of the whole Ocean, or of all the Seas of the Globe, Mr. *Keil* computes (in his Examination of Dr. *Burnet's Theory of the Earth*) to be 85490506 ſquare Miles; and therefore ſuppoſing the Depth of the Ocean *Communibus Locis* to be $\frac{1}{4}$ of a Mile, the Quantity of Water in the whole is 21372626$\frac{1}{2}$ Cubick Miles.

OCHTHODES, are Ulcers whoſe ſides are Callous, or of the Nature of Warts, but not malignant. *Blanchard*.

OCTAGON, in *Geometry*, is a Figure of eight Sides and Angles. And this, when all the Sides and Angles are equal, is called a *Regular Octagon*; or which may be Inſcribed in a Circle.

PROPOSITION.

The Side of such a Regular Octagon (b a) *is equal in Power to half the Side of the Square* a p, *and to the Difference between that half side and the Radius*: (viz. b p,) *taken both together.*



DEMONSTRATION.

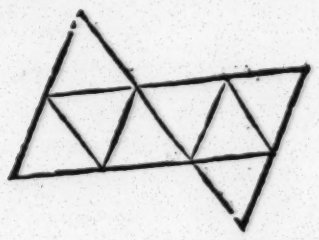
That $b\,a\,\square = b\,p\,\square + p\,a\,\square$ is plain from the 47 *è* 1 *Euclid.*

All therefore that is wanting to be proved, is that $b\,p$ is the Difference between the half side of the Square and the Radius; which will be very evident when you consider that $p\,c$ must be equal to $p\,a$, because the Angle *a* and *c* being both Semi-right, must be Equal.

OCTANT, or OCTILE, in *Astronomy*, signifies a Planets, *&c.* being in such an Aspect or Position to another, that their Places differ only an eighth part of a Circle, or 45 deg. from one another.

OCTAHEDRON; see *Regular Bodies.*

The following Figure being drawn on Past-board, half cut thro', and then folded up, will represent an Octahedron.



The *Octahedron* is two Pyramids put together at their Bases, therefore its Solidity is obtained by multiplying the Quadrangular Base of either (here they are both joined together in the middle of the Figure) by one third of the Perpendicular Height of one of them, and then doubling the Product.

OCTAVE, or *Eighth* in Musick, is an Interval of Eight Sounds; every Eighth Note in the Scale of the *Gam-ut*, being the same as far as the Compass of Musick requires. Tho' an Humane Voice can reach only to three of these *Octaves*, but the Tones of the Organ go as far as Eight.

OCTO *Tales*; see *Tales.*

OCULUS, in *Botany*, signifies the same with *Gemma*, or a *Budd* of a Tree, or any Plant.

OCULUS, the Eye, is the external Organ of the Sight; it is compounded of *Six Muscles*, to wit, of two direct, and as many Transverse ones; to which a seventh is added in Brutes. It has seven Tunicks, the *Adnata*, *Innominata*, *Cornea*, *Uvea*, *Retiformis*, *Chrystallina*, and *Vitrea*: It has also the *Optick Nerve*, the *Iris*, and the *Pupilla*. See them singly in their proper Places. *Blanchard.*

How Vision or Sight is made in the Eye. See *Vision* or *Eye.*

OCTOSTYLE, in *Architecture*, is the Face of an Edifice adorned with Eight Columns.

OCULORUM *Motores*, a pair of Nerves arising from the *Medulla oblongata*, on each side of the *Infundibulum*, and having the *Carotidal* Arteries lying between them: From thence passing thro' the *Foramina Lacera* of the *Os Sphænoides*, they give a Branch, which with a Branch of the fifth pair, forms a considerable *Plexus*, which sends out several Twigs that embrace the *Optick Nerve*, and are spent on the Tunicles of the Eye; they give a Branch to the Muscles called *Attollens*, *primens*, and *Obliquus Minor.*

ODAXISMUS is the Itching of the Gums when Children breed Teeth. *Blanchard.*

ODONTALGIA, the Tooth-ach.

ODONTOIDES, that which is like a Tooth, as the Tooth of the second *Vertebra*, and of other Bones. *Blanchard.*

ODOR, by this Word the Ancients did signifie sometimes the *Sense of Smelling*; but now 'tis generally and more properly used for those agreeable or disagreeable Effluvia, which are emitted by many Bodies which are called *Odorous*, and which excite in us the Sensation of *Smelling.*

ODOURS. That Odours depend very much on the Texture of Odorous Bodies, is plain from this Experiment, that that very Odorous Body *Camphire*, when dissolved in and mingled with Oyl of *Vitriol*, will in a manner quite lose its Scent; but as soon as ever a little Water is poured into the Solution, the proper Odour of the *Camphire* will be restored, and diffused all around.

OEDEMA, is sometimes taken in a large Sence, by *Hippocrates*, for any Tumour; but strictly, for a white, soft, insensible Tumour, proceeding from pituitous Matter heaped up together. It has no Pulse, and yields easily to the Fingers: it may proceed likewise in some measure from the *Lympha*, or Nutritious Juice extravasated and turned into a Jelly. *Blanchard.*

OESOPHAGEÆUS, or *Sphincter Gulæ*, seems to be a Continuation of the Muscle called *Pterigopharyngæus*, arising from each side of the Scutiformal Cartilage, and like it, passes to a middle Line on the back-part of the *Fauces.*

This do's not assist the *Pterigopharyngæus* in compressing the masticated Aliment into the *Gula*, but is thought by some to strengthen the *Scutiformis*, and render the Tone of the Voice more acute.

OESOPHAGUS, the Gullet, is the Pipe or Funnel that conveys the Meat into the Stomach. It is an Organical Part of the Body, round and hollow, beginning at the Root of the Tongue behind the *Larynx*, (which Part of it is called *Pharynx*)

and

and deſcendeth from thence directly, between the Windpipe and *Vertebræ* of the Neck, and the Four firſt *Vertebræ* of the *Thorax*, upon which it reſteth; but when it is come to the Fifth *Vertebra*, it giveth way to the deſcending Trunk of the great Artery, by bending a little to the Right ſide; afterward accompanying the Artery down to the Ninth *Vertebra*, there it turns a little to the Left again, and climbs upon the Artery; and by and by, about the Eleventh *Vertebra*, it paſſeth thro' the Midriff, a little on the Left ſide of its Nervous Centre, at a Hole diſtinct from that of the great Artery, and is inſerted or continued into the Left Orifice of the *Ventricle*.

It is compoſed of Three *Membranes*; the Outmoſt is common to it and the Stomach, and is very thin, being endowed only with membranous Fibres, and thoſe very ſlender. Some derive its Origin from the *Midriff*, ſome from the *Pleura*, and ſome from the Ligaments of the *Vertebræ* of the Neck and Breaſt, upon which it reſteth: All which Opinions (according to Dr. *Gliſſon*) may be true, if they be intended only of an Origin of Continuation or Connexion, ſeeing it is continued plainly to the Three firſt, and knit to the laſt; but none of them is true, if they be intended of a ſuſtaining or maintaining Origin, or of a Principle of Influence. The Second or Middle is fleſhy and thick, and conſiſts of Two Ranks of fleſhy Fibres, which aſcend and deſcend obliquely, (ſpiralwiſe) and do mutually intercuſſate or croſs one another, ſo as that the Fibre, which before it met with another to interſect, did lie underneath another, rides upon that which it interſects, and ſo continues uppermoſt, till it comes to a ſecond, and ſo on by Turns. The Third or Innermoſt is endued with ſlender ſtrait Fibres, and thoſe only, as Ancient Anatomiſts have taught; but Dr. *Willis* affirms it to have Fibres of divers kinds, and thoſe diverſly woven one with another. It is wholly nervous, ſaving a certain hoary or downy Subſtance that cloaths its Inſide. It is continued to that Membrane that covereth the Mouth, Jaws and Lips; and (according to Dr. *Willis*) it deſcends Three Fingers Breadth below the Mouth of the Stomach.

From its being thus common to the Mouth, Gullet, and upper Orifice of the Stomach, proceeds that great Conſent among theſe Parts in Vomiting, &c.

It hath *Veins* in the Neck from the Jugulars, in the *Thorax* from the *Vena ſine pari*; but where it is joined to the Stomach, it hath ſome Twigs from the *Ramus coronarius*, which is a Branch of the *Vena portæ*.

It hath *Arteries* in the Neck from the *Carotides*; in the *Thorax*, from the *Intercoſtals*; and in the *Abdomen*, from the *Ramus cæliacus coronarius*.

Nerves it hath, from the *Par vagum* or Eighth Pair.

It hath Four *Glandules*; Two in the Throat, which are called *Tonſillæ*, or Almonds, common to it and the *Larynx*, which ſeparate a mucous or pituitous Humour to moiſten them. Other Two it hath near its middle, on its out and back-ſide, about the Fifth *Vertebra* of the *Thorax*; namely, where it gives way to the Trunk of the *Aorta*, and turns ſomewhat to the Right ſide, or at the Place where the *Aſpera Arteria* is divided into two Branches. Theſe are as big, each of them, as a Kidney-bean, and of the ſame Shape; but ſometimes there are more than two, and then they are leſs: They are ſoft and fungous; and their Uſe hath been reckoned to be for the Separation of a Juice to moiſten the Gullet. But Dr. *Wharton* rejects this Opinion, becauſe there appears no excretory Veſſels that might convey the Liquor that is ſeparated in them to within the Gullet. However, tho' ſuch Veſſels do not appear, yet it is more probable that they ſerve for that Uſe, than for that which he aſſigns to them, *viz.* to draw out from the *Lympha*, that runs through them, that Juice which is more mild and fit for Nouriſhment, for the Uſe of the Nerves that are faſtened to them; or to depoſite the Remainder into the common *Chyliferous Duct* by a Pipe, which he ſuppoſeth there muſt be, but does not deſcribe.

The Gullet ſerveth as a Conduit to convey Meat and Drink by from the Mouth to the Stomach; for theſe being turned down into the Throat by the Tongue, all the Membranes of the *Pharynx* are relaxed for the Reception thereof, and preſently the ſame are ſqueezed down the Gullet, by the Conſtriction of its middle Coat, and the Muſcles of the *Pharynx*.

OFFA *Alba*. So *V. Helmont* calls a white Coagulation which will ariſe, if equal Parts of highly Rectified Spirits of Wine and Urine be mix'd and ſhaken together; but the Spirit of Urine muſt be diſtilled from well-fermented Urine, and it muſt be truly dephlegmated, or elſe it will not ſucceed.

OFFICE, ſignifies not only that Function, by Virtue whereof a Man hath ſome Employment in the Affairs of another; but alſo an Inquiſition made to the King's Uſe of any thing, by virtue of his *Office* who enquireth: And therefore we oftentimes read of an Office found, which is nothing elſe but ſuch a thing found by Inquiſition made *ex officio*. And 'tis uſed in this Sence in 33 *H.* 8. 20. and in *Stamf. Prærog.* Fol. 6. 61. Where *to traverſe an Office*, is to traverſe the Inquiſition taken of an *Office*. And in *Kitchin*, Fol. 177, *to return an Office*, is to return that which is found by virtue of the *Office*. And there be two ſorts of *Offices*, in this Signification, iſſuing out of the *Exchequer* by Commiſſion, *viz. An* Office *to entitle the King to the Thing enquired of*, and *An* Office *of Inſtruction*. *Office in Fee*, is that which a Man hath to himſelf and his Heirs.

OFFICIAL. This Word, by the Ancient Civil Law, ſignified him that was the Miniſter or Apparitor of a Magiſtrate or Judge. In the Canon Law it is ſpecially taken for him to whom any Biſhop doth generally commit the Charge of his Spiritual Juriſdiction: And in this Sence, one in every Dioceſs is *Officialis Principalis*, whom the Statutes and Laws of this Kingdom call *Chancellor*: The reſt, if there be more, are by the Canon Law called *Officiales Foranei*, but in Common Law *Commiſſioners*. The Difference of the Two Powers you'll find in *Linwood*, *Tit. De Sequeſtra poſſeſſ.* cap. 1. *verbo Officialis*. And this Word *Official*, in our Statutes and Common Law, ſignifies him whom the Arch-deacon ſubſtituteth in the executing of his Juriſdiction.

Officiatus non faciendis vel amovendis, is a Writ directed to the Magiſtrates of a Corporation, willing them not to make ſuch a Man an Officer, and to put him out of the Office he hath; until

Enquiry

Enquiry be made of his Manners, according to an Inquiſition formerly ordained.

OFFIN. So the Seamen call that Part of the Sea which is a good Diſtance from Shoar, where there is deep Water, and no need of a Pilot to conduct the Ship into the Port. Thus if a Ship from Shoar be ſeen ſailing out to Sea-ward, they ſay ſhe ſtands for the *Offin*; and if a Ship having the Shoar near her, have another good way without her, or towards the Sea, they ſay that Ship is in the *Offin*.

OFF-WARD. If a Ship, being a-ground by the Shore, doth heel towards the Water-ſide, they ſay ſhe heels to the *Off-ward*; ſo if ſhe lie with her Stern only to Sea-ward, they ſay ſhe lies with her Stern to the *Off-ward*, and her Head to Shoar-ward.

OGRESSES, a Term in Heraldry; the ſame with *Pellets*, which ſee.

OIL, which the Chymiſts call *Sulphur*, is the Second of their *Hypoſtatical* and of the true Five Chymical Principles. 'Tis an inflammable, unctuous, ſubtile Subſtance, which uſually ariſes after the Spirit. The Chymiſts attribute to this Principle all the Diverſity of Colours, and all the Beauty and Deformity of Bodies: Probably their various Odours do in a great meaſure ariſe from it. And it ſweetens the Acrimony of Salts; and by ſtopping or filling up the Pores of a mixt Body, keeps it longer from Corruption, where it abounds. And we find that the *Ever-greens*, ſuch as *Box*, *Holly*, &c. do abound more with Oil than other Plants.

There are two ſorts of Oils; One which ſeems to be mixt with Spirit, (for it can never be drawn pure) and which will ſwim upon Water; ſuch as Oil of Aniſeeds, Lavender, Roſemary, *&c.* which the Chymiſts call *Eſſential*, and is commonly drawn in a Limbeck with ſtore of Water. And another kind, which probably is mixt with Salts, and theſe will ſink in Water; ſuch as the Oils of ponderous Woods, as of Guaiacum, Box, Cloves, *&c.*

There are ſome things which are very improperly called Oils; as *Oil of Tartar per Deliquium*, which is only a Fixt Salt diſſolved. *Oil of Vitriol*, which is nothing but the moſt cauſtick and ſtrongeſt part of the Spirit of Vitriol. *Oil of Antimony*, which is only a Mixture of Antimony, and an acid Spirit.

Mr. *Boyle*, to ſhew the Producibleneſs of Chymical Principles, tells us, That by mixing carefully and gradually together an equal Weight of Oil of Vitrol, and truly rectified Spirit of Wine; and then, by a very wary Management of the Fire, drawing off what will come over, he could obtain (beſides a ſubtil odoriferous Spirit, and an acid and ſulphurous Liquor) a conſiderable Quantity of Chymical Oil, ſometimes deeply coloured, ſometimes pale like Water, and ſometimes exceeding fragrant, and without any Acidity in it at all; yet was ſo ponderous, as not only to ſink in Water, but even in the acid Spirit which was drawn off with it, and ſeems to be the Oil of Vitriol only altered and exalted; nor would this Anomalous Oil at all mingle with Water, tho' both the Oil and Spirit, from whence it was diſtilled, would readily do ſo.

OIL *of Philoſophers*. So the Vapouring Chymiſts call a Diſtillation in a Retort of pieces of Brick heated red hot, and then caſt (while ſo) into Oil of Olives, the Bricks will imbibe a good deal of Oil; which Oil being afterwards drawn from them again, is their *Oil of Bricks*, or *Oil of Philoſophers*; and they attribute great Vertues to it.

OIL *of Sulphur per Campanam*. See *Spirit of Sulphur*.

OIL *of Tartar per Deliquium*, is a Fixt Salt of Tartar diſſolved, by being expoſed to the Air in a cool moiſt Place.

OIL *of Vitriol*, improperly ſo called, is what remains in the Cucurbite after the Diſtillation of Vitriol is rectified, and the Sulphureous and Acid Spirit both drawn off; 'tis the more Fixt Part of the Spirit of Vitriol, rendered Cauſtick by a vaſt Degree and Continuance of Fire. 'Tis uſed in the Diſſolution of Metals, and ſometimes given inwardly, when in a ſmall Doſe, and duly diluted.

This Oil, if it be mingled either with Spirit of Vitriol, common Water, or any *Etherial Oil*, as the Chymiſts call Oil of Turpentine, *&c.* it will grow ſo very hot, as often to break the Viol that contains the Mixture.

OLEAGINOUS, Oily, or pertaining to the Nature of Oil: Thus in Soap, which is made of Oil, (or Greaſe) Salt and Water; we ſay there are ſome *Oleaginous*, ſome *Saline*, and ſome *Aqueous* Parts.

OLECRANUM, or *Ancon*, is the greater Proceſs of the firſt Bone of the Cubit called *Ulna*; alſo the upper part of the Shoulder. *Blanchard*.

OLIGOTROPHUS *(Cibus)* is Meat that nouriſhes little; to which is oppoſed *Polytrophus*, that which affords much Nouriſhment. *Blanchard*.

OLIGOTROPHY, is a Decreaſe of Nutrition; or a very ſmall one.

OLFACTORY *Nerves*, or thoſe which give us the Senſe of Smelling, are the firſt Pair of thoſe Ten which ariſe from the *Medulla oblongata*: They come from the Baſis of the *Corpora ſtriata*, and paſſing through the little Holes of the *Os Cribriforme*, they are ſpread upon the Membrane which covers the *Os ſpongioſum*.

OLIVARIA *Corpora*, are two Protuberances of the under part of the Brain, placed on each ſide of the *Corpora Pyramidalia*, towards the lower end; having their Name from their Figure, which is like that of an *Olive*.

OLOR. See *Cygnus*.

OLYMPIAD, a Term in Chronology, ſignifying the Space of Four Years, or Fifty Months, reckoning Thirty Days to a Month; from whence the Ancient *Grecians* derived their Account of Time. This kind of Computation took its Riſe from thoſe Famous *Olympick* Games which were celebrated every Fifth Year, in the Eſtival Solſtice, during Five Days, on the Banks of the River *Alpheus*, near the City *Olympia*, where the noted Temple of *Jupiter Olympicus* ſtood. The Firſt *Olympiad* began about 500 Years after the Deſtruction of *Troy*, in the 3938 Year of the *Julian Period*, *A. M.* 3174, and 766 Years before Chriſt.

OMENTUM, *Rete*, or *Reticulum*, the Cawl, is a double Membrane ariſing from the *Peritonæum*, or as ſome ſay, from the *Myſentery*, ſpread upon the Inteſtines or Guts, interwoven with fat and ſmall Veſſels like a Fiſher's Net, enriched alſo with two or three Glandules; on the Fore-part it is annexed to the Bottom of the Stomach

mach, to the Gut *Colon*, to the Spleen; and ſometimes to the *Pancreas*, and the round Lobe of the Liver.

Its Uſe is to cheriſh the Inteſtines with its Warmth, and to facilitate the Concoction of the Aliments in the Guts, as well as to knit looſely the Stomach, Spleen, Pancreas, Colon, &c. together.

It hath ſome Milky and Lymphatick Veſſels, as alſo a great many *Ductus*'s, and little Bags of Fat.

OMOPLATA, and *Homoplata*, the ſame with *Scapula*.

OMPHALMICUS, is a Branch of the Fifth Pair of Nerves which move the Eye.

OMPHALOCELE, is a Rupture about the Navel, to wit, when the Cawl or Inteſtines are Protuberant in that Part; which happens from a Relaxation, or burſting of the *Peritonæum*.

ONERANDO *pro rata portionis*, is a Writ that lies for a Joint-Tenant, or Tenant in Common, that is diſtrained for more Rent than his Proportion of the Land cometh to.

ONI. In the *Exchequer*, as ſoon as a Sheriff enters into his Accompts, for Iſſues, Amerciaments, and mean Profits, they ſet upon his Head this Mark, *Oni*, which denotes *Oneratur, niſi habet ſufficientem exonerationem*; and thereupon he forthwith becomes the King's Debtor, and a *Debt* is ſet upon his Head; and then the Parties *Peravayle* become Debtors to the Sheriff, and diſcharged againſt the King.

ONYX, the ſame with *Hypopyon*, a gathering of Matter under the *Tunica Cornea* of the Eye.

OPACOUS *Bodies*, are ſuch whoſe Pores (probably) lying in an oblique and crooked Poſition, the Rays of Light cannot freely permeate and paſs through them, as they do thro' tranſparent ones; wherefore if you hold them up againſt the Light, you cannot ſee through them.

OPEN *Flank*, in Fortification, is that part of the *Flank* which is covered by the *Shoulder* or *Orillion*.

OPERA, is a ſort of Solemn Entertainment of Muſick upon the Theatre or Stage, and is very common in *France* and *Italy*: It uſually begins with an *Ouverture*, which commonly ends with a *Fugue*; the reſt is compoſed of *Symphonys*, *Recitativo*'s, *Chacoons*, *Preludes*, &c. with all ſorts of Vocal and Inſtrumental Muſick.

OPHIASIS, is a Diſeaſe where the Hairs grow thin and fall off here and there, ſo that they leave the Head ſpotted like a Serpent. *Blanchard*.

OPHIUCUS, one of the Northern Conſtellations, the ſame with *Serpentarius*: It contains 30 Stars, of which, one in the Head of the Man holding the Serpent, is of the ſecond Light or Magnitude.

OPHTHALMICKS, are ſuch Medicines as are good for Diſeaſes in the Eyes.

OPIATES, are Medicines made of *Opium*, or ſomething of the ſame Nature with it, deſigned to cauſe Sleep, and to eaſe Pain: When they produce the latter Effect, they call them *Anodynes*; when the former, *Hypnoticks*; and when they cauſe a very great Sleep or Stupefaction, *Narcoticks*. The Foreign Phyſicians confound an *Opiate* and an *Electuary*; ſee *Blanchard* on the Word *Opiata*.

OPISTHOTONUS; ſee *Poſticum*.

OPISTHOTONUS, or *Tetanus*, is a kind of Cramp, or ſtretching of the Muſcles of the Neck backwards; which proceeds ſometimes from a Palſie of the Muſcles of the Neck, whereupon the Antagoniſts or oppoſite Muſcles move the intermediate Parts too much; or from a ſharp and ſerous Matter in the Tendons; or from the Animal Spirits which enter the Fleſhy Pipes more than uſual, and will not eaſily recede, ſo that the Parts are ſwelled and wrinkled up. *Blanchard*.

OPPOSITE *Angles*; ſee *Angles*.

OPPOSITE *Cones*, are two Similar Cones vertically oppoſite, and having the ſame common Axis. And

OPPOSITE *Sections* are the two *Hyperbola*'s made by a Plane cutting both thoſe Cones. See the Figure under the Word *Latus Tranſverſum*, where the Cones VAD and BVA are oppoſite, and the Sections ODO, OEO, are oppoſite *Hyperbola*'s.

OPPOSITION, is that Poſition or Aſpect of the Stars or Planets, when they are 6 Signs, or 180 Degrees diſtant from one another, and is marked thus ☍.

OPTATIVE *Mood*, (in Grammar) is the way of forming a Verb ſo, as that it may expreſs an ardent Deſire that ſuch a Thing may happen; and therefore there is uſually an Adverb of wiſhing connected with it, as *Utinam*, &c.

OPTHALMY, is an Inflammation of the Tunicks of the Eyes, proceeding from Arterious Blood, collected and extravaſated there, becauſe it cannot return by the Veins. *Blanchard*.

OPTICKS, is a Mathematical Science that treats of the *Sight* in general, and of every thing that is ſeen with *direct Rays*; and explains the ſeveral Properties and Effects of Viſion in general, and properly of that which is direct and ordinary: For when the Rays of Light are conſidered as reflected, the Science which teaches their Laws and Properties, is called *Catoptricks*; and when the Refraction of Rays is conſidered, and the Laws and Nature of it explained and demonſtrated, the Science is called *Dioptricks*. So that *Opticks* comprehends the Whole; of which *Catoptricks* and *Dioptricks*, are the two Parts.

OPTICK *Glaſſes*. Sir *Iſaac Newton*, in his *Philoſ. Natur. Princip. Math. Lib.* 1 *Schol. ad Prop.* 98, ſays, That for all *Optick* Uſes, *Spherick* Figures are the moſt commodious. If the Object-Glaſſes of *Teleſcopes* were compoſed of two *Spherick Glaſſes* containing Water between them, perhaps the Irregularity of the *Refractions* that are made on the Surfaces of the Glaſſes towards their Edges, may be accurately enough corrected by the Refractions of the Water. And ſuch Object-Glaſſes are preferable to *Elliptick* or *Hyperbolick* Glaſſes, not only becauſe they are eaſier and more accurately to be formed, but alſo becauſe they refract more accurately thoſe Pencils of Rays that are (*collateral*, or) out of the Glaſſes Axis. But the *different Refrangibility* of different Rays will for ever hinder us from perfecting *Opticks* by Glaſſes, either Spherick, or of any other Figures whatſoever: And unleſs we can correct the Errors that ariſe from hence, all our Labour is loſt in other Corrections.

Nor indeed is it poſſible, by whatever Figures, to render the Appearance of the *Collateral* Parts of an Object ſo diſtinct as the Direct; for the very Natural Eye does it not: And therefore we are

are forced to apply it ſucceſſively, *directly* before the Parts of any Object we deſign to view.

To know whether Optick-Glaſſes *be truly* Centered, *or not.*

Firſt Way.

Holding the Glaſſes at a due Diſtance from the Eye, obſerve the two reflected Images of a Candle; for where thoſe two Images *unite*, or *Coaleſce*, there is the *true Centre* of the *Glaſs*: And if this be in the *middle* or *central* Point of the *Glaſs*'s Breadth, the Glaſs is *truly centered.*

A Second Way is

By preſenting the Glaſs before the Sun, and making it reflect the Light on a Plane nighly parallel to its Surface, and at a proper Diſtance; for then you'll perceive two ſorts of Light reflected, one *ſmaller*, but much more *ſtrong* and *vigorous*, within another more *faint* and *large*. Then by a due Poſture of the Glaſs (found by Trials) both theſe Lights are to be projected as round as poſſible, and at a proper Diſtance from the Wall on which they are reflected; the *round brighteſt Spot* is to be brought into the ſmalleſt Compaſs that it can. (Trial will make all this plain.) When the Glaſs is in this Poſture, if the *bright Spot* be projected juſt in the middle of the fainter Light, the Glaſs is *well centered*: But to whatever ſide of the *faint* Light this *bright* Spot is projected, *on that ſide* is the Glaſs *thickeſt*, and on that ſide lies the *true Centre.*

A Third Way

Of Examining the Centres *of Glaſſes, is yet more* Compleat *than the former: For it does not only diſcover the Fault, (if there be any, as in long* Object-Glaſſes *'tis very rare but there is, eſpecially if they be wrought in the* Form *by the unguided Hand, and not by an Engine) but withal it rectifies the Fault; and is thus:*

Cover the Surface of the Glaſs within a thin piece of Paper, in which there is cut a round Hole of about an Inch Diameter; about this Hole there are to be ſtruck two or three Concentrick Circles. Move this Paper upon the Glaſs, 'till you ſee on the Plane that receives the reflected Light, that the *bright* Spot is exactly in the middle of the other fainter Light round it.

This alſo one may meaſure by a Pair of Compaſſes, having, to that end, ſlightly fix'd the Paper to the Glaſs, that we may more nicely determine whether this *bright* Spot be exactly in the middle. This therefore being carefully adjuſted, by gently ſliding the Paper on the Glaſs, (if it be requiſite) we are, without the leaſt altering this true Poſition of the Paper, to fix it more firmly to the Glaſs; and laying it thus on a Table, let us mark on the Glaſs (by the Point of a Diamond) three Points in one of the Circumferences concentrick to the round Hole in the Paper; and ſticking a ſmall piece of Cement on the Glaſs, about the middle of the round Hole, by means of the three marked Points let us find the exact Centre of this round Hole: Then uncovering the whole Glaſs, (except only the Cement in which the Centre is marked) with a Diamond-pointed Compaſs let us ſtrike as large a Circle on the Glaſs as its Breadth will bear; then *round* the Glaſs according to this Circle, and 'tis as exactly *centred* as the Senſe can judge.

For trying the Regularity and Goodneſs of an Object-Glaſs, *to the greateſt Exactneſs.*

On a Paper ſtrike two Concentrick Circles, one whoſe Diameter is the ſame with the Breadth of the Object-Glaſs, t'other, of half that Diameter: This inward Circumference divide into ſix equal parts, by the known way of applying the Radius ſix times in the Circumference, and making ſix fine ſmall Holes therein with a Needle. Let us cover one ſide of the Glaſs with this Paper, and then expoſing it to the Sun, we are to receive the Rays that paſs through theſe ſix Holes, on a Plane, at a juſt Diſtance from the Glaſs; and by withdrawing or approaching this Plane from or to the Glaſs, we ſhall find whether the Rays that paſs through theſe ſix Holes unite exactly together at any Diſtance from the Glaſs; if they do, we may be aſſured of the *Regularity* of the Glaſs, that is of its *juſt Form*; and at the ſame time we obtain exactly the Glaſs's *Focal* Length.

But, after all, there is no better way for trying the Excellency of an *Object-Glaſs*, than by placing it in a Tube, and trying it with ſmall Eye-Glaſſes, at ſeveral diſtant Objects: For that Object-Glaſs that repreſents the Objects the *brighteſt* and moſt *diſtinct*, that bears the *greateſt Aperture*, and moſt Convex and Concave Eye-Glaſs, without Colouring or Hazineſs, is ſurely the beſt. The moſt convenient Object to try them at, is the *Title Page* of a large Book, where there are generally Letters printed of divers Magnitudes, and therefore affords Variety of ſmall Objects; whereby the Comparative Excellency of Object-Glaſſes may be nicely eſtimated.

OPTICK *Nerves*, or the *Nervi Viſorii*, are the Second Pair, which beſtow on the Eyes the Faculty of Seeing. They ſpring from the upper ſides of thoſe unequal Protuberances of the *Crura* of the *Medulla oblongata*, which are called *Nervorum opticorum thalami*; from whence being carried forward, and ſomewhat downwards, after having fetch'd a Compaſs, they meet one another about the *Infundibulum*, upon the *Sella* of the *Os ſphænoides*; where they are united by the cloſeſt Conjunction, but not Confuſion, of their Fibres, which run parallel lengthways in theſe Nerves, as they do in all other.

They are obſcurely hollow untill they be united; but after, their Hollowneſs cannot be diſcerned. This Hollowneſs may be ſhewed in a large Beaſt newly killed, and in a clear Light.

Thus do *Riolanus*, *Gliſſon*, &c. teach; but *Veſalius*, *Aquapendente*, &c. deny that they have any manner of Cavity. *Malpighius* ſays, they have not one Cavity only, but ſundry; but that theſe Cavities reſult only from the Neceſſity of their Structure, all their inner or medullar part conſiſting of round *Inteſtinula* or Fibres running lengthways, which cannot be ſo cloſely fitted to one another, but that there will reſult long Interſtices, which yet perhaps are of no uſe, nor of

the Nature of Ducts, but only accidental; but whether the *Inteſtinula*, or Filaments themſelves, have not little Chanels in them (like to Blood-veſſels) he thinks may be doubted of: But ſeeing Senſe hath not diſcovered any ſuch, 'tis probable that there are to be admitted only little Pores and Interſtices in the medullar Subſtance, by means whereof the nouriſhing and vivifying Juice may be propagated. After their Unition they are ſeparated again, and each of them running farther forwards, paſſes thro' an Hole of the *Os Cuneiforme*, and is inſerted obliquely into the Centre of the Eye on its own ſide.

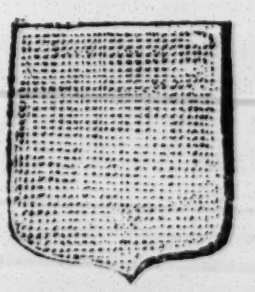
Dr. *Willis* ſays, they receive not only nervous Fibres from the Third Pair of Nerves, but alſo Twigs of Arteries from the fore Branches of the *Carotides*, which run upon them as far as the *Baſis* of the Eye: Whence, he thinks, a Reaſon may be aſſign'd, why, when a Man grows ſleepy after plentiful eating or drinking, he preſently feels a notable Heavineſs or Oppreſſion as it were about his Eyes. For when the Blood, becoming very turgid, fills the Veſſels that run through the Brain, more than uſual, and by diſtending them, ſtops the Pores of the Brain; theſe Nerves alſo in their whole Courſe are compreſſed by the Blood that is become turgid in their Blood-Veſſels likewiſe.

Dr. *Ridley* ſays, That he has ſeen the Blood-Veſſels to run not only upon or within them, but alſo in injected Bodies exactly quite thro' the medullary Subſtance of them, into the Reticular Coat of the Eye, wherein they end in an infinte Number of the moſt capillary Ramifications, which, by an Injection of that Artery, made with Mercury, becomes very delightfully conſpicuous to the Eye.

They are very ſoft, ſo long as they are within the Skull; but having paſs'd the *Os ſphænoides*, they become ſomewhat more firm and hard. The Reaſon of which Alteration ſeems to be, that within the Skull they are only clad with the *Pia mater*; but as they go out, they aſſume a Second Coat from the *Dura mater*.

From the whole Subſtance of theſe Nerves, *viz.* from their two Membranes and the inner medullar and fibrous Subſtance, are the three (proper) Tunicles of the Eyes framed; for the *Cornea* or *Sclerotica* doth proceed from the *Dura mater*, the *Choroides*, or *Uvea* from the *Pia mater*, and the *Retina* from the marrowy Subſtance.

OPTICK *Place of a Star or Planet*, is that Point or Part of its Orbit which is determined by our Sight when the Star is there: And this is either *True*, when the Obſerver's Eye is ſuppoſed to be at the Centre of the Earth or Planet he inhabits; or *Apparent*, when his Eye is at the Circumference of the Earth: And the Difference between theſe two is the *Parallax*, whoſe Uſe is great in determining the Diſtances of the Planets, *&c.*



OR, (*French*) in Heraldry, is the Colour of *Gold*; and they ſay without this, or *Argent*, there can be no good Armoury. In the Coats of Nobles 'tis called *Topaz*, and in thoſe of Sovereign Princes, *Sol*. 'Tis repreſented in Engraving by ſmall Points or Pricks, thus.

ORB, is only a Hollow Sphere.

ORBICULAR *Bone*, is one of the little Bones of the inward Ear, ty'd by a ſlender Ligament to the ſides of the *Stapes*.

ORBICULARIS, or *Conſtringens*, or *Oſculatorius*, is a Muſcle that draws both Lips together: 'Tis called alſo *Sphincter Labiorum*.

ORBICULARIS *Palpebrarum*, is a thin fleſhy Muſcle, whoſe Fibres do Circularly environ the Eye-lids, and are inſerted to them, (like the *Sphincter Labiorum*) not adhering to any Bone, from whence we may derive their Origin, except the Superior part of the great Bone of the Noſe, by ſome reckoned the fourth Bone of the Upper Jaw: The Muſcle acting like the Sphincters of all other Parts, conſtringes the Eye-Lids.

ORBIS *Magnus* is the Orbit of the Earth in its Annual Revolution round the Sun.

This *Copernicus*, Dr. *Gregory*, and ſome others, will have to be but a Point in compariſon of the Diſtance between us and the fix'd Star's: But our moſt Accurate Aſtronomer, Mr. *Flamſteed*, found a very ſenſible Parallax of this *Orbis Magnus*, in reſpect of the Pole Star; ſo that the Pole Star was nearer to the Pole in Summer (at the Solſtice) than in Winter by 40 or 45″; and this was the Reſult of above Seven Years moſt Accurate and continual Obſervation. And from hence he juſtly draws a *Demonſtration* for the *Annual Motion* of the Earth. *Vide Wallis Latin Works, Tom.* 3.

The Semi-diameter of this Annual Orbit of the Earth round the Sun, Dr. *Gregory* makes to be 500000000000, or Fifty Thouſand Millions of Feet; which is (allowing 5280 Feet to a Mile) 94.696969 Miles *Engliſh*. Which therefore may be taken for the mean Diſtance of the Earth from the Sun. And the Semi-diameter of *Saturn*'s Orbit, is about 10 times as great.

All the Ancients and the *Aſtronomers* before the Great *Kepler* ſuppoſed this Orbit to be a perfect Circle, but he proves it to be an Ellipſis; the remoteſt end of whoſe Longer or Tranſverſe Diameter is eight Signs and eight Degrees diſtant from the firſt Star in *Aries*, and having the Sun in one of its Focal Points.

ORBIT of any Planet, is the Curve that it deſcribes in its Revolution round its Central Body: Thus the Orbit of the Sun (or of the Earth) in its Annual Courſe, is the Ecliptick.

ORBITER *Exturnus*, is a Hole in the *Os Maxillare*, below the Orbit, thro' which the Nerves and Veſſels which come from the Teeth, paſs to the Cheeks.

ORBITER *Internus*, is a Hole in the *Coronal Bone*, within the Orbit a little above the *Os Planum*, thro' which paſſes a Branch of the fifth pair of Nerves which goes to the Noſe.

ORDER is a Term in *Military Diſcipline*, being the equal Diſtance of one *Rank* or *File* from another. The uſual *Order* in *Files* is 3 Foot, and in *Ranks* 6 Foot; the *Open Order* is double in each.

ORDER in *Architecture*, is a Rule for the Proportion to be obſerved in the erecting of Pillars, and for the form of certain parts appertaining to them.

So Buildings are ſaid to be of ſeveral *Orders*, when the Proportion between the thickneſs of the Columns, and their height, together with all things requiſite thereto are different.

There are Five Principal Orders *of* Architecture, *viz. The* Tuſcan, Dorick, Ionick, Corinthian, *and the* Compoſit.

The *Tuſcan* is the moſt Simple, and the moſt deſtitute of Ornaments, ſo that it is ſeldom uſed except

except in Vaults, in ſome Ruſtick Edifices, vaſt Piles of Buildings, as *Amphitheatres*, &c.

The *Tuſcan* Pillar with its Baſe and Capital generally hath for its height ſeven Diameters of its thickneſs taken below, and the top ought to be diminiſhed one quarter of its Diameter: The Pedeſtal is very plain, and only one Model high.

The *Dorick Order*, hath its Column eight Diameters high, and ought to have no Ornament neither in its Capital nor Baſe. The *Aſtragal* and *Liſtel* below the Capital, which is half a Diameter high, conſtituting part of the Shank or Body of this Pillar.

The *Ionick Order*, when firſt invented had its Column only eight Models high; but the Ancients deſigning to make it more beautiful, augmented the height of the Pillars, and added a Baſe not uſed before; ſo that with its Capital and Baſe it contains nine Diameters of its thickneſs taken below: The Pedeſtal is two Diameters, and about two thirds high; and the Capital is chiefly compoſed of *Voluta's* or Scrolls, which render it different from the other *Orders*: The *Ionick* Pillars are alſo uſually channelled with 24 Flutes.

The *Corinthian Order*, is the fineſt and richeſt of all; the Length of its Columns with their Baſes and Capitals, is commonly about nine and a half or ten Diameters; and the Capitals are adorned with two Rows of Leaves, and eight *Voluta's* that ſupport the *Abacus*.

The *Compoſit* or *Roman Order*, hath the Capital of its Pillar compoſed of two Rows of Leaves like the *Corinthian*, and of the *Voluta's* or Scrolls of the *Ionick*. Theſe Columns are uſually ten Diameters high, altogether like the *Corinthian* in all its Dimenſions and Numbers, except the Capital, which hath only four *Voluta's* taking up the whole Space, which is filled both by the *Voluta's* and Stems or Stalks in the *Corinthian*.

To theſe Five Orders, *may be added alſo*,

The *Attick*, which is a ſmall *Order* of *Pilaſters* of the ſhorteſt Proportion, having a Cornice raiſed after the manner of an Architrave, for its Entablature. As alſo

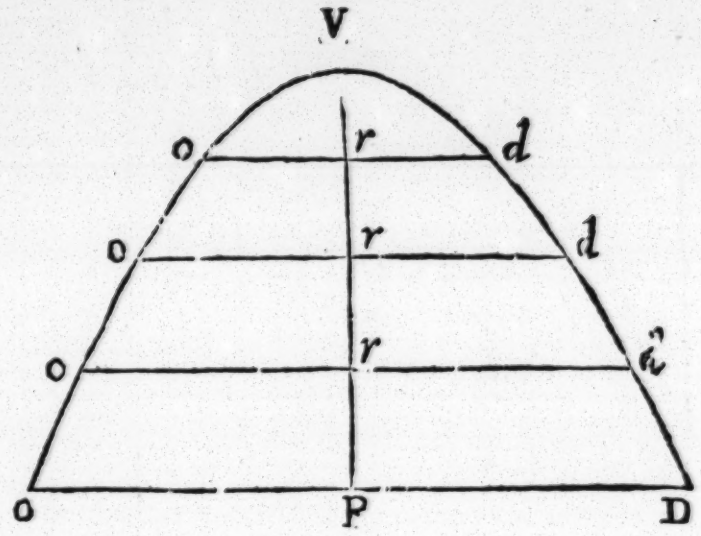
The *Gothick Order*, which is ſo far from the ancient Proportions and Ornaments, that its Columns are either too maſſie in form of vaſt Pillars, or as ſlender as Poles, having Capitals without any certain Dimenſions, carved with the Thorny Leaves of *Thiſtles*, *Coleworts*, *Bears-foot*.

ORDINANCE *of Parliament*, the ſame with *Acts of Parliament*: And Acts of Parliament are in the Parliament-Rolls often called *Ordinances of Parliament*. If there be any Difference, it is, that an *Ordinance* is but Temporary, and to be alter'd by Commons alone; but an *Act* is a perpetual Law, and cannot be altered but by King, Lords and Commons. But Sir *Edw. Coke* aſſerts, That an *Ordinance of Parliament* is to be diſtinguiſhed from an *Act*, for as much as the latter can be only made by the King and the threefold Conſent of the Eſtates, whereas the former is ordain'd with or by two of them.

ORDINARY, in the Civil Law, ſignifies any Judge that hath Authority to take Cognizance of Cauſes in his own Right, as he is a Magiſtrate, and not by Deputation; but in the Common Law, it is taken for him that hath exempt and immediate Juriſdiction in Cauſes Eccleſiaſtical.

ORDINARIES, in Heraldry, are ſuch Charges as are proper to the Art and Uſage of Armory; and therefore are commonly called the Honourable Ordinaries; and are the *Croſs*, the *Chef*, the *Pale*, the *Bend*, the *Feſſe*, the *Eſcutcheon*, the *Chevron*, the *Saltier*, and the *Bar*.

ORDINATE, or *Ordinate Applicate*, is a Line in any Conick Section drawn at Right Angles to and biſſected by the Axis, and reaching from one ſide of the Section to the other; the half of which is properly the Semi-ordinate, but is now uſually called the Ordinate.



Thus, in the Parabola O V D, O D, or *o d*, is an Ordinate rightly apply'd, and its half *r d*, or R D, is the true Semi-ordinate, tho' uſually called the Ordinate it ſelf.

The Properties of theſe Lines you will find under the ſeveral *Conick Sections*.

Dr. *Wallis* in his *Conick Sections*, calls the whole Ordinates O D, &c. the *Lineæ Ordinatim Inſcriptæ*, and the Semi-ordinates O R, &c. he calls the *Ordinate Applicates*.

ORDINATIONE *contra ſervientes*, is a Writ that lieth againſt a Servant for leaving his Maſter.

ORDNANCE, all ſort of Great Guns uſed in War. The ſeveral Parts of a Piece of Ordnance, or Great Gun, are thus called.

1. The Outſide round about the Piece, is called the *Superficies of her Metal*.

2. The Subſtance or whole Maſs of Metal, is called her *Body*.

3. The Part next to us when ſhe ſtands ready to fire, is called the *Breech* or *Coyle*, and the Pummel or round Knob at the End of it, is called the *Caſcabell*; by ſome the *Caſcabell Dock*.

4. The *Trunnions* are the two Knobs, Spindles, or Ears, which hold the Piece in the Carriage.

5. *Maniglions* or *Dolphins*, after the *German* way of caſting Guns, are two Handles placed on the Back of the Piece near the *Trunnions*, and near the Centre of Gravity, to mount and diſmount it the more eaſily.

6. The *Rings* about it are these four: The *Base Ring* is that which is next below the Touch-hole: The next Ring above the Touch-hole is called the *Reinforced Ring*: The next to that forward the *Trunnion Ring*: The next to that, the *Cornice-Ring*: And that at the Mouth is called the *Muzzle-Ring*, or the *Freeze*: Also all the Rings near the Mouth are sometimes called the *Freezes*.

7. As to the Internal Parts, the whole Cavity or *Bore* of the Piece is called her *Chase*. That Part of the Cavity between the *Trunnions*, and the *Muzzle* or Mouth, is called the *Vacant Cylinder*: The Part from the *Trunnions* to the end of the Cavity, or so much of it as containeth (or is *Loaded* with) the Powder and Shot is, called the *Chamber*. The Diameter of the Mouth is called the *Calibre*. The Space between the Shot and the Hollow Superficies of the Piece within is called the *Vent*; being the Difference between the Diameter of the Shot, and of the Mouth of the Piece.

Great Guns in *England* are distinguished into two kinds only, *viz. Field-Pieces*, which are from the least sort of all, to 12 Pounders (*i. e.*) those which carry a Ball or Shot of 12 Pound; and *Cannon of Battery*, which are from a *Culvering* to an whole Cannon.

The Table following gives you all things necessary to be known of the Names, Proportions, Weights, Lengths, Bullets, Ranges, &c. of a Great Gun,

PHILLIPS's TABLE.

The Names of the several Pieces of Ordnance.	Guns Length. Inches. Feet.	Guns Weight. Pounds.	Guns Bore. 8 Parts. Inches.	Bullets Diameter. 8 Parts. Inches.	Bullets Weight. Ounces. Pounds.	Ladles Length. 8 Parts. Inches.	Ladles Breadth. 8 Parts. Inches.	Weight of Powder. Ounces. Pounds.	Point-Blank, or the Level Range. Paces.	Utmost Random. Paces.
A Base	4 6	200	1 2	1 1	0 5	4 0	2 0	0 8	60	600
A Rabinet	5 6	300	1 4	1 3	0 0 8	4 1	2 4 0	0 0 12	70	700
A Falconet	6 0	400	2 2	2 2	0 1 5	4 4	2 4 0	0 1 4	90	900
A Falcon	7 0	750	2 6	2 5	0 2 8	4 8	2 4 4	0 2 4	130	1300
A Minion *Ordinary*	7 0	800	3 0	2 7	0 3 4	4 8	2 4 5	0 2 8	120	1200
A Minion *Largest*	8 0	1000	3 2	3 0	0 3 12	5 0	2 9	0 3 4	125	1250
Saker *Least*	8 0	1400	3 4	3 2	0 4 12	5 6	2 9	0 3 4	150	1500
Saker *Ordinary*	9 0	1500	3 6	3 4	0 6 0	6 0	2 10	0 3 4	160	1600
Saker *Old Sort*	10 0	1800	4 0	3 6	0 7 5	6 2	2 11	0 4 5	163	1630
Demiculverin *Least*	10 0	2000	4 2	4 0	0 9 0	6 4	2 12	0 5 6	174	1740
Demiculv. *Ordinary*	11 0	2700	4 4	4 2	0 10 11	6 6	3 0	0 7 4	175	1750
Demiculv. *Old sort*	11 0	3000	4 6	4 4	0 12 11	6 8	3 4	0 8 8	178	1780
Culverin *Least*	11 0	4000	5 0	4 6	0 15 0	6 10	3 6	0 10 0	180	1800

Demi-Can. *Large*	12 0	6000	6 6	6 3	1 36 0	7 2	3 10	0 12 0	180	1800
Royal Whole Can.	12 0	8000	8 0	7 4	1 58 0	8 0	4 0	0 14 6	185	1850

To this Table I thought it necessary to adjoin Mr. *Anderson*'s; which, I question not, is *much truer*: As being the Result of more Experience, and more Skill in this kind of Mathematical Learning. However, the Differences of the Ranges are so great, that it is worth Examining which is the Truest.

Mr. Anderson's

Mr. Anderſon's TABLE *of the* Names, Diameters, Chaſes, Requiſites of Powder, Comparative Forces, *and* Greateſt Ranges, *to Eight Degrees of Elevation, of Ten ſeveral Pieces of* Cannon, *Experimentally and Mathematically demonſtrated.*

Names of the Pieces.	Length of the Chaſe.	Diamet. of the Bore.	Requiſite of Powder	Greateſt Range.	Comparative Force.
	Feet.	Inches.	lb. ʒ.	Paces.	
1 A *Rabbinet*	3	1 75	5	3769	38

9 A *Whole Cannon*	12	7	21 5	3769	2422
10 A *Cannon-Royal*	12	8	27 14	3298	3382

The Strength and Serviceableneſs of a Piece of Ordnance, conſiſts very much in the Thickneſs of the Metal, eſpecially about its *Chamber* and *Breech*, and this is called its *Fortification*.

And of this there are three degrees both for Cannons and Culverines.

1. Such as are ordinarily fortified, are called *Legitimate Pieces*.

2. Thoſe whoſe Fortification is leſſened, are called *Baſtard Pieces*.

3. There are ſome that are doubly fortified, which are called *Double-fortified*, or *Extraordinary Pieces*.

The Fortification of a Gun is reckoned from the Thickneſs of the Metal at the Touch-hole, at the Trunnions and at the Muzzle, in proportion to the Diameter of the Bore.

The *Doubly-fortified Pieces*, are a full Diameter of the Bore in Thickneſs at the Touch-hole, $\frac{11}{10}$ of it at the Trunnions, at $\frac{7}{10}$ at their Muzzle.

The *Leſſened Cannons* have but $\frac{1}{4}$ or $\frac{12}{10}$ of the Diameter of their Bore, in Thickneſs at the Touch-hole, $\frac{9}{10}$ at the Trunnions, $\frac{5}{10}$ at the Muzzle.

All the *Double-fortified Culverines*, and all leſſer Pieces of that kind, have a Diameter and $\frac{1}{5}$ at the Touch-hole, $\frac{15}{10}$ at the Trunnions, and $\frac{9}{10}$ at the Muzzle. And the Ordinary Fortified Culverines are every way as your Double-Fortified Cannon; and the Leſſened Culverines are as the Ordinary Cannons, in all reſpects.

The *Ordinary Fortified Cannons* have $\frac{7}{8}$ at the Touch-hole, $\frac{1}{8}$ at the Trunnions, and $\frac{3}{8}$ at the Muzzle.

The Famous *Galilæus* was the firſt who proved the Line of a Bullet to be in the Curve of a Parabola (*abſtracting from the Line of Impulſe, and the Reſiſtance of the Medium*, as I judge) as you may find in his Fourth Dialogue; where alſo he gives a Table of *Horizontal Ranges*. *Diſcorſi è Demoſtrazioni Mathematiche*, p. 280, 281.

And his Scholar *Torricellius*, in his Second Book *De Motu Projectorum*, brings the *Horizontal Ranges* to the Table of Sines, and the greateſt Altitudes to the Verſed Sines: That is, he proves, *That all Ranges on the Plane of the Horizon, are in proportion to one another, as the Sines of the Double Angles of the Elevation of their Lines of Direction.* And for the Time of the Continuance of any Shot above the *Horizon*, he ſhews in *Prop.* 18. *Book* 2. That as Radius is to the greateſt Duration (*i. e.* when the Elevation of the Piece is 90 degrees, or when it ſtands perpendicular) : : ſo is the Sine of any other Elevation of the Gun, to the Time of the Range of that Shot.

After this, one *Robert Anderſon*, by Trade a Weaver, but peculiarly ſkilful both in the Application of Mathematicks to this Matter, and alſo prodigiouſly induſtrious and accurate in making Trials with both Guns and Mortars, which he procured to be caſt and fitted at his own Charge: This Man, I ſay, in the Year 1674. publiſhed a Book *of the Genuine Uſe and Effects of the Gun*, together with Tables of the Altitudes of Projections above the *Horizon*, &c. Calculated by Mr. *Street*; in which, in Fifty *Propoſitions*, he ſhews:

1. How from any Shot of a Great Gun, or any Piece, howſoever made, to find the greateſt Random of that Piece: And alſo to ſtrike any Place upon either Aſcents or Deſcents within the Reach of the Piece.

2. He ſhews the Relations of all Guns of the ſame kind among themſelves; and thence the Dimenſions and requiſite Powder of any Piece with a Range anſwerable to any Degree being given: He gives Rules to find the requiſite Powder of any other Piece, and to ſtrike any Place at demand within Reach, its Dimenſions being alſo given.

3. He

3. He ſhews the Nature, Uſe and Property of Mortar-pieces, with their Complications and Relations.

4. He conſiders the Method of ſhooting Grenadoes out of Long Guns, with their manifold Uſes, &c.

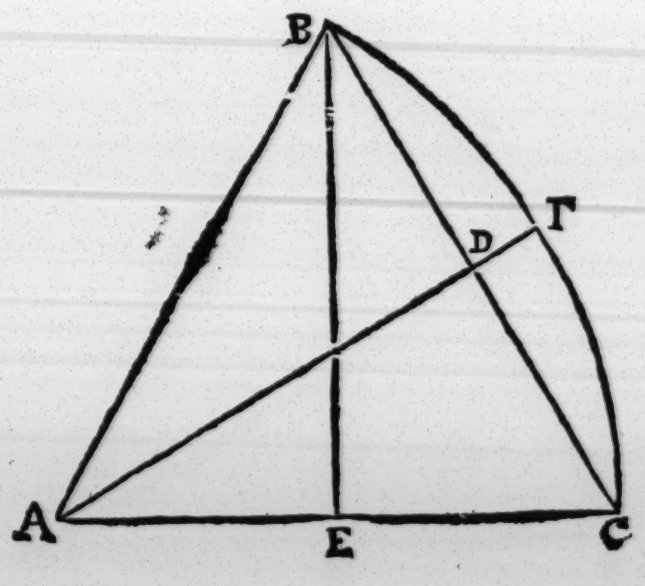
And now, very lately, that excellent Workman Mr. *John Rawley*, Mathematical Inſtrument-maker under St. *Dunſtan*'s Church in *Fleet-ſtreet*, hath contrived a Method of putting *Anderſon*'s Tables upon a Scale; where knowing only the utmoſt Random of any Gun, you have by Inſpection the upper and lower Elevations that are neceſſary to throw the Shot to any aſſigned Diſtance within the Reach of the Piece, and *vice verſa*.

In the Year 1690, *Anderſon* publiſhed another Book, intituled, *To hit a Mark as well upon Aſcents and Deſcents, as upon the Plane of the Horizon*: And in the Preface, he takes Notice of what Mr. *Blondell*, *Mariotte*, *Perault*, and *Halley* have done in this Matter; and agrees with *Cavallerius*, to begin to account the Curve of the Shot to be a Parabola, juſt then where the Force leaves the Thing projected; and the Line of Shot to that place, he calls, *The Line of Impulſe of the Fire*, and for Eaſe of Calculation, takes it for a Right Line: Only he ſays, That the more irregular the Figure of the projected Body is, the longer the Line will be before it paſſes into its Parabola.

He ſaith, after 15 Years Experience (in which Time he made ſome Thouſands of Shots) he knows how to find the Line of Impulſe of Fire, and how to carry the Matter on, on the Principles of *Galilæus*, and can hit a Mark not only on the Plane of the *Horizon*, but upon Aſcents and Deſcents, according to Mathematical Principles; the Method of which you have in his Book.

The Learned Mr. Halley, *now* Savilian *Profeſſor of Geometry in* Oxon, *in* Philoſophical Tranſactions, N°. 179. *having proved the Motion of all* Projectiles, *to be in the Curve of a* Parabola, (*which you will find under* Projectile) *premiſes this* Lemma.

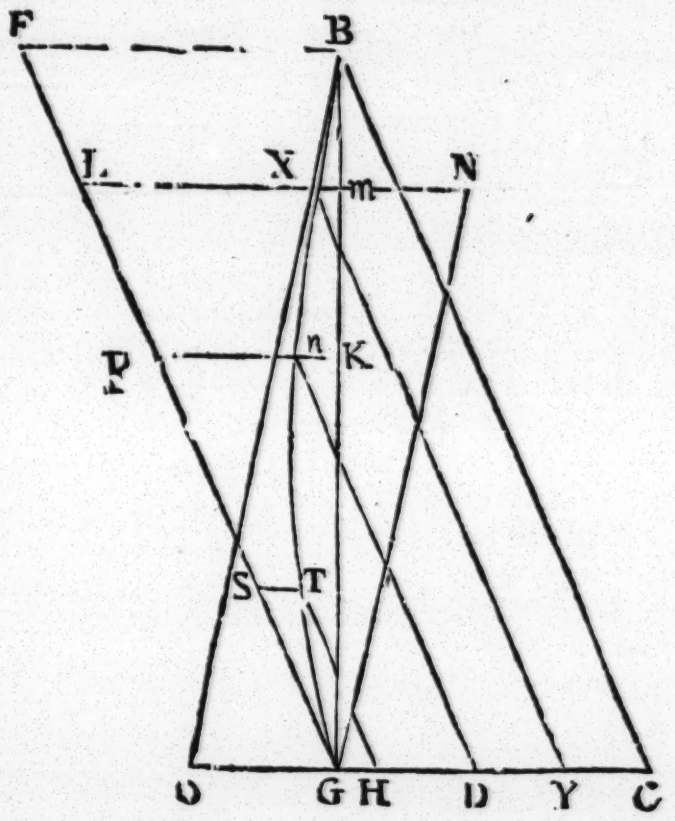
That the Sine of the Double of any Arch, is equal to twice the Sine of that Arch into its Co-ſine, divided by Radius; and the Verſed Sine of the Double of any Arch is equal to the Square of the Sine thereof, divided by Radius.



Let the Arch B C (in *Fig.* 1.) be double to the Arch B F, and A the Centre: Draw the *Radii*, A B, A F, A C, and the Chord B D C, and let fall B E perpendicular to A C, and the Angle B C E, will be equal to the Angle A B D, and the Triangle B C E, will be like to the Triangle B D A: Wherefore it will be as A B to A D, ſo B C, or twice B D, to B E, that is as Radius to Co-ſine, ſo twice Sine to Sine of the Double Arch. And as A B to B D, ſo twice B D or B C, to E C, that is as Radius to Sine, ſo twice that Sine to the Verſed Sine of the Double Arch; which two Analogies reſolved into Equations, are the Propoſitions contained in the Lemma to be proved.

PROPOSITION I.

The Horizontal Diſtances of Projections made with the ſame Velocity at ſeveral Elevations of the Line of Direction, are as the Sines of the double Angles of Elevation.



Let G B (*Fig.* 2.) the Horizontal Diſtance, be $= Z$, the Sine of the Angle of Elevation, F G B, $b = s$, its Co-ſine $= c$, Radius $= r$, and the Parameter $= p$, it will be as c to s :: ſo z to $\frac{sz}{c} =$ F B $=$ G C, and by reaſon of the Parabola $\frac{psz}{c} =$ to the Square of C B, or G F: Now as c to r :: ſo is z to $\frac{zr}{c} =$ G F, and its Square $\frac{zzrr}{cc}$ will be therefore $=$ to $\frac{psz}{c}$: Which Equation reduced, will be $\frac{psc}{rr} = Z$. But by the former Lemma $\frac{2sc}{r}$ is equal to the Sine of the Double Angle, whereof S is the Sine: Wherefore 'twill be as Radius to Sine of double the Angle F G B, ſo is half the Parameter, to the Horizontal Range or Diſtance ſought; and at the ſeveral Elevations, the Ranges are as the Sines of the double Angles of Elevation. *Q. E. D.*

CORO-

COROLLARY.

Hence it follows, *That half the Parameter is the greateſt Random, and that happens at the Elevation of* 45 *Degrees, the Sine of whoſe double is Radius: Likewiſe that the Ranges equally diſtant above and below* 45 *are equal, as are the Sines of all double Arches to the Sines of their double Complements.*

PROP. II.

The Altitudes of Projections made with the ſame Velocity, at ſeveral Elevations, are as the Verſed Sines of the double Angles of Elevations.

As e is to s : : ſo is $\frac{p\,s\,s}{r\,r}$ = G B to $\frac{p\,s\,s}{r\,r}$ = B F, and U K = R U = $\frac{\text{B F}}{4}$ the Altitude of the Projection = $\frac{p\,s\,s}{4\,r\,r}$. Now by the foregoing Lemma $\frac{2\,s\,s}{r}$ = to the Verſed Sine of the double Angle, and therefore it will be as Radius to Verſed Sine of double the Angle F G B, ſo an 8th of the Parameter to the height of the Projection U K; and ſo theſe Heights at ſeveral Elevations, are as the ſaid Verſed Sines, *Q. E. D.*

COROLLARY.

From hence it is plain, that the greateſt Altitude of the Perpendicular Projection is a 4*th of a Parameter, or half the greateſt Horizontal Range; the Verſed Sign of* 180 *Degrees, being* = 2 r.

PROP. III.

The Lines G F, *or Times of the Flight of a Project caſt with the ſame Degree of Velocity at different Elevations, are as the Signs of the Elevations.*

As c is to r : : ſo is $\frac{p\,s\,c}{r\,r}$ = G B by the 6th Propoſition to $\frac{p\,s}{r}$ = G F; that is, as Radius to Sine of Elevation, ſo the Parameter to the Line G F; ſo the Lines G F are as the Sines of Elevation, and the Times are proportional to thoſe Lines: Wherefore the Times are as the Sines of the Elevation: *Ergo conſtat propoſitio.*

PROP. IV.

Problem. *A Projection being made as you pleaſe, having the Diſtance and Altitude, or Deſcent of an Object through which the Project paſſes, together with the Angle of Elevation, with the Line of Direction; to find the Parameter and Velocity that is (in* Fig. 2.*) having the Angle* F G B, G M, *and* M X.

SOLUTION.

As Radius to Secant of F G B, ſo G M the Diſtance given, to G L; and as Radius to Tangent of F G B, ſo G M to L M. Then L M — M X in Heights, or + M X in Deſcents; or elſe M X — M L, if the Direction be below the Horizontal Line, is the Fall in the Time that the direct Impulſe given in G, would have carried the Project from G to L = L X = G Y. Then by reaſon of the Parabola, as L X or G Y is to G L or Y X : : ſo is G L to the Parameter ſought.

To find the Velocity of the Impulſe, by *Prop.* 2. and 4, find the Time in Seconds that a Body would fall the Space L X, and by that dividing the Line G L, the Quote will be the Velocity, or Space moved in a Second ſought, which is always a mean Proportional between the Parameter, and 16 Feet 1 Inch.

PROP. V.

Problem 2. *Having the Parameter, Horizontal Diſtance, and Height or Deſcent of an Object, to find the Elevations of the Line of Directions neceſſary to hit the given Object; that is, Having* G M. M X, *and the greateſt Random equal to half the Parameter; to find the Angles* F G B.

Let the Tangent of the Angle ſought be = t, the Horizontal Diſtance G M = b, the Altitude of the Object M X = h, the Parameter = p, and Radius = r, and it will be as r to t, ſo b to $\frac{t\,b}{r}$ = M L, and $\frac{t\,b}{r} \mp h$ $\begin{cases}\text{in Aſcents}\\ \text{in Deſcents}\end{cases}$ = L X, and $\frac{p\,t\,b}{r} \mp p\,h$ = G L □ = + Y □ by reaſon of the *Parab.* but $b\,b + \frac{t\,t\,b\,b}{r\,r}$ = G L □. 47. 1 *Euclid.* Wherefore $\frac{p\,t\,b}{r} \mp p\,h$ = $b\,b \mp \frac{t\,t\,b\,b}{r\,r}$, which Equation tranſpoſed, is $\frac{t\,t\,b\,b}{r} = \frac{p\,t\,b}{r} \mp p\,h - b\,b$, divided by $b\,b$ is $\frac{t\,t}{r\,r} = \frac{p\,t}{b\,r} + \frac{p\,h}{b\,b} - 1$. This Equation ſhews the Queſtion to have two Anſwers, and the Roots thereof are $\frac{t}{r} = \frac{p}{2\,b} \mp \sqrt{\frac{p\,p}{4\,b\,b} + \frac{p\,h}{b\,b}} - 1$. From which I derive the following Rule.

Divide half the Parameter by the Horizontal Diſtance, and keep the Quote, *viz.* $\frac{p}{2\,b}$, then ſay, As Square of the Diſtance given to the half Parameter, ſo half Parameter $\mp$ double $\begin{cases}\text{Height}\\ \text{Deſcent}\end{cases}$ to the Square of the Secant = $\frac{p\,p \mp 4\,p\,h}{4\,b\,b}$ the Tangent anſwering to that Secant, will be $\sqrt{\frac{p\,p \mp 4\,p\,h}{4\,b\,b}} - 1$ or $r\,r$: So then the Sum

and

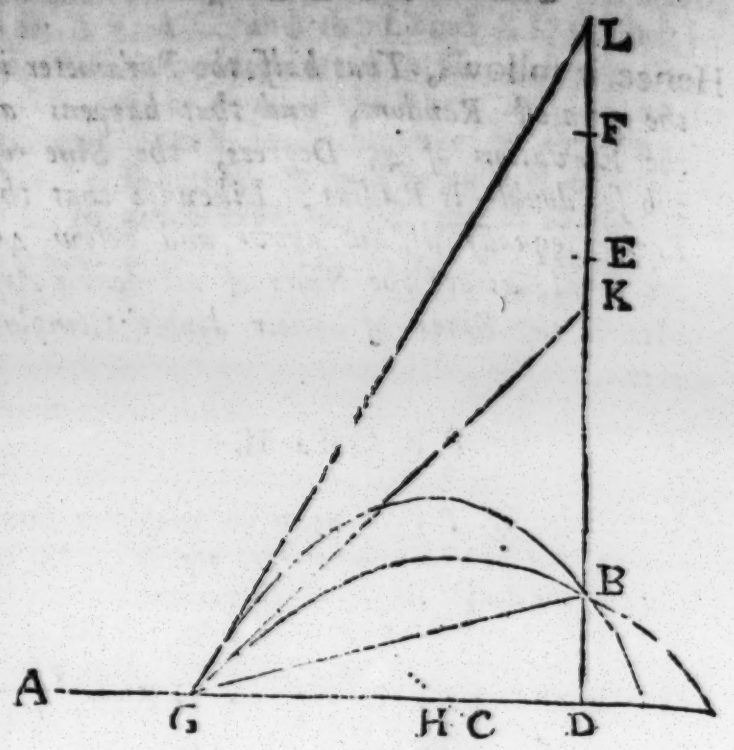
and Difference of the aforeſaid Quote, and this Tangent will be the Roots of the Equation, and the Tangents of the Elevations ſought.

Note here, that in Deſcents, if the Tangent exceed the Quote, as it does when $p\,h$ is more than $b\,b$, the Direction of the lower Elevation will be below the Horizon, and if $p\,h = b\,b$, it muſt be directed Horizontal, and the Tangent of the upper Elevation will be $\frac{p\,r}{b}$: Note, likewiſe, That if $4\,b\,b + 4\,p\,h$ in Aſcents, or $4\,b\,b - 4\,p\,h$ in Deſcents, be equal to $p\,p$, there is but one Elevation that can hit the Object, and its Tangent is $\frac{p\,r}{2\,b}$; and if $4\,b\,b + 4\,p\,h$ in Aſcents, and $4\,b\,b - 4\,p\,h$ in Deſcents, do exceed $p\,p$, the Object is without the reach of a Project caſt with that Velocity, and ſo the Thing impoſſible.

From this Equation $4\,b\,b + 4\,p\,h = p\,p$ are determined the utmoſt Limits of the reach of any Project, and the Figure aſſigned, wherein are all the Heights upon each Horizontal Diſtance, beyond which it cannot paſs; for by Reduction of that Equation, h will be found equal $\frac{1}{4}\,p - \frac{b\,b}{p}$ in Heights, and $\frac{b\,b}{p} - \frac{1}{4}\,p$ in Deſcents: From whence it follows, That all the Points h, are in the Curve of the Parabola, whoſe Focus is the Point from whence the Project is caſt, and whoſe *Latus Rectum*, or Parameter *ad Axem* is $= p$. Likewiſe from the ſame Equation, may the leaſt Parameter or Velocity be found capable to reach the Object propoſed; ; for $b\,b = \frac{1}{4}\,p\,p + p\,h$ being reduced $\frac{1}{2}\,p$ will be $= \sqrt{b\,b + h\,h} + h$ in Aſcents, which is the Horizontal Range at forty five Degrees of Elevation that would juſt reach the Object and the Elevation requiſite will be eaſily had; for dividing the ſo found Semi-parameter by the Horizontal Diſtance given b, the Quote into Radius will be the Tangent of the Elevation ſought.

The Rule may be of good Uſe to all Bombardeers and Gunners, not only that they may uſe no more Powder than is neceſſary, to caſt their Bombs into the Place aſſign'd, but that they may ſhoot with much more Certainty, for that a ſmall Error committed in the Elevation of the Piece, will produce no ſenſible Difference in the Fall of the Shot: For which Reaſon the *French* Engineers in their late Sieges have uſed Mortar-pieces inclined conſtantly to the Elevation of 45, proportioning their Charge of Powder according to the Diſtance of the Object they intend to ſtrike on the Horizon.

And this is all that need to be ſaid concerning this *Problem*, of Shooting upon Heights and Deſcents. But if a Geometrical Conſtruction thereof be required, I think I have one that is as eaſie as any that can be expected, which I deduce from the foregoing Analytical Solution, *viz.* $\frac{s}{r} = \frac{p}{2\,b} + \sqrt{\frac{\frac{1}{4}\,p\,p + p\,b - b\cdot b}{b\,b}}$ and 'tis this.



Having made the Right Angle L D A, *Fig.* 3. make D A, D F $= p$, or greateſt Range, D G $= b$ the Horizontal Diſtance, D B, D C $= h$, the Perpendicular Height of the Object; and draw G B, and make D E $=$ thereto: Then with the Radius A C and Centre E ſweep an Arch, which if the thing be poſſible, will Interſect the Line A D in H; and the Line D H being laid both ways from F, will give the Points K and L, to which draw the Lines G L, G K: I ſay the Angles L G D, K G D are the Elevations required for hitting the Object B. If below the Horizon, its Deſcent D C $=$ D B muſt be laid from A, ſo as to have A C $=$ A D $+$ D C.

Note likewiſe, that if in Deſcents D H be greater than F D, and ſo K fall below D, the Angle K G D ſhall be the Depreſſion below the Horizon. Now this Conſtruction ſo naturally follows from the Equation, that I ſhall need ſay no more about it.

PROP. VI.

To determine the Force or Velocity of a Project in every Point of the Curve it deſcribes.

To this we need no other *Præcognita*, but only the Third Propoſition, *viz. That the Velocity of Falling Bodies, is double to that which in the ſame time would have deſcribed the Space fallen by an equable Motion*: For the Velocity of a Project, is compounded of the conſtant equal Velocity of the Impreſſed Motion, and the Velocity of the Fall, under a given Angle, *viz.* the Complement of the Elevation.

For Inſtance, in *Fig.* 2. in the time wherein a Project would move from G to L, it deſcends from L to X: And by the Third Propoſition, has acquired a Velocity, which in that time would have carried it by an unequal Motion from L to Z, or twice the Deſcent L X: And drawing the Line G Z, I ſay the Velocity in the Point X, compounded of the Velocities G L, and L Z, under the Angle G L Z, is to the Velocity impreſt in the Point G, as G Z is to G L. This follows from the Second Axiome; and by the 20th and 21ſt *Prop. Lib.* 1. *Con. Mydorgii*, X O parallel and equal to G Z, ſhall touch the Parabola in the Point X. So that the Velocities in the ſeveral

ral Points, as are the Lengths of the Tangents to the Parabola in those Points, intercepted between any two Diameters: And these again are as the Secants of the Angles, which those Tangents continu'd, make with the Horizontal Line G B.

From what is here laid down, may the comparative force of a Shot in any Two Points of the Curve, be either Geometrically or Arithmetically discovered.

COROLLARY.

From hence it follows, *That the Force of a Shot is always least at* U, *or the Vertex of the Parabola, and that at equal Distances therefrom, as at* T *and* X, G *and* B, *its Force is always equal; and that the least Force in* U, *is to that in* G *and* B, *as Radius to the Secant of the Angle of Elevation* F G B.

These Propositions considered, there is no Question relating to Projects, which by the Help of them may not easily be solved; and tho' it be true that most of them are to be met withal, in *Galilæus*, *Torricellius*, and others, who have taken them from those Authors; yet their Books being Foreign, and not easie to come by, and their Demonstrations long and difficult, I thought it not amiss to give the whole Doctrine here in *English*, with such short Analytical Proofs of my own, as might be sufficient to evince their Truth.

The Tenth Proposition contains a Problem, untouch'd by *Torricellius*, which is of the greatest Use in Gunnery; and for the sake of which, this Discourse was principally intended: It was first Solved by Mr. *Anderson*, in his Book of *The Genuine Use and Effects of the Gun*, Printed in the Year 1674; but his Solution required so much Calculation, that it put me upon Search, Whether it might not be done more easily? And thereupon in the Year 1678, I found out the Rule I now publish; and from it the Geometrical Construction: Since which time there has a large Treatise on this Subject, Entituled, *L'Art de jetter les Bombes*, been publish'd in *France*, by Monsieur *Blondel*, wherein he gives the Solutions of this Problem by Messieurs *Bout*, *Romer*, and *De la Hire*; but none of them being the same with mine, or in my Opinion more easie, and most of them more Operose; and besides mine finding the Tangent, which generally determines the Angle better than its Sine, I thought my self obliged to Print it for the Use of all such as desire to be informed in the Mathematical part of the Art of Gunnery.

Now these Rules were rigidly true, were it not, as I said before, for the Opposition of the Medium, whereby not only the direct impress Motion is continually retarded, but likewise the Increase of the Velocity of the Fall, so that the Spaces described thereby, are not exactly as the Squares of the Times: But what this Opposition of the Air is, against several Velocities, Bulks, and Weights, is not so easie to determine. 'Tis certain that the Weight of Air, to that of Water, is nearly as 1 to 800, whence the Weight thereof, to that of any Project is given; 'tis very likely, that to the same Velocity and Magnitude but of different Matter, the Opposition should be reciprocally as the Weights of the Shot; as likewise that to Shot of the same Velocity and Matter, but of different Sizes. it should be as the Diameters reciprocally: Whence generally the Opposition to Shot with the same Velocity, but of different Diameters, and Materials, should be as their Specifick Gravities unto their Diameters reciprocally; but whether the Opposition, to differing Velocities of the same Shot, be as the Squares of those Velocities, or as the Velocities themselves, or otherwise, is yet a harder Question. However it be, 'tis certain, that in large Shot of Metal, whose Weight many Thousand times surpasses that of the Air, and whose force is very great, in proportion to the Surface wherewith they press thereon; this Opposition is scarce discernable: For by several Experiments made with all Care and Circumspection with a Mortar-piece extraordinarily well fix'd to the Earth on purpose, which carried a solid Brass Shot of $4\frac{1}{2}$ Inches Diameter, and of about 14 Pounds Weight, the Ranges above and below 45 Degrees were found nearly equal, if there were any Difference, the wider Ranges went rather the furthest, but those Differences were usually less than the Errors committed in ordinary practice, by the unequal Goodness and Driness of the same sort of Powder by the Unfitness of the Shot to the Bore, and by the looseness of the Carriage.

In a smaller Brass Shot of about an Inch and half Diameter, cast by a Cross-Bow, which ranged it, at most about 400 Foot, the Force being much more equal than in the Mortar-piece, this Difference were found more curiously, and constantly, and most evidently, the under Ranges outwent the upper.

From which Trials I conclude, That altho' in small and light Shot, the Opposition of the Air, ought and must be accounted for; yet in Shooting of great and weighty Bombs, there need be very little or no Allowance made; and so these Rules may be put in practice to all Intents and Purposes, as if this Impediment were absolutely removed.

Then after this in *Philosophical Transactions*, Numb. 261. The same Excellent Geometrician pursues this Matter further in the following Discourse, *viz.*

A Proposition of General Use in the Art of Gunnery, *shewing the Rule of Laying a Mortar to pass, in order to strike any Object above or below the Horizon. By* E. Halley.

It was formerly the Opinion of those concerned in Artillery, That there was a certain Requisite of Powder for each Gun; and in Mortars, where the Distance was to be varied, it must be done by giving a greater or lesser Elevation to the Piece. But now our later Experience has taught us, that the same thing may be more certainly and readily performed by increasing and diminishing the Quantity of Powder, whether regard be had to the Execution to be done, or to the Charge of doing it. For when Bombs are discharged with great Elevations of the Mortar, they fall too perpendicular, and bury themselves

too deep in the Ground, to do all that Damage they might, if they came more Oblique, and broke upon or near the Surface of the Earth; which is a thing acknowledged by the Beſieged in all Towns, who unpave their Streets to let the Bombs bury themſelves, and thereby ſtifle the force of their Splinters.

A Second Convenience is, That at the extream Elevation, the Gunner is not obliged to be ſo Curious in the Direction of his Piece, but it will ſuffice to be within a Degree or two of the Truth; whereas in the other Method of Shooting he ought to be very curious.

But a Third, and no leſs conſiderable Advantage is, in the ſaving of the King's Powder, which in ſo great, and ſo numerous Diſcharges, as we have lately ſeen, muſt needs amount to a conſiderable Value.

And for Sea Mortars, it is ſcarce practicable otherwiſe to uſe them, where the Agitation of the Sea continually changes the Direction of the Mortar, and would render the Shot very uncertain, were it not that they are placed about 45 Degrees of Elevation, where ſeveral Degrees above or under, make very little difference in the Effect.

In Numb. 179. of theſe *Tranſactions*, I conſidered and demonſtrated all the Propoſitions relating to the Motion of the *Projectiles*, and gave a Solution to this *Problem*, viz. *To hit an Object above or below the Horizontal Line, with the greateſt Certainty and leaſt Force*, as may be ſeen in that *Tranſaction*, p. 16, 17. That is, That the Horizontal Diſtance of the Object being put $= b$, and the perpendicular Height $= h$, the Charge requiſite to ſtrike the Object with the greateſt Advantage, was that which with an Elevation of 45 Degrees, would caſt the Shot on the Horizontal Line, to the Diſtance of $\sqrt{bb+hh}+h$, when the Object was above the Horizon; or if it were below it, the Charge muſt be leſſer, ſo as to reach on the Horizon, at 45 Degrees Elevation, no greater a Diſtance than $\sqrt{bb+hh}-h$; that is in the one Caſe, the Sum of the Hypothenuſal Diſtance of the Object from the Gun, and the Perpendicular Height thereof above the Gun; and in the other Caſe, when the Object is below the Horizon, the Difference of the ſame, *per* 47. 1. *Euclid*.

And I then ſhewed how to find the Elevation proper for the Gun ſo charged, *viz.* As the Horizontal Diſtance of the Object, to the Sum or Difference of the Hypothenuſal Diſtance, and Perpendicular Height :: So Radius to the Tangent of the Elevation ſought. But I was not at that time aware that the aforeſaid Elevation did conſtantly biſect the Angle between the Perpendicular and the Object, as is demonſtrated from the Difference and Sum of the Tangent and Secant of any Arch, being always equal to the Tangent and Co-tangent of the half Compliment thereof to a Quadrant.

Having diſcovered this, I think nothing can be more compendious, or bids fairer to compleat the Art of *Gunnery*, it being as eaſie to ſhoot with a Mortar at any Object on Demand, as if it were on the Level: Neither is there need of any Computation, but only ſimply laying the Gun to paſs, in the middle Line between the Zenith and the Object, and giving it its due Charge. Nor is there any great need of Inſtruments for this Purpoſe: For if the Muzzle of the Mortar be turned truly Square to the Bore of the Piece, as it uſually is, or ought to be, a piece of Looking-glaſs Plate applied parallel to the Muzzle, will by its Reflection give the true Poſition of the Piece; the Bombardeer having no more to do, but to look perpendicularly down on the Looking-glaſs, alongſt a ſmall Thread with a Plummet, and to raiſe or depreſs the Elevation of the Piece, till the Object appear reflected on the ſome Point of the Speculum, on which the Plummet falls; for the Angle of Incidence and Reflection being equal, in this caſe a Line at Right Angles, to the Speculum, as is the Axis of the Chaſe of the Piece, will biſect the Angle between the Perpendicular and the Object, according as our Propoſition requires. So that it only remains by good and valid Experiments to be aſſured of the force of Gun-powder. How to make and conſerve it equal, and to know the Effect thereof in each Piece; that is, how far differing Charges will caſt the ſame Shot out of it; which may moſt conveniently be engraven on the outſide thereof, as a ſtanding Direction to all Gunners, who ſhall from thenceforward have occaſion to uſe that Piece: And were this Matter well aſcertained, it might be worth the While to make all Mortars of the like Diameter, as near as may be alike in length of Chaſe, Weight, Chamber, and all other Circumſtances.

This Diſcovery that the utmoſt Range on an inclined Plane is, when the Axis of the Piece makes equal Angles with the Perpendicular and the Object, compared with what I have demonſtrated of the ſame *Problem* in the aforeſaid Number 179, does lead to and diſcover two very ready *Theorems*; the one to find the greateſt Horizontal Range at 45 Degrees Elevation by any Shot made upon any inclined Plain with any Elevation of the Piece whatſoever: And the other to find the Elevations proper to ſtrike a given Object with any Force greater than what ſuffices to reach it with the aforeſaid middle Elevation. Both which being performed by one Single Proportion, may be very ſerviceable to ſuch as are concerned in the Practice of *Gunnery*, but are unwilling to trouble themſelves with tedious and difficult Rules.

The Two Propoſitions are theſe.

PROP. I.

A Shot being made on an inclined Plane, having the Horizontal Diſtance of the Object it ſtrikes, with the Elevation of the Piece, and the Angle at the Gun between the Object and the Perpendicular: To find the greateſt Horizontal Range of that Piece, laden with the ſame Charge; that is, half the Latus Rectum *of all the* Parabolæ, *made with the ſame* Impetus.

RULE.

Take half the Diſtance of the Object from the Nadir, and take the Difference of the given Elevation from that half; the Verſed Sine of that Difference ſubtract from the Verſed Sine of the Diſtance of the Object from the Zenith: Then ſhall the Difference of thoſe Verſed Sines be to the Sine of the Diſtance of the Object from the

the Zenith, as the Horizontal Diſtance of the Object ſtruck, to the greateſt Horizontal Range at 45 Degrees.

PROP. II.

Having the greateſt Horizontal Range of a Gun, the Horizontal Diſtance, and the Angle of Inclination of an Object to the Perpendicular, to find the two Elevations neceſſary to ſtrike that Object.

RULE.

Halve the Diſtance of the Object from the Nadir, this half is always equal to the half Sum of the two Elevations we ſeek. Then ſay, As the greateſt Horizontal Range is to the Horizontal Diſtance of the Object : So is the Sine of the Angle of Inclination or Diſtance of the Object from the Perpendicular, to a fourth Proportional ; which Fourth being ſubtracted from the Verſed Sine of the Diſtance of the Object from the Zenith, leaves the Verſed Sine of half the Difference of the Elevation ſought ; which Elevations are therefore had by adding and ſubtracting that half Difference to and from the aforeſaid half Sum.

I ſhall not need to ſpeak of the Facility of theſe Solutions : I ſhall only obſerve, That they are both general, without Exception or Caution, and derived from the Knowledge that theſe two Elevations are equi-diſtant above and below the Line, biſſecting the Angle between the Object and the Zenith.

ORDONANCE, in Architecture, is the giving to all the Parts of an Edifice that juſt Quantity and Dimenſion which they ought to have, according to the Model.

OREXIS, is the Natural Appetite of Meat, which proceeds from an Acid Ferment in the Ventricle that comes from the *Cæliac* Arteries, with which the nervous Tunick of the Stomach and its Nerves are extraordinarily moved to covet Nouriſhment. *Blanchard.*

ORGANICAL *Part*, is that Part of an Animal or Vegetable Body which is deſigned for the performing ſome particular Action : Whereas ſome Parts are *Non organical* ; which have no particular Action, but rather ſome Uſe in the Oeconomy of the Whole.

ORGANS, the Parts of an Animal Body, fitted as Inſtruments to diſcharge any particular Office or Function. Thus the Organ of Sight is the Eye with all its Parts ; the Organ of Hearing is the Ear, *&c.* Therefore by *Organical Parts* are meant the Subſtantial Parts or Members of the Body, appointed to perform any particular Function or Action.

ORGANUM, or *Organon*, the Name or Title that *Ariſtotle* gave to his Book of Logick.

ORGASMUS, is an *Impetus* and quick Motion of Blood or Spirits ; as when the Animal Spirits ruſh violently into the Nerves.

ORIENT, is the Eaſt Quarter of the *Horizon*, or is that Part of the *Horizon* where the Ecliptick, or the Sun therein, aſcends into the upper Hemiſphere ; and therefore, according to ſome Writers way of Expreſſion, the

Eſtival ORIENT, is that Point of the Horizon where the Sun riſes, when he enters into *Capricorn.*

Equinctial ORIENT, is that Point of the Horizon which the Sun riſes upon, when he enters into *Aries* or *Libra.*

ORIENTAL, in Aſtronomy : A Planet is ſaid to be *Oriental*, when it riſes in the Morning before the Sun.

ORIFICE, the Mouth, Entry, or Brim of any thing, more-eſpecially that of a Wound, Vein, Tube, *&c.*

ORIGINAL *Equations.* A Term uſed by *Harriot* in his Algebra ; ſee *Quadratick Equations.*

ORIGINALIA, in the Treaſurer's Remembrancer's Office in the *Exchequer*, are Records or Tranſcripts ſent thither out of the *Chancery*, and are diſtinguiſhed from *Recorda*, which contain the Judgments and Pleadings in Suits tryed before the Barons of that Court.

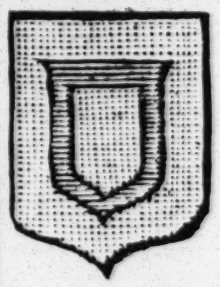
ORILLON, in Fortification, is a ſmall Rounding of Earth lined with a Wall, which is raiſed on the Shoulder of thoſe Baſtions that have Caſements, to cover the Cannon in the Retired Flank, and prevent their being diſmounted by the Enemy.

There are alſo other ſorts of *Orillons*, properly called *Shoulderings*, which are almoſt of a Square Figure : They are alſo called *Epaulements.*

ORION, a Southern Conſtellation, conſiſting of 39 Stars.

ORGUES, in Fortification, are many Harquebuſſes link'd together, or divers Musket-Barrels laid in a row, within one Wooden Stock, ſo that they may be diſcharged either all at once, or ſeparately. They are made uſe of to defend Breaches and other Poſts that are attack'd.

This Term is alſo appropriated to certain long and thick pieces of Timber, arm'd with Iron Plates at the ends, and ſeparated one from another. They are hung with Cords over the Gates of a Town or Fortreſs, and in Caſe of Surprize, let fall perpendicularly ; by which means the Paſſage is ſtopt, ſo that the Enemy cannot eaſily remove or hoiſt up all the Wooden Bars with a Leaver, or any other Machine ſet under them : On which account theſe *Orgues* are to be preferr'd before *Herſes* or *Portcullices*, becauſe the Pieces whereof the latter conſiſt are join'd together ; ſo that when any Part is hung or heaved up, the whole Machine is likewiſe removed. Theſe *Orgues* therefore are much better than *Portcullices.*



ORLE, is an Ordinary in Heraldry, almoſt of the Figure of an *Ineſcocheon*, only it is voided, ſo that the Field appears through, Thus : He beareth *Or*, an *Orle Azure*, by the Name of *Bertram.* Whenever an *Orle* is flowered, it is called a *Treſſure* ; and if there be two of them, a *Double Treſſure.*

Sometimes an *Orle* conſiſts of three pieces one within another. Alſo if a Round of *Martlets*, *Cinquefoils*, *Eſcallop-ſhells*, &c. are placed about any *Ordinary*, 'tis called an *Orle* of *Martlet's*, *Cinquefoils*, &c.

ORLE, a Term in Architecture ; the ſame with *Plinth*, which ſee.

ORLOPE, properly the Spare-Deck in a great Ship, reaching from the Main-maſt to the Miſſen ; and in a Three-Deck'd Ship the Second and Loweſt Deck are ſometimes called *Orlopes.*

ORNAMENTS, in Architecture, are the *Architraves*, *Friezes*, and *Cornices* of the ſeveral *Orders.* But there are alſo many Ornaments frequent-

ly carved in the Mouldings, and on all other Members; as divers ſorts of *Leaves*, *Chaunellings*, *Wreaths*, *Ovals*, *Chaplets*, *Treſſes*, *Feſtoons*, *Flowers*, *Roſes*, &c. The *Ornaments* of the Columns the *French* call *Oeufs*.

ORNITHOLOGY, is a Deſcription of the ſeveral Natures and Kinds of Birds.

OROBOIDES, is a ſubſiding in Urine, like to a kind of Pulſe called *Vetches*. *Blanchard*.

ORTEIL, a Term in Fortification; the ſame with *Berme*, which ſee.

ORTHODROMIQUES, is the Art of ſailing in the Ark of ſome great Circle: For the Ark of every great Circle is ὀρθοδρομία, the ſhorteſt ſtraiteſt Diſtance between any two Points on the Surface of the Globe.

ORTHOGRAPHY, in *Grammar*, is writing and ſpelling any Language truly, according, to its juſt Etymologies and Proprieties.

ORTHOGRAPHY, in *Mathematicks*, is the true Delineation of the fore-right Plain of any Object.

In *Architecture*, 'tis taken for the Model, Platform, and Delineation of the Front of a Houſe that is to be built and contrived according to the Rules of Geometry; according to which Pattern, the whole Fabrick is erected and finiſhed.

In *Perſpective*, the *Orthography* of any Body, or Building, is the foreright ſide of any Plane; that is, the Side or Plane that lies parallel to a ſtreight Line, that may be imagined to paſs thro' the outward Convex Points of the Eyes, continued to a convenient Length. The Word *Schenography* is uſed by *Lamy* and Others in the ſame Senſe.

In *Fortification*, it is the *Profile* or Repreſentation of a Fortreſs, made after ſuch a manner, that the Length, Breadth and Height of its ſeveral Parts may be diſcovered.

ORTHOGRAPHICAL *Projection of the Sphere*, is the drawing the Superficies of the *Sphere* on a Plane which cutteth it in the middle, the Eye being placed at an infinite Diſtance vertically to one of the *Hemiſpheres*; then a Right Line extended from the Eye to any aſſigned Point in the Surface of that Hemiſphere, ſhall project the aſſigned Point upon the Plane; and the Diſtance upon the Plane from the Apex, or top of the Hemiſphere to the projected Point, is equal to the Sine of the Ark, from the Vertex of the Hemiſphere to the aſſigned Point, the Radius being the Semi-diameter of the *Sphere*. This Projection is alſo called the *Analemma*, which ſee.

ORTHOGONIAL, the ſame with *Right-angled*; and when referred to a Plain Figure, ſuppoſes one Leg or Side to ſtand perpendicular to the other: And when it is ſpoken of Solids, it ſuppoſes their Axis to be perpendicular to the Plane of the Horizon.

ORTHOPNOEA, is an ill Reſpiration, when the Perſon affected cannot breathe but with his Neck erect.

OS, a Bone, is an hard, dry, and cold Subſtance, conſiſting eſpecially of earthy and ſaline Particles; which Particles, ſaith Dr. *Havers*, being in their ſeveral Series united at their Extremities, form Strings; and thoſe Strings united make diſtinct Plates, which lying one above another, conſtitute the whole Thickneſs of the Bone.

The Bones in an Human Body, are deſigned for the upholding of the Body, to render its Motion eaſie, and for a Fence for ſeveral Parts. Some make the Number of the Bones to be 249, others commonly 304, and others as many as the Days of the Year; yet the Number of them is uncertain, becauſe the Bones of Infants differ from thoſe of Adult Perſons; alſo, becauſe the Bones called *Seſamoidea*, (ſee them in their proper Place) and the Teeth, are not determined to a certain Number in Old Men and Adult Perſons. They are of different Shapes; ſome are round, others plain, acute, obtuſe, hollow, ſpongy, ſolid, oblong, triangular, &c. If you would find any particular Bone, ſee the Word that diſtinguiſhes it; as, for *Os frontis*, or *Coronale*; ſee *Frontis Os*, or *Coronale*.

OS *Calcis*. See *Calcaneus*.

OSCILLATION. If a Ball be hung at the end of a String or Wire, and that Wire or String hang on a Pin faſtened above, ſo that the Ball may ſwing or play freely on that Pin, it is called a *Pendulum*, and the Pin is the *Centre of Suſpenſion*: But if you imagine the Pin to be the Centre of a Circle, whoſe Circumference ſhall divide the Ball or Bob into two equal Parts, the middle Point of the Ark, ſo dividing the Ball, is called the *Centre of Oſcillation*. If the Bob be of any other Figure but orbicular, the Centre of Gravity of it will be the Centre of Oſcillation.

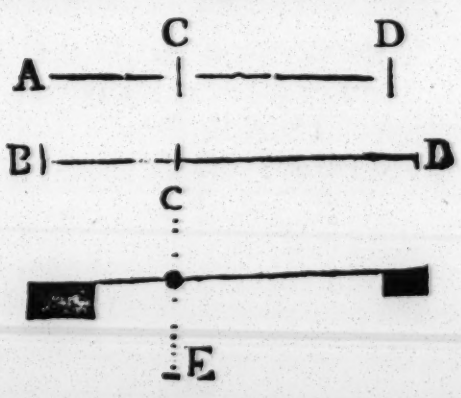
N. B. The ſhorter the *Oſcillations* or Swings are, the truer will the *Pendulum* meaſure Time; or the more *Iſochrone* will the *Vibrations* be, as ſome love to expreſs themſelves.

To find the Centre of Oſcillation *exactly, in order to adjuſt the Royal Pendulum of a Clock, Mr.* Hugens *gives this Proportion,* (Horol. Oſcillat. p. 141.)

As the Length of the String from the Point of Suſpenſion, to the Centre of a Ball or Bob: is to the Semi-diameter of that Ball or Bob :: ſo is that Semi-diameter to a Fourth Number.

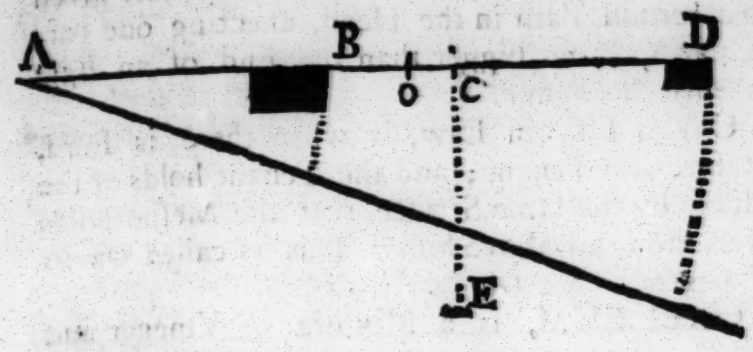
Add $\frac{2}{5}$ of that Fourth Number to the former Length, and you have the *Centre of Oſcillation*.

But this Term, the *Centre of Oſcillation* is often in *Mechanicks* taken in a more large and comprehenſive Senſe. As ſuppoſe there be a *Libra*, as B D, having the Weights B and D,



hanging at its ends by their Centres of Gravity B and D; and let the Point C be the *Hypomochlion*, *Fulciment* or Prop which is ſuppoſed to ſupport the *Libra* in the common Centre of Gravity C, belonging to the two Bodies B and D; then will thoſe Weights be *in Æquilibrio*. Let this *Libra*, with the Weights B and D hanging at it, deſcend perpendicular to the Horizon all together, and ſtill retain a Paralleliſm to its ſelf

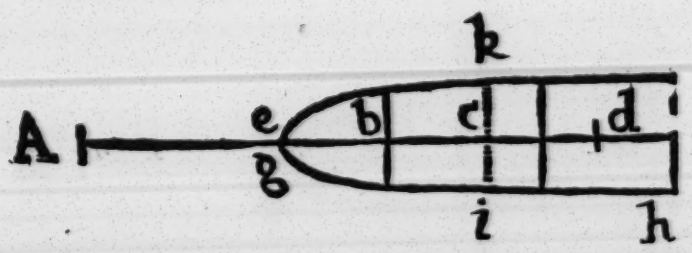
ſelf in its firſt Situation; and as it thus moves, let it meet with an Obſtacle, as E, which ſhall ſtrike it in C, the above-mentioned common Centre of Gravity: Then becauſe the Deſcent of the *Libra* was by a parallel Motion, the Points B and D will have acquired equal Velocities; and conſequently the Weights hanging at ſuch Points will alſo gain equal Velocities; and therefore if the *Libra* ſtrike upon E, the *Æquilibrium* muſt continue the ſame as before, that is, will not *oſcillate* or ſwing any way, but keep at Right Angles with the Line C E: Wherefore C is both the common Centre of Gravity, and alſo of Oſcillation.



But ſuppoſing the *Libra* to turn round the Centre A, or to ſwing on it like a *Pendulum*, with its Weights B and D affixed to it, as before: In this Caſe will the Weights B and D acquire each a Degree of Velocity, proportionable to their reſpective Diſtances from the Centre. And conſequently if *o* (ſuppoſe) had been their common Centre of Gravity, before the new Rotation of the *Libra* round A, it cannot now be the Point on which the Revolving Bodies B and D will poize, or be in *Æquilibrio*: That is, the Point *o* cannot be the Centre of Oſcillation.

For ſince *o* is ſuppoſed to be the common Centre of Gravity, therefore the Moment of B O x, B, muſt be equal to the Moment of D O multiplied by D: But ſince the Velocity of B is to that of D, as A B is to A D; therefore the Compound Moment of B x B O x A B cannot be equal to the Compound Moment of D x D *o* x A D; and conſequently there cannot be an *Æquilibrium* about the Point *o*: Wherefore if an *Obex* or Obſtacle ſhould meet with the *Libra* in the Point *o*, the *Libra* would oſcillate or dip towards the Parts of D, becauſe that *Momentum* is the greater of the two. But the true Centre of Oſcillation will be a Point as C, taken ſo, that the Moment of B x B C x A B, ſhall be equal to the Moment of B x D C x A D. That is, if A D. A B :: B x B C. D x D C, then will C be the true Centre of Oſcillation; and if the Revolving *Libra* ſhould be ſuppoſed to meet with an *Obex*, it would not oſcillate upon it.

In like manner, if inſtead of a *Libra* burden'd with two Weights, as above, we conceive any plain or ſolid Figure to revolve about the Centre A, its Centre of Oſcillation is to be determin'd by the ſame Principle.



Thro' the Point C of the Revolving Figure taken in the Axis *e d*, let the Line *k i* be drawn, dividing the Figure into two Parts, *e k i g*, and *k f b i*; the Centres of Gravity of which Parts ſuppoſe to be at *b* and *d*: Then if the Compound Moment of *i e*, *k e* x *b c* x A *b* = *k f b i* x *c d* x A *d*: for the ſame Reaſon as before, C will be the Centre of Oſcillation.

This I had from Mr. Humphry Ditton.

OSCITATION, Yawning, is a certain light Convulſive Motion of thoſe Muſcles which open the lower Jaw of the Face. Some think that Excrementitious and Halituous Matter, which irritates the neighbouring Parts, is expelled by this Action of Yawning.

OSCULA, are the Openings of Veſſels in an Animal Body, at their ends.

OSCULATORIUS *Muſculus*. See *Orbicularis*.

OS *Mali*. See *Zygoma*.

OS *Unguis*. See *Unguis Os*.

OS *Occipitis*. See *Occipitis Os*.

OS *Palati*. See *Palati Os*.

OSSA *Parietalia*. See *Parietalia Oſſa*.

OSSA *Temporum*. See *Temporum Oſſa*.

OS *Sphænoides*. See *Sphænoides*.

OSSICULUM, among the Botaniſts, is the Stone of a Plum, Cherry, or ſuch like Fruit.

OSTENSIVE *Demonſtrations*, are ſuch as plainly and directly demonſtrate the Truth of any Propoſition; in which they are diſtinguiſhed from *Apogogical* ones, or *Deductiones ad Abſurdum*, *ſive ad Impoſſibile*, which prove the Truth propoſed, by demonſtrating the Abſurdity or Impoſſibility of aſſerting the contrary.

OSTENSIVE *Demonſtrations*, are of two ſorts: Some of which barely (but directly) prove the Thing to be, which they call ὅτι; and Others demonſtrate the Thing from its Cauſe, Nature, or Eſſential Properties, and theſe are called in the Schools διότι.

OSTEOLOGIA, is a Deſcription of Bones.

OSTOCOPI, are Pains in the Bones, or rather in the Membranes and Nerves about the Bones: For Bones, as ſuch, are inſenſible. *Blanchard*.

OTACOUSTICKS, are Inſtruments which help or improve the Senſe of Hearing. See *Acouſtica*.

OTALGIA, is a Pain in the Ears, whenceſoever it proceeds.

OTENCHYTA, an Auricular Clyſter. *Celſus* calls it *Oegin*, a little Syringe or Squirt which injects Medicines into the Ears.

OTICA, are Medicines againſt Diſtempers in the Ears.

OVAL, in Architecture, the ſame with *Echinus*. Some write it *Ovo*, becauſe of its Figure, being like an Egg. It is placed in the Mouldings of the Cornices, for Ornament; and in a Pillar it is placed next the *Abacus*.

OVAL *Figure*, in Geometry, is a Figure bounded by a regular Curve Line returning into its ſelf; but of its two Diameters cutting each other at Right Angles in the Centre, one is longer than the other, in which it differs from the *Circle*. See *Ellipſis*.

OVAL *Window*, one of the Holes in the Hollow of the Ear, opening pretty wide into the *Labyrinth*; the other being called the *Round Window*.

OVARIA, are the Teſticles of Females, and are ſo called, becauſe they reſemble and have the ſame Uſe as the Lathers or Collections of Eggs in the Bodies of Fowls.

OVELTY *of Services*, in Law, ſignifies Equality of *Services*; as when the Tenant Paravail owes as much to the Meſne, as the Meſne does to the Lord Paramount.

OVER-*Rake*. When a Ship, riding at Anchor, doth ſo over-beat her ſelf into a Head Sea, that ſhe is waſh'd by the Waves breaking in upon her, then they ſay the Waves do *Over-rake her*.

OVERT-ACT, a Term in Law, ſignifying an Open ACT, which may be manifeſtly proved.

OVIDUCTUS, the ſame with *Tuba Fallopiana*.

OVIPAROUS *Animals*, are ſuch as lay Eggs.

OUTACOUSTACON, an Ear-pipe to augment Hearing.

OUTLAW, ſignifies one deprived of the Benefit of the Law, and out of the King's Protection.

OUTLAWRY, is the Loſs of the Benefit of a Subject, that is, of the King's Protection. See *Utlawry*.

OUTLICKER, in a Ship, is a ſmall piece of Timber three or four Yards long, as Occaſion ſerves, and is made faſt to the top of the Poop, and ſo ſtands right out a-ſtern: At the outmoſt end of it is a Hole, into which the ſtanding part of the Sheet is reeved and made faſt through the Block of the Sheet; and then again reeved thro' another Block, which is ſeized to this Outlicker, hard by the end of it. This is ſeldom uſed in Men of War, or in great Ships; and whenever it is made uſe of, it is becauſe the Miſſen-maſt is placed ſo far *aft*, that there is not room enough within board to hale the Sheet flat.

OUTRIDERS, in Law, are Bailiffs Errant employed by the Sheriffs, or their Deputies, to *ride* to the fartheſt Places of their Counties or Hundreds, with the more ſpeed to Summon ſuch as they thought good to their County or Hundred Courts.

OUTWARD *Flanking-Angle*, or the *Angle of the Tenaille*, is comprehended by the two Flanking Lines of Defence.

OUT-*Works*, in Fortification, are all ſorts of Works which are rais'd without the Incloſure of a Place, and ſerve for its better Defence, and to cover it from the Enemy, in the Plain without; as, *Ravelins*, *Half moons*, *Horn-works*, *Crown-works*, *Counter-guards*, *Tenailles*, &c.

It is a general Rule in all Out-works, that if there be ſeveral of them one before another to cover one and the ſelf-ſame *Tenaille* of a Place, the nearer ones muſt gradually, and one after another, command thoſe which are fartheſt advanced out into the Campain; that is, muſt have higher Ramparts, that ſo they may over-look and fire upon the Beſiegers, when they are Maſters of the more outward Works.

The *Gorges* alſo of all Outworks muſt always be plain, and without Parapets; leſt, when taken, they ſhould ſerve to ſecure the Beſiegers againſt the Fire of the Retiring Beſieged; wherefore the *Gorges* of Out-works are only Palliſado'd, to prevent a Surprize.

OUVERTURE, is a kind of Muſick, uſually played at the Opening or Beginning of an Opera; it commonly ends with a *Fugue*.

OVUM, by ſome Writers, is a Name given to a certain Pain in the Head, affecting one particular Spot, no bigger than the End of an Egg; whence the Name.

OWELTY, in Law, is when there is Lord, Meſne, and Tenant; and the Tenant holds of the Meſne by the ſame Service that the Meſne holds over the Lord above him: This is called *Owelty of Services*. See *Ovelty*.

OXELÆUM, is a Mixture of Vinegar and Oil.

OXYCRATUM, is a Mixture of Vinegar with Water, called *Puſca* or *Poſca*.

OXYDERCICA, are Medicines which quicken the Sight.

OXYGALE, is Sowre Milk.

OXYGONE, the ſame with an *Acute-Angled Triangle*; which ſee. And in the General,

OXYGONIAL, is *Acute-Angular*.

OXYMEL, is a Compoſition of Vinegar and Honey, like a Syrup.

OXYREGMIA, is an acid ſowre Belch from the Stomach.

OXYRHODINUM, is Vinegar of Roſes mix'd with Roſe-water.

OYER and *Terminer*, in Law, is a Commiſſion eſpecially granted to ſome Eminent Perſons for the hearing and determining one or more Cauſes: It is the firſt and largeſt of the Commiſſions, by which the Judges of Aſſiſe do ſit in their ſeveral Circuits.

OYER *de Record*, is a Petition made in Court, That the Judges, for better Proofs ſake, will be pleaſed to hear or look upon any *Record*. So when an Action is brought upon an Obligation, the Defendant may pray *Oyer* of the Bond; or if Executors ſue for any one, the Party ſued may demand *Oyer* of the Teſtament.

OZOENA, is an old ſtinking Ulcer in the inſide of the Noſtrils, taking its Name from the Fulſomneſs of its Smell.

PACHUNTICK Medicines (from παχὺς) Thick, Denſe, &c. are ſuch as are of a thickning Nature, but withal cold; theſe when mix'd with a thin Juice, by joining the Parts together ſtiffen it, and make it of a more Denſe, and firm Compoſition: Such as Bole-Armoniack, Almonds, Poppies, Water-Lilies, &c. *Blanchard.*

PAINE *fort & dure*, in Law it ſignifies an eſpecial Puniſhment for him that being Arraigned of Felony, refuſes to put himſelf upon the ordinary Trial of God and his Country, and thereby ſtands Mute by the Interpretation of the Law.

And is thus deſcribed by *Stamford.*

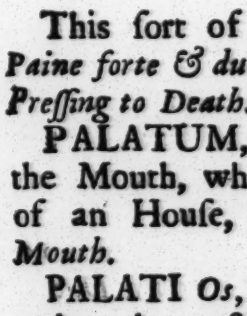
"He ſhall be ſent back to the Priſon, whence "he came, and laid in ſome low dark Houſe, "where he ſhall lie Naked on the Earth, with-"out any Litter, Ruſhes, or other Cloathing, and "without any Rayment about him, but only "ſomething to cover his Privy Members: And "he ſhall lie upon his Back, with his Head co-"vered and his Feet; and one Arm ſhall be "drawn to one quarter of the Houſe with a "Cord, and the other Arm to another quarter, "and his Legs uſed in the ſame manner; let "there be laid upon his Body, Iron and Stone as "much as he may bear, or more: And the next "Day following he ſhall have three Morſels of "Barly-bread, without Drink; and the ſecond "Day he ſhall have Drink three times, as much "at each time as he can Drink of the Water "next unto the Priſon, except it be running "Water, without any Bread: And this ſhall be "his Diet till he Die."

This ſort of Puniſhment, called by the Law *Paine forte & dure*, is that which is vulgarly called *Preſſing to Death.*

PALATUM, the Palate, is the upper part of the Mouth, which becauſe it reſembles the Roof of an Houſe, is thence called the *Roof of the Mouth.*

PALATI *Os*, is a ſmall Bone almoſt ſquare, it makes the poſterior part of the Roof of the Mouth: It is joined to that part of the *Os Maxillare*, which makes the fore-part of the Palate; it is alſo joined to its Fellow, and the *Proceſſus Pterigoidæus.* It has a ſmall Hole, thro' which a Branch of the fifth pair of Nerves goes to the Membrane of the Palate.

PALINDROME, is a Diſeaſe into which one relapſes. *Blanchard.*



PALE, one of the Eight Honourable Ordinaries in Heraldry, containing the third part of the Eſcutcheon, thus:

He beareth *Gules*, a *Pale Or.*

PALL, the Heralds have a kind of Croſs, which they call by this Name, and they deſcribe it thus:

He beareth *Gules* a *Croſs Pall Argent.*

PALLET, is the Moiety, or half of the *Pale*, and muſt never be charged with any thing either Quick or Dead; neither can it be divided into two equal parts, but it may into four, for one fourth part of the *Pallate*, or $\frac{1}{4}$ part of the *Pale*, is called an *Endorſe.*

If the *Pale* be upon any Beaſt, they ſay the Beaſt is *Debruſed with the Pale:* But if the Beaſt be upon the *Pale*, they ſay he is *Supported of the Pale.*

Pallets alſo is a Term which belongs to the *Ballance* of a Watch or Movement. See *Ballance.*

PALLET is a Room within the Hold of a Ship, cloſely parted from it, in which by laying ſome Pigs of Lead, &c. a Ship may be ſufficiently Balaſted, without loſing room in the Hold; which therefore will ſerve for Stowing the more Goods.

PALLIATION of a Diſeaſe, or a *Palliative Cure*, is a Method which helps (as much as is poſſible) incurable Diſeaſes by the Application of preſent Remedies.

PALLIER, a Landing-place in a Stair-Caſe or a Step, which being much broader than the others, ſerves to reſt upon.

PALLISADOES, or *Palliſades* in Fortification, are ſtrong Wooden ſharp-pointed Stakes, ſix or ſeven Inches ſquare, eight Foot long, of which three Foot is in the Ground, ſet up half a Foot ſometimes one above another, with a croſs piece of Timber that binds them together. Some of theſe are alſo ſometimes arm'd with two or three Iron-Spikes.

Theſe *Palliſadoes* are uſually fixed in the void Spaces without the *Glacis*, near the Baſtions and Curtains; and in the Avenues of all ſuch Poſts as are liable to be ſurprized by the Enemy, or carried by Aſſault. Sometimes they are driven downright in the Ground, and ſometimes ſtand at an Acute Angle towards the Enemy, that if they ſhould throw Cords about them to pull them up, they may ſlip off again.

Palliſadoes are always planted on the *Berme* of Baſtions, and at the *Gorges* of Half-Moons and other Out-works: They alſo *Palliſade* uſually the Bottom of the Ditch; and to be ſure, the *Parapet* of the *Covert way:* And tho' ſometimes they have placed theſe *Palliſadoes* three Foot from the ſaid Parapet outwards towards the Campaign, yet of late they have been planted in the very middle of the *Covert way:* All *Palliſadoes* ſhould ſtand ſo cloſe, as to admit between them only the Muzzle of a Muſquet, or a Pike.

PALMARIS *Longus*, is a Muſcle of the Palm of the Hand, which has an Acute Beginning from the Internal Extuberance of the *Os Humeri*; and ſoon becoming a Fleſhy Belly, and contracting

cting it ſelf again to a long, flat, ſlender Tendon, marches Obliquely with the Tendon of the *Flexor Carpi Superior*; and paſſing over the *Ligamentum Annulare*, where it expands it ſelf, and cleaves firmly to the Skin of the Palm, is inſerted to the Roots of the Fingers laterally; it being there divided to tranſmit the Tendons that bend them.

Columbus obſerves the long Beginning of this Muſcle, from the Extuberance of the *Os Humeri*, is ſometimes wanting, which Obſervation is alſo confirmed by our Experience (ſaith Mr. *Cowper*:) It aſſiſts, in firmly graſping any Tactile Body, and defends the ſubjacent Tendons from External Injuries.

PALMARIS *Brevis*, is a Muſcle of the Palm of the Hand, by *Spigelius*, called, *Caro Muſculoſa Quadrata*. Anatomiſts (ſaith *Cowper*) have been extreamly deceived in their Idea's of this Muſcle; it not ariſing from the *Membrana Carnoſa*, as *Columbus* pretends, or from the eighth Bone of the *Carpus*, as *Fallopius* writes; but it ſpringeth with a broad Membrane-like Tendon from the External part of the *Os Metacarpi Minimi Digiti*, and one of the Bones of the *Carpus*; whence aſcending over the *Abductor Minimi Digiti*, it becomes a thin diſgregated Fleſhy Muſcle, marching under the Tendinous expanſion of the former in the Palm; and is inſerted by a ſhort, ſtrong Tendon, to the eighth Bone of the *Carpus*, This acting draws the *Mons Lunæ* towards the *Os Metacarpi Minimi Digiti*, whereby the Palm becomes hollow; contrary to the Opinion of *Spigelius*, who pretends it extends the Hand when we open it; which is not done by any proper Muſcle, but by the Common Extenders of the Fingers.

PALMUS, is a Shivering, or Palpitation of the Heart, cauſed by a Convulſion, or Irritation of the Nerves. *Blanchard.*

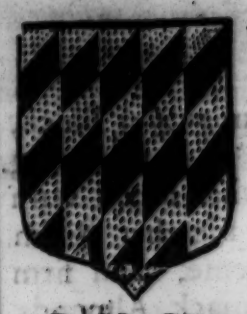
PALPEBRÆ are the *Eye-lids*, or Coverings of the Eyes; they conſiſt outwardly of a very thin Skin; inwardly they are lined with the *Pericranium*, which is here moſt thin and ſmooth; and between theſe two, is the *Membrana Carnoſa*, which is alſo very thin.

Steno obſerved ſeveral *Puncta Lachrymalia* in the Inner Membrane, which run on each ſide into one Duct (which he calls *Colliciæ*) whereby the ſuperfluous Moiſture of the Eye-lids is conveyed into the Noſtrils. At their Edges they have little ſoft Cartilages called *Cilia*, which ſerve to ſtrengthen them, and to make them meet and cloſe the more exactly. Their Corners are called *Canthi*, the outer and leſſer of which hath a Gland in it called *Innominata*, which might well be called *Lachrymalis*, becauſe it ſupplies moſt of the Matter of the Tears.

PALPITATION *of the Heart*, when Natural is in the Syſtole thereof; whilſt the Cone and the Sides are preſs'd together, the Baſis and the Roots of the Veſſels being blown up with the Blood that gathers there, grows big and ſwoln. But it oft alſo proceeds from an extraordinary Contraction of the Heart, or a Thick and irritating Matter which ſticks in the Heart; and this is a Diſeaſe and preternatural. *Blanchard.*

PALSEY. See *Paralyſis.*

PALY, when an Eſcutcheon is divide into 6, 8, or 10 Even Diviſions *Pale-wiſe*; 'tis always Blazon'd, *Paly* of 6, 8, or 10, &c. *Pieces*; but if the Number be odd, then the Field is firſt named, and the Number of the *Pales* ſpecified. The like is to be underſtood alſo of *Barry* and *Bendy*.



PALY *Bendy*, is when a Coat is divided both *Pale* and *Bend-wiſe*, as here.

The Field *Paly Bendy Topaz* and *Diamond*. *Guillim*, p. 279.

PANACEA, was anciently a Name given by *Galen* to ſome Medicines which he had a great Opinion of: After, by the Chymiſts, it was the Term for their Boaſted *Univerſal Medicine*, which they pretended would Cure all Diſeaſes in all Circumſtances, Ages, and Conſtitutions. There are ſeveral *Panacea*'s whoſe Preparation you will find in Books of Chymiſtry and Pharmacy; as that of Mercury, of Antimony, &c. which perhaps may be good Medicines in many Caſes, but do all fall ſhort of the Character of being *Univerſal Medicines*, and indeed it ſeems impoſſible there can be any ſuch thing. The Word *Panacea* comes from the *Greek*, πᾶν and ἀκέομαι, *omnia ſano*. There is alſo a Plant of this Name.

PANARITIUM, *Vid. Paronychia.*

PANCHYMAGOGUES, are Univerſal Purgative Medicines that expel all kinds of Humours; according to the ancient Way of Expreſſion.

PANCREAS, the Sweet-bread, *Pancration*, *Pancreon*, *Callicreas*, *Callicreon*, and *Lactes*, are all Synonymous. It is a conglomerated Glandule in the *Abdomen*, compacted out of many Globules, or knots of Glands included in a common Membrane which it hath from the *Peritonæum*; theſe Globules are joined to one another, partly by Membranes, and partly by Veſſels. It is placed behind the *Ventricle*, and faſtened to the Gut *Duodenum*, and reaches from the Cavity of the Liver croſs the *Abdomen*, to the lower end of the Spleen: By its Duct it is annexed to the *Duodenum*, and ſometimes to the *Porus Bilarius*, to the *Rami Splenici*, the *Caul*, the upper-part of the *Meſentery*, and the upper Nervous *Plexus* of the *Abdomen*; the Uſe and Office thereof, is to convey a Volatile, Inſipid, and Lymphatick Juice, or as others will have it (for it is a diſputable Point) a ſomething acid Juice, by its own *Ductus* to the Gut *Duodenum*, in order to a farther Fermentation and Volatilization of the Chyle, and to attemperate and allay the Qualities of the Gall: It is the biggeſt Glandule in the whole Body, but bigger in a Dog than a Man.

Its Veſſels are of five Kinds; for it hath Veins from the *Ramus Splenicus*; Arteries from the Left Branch of the *Cæliaca*, and ſometimes from the *Splenica*. Nerves it receives from the Intercoſtal Pair, eſpecially from the Upper *Plexus* of the *Abdomen*. It hath alſo many *Lymphatick* Veſſels, which paſs as the reſt do, to the common Receptacle of the Chyle. Beſides which it hath a proper Duct of its own, which is ſometimes called *Ductus Wirtſungianus*, becauſe found out by one *Wirtſungus* at *Padua*, about 50 Years ago, but we uſually call it the *Pancreatick Duct*: This Veſſel hath uſually but one Trunk, whoſe Orifice opens into the lower End of the *Ducdenum*, or Beginning of the *Jejunum*, and ſometimes is joined to the *Ductus Bilarius*, with which it makes but one Mouth into the Inteſtine; within the *Pancreas* (ſaith *Whar-*

(*Wharton*) it is divided into two Branches which ſend forth abundance of little Twigs into all the Globules, of which the Subſtance of the *Pancreas* is compoſed, where they imbibe the Humour that is ſeparated by them from the Arteries, and by their Trunk tranſmit it to the Guts. The Pancreatick Juice is never found in this Duct, any more than Urine is found in the *Ureters*, by reaſon of the Swiftneſs of its Motion, and the Steepneſs of the Way.

PANDALEA, as the Modern Phyſicians call it, is the ſame with a ſolid Electuary, but that it remains *intire*; for the Sugar being rightly boiled, is let grow hard: The Patient takes a Piece of it like a Lambitive. It only differs from Rolls and Morſels as to its Shape. *Blanchard.*

PANDEMIUS, (*ſt. Morbus*) is a Diſeaſe which is univerſally rife in any place.

PANDICULATION, is the Reſtleſſneſs, Stretching, and Uneaſineſs that uſually accompanies the cold Fit of an Intermitting Fever: 'Tis ſuppoſed to be occaſioned by a Convulſive Dilatation of the Muſcles, by which Nature endeavours to throw off ſomething that is diſagreeable to them.

PANICULA, is a Term in *Botany*, for a kind of ſoft Woolly Beard or String, on which the Seeds of ſome Plants do hang pendulous, as in *Reeds*, *Millet*, &c. It ſignifies the ſame with *Juba*, and is oppoſed to *Spica*.

PANIS *fortis & durus.* See *Paine fort & dure.*

PANNICULUS *Carnoſus*, is a flat ſort of Membrane, in ſome part thick and muſculous; in other parts thin, with many *Ductus*'s of Fat in it: It covers the whole Body.

PANSELENE, ſignifies the *Full Moon*.

PANUS, is a ſort of Botch or Sore under the Arm-pits, Jaws, Ears, and Groins; to wit, in the Glandulous Parts. It is alſo taken for *Phygethus*.

PAPER-*Office*. All the Acts of the Council-board, occaſional Proclamations, Diſpatches, and Inſtructions for Foreign Miniſters, Letters of Intelligence, and many other publick Papers communicated to the King's Council, or the two Secretaries of State, are afterwards tranſmitted to the *Paper-Office*, wherein they are all diſpoſed in a Place of good Security and Convenience within the King's Royal Palace.

Alſo an Office ſo called belonging to the *King's-Bench*.

PAPILIONACEOUS Flower of a Plant; is by the Botaniſts accounted ſuch an one as repreſents ſomething of the Figure of a Butter-fly with its Wings diſplayed: And here the *Petala*, or Flower Leaves, are always of a very Difform Figure. They are Four in Number, but joined together at the Extremities, wherefore they are rather *Monopetalous*, than truly *Tetrapetalous*. One of theſe four Leaves is uſually larger than the reſt, and is erected in the middle of the Flower, and by ſome called *Vexillum* and *Clypeus*. The Plants that have this Flower, are of the Leguminous kind, as *Peaſe*, *Vetches*, &c.

PAPILLA, or the Nipple, is a red Excreſcency in the middle of each Breaſt, in the Pores whereof are received all the Milky Tubes or Pipes, proceeding from the Glandules of the Breaſt: It is of a ſpongy Subſtance, and covered with a very thin Skin: It is of exquiſite Senſe, that both the Infant's Mouth in Sucking, and the Trickling of the Milk through it, may affect the Nurſe with Pleaſure in Suckling the Child.

PAPILLÆ *Inteſtinorum*, are little Glandules, wherewith the Innermoſt Tunick of the Inteſtines or Guts is full: They ſoak in the percolated Chyle, and diſpenſe it to the Lacteal Veins. *Pecquet* calls this Lining of the Guts, a *Spongy Periſtoma*; and *Bilſius*, a *Woolly Moſs*. 'Tis probable alſo, that theſe *Papillæ* hinder the Excoriation of the Inteſtines. *Willis* takes them for a diſtinct Coat, and calls it *Glanduloſa*, and *Villoſa Tunica Inteſtinorum*.

PAPILLARUM *Proceſſus*, or the *Proceſſus Mamillares*, are the Extremities of the Olfactory Nerves, which convey the ſlimy viſcous Humours by the Fibres, which perforate the *Os cribriforme*, to the Noſtrils and Palate.

PAPPOSE *Herbs.* See *Pappus.*

PAPPUS, in *Botany*, is that ſoft light *Down* which grows out of the Seeds of ſome Plants, ſuch as *Thiſtles*, *Dandelion*, *Hawkweed*, &c. and which buoys them up ſo in the Air, that they can be blown any where by the Wind. And therefore this diſtinguiſhes one kind of Plants which is called *Pappoſa* or *Pappi Flora*.

PAPULÆ, the ſame with *Puſtulæ*; alſo a kind of *Small-pox*: See *Exanthemata*.

PARABOLA; the Quotient in Geometrical Diviſion, is called by this Name, by *Diophantus* and others: The Reaſon of which ſee in *Diviſion*.

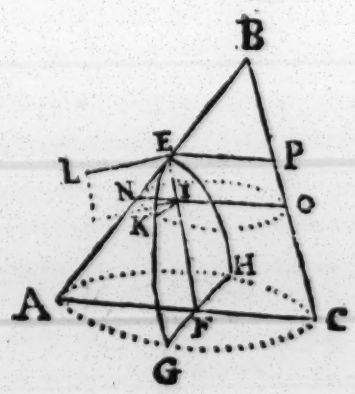
PARABOLA, is a *Conick Section* ariſing from a Cone's being cut by a Plane parallel to one of its Sides, or parallel to a Plane that touches one Side of the Cone.

In any *Parabola*, G K E H, the Square of I K, the *Ordinate Applicate*, or *Semi-ordinate*, is equal to the Rectangle I L, under the *Latus Rectum* E L, and the *Abſciſſa*, or *Intercepted Ax* E I.

NOTATION.

Let the Side A B (of the Cone) be a, the Side B C $= b$, the Diameter of the Baſe A C $= c$: Let E B be called $o\,a$, and E I $= e\,b$.

Wherefore the Triangles B C A and E I N being ſimilar, B C (or b) will be to A C (or C) : : as E I ($= e\,b$) is to N I a Fourth Proportional; which in this Notation will be $\frac{e\,b\,c}{b}$, or $e\,c$. Therefore N I $= e\,e$.



Alſo becauſe the Triangles A B C, and B E P are ſimilar, E P, or its Equal I O, will (this way) be found to be $o\,c$.

DEMONSTRATION.

K I is a mean Proportional between N I and I O, (the Segments of the Diameter to which it is perpendicular) wherefore the □ of I K = □ N I O, which in this Notation is $eoccc$. Divide therefore $eocc$ by the *Abſciſſa* E I = eb, the Quotient is $\frac{occ}{b}$, which muſt be the *Latus Rectum*: For it multiplied into the *Abſciſſa*, makes $eoccc$, the Square of the Ordinate I K. And from this Equality between the Square and the Rectangle, *Apollonius* gave this Section the Name of the *Parabola*.

COROLLARIES.

I. Hence may the *Latus Rectum* be found very eaſily, if to bc, and oc, (that is, to the *Side of the Cone parallel to the Axis of the Section*, to the *Diameter of the Baſe*, and to the *Latus Primarium*) you find a Fourth Proportional; for that will be $\frac{occ}{b}$, the *Parameter*, or *Latus Rectum* = E L.

II. And if you multiply the *Parameter* $\frac{occ}{b}$ both above and below the Line by a (the Side of the Cone in which is the Vertex of the Section) you will have this Quantity $\frac{aocc}{ab}$; which may eaſily be reſolved into theſe Proportionals,

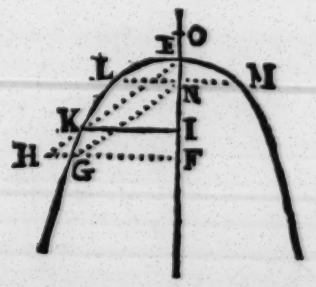
$$ab : cc :: ao : \frac{aocc}{ab}, \text{ i.e. } \frac{occ}{b}.$$

Which gives *Apollonius* his Canon to find the *Latus Rectum*, (Lib. 1. Prop. 11. *Barrow*) and is in Words thus: *As the Rectangle under the Sides of the Cone is to the Square of the Diameter of the Baſe* : : *ſo is the Diſtance between the Vertices of the Cone and of the Section, to the* Latus Rectum.

III. *Praxis* 1. Hence if you have the *Vertex* and *Parameter* of any *Parabola*, 'tis eaſie to deſcribe it on a Plane.

For draw a Right Line for the Axis, and in *that* take as many *Abſciſſæ* as you pleaſe; then find between them ſingly and the *Latus Rectum*, ſo many mean Proportionals, which if you rightly apply to the Axis will be *Semi-ordinates*; and, laſtly, their Ends or Extreams neatly joined, ſhall give the Curve of the *Parabola*.

IV. *Praxis* 2. Having the Vertex and Ordinate, To find the *Parameter*, Geometrically,



Apply rightly the Semi-ordinate K I, and take from the Vertex O, E F = I K; then through F, draw a Parallel (as H F) to the Ordinate I K, and produce O K to H; ſo will H F be the *Parameter* or *Latus Rectum* ſought.

For the Triangles O K I and O H F being ſimilar, E I : I K : : E F (= I K) : F H; and conſequently F H is a true *Parameter*.

V. And ſince the *Parameter* in this way of Notation, is $\frac{occ}{b}$, let it in the laſt Figure be applied to the *Parabola* in the Poſition L M. Then will N be the Point which is called the *Focus* of the *Parabola*: L N will be $\frac{occ}{2b}$, and its Square $\frac{oocccc}{4bb}$, which divided by the *Parameter* $\frac{occ}{b}$, gives $\frac{occ}{4b}$ for the *Abſciſſa* E N: *And ſhews that the Focus is always diſtant from the Vertex of the* Parabola *by* $\frac{1}{4}$ *of the Parameter.*

VI. *Praxis* 3. Having thus gained the *Focus*, the Curve of a *Parabola* may be deſcribed yet more eaſily and readily: If you draw firſt the Axis O F (*Fig. laſt*) and then an Ordinate in any Point, as F. After this, take the *Abſciſſa* O F in your Compaſſes, and ſetting one Foot in the *Focus* N, croſs the Ordinate in G, ſo ſhall the Point G be in the *Parabola*. And thus may as many Points as you will, be ſpeedily found.

The DEMONSTRATION *of which Practice depends upon this:*

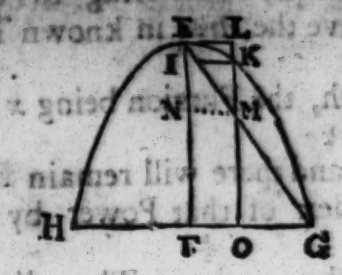
That E N being = $\frac{occ}{4b}$ for E F, put ib; then ſhall N F = $ib - \frac{occ}{4b}$, whoſe Square is $iibb - \frac{occi}{2} + \frac{oocccc}{16bb}$. To which if you add the Square of G F, which in this way of Notation was above ſhewed to be $oicc$, then the Square of N G will be $iibb + \frac{oicc}{2} + \frac{oocccc}{16bb}$, whoſe Root in this Notation, will be $ib + \frac{occ}{4}$. So that a Line drawn from the *Focus* to the End of the Ordinate will always be equal to the *Abſciſſa* E F + E N. That is, (ſuppoſing E O taken equal to E N) to the Line F O.

PROPOSITION II.

In the Parabola E K G H, *the Squares of the* Ordinates *are as the* Abſciſſæ.

I ſay, □ K I □ G F : : E I : E F.

For



For let E F be called $i\,b$, as E I was before called $e\,b$: Then the Parameter being $\frac{o\,c\,c}{b}$ the Square of F G the Ordinate, will be equal to the Parameter multiplied by $i\,b$ the *Abſciſſa*; that is $= o\,i\,c\,c$: as before, the Square of K I was $= o\,e\,c\,c$. But Rectangles having the ſame Baſes, are as their Altitudes; wherefore theſe Rectangles will be as the *Abſciſſæ*: And theſe Rectangles are = to the Squares of the Ordinates; wherefore the Squares of the Ordinates are as the *Abſciſſæ*. *Q. E. D.*

COROLLARY.

If a Line, as L O, be drawn parallel to the Diameter or Axis of the Section, and be cut by the Tranſverſe Line E G in M, and by the Curve of the Parabola in K; then ſhall O L, M L, and K L, be in continual Proportion.

For the Triangles E F G and E N M being ſimilar, and N M parallel to F G, E F muſt be to E N :: as F G : N M (*i. e.* I K). But the Squares of G F and I K are in a *duplicate Ratio* of E F to E N, and yet are by this Propoſition as the *Abſciſſæ* F E and E I; wherefore F E to I E, is in a *duplicate Ratio* of E F to E N; that is, E F : E N :: E N : E I. And by the Conſtruction of the Figure, it will be the ſame in L O, which is parallel to E F: that is, O L : M L :: M L : K L : or O L, M L, and K L are in continual Proportion. *Q. E. D.*

PROPOSITION III.

In the Parabola, *the* Parameter *is to the Sum of any two* Ordinates, *as their Difference is to the Difference of the* Abſciſſæ.

I ſay, E L the Parameter, is to I K + F G :: (*ſee the laſt Figure*) that is, to H O :: O G their Difference, is to I F (or K O) the Difference of the *Abſciſſæ*.

Let E F the greater *Abſciſſa* be called $i\,b$, and the leſſer E I, $e\,b$. Then, by *Prop.* 1. the Square of the Ordinate K I, will be $o\,e\,c\,c$, and conſequently the Ordinate itſelf $= \sqrt{:}\, o\,e\,c\,c$; ſo alſo putting i inſtead of e, $\sqrt{:}\, o\,i\,c\,c$ will be the Ordinate F G.

Having thus noted them, if you ſet the *Latus Rectum*, the Sum and Difference of the *Ordinates*, and the Difference of the *Abſciſſæ*, after the manner of four Terms, in disjunct Geometrical Proportion (as below) you will find the Rectangles of the Extreams and Means equal, and conſequently the four Terms to be truly proportional. *Q. E. D.* As,

Param.
$o\,c\,c$: Sum of the Ord. :: Diff. of the Ord. : D. Abſ.
$b \;.\; \sqrt{:}\, o\,i\,c\,c + \sqrt{:}\, o\,e\,c\,c \;::\; \sqrt{:}\, o\,i\,c\,c - \sqrt{:}\, o\,e\,c\,c \;:\; i\,b - e\,b.$

And to avoid the Trouble of Multiplication in Surds, which is the Caſe of the two middle Terms, you need only conſider this *Theorem*: That *the Sum of any Two Quantities multiplied by their Difference, is equal to the Difference of their Squares.* For ſo you will eaſily find, that the Product in both Caſes, will be the ſame Quantity $o\,i\,c\,c - o\,e\,c\,c$.

N. B. This is that Property of the *Parabola* on which our famous Mr. *Baker* founded his *Clavis Geometrica Catholica*, which was unknown to the Ancients, and communicated to him by Mr. *Tho. Strode* of *Maperton* in *Dorſetſhire*: And by which he ſhews how to find the Value of the Unknown Root in all Equations, not exceeding *Biquadraticks.*

See *Conſtruction* and *Central Rule.*

This Property of the *Parabola*, I thus briefly demonſtrate in my *Algebra*, p. 78.

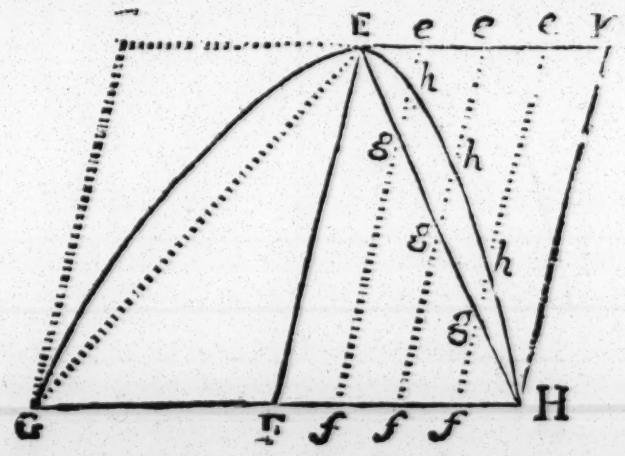
Let P be the Parameter of any *Parabola*, whoſe two *Ordinates* are O and *o*, and their reſpective *Abſciſſæ* A and *a*. Then I am to prove that P : O + *o* :: O − *o* . A − *a*. Which is clear; becauſe from the firſt Property of the *Parabola*, P A $=$ O O and P *a* $=$ *o o*. Wherefore P A − P *a* $=$ O O − *o o*, from the Nature of Equations. And that laſt, reſolved into Proportionals, will ſtand thus,

P : O + *o* :: O − *o* : A − *a*.

Which was the Thing at firſt propoſed to be proved.

A PARABOLICK *Space*, is that Area contain'd between the Curve of the *Parabola* and any *Entire Ordinate* G H.

And this *Space* is to a *Parallelogram circumſcribed* as 2, 3, and to a *Triangle inſcribed* as 4, 3.



Let F H, the Semi-Ordinate be divided into 4 $=$ Parts, or into 8, 16, *&c.* and thro' the Diviſions draw Lines, as *e f*, *e f*, &c. to parallel the Axis E F. Suppoſe alſo E F to be 4.

Then I ſay, The *Parabolick Space* E H F, is to the *Parallelogram* F . K :: 2 . 3. But to the △ E F H :: as 4 . 3.

For, 1. gf, gf, gf, &c. are in continual Arithmetical Proportion from the Nature of Plain Triangles.

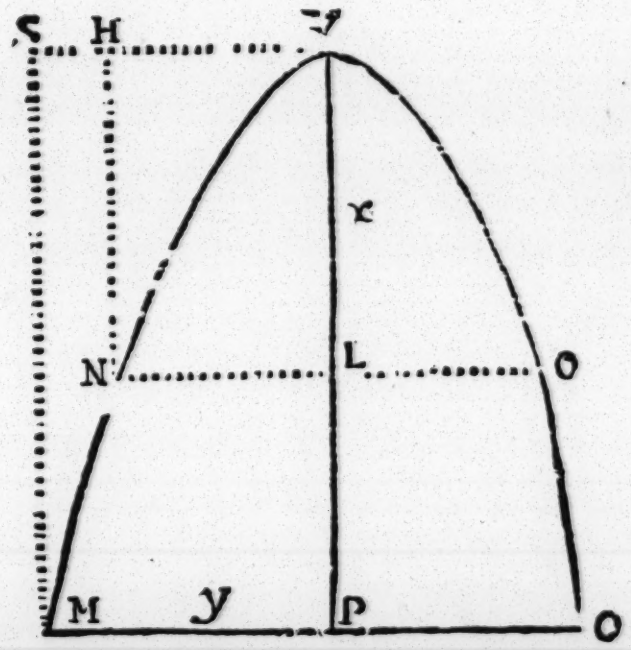
2. $fe . ge :: ge . eh$, (by *Cor.* 1. *Prop.* 2. of the *Parabola.*) But be in the Axis $EF = o$, and in the firſt Parallel ef muſt be equal to $\frac{1}{4}$: in the next ef, it will be equal to $\frac{4}{4}$; in the third to $\frac{9}{4}$; and ſo on in a Duplicate Arithmetical Progreſſion. For as ef $(=4)$. ge . $(=1.)$ :: ſo is ge $(=1)$. eh $(=\frac{1}{4}.)$ And as the ſecond ef $(=4)$. eg $(=2)$: : eg 2, to $eh = \frac{4}{4}$, &c. And thus will it be if the Lines Ff, ff, &c. be again biſſected, &c. *ad Infinitum.* So that all the Indiviſibles of the Trilinear Space EKHE will be in a Duplicate Arithmetical Progreſſion increaſing. But

3. The Sum of a Rank of ſuch Terms is ſubtriple to a Rank of as many equal to the greateſt; (as we proved in N° 7. of *Arithmetical Progreſſion*, which ſee) wherefore the whole Trilinear Space EKHE is to the Parallelogram : : as 1 to 3. And conſequently the remaining Parabolick Space muſt be to it as 2 to 3. *Q. E. D.*

And ſince the Triangle FEH is to the Parallelogram as 1 to 2, it muſt be to the Parabola as $1\frac{1}{2}$ to 2, or as 3 to 4. *Q. E. D.*

And this is a true and very ſhort Quadrature of the *Parabola* of which *Archimedes* wrote ſo long ago, and many Geometricians have ſince expedited. 'Tis plain alſo that this Demonſtration is Univerſal, and extends to any *Parabolick Space.*

The *Quadrature* of the *Parabola*, by the Method of *Fluxions*, I have formerly in my *Algebra* ſhewed to be very briefly thus:



Let the *Parameter* be $p = 1$, the *Abſciſſa* be called x, and the *Ordinate* y.

Then by the firſt Property of the Parabola $x = yy$, becauſe $p = 1$.

And conſequently by the Extraction of the Roots of each, and uſing the new Notation, $\dot{x}^{\frac{1}{2}} = y$. Then multiplying $\dot{x}^{\frac{1}{2}}$ by $\dot{x}$ the *Fluxion* of the *Abſciſſa*, it will ſtand thus $\dot{x}\,\dot{x}^{\frac{1}{2}} =$ to the *Fluxion* of the *Area.* After which find the Flowing Quantity anſwering to that Fluxion, which ſhall give the *Area* in known Terms.

To do which, the Fluxion being $\dot{x}\,\dot{x}^{\frac{1}{2}}$, firſt take away the $\dot{x}$, and there will remain $\dot{x}^{\frac{1}{2}}$; next increaſe the Index of that Power by Unity, and it will ſtand thus $\dot{x}\,\dot{x}^{\frac{1}{2}}$. Then divide $\dot{x}\,\dot{x}^{\frac{1}{2}}$ by $1 + \frac{1}{2}$ or by $\frac{3}{2}$ (thus $\frac{1}{3}$) $\frac{\dot{x}\,\dot{x}^{\frac{1}{2}}}{1}\left(\frac{2\,\dot{x}\,\dot{x}^{\frac{1}{2}}}{3}\right)$ and the Quotient you ſee will be $\frac{2\,\dot{x}\,\dot{x}^{\frac{1}{2}}}{3}$.

Laſtly, inſtead of $\dot{x}^{\frac{1}{2}}$ ſubſtitute what was before found equal to it, *viz.* $\dot{y}$, and it will be $\frac{2\,x\,\dot{y}}{3} =$ to the *Area* of the *Semi-parabola* VMP. And if you double that, you will gain the *Area* of the whole *Parabola* MVO.

Wherefore the *Parabolick Area* is Two thirds of a Rectangle under the *Abſciſſa* and the *Ordinate.* *Q. E. D.*

The Following General Method for the Quadrature of all manner of Parabolick Curves, *is Mr.* Humphrey Ditton's.

The General Equation of theſe Curves, is $r^{p-q}\,x^{q} = y^{p}$, where p and q are the Indexes, and r is the *Latus Rectum*: That is, becauſe of r a ſtable quantity, $x^{q} = y^{p}$, wherefore in Fluxions $p\,y^{p-1}\,\dot{y} = q\,x^{q-1}\,\dot{x}$, and from the General Equation, it is $y^{p-1} : x^{q-1} :: x : y$, wherefore ſubſtituting x and y, inſtead of y^{p-1}, and x^{q-1} in the Fluxional Equation, we have $p\,\dot{x}\,y = q\,\dot{y}\,x$, but all $\dot{x}\,y =$ all SHMN = the Complement, and all $\dot{y}\,x =$ all PLMN = the Area: The Area therefore is to the Complement as p. q. *Q. E. D.*

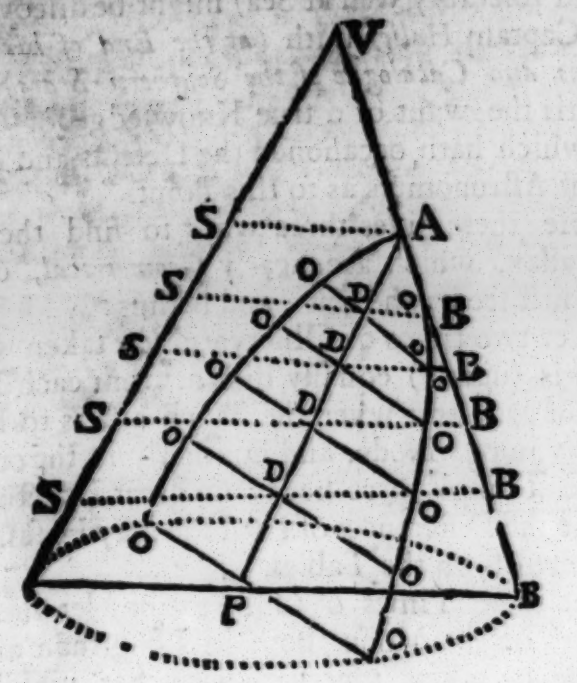
PARABOLICK *Pyramidoid*, is a ſolid Figure, ſo named by Dr. *Wallis* from its Geneſis, or Formation, which is as follows.

Let all the Squares of the Ordinate Applicates in the *Parabola* be imagined to be ſo placed, that the Axe ſhall paſs thro' all their Centres at Right Angles.

Then will the Aggregate of theſe Planes, which he proves before to be Arithmetically proportional (*Prop.* 9. *Wallis Con. Sect.*) Form the *Parabolick Pyramidoid.*

Whoſe Solidity is gain'd by multiplying the Baſe by half the Altitude: The Reaſon of which is clear; for its component Planes being a Series of Arithmetical Proportionals beginning from o, their Sum will be = to the Extreams multiplied by half the Number of Terms, *i. e.* in the preſent caſe = to the Baſe multiply'd by half the height.

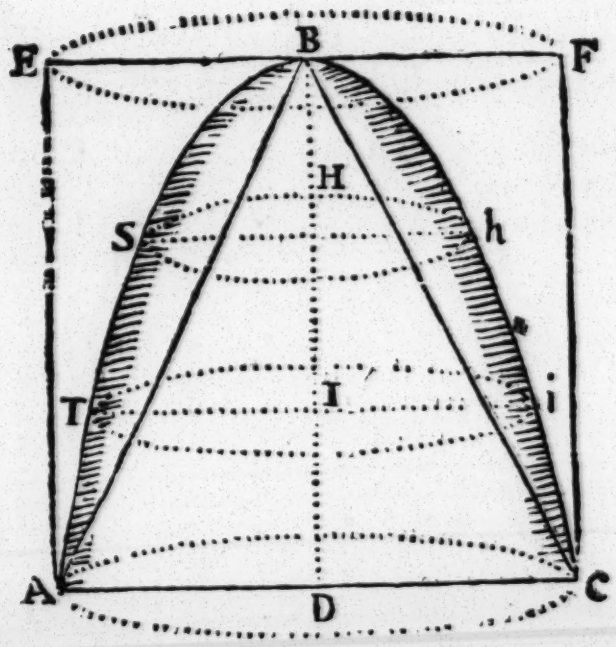
PARABOLICK *Cuneus*, is a Solid mention'd by the ſame Author, and formed thus:



Multiply all the D B's into the D S's, or which is the ſame thing, upon the Baſe A P B erect a Priſm, whoſe Altitude ſhall be A S or P S; and this ſhall be the *Parabolical Cuneus*, which muſt of Neceſſity be equal to the *Parabolical Pyramidoid*; being all the Component Rectangles in one, are ſeverally equal to all the Component Squares in the other.

PARABOLICK *Conoid*, is a ſolid Figure made by the Rotation of a *Semi-Parabola* about its Axe, and is $= \frac{1}{2}$ of its circumſcribing Cylinder: And the Circles which may be conceived to be the Elements of this Figure, are in an Arithmetical Proportion decreaſing towards the *Vertex*.

A PARABOLICK *Conoid*, A S B *h* C, is to a *Cylinder* of the ſame Baſe and Height, as 1 to 2; and to a *Cone* of the ſame Baſe and Height, as $1\frac{1}{2}$ to 1.



Let B D be divided into Three equal parts; then □ A D : □ S H :: B D : B H, (by the ſecond Property of the *Parabola*) that is, as 3 to 1, and □ A D : □ T I :: B D : B I :: 3 : 2. Wherefore 'tis plain, That the Squares on S H, T I and A D, (as alſo on S *h*, T *i*, and A C) and the Circles anſwering to them, will be in Arithmetical Progreſſion, or as 1, 2, 3; and thus it will be *ad Infinitum*, if the Three Diviſions be biſſected, and thoſe again biſſected, *&c.* But a Rank of Numbers in ſimple Arithmetical Progreſſion, will be to a Rank of as many equal to the greateſt as 1 to 2, and conſequently, the *Parabolick Conoid*, will be juſt half the *Cylinder*. *Q. E. D.*

And a *Cone* being $\frac{1}{3}$ of the *Cylinder*, the *Conoid* will be $= 1\frac{1}{2}$ of it; and therefore *Cylinder Conoid*, and *Cone* will be as $\frac{1}{3}$, $1\frac{1}{2}$, 1.

PARABOLICK *Spindle*, is a ſolid Body made by Rotation of a *Semi-parabola* about its *Ordinate*; and is equal to $\frac{8}{15}$ of its circumſcribing Cylinder, *Cavalerius Exerc. Geometr.* p. 282.

PARABOLISMUS, the ſame with the *Depreſſion of an Equation*. See *Equation*, N 3.

PARACELSISTICK Medicines. See *Hermetical*.

PARACENTESIS, or *Punctio*, is a Perforation of the Cheſt, or *Abdomen*. It is made in the Breaſt, when that is ſtuffed with putrified Matter, or Water, and then the Perforation is made in the Side between the fifth and ſixth *Vertebra*. It is made in the *Abdomen*, when that is ſwelled by a Dropſie, and near the *Linea Alba*, in the Muſcles that either aſcend right or oblique: In which laſt Caſe, if a Man be ſtrong, and has taken a Purge, and alſo his Lungs, and the reſt of his Entrails be uncorrupted, when you ſee the Navel doth Protuberate, there you muſt make the Inciſion; don't let Purulency and Water come out both together, for that were to kill the Patient, but one after the other: As in Seven Days about a Pound, or a Pound and a half, as the Patient can endure it: After the Operation is finiſhed, draw the Wound up with an Aſtringent Plaiſter. *Blanchard.*

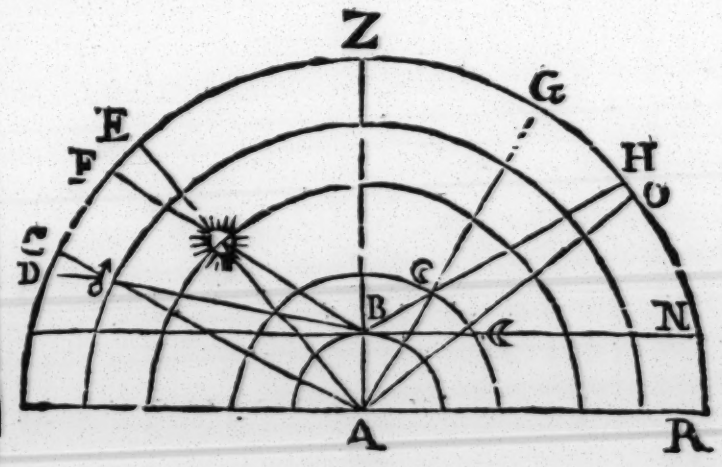
PARACIUM, in Law, ſignifies the Tenure that is between *Parceners*, viz. That which the Youngeſt oweth to the Eldeſt.

PARACHYNANCHE, is an Inflammation with a continual Fever and difficulty of Breathing excited in the outward Muſcles of the Larynx.

PARACMASTICA, is a daily declining Fever; alſo declining Age. *Blanchard.*

PARADE, is a Military Word, ſignifying the Place where Troops uſually draw together, in order to mount the Guards, or for any other Service.

PARALLAX, is that Arch of a great Circle, paſſing thro' the Zenith and true Place of the Sun or Stars, and intercepted between the true and apparent Place.



In this Figure,

A, denotes the Centre of the Earth.

B, the Place on the Superficies of the Earth, from whence the Star is ſeen.

♂, ☉ ☾, the Stars or Planets Places in their Orbs.

A ♂ C, A ☉ E, A ☽ G, the Lines of their true Places.

B ♂ D, B ⊙ F, B ☾; the Lines of their apparent Places.

Here the Angle made by the Interſection of the ſaid two Lines thro' the Body of the Planet, is the Angle of *Parallax*.

That is,

In *Mars*, the Angle A ♂ B = Angle C ♂ D, (by 15 *e. i.*)

In the *Sun*, the Angle of *Parallax*, is the Angle A ⊙ B = Angle E ⊙ F.

In the *Moon*, it is the Angle A ☾ B = Angle G ☾ H.

Here 'tis manifeſt, that the nearer the Star is to the Horizon, and Center of the Earth, the greater is the *Parallax*: Whence it is, That the Orbit of the Moon being neareſt to the Earth, her *Parallax* is greateſt and moſt perceptible: For the Semi-diameter of the Earth bears a greater Proportion to the Semi-diameter of the Moon's Orbit, than to any of the reſt.

The Horizontal Parallax of the Moon is the Difference between her Real and Apparent Place when ſhe is either Riſing or Setting. As ſuppoſe her Setting, then the Angle of the Horizontal Parallax will be B ☾ A = ☉ A R. The Knowledge of the Quantity of which, is of the greateſt uſe in Aſtronomy; becauſe from thence the Diſtance of the Moon, Sun, (or any other Planet) from the Earth may moſt eaſily be had; for in the Triangle B A ☾: A B the Semi-diameter of the Earth, B the Right Angle, and ☾ the Angle of the Parallax being known, 'tis eaſie to find any Side or Angle ſought, and conſequently A ☾, the Diſtance of the Moon from the Earth. This came firſt to be diſcovered by the ancient Aſtronomers, thus:

They obſerved, That the apparent Semi-Diurnal Motion of the Moon was but 4 Degrees, whereas in Reality and Truth, it was 6 Degrees: Wherefore they concluded, That the Moon's Place was put forward in her Riſing 1 Degree, and as much put backwards in her Setting; which muſt needs cauſe her viſible Motion above the Earth in 12 Hours, to be obſerved nearly 2 Degrees leſs, than the half of 12 Degrees, her apparent Motion, in 24 Hours.

Wherefore from hence they concluded the Horizontal Parallax to be juſt 1 Degree: which having found, 'twas eaſie to diſcover, that A ☾ muſt be near 60 times A B, or 60 Semi-Diameters of the Earth (*i. e.* at 70 Miles to a Degree, and 4000 Miles the Earth's Radius) 240000 Miles *Engliſh*.

Mr. Auzout *gives you a* Method *to find the* Moon's Parallax, *thus; On a Day when ſhe is in her* Perigee, *or* Apogee, *and in the moſt Boreal Signs,*

Take her Diameter towards the Horizon, and then towards the South, with her Altitude above the Horizon; the Difference of which Diameters will ſhew the Proportion of her Diſtance with the Semi-diameter of the Earth; but this is beſt of all done in thoſe Places where ſhe paſſes thro' the Zenith.

If the Moon's Horizontal Parallax could be truly and exactly found, it would be of prodigious Advantage; for by it the Longitudes of Places on Land (and tolerably well at Sea) might be diſcovered.

Captain *Halley* ſaith (*at the End of his Obſervations and Catalogue of the Southern Stars*), "That "'tis the want of a true Knowledge of *Geometry*, "which hath occaſioned the Defects and Miſtakes "of Aſtronomers as to this Point."

He there gives three ways to find the Moon's Parallax, which are nearly *Geometrical*, of which the firſt ſeems the beſt; and is thus:

Let two times of Obſervation be taken when the Sun is (nearly) equally diſtant from each Node of the Moon, and when the Moon alſo is to be Northerly in one Node, and Southerly in the other; in theſe Things there needs no great Exactneſs, becauſe the Differences of Latitude may be ſufficiently ſupplied from the Tables.

At theſe Times of Obſervation, let the viſible Places of the Moon, both in Longitude and Latitude be taken, together with her viſible Altitudes and Diameters, which let be reduced to the Horizontal; then from the Times and viſible Places, let in each Obſervation the Vertical Angle be computed, which is made with the Circle of Latitude at the Moon's Centre; and then the Difference by which the Southern Latitude exceeds the Northern (in our Northern Part of the World) is the Sum of the Parallaxes of Latitude, which muſt be divided into two Parts; which to do, put into one Sum the Logarithms of the Sine of the Horizontal Semi-diameter of the viſible Diſtance of the Moon from the Vertex, and of the Complement of the Angle of the Vertical Circle, with the Cycle of Latitude, in each Obſervation.

Then out of the greater Sum, take the leſſer, and to the Difference add Radius, the Sum ſhall be the Logarithm of the Tangent of an Ark, from whence take 45 Degrees; then will it be as Radius to the Tangent of the Remaining Ark:: So is the Tangent of the half Sum of the Parallax, to the Tangent of half their Difference: But the half Sum and half Difference together, is the greater Parallax of Latitude, and the Difference between them is the leſſer. Take this Parallax of Latitude out of the viſible Southern Latitude; or add it to the Northern, and it will ſhew the *Inclination*.

And then, laſtly, it will be as the Rectangle under the Sines of the Diſtance ſeen from the Zenith, and of the Complement of the Angle of the Vertical Circle with the Circle of Latitude, is to the Square of the Radius:: So is the Sine of the Parallax of Latitude, to the Sine of the Horizontal Parallax.

And there is between the Sine of the Horizontal Semi-diameter of the Moon, and the Horizontal Parallax, ſo conſtant a Proportion, that if it can be but once known, the Moon's Parallax at any time will be had from the Obſervation of her Diameter.

All the Difficulty of this Proceſs, is, in obſerving the viſible Latitudes of the Moon, and which indeed cannot be had without the Help of the Fixed Stars, whoſe Latitudes are in no Catalogue yet extant, correct to a Minute: Therefore the accurate Solution of this Problem muſt depend on ſome better Tables than are yet publiſhed. And thoſe I hope we may expect from the moſt

Accurate

Accurate Aſtronomer, Mr. *Flamſteed*, when he hath finiſhed his Catalogue of the Fixed Stars, which he is now about.

In the Ingenious Dr. *Gregory*'s *Aſtronomia Phyſica & Geometrica*, you have a great and very uſeful Variety of Propoſitions for the finding the Parallax, *Vide Lib.* 2. *Sect.* 7.

Though there be no Parallax of the Fixed Stars, in reſpect of the Earth's Semi-diameter, the whole Body of the Earth being but a Point in reference to the Diſtance between us and the Fixed Stars; yet in reſpect of the annual Orbit of the Earth, it hath juſtly been expected by Aſtronomers, that ſome Parallax ſhould be found: And this would be a Diſcovery of great Moment, if it could be made; becauſe it would be an undoubted Demonſtration for the annual Motion of the Earth round the Sun, if any ſuch Parallax could be diſcovered.

This the Ingenious Dr. *Hook* attempted to find by obſerving the various Diſtance of a Fixed Star from the Zenith (See a Diſſertation of his deſignedly written on this Subject). And our Excellent Aſtronomer Mr. *Flamſteed*, actually did obſerve it by the Acceſs and Receſs of a Fixed Star to and from the Pole of the Equator at different Times of the Year.

And he aſſures us, in his Letter to Dr. *Wallis*, written *Decemb.* 20. 1698, and publiſhed in the *Latin* Edition of Dr. *Wallis*'s Works: "That he "found the Diſtance of a Fixed Star near the Pole "of the World to be 40 Seconds, or 45 Seconds "nearer to it at the Winter-Solſtice than at the "Summer one." And this he obſerved for Seven Years together with great Accuracy.

So that he judges the Objection of *Ricciolus* againſt the Earth's Motion to be intirely removed, and its Revolution round the Sun proved.

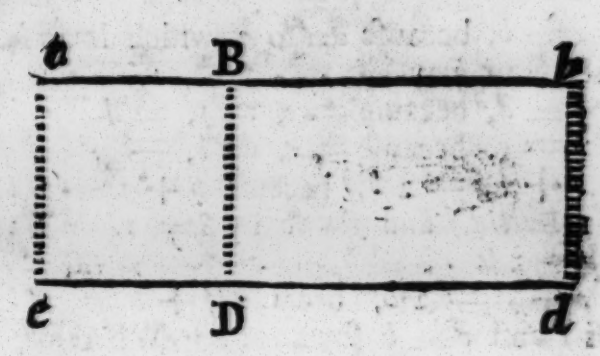
Dr. *Gregory* ſeems not ſatisfied with this Proof, (though he believes the Doctrine from other Principles) but inclines rather to the Opinion of *Copernicus*, That the Diameter of the Earth's annual Orbit is inſenſible, in reſpect of the Diſtance of the Fixed Stars. But others may judge whether he brings Reaſons ſufficient to overthrow Obſervations ſo carefully, and ſo often made, as thoſe produced by Mr. *Flamſteed*. See his *Aſtron.* p. 275, 276.

PARALLAX *of Latitude*, is an Arch of a great Circle paſſing by the Poles of the Zodiack to the apparent Place of the Star, and intercepted between two Circles of the Ecliptick equally diſtant, whereof the one paſſeth by the True place of the Star, and the other by the Apparent place.

PARALLAX *of Longitude*, is an Arch of the Ecliptick (or Parallel thereto) intercepted between two great Circles, whereof the one paſſeth from the Poles of the Ecliptick, and the true Place; the other from the ſaid Poles by the apparent Place: So that the Parallax of Longitude is only the Difference of the true and apparent Place according to to the Longitude of the Ecliptick.

PARALLACTICAL *Angle*, is an Angle made by the Oblique cutting of a Circle of Altitude, or Vertical Circle with the Ecliptick. How to find it, ſee *Angle of the Ecliptick with the Vertical Circle.*

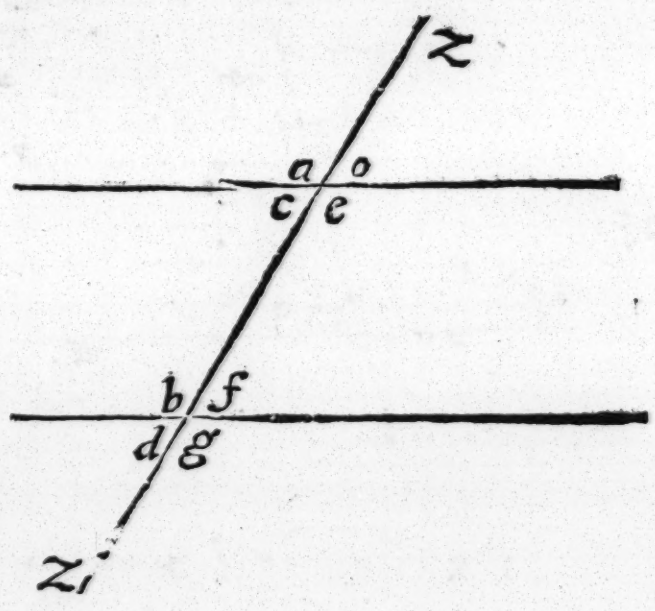
PARALLEL *Lines*, in Geometry, are thoſe which run always equi-diſtant from each other; ſo that if they were infinitely produced, they would neither go further from, nor come nearer to each other; and their Diſtance is always meaſured by a Perpendicular, which, where-ever it be taken, is of the ſame Length, or is always equal to it ſelf.



Thus the two Lines, *a b* and *d e*, are *Parallel*, if they are equally diſtant from each other in *a e*, B D, *b d*, and in all other Places.

COROLLARY I.

Parallel Lines P *p*, have the ſame Inclination one as the other, to any Right Line as Z Z, which cuts or croſſeth them both, and conſequently (ſince an Angle is the Mutual Inclination of two Lines which meet in a Point) the *External Angle o* or *a*, muſt be equal to the *Internal and Oppoſite One*, *f* or *b*: that is, *o* = *f*, and *a* = *b*.



For if *o* be not equal to *f*, and *a* not equal to *b*, it muſt be becauſe the upper Parallel P, is either more or leſs inclined to Z Z, than the lower Parallel *p* is; which if true, then the Line cannot be parallel; which contradicts the Suppoſition.

PROPOSITION.

A Right Line Z Z *falling on Two Parallel Lines* P *p*, *makes the* alternate Angles *o* = *f*, *and e* = *b*; *alſo o* = *d*, *and a* = *g*, *and the two* Internal Angles *c* + *b*, *or e* + *f* = *to two Right ones.*

That is, $\left\{\begin{matrix}1\ c = f\\ 2\ e = b\\ 3\ o = d\\ 4\ a = g\end{matrix}\right\}$ and $\left\{\begin{matrix}5\ c + b\\ 6\ e + f\end{matrix}\right\} = 2\ L$

DEMON-

DEMONSTRATION.

1. $c = f$, becauſe $c = o$, its Vertical or oppoſite Angle, and $o = f$, by the precedent Corollary.

2. $e = b$, becauſe $=$ to a, which is $= b$, proved the ſame way.

3. $o = d$, becauſe $= c$, $= f$, $= d$.

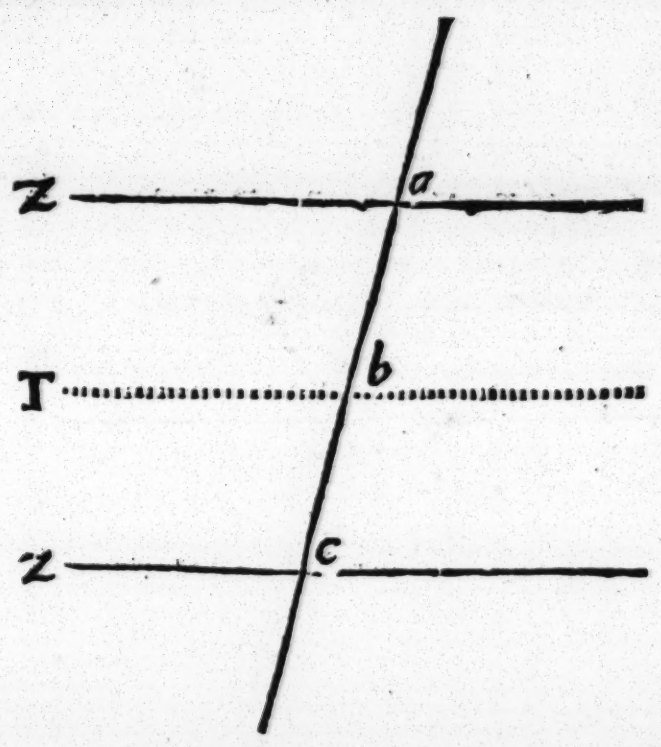
4. $a = g$, becauſe $= e$, $= b$, $= g$.

5. $e + b$, $= 2 L$, becauſe $b + f = 2 L$, (by 13 *è* 1 *Euclid.*) and $f = c$ by *Step.* 1. Wherefore $c + b - 2 L$.

6. $e + f = 2 L$, becauſe $f + b = 2 L$, (by 13 *è* 1.) and $e = b$ (by *Step.* 2.) Wherefore $e + f = 2 L$. *See the laſt Figure.*

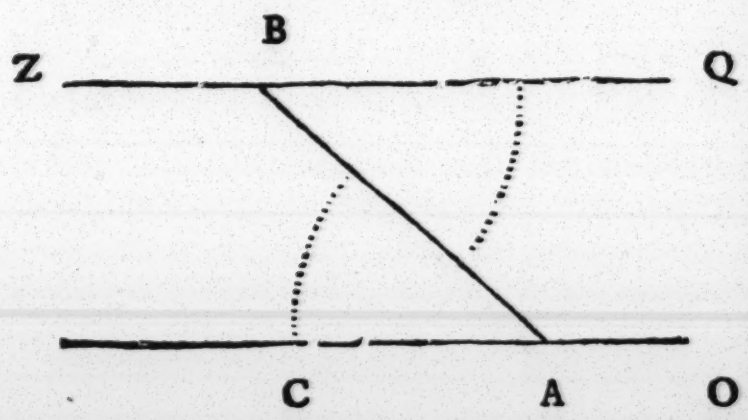
COROLLARY II.

Two Right Lines as Z Z, parallel to a Third, as T, are parallel to each other. For ſince the Angle $a = b$, and c alſo $= b$, becauſe the Outer Lines are parallel to the Inner one: Therefore the Angle $a = c$, *i. e.* the two Outer Lines, are alſo parallel by *Cor.* 1.



PROBLEM I.

A Right Line, as Z Q, *being given, to draw another* parallel *to it, thro'* A, *a given Point.*



From A draw a Line making any Angle, as A B Q, with the given Line; then ſetting one Foot of the Compaſſes in A, make the Angle B A C = A B Q, ſo ſhall C A O be the Line required, for the Angle A = to the Alternate one B.

PARALLEL *Sphere*, is where the Poles are in the Zenith and Nadir, and the Equator in the Horizon, which is the Caſe of ſuch (if any ſuch there be) who live directly under the North and South Pole.

The Conſequences of this Poſition are, That the Parallels of the Sun's Declination will alſo be Parallels of his Altitude.

The Inhabitants can ſee only ſuch Stars as are on their ſide the Equinoctial; and they muſt have ſix Months Day, and ſix Months continual Night every Year; and the Sun can never be higher with them, than 23 Degrees 30 Minutes, which is not ſo high as he is with us in *February*.

PARALLEL *Ruler*, is an Inſtrument made of Braſs, Steel, or Wood, to draw Lines parallel to each other; of great Uſe in Fortification, Architecture, and many other Parts of the *Mathematicks*.

PARALLELS *of Altitudes*, or *Almacanters*, are Circles parallel to the Horizon, imagined to paſs thro' every Degree and Minute of the Meridian, between the Horizon and Zenith, having their Poles in the Zenith. And on the *Globes* theſe are deſcribed by the Diviſions on the *Quadrant of Altitude*, in its Motion about the Body of the Globe, when 'tis ſcrew'd to the Zenith of any Place.

PARALLELS *of Latitude*, on the *Terreſtrial Globes*, are the ſame with *Parallels of Declination* on the *Celeſtial*. But the

PARALLELS *of Latitude* on the *Celeſtial Globes*, are ſmall Circles parallel to the *Ecliptick*, imagined to paſs through every Degree and Minute of the *Colures*, and are repreſented there by the Diviſions of the *Quadrant of Altitude*, in its Motion round the Globe, when it is ſcrew'd over the *Poles of the Ecliptick*.

PARALLELS *of Declination*, are Circles parallel to the *Equinoctial*, imagined to paſs thro' every Degree and Minute of the Meridians, between the *Equinoctial* and each *Pole of the World*.

PARALLEL *Rays*, in *Opticks*, are thoſe that keep an equal Diſtance from the viſible Object to the Eye, which is ſuppoſed to be infinitely remote from the Object.

PARALLEL *Planes*, are thoſe Planes which have all the Perpendiculars drawn betwixt them equal to each other; that is, when they are every where equally diſtant.

PARALLEL *Circles* on the *Globes*, the ſame with the *Leſſer Circles*.

PARALLELS alſo on the *Terreſtrial Globe*, are Circles drawn thro' the middle of every *Climate*, dividing them into two Halves, which are called *Parallels*.

PARALLELISM of the Earth's Axis, is the Earth's keeping its Axis in its annual Revolution round the Sun, in a Poſition always parallel to its ſelf, which it doth nearly, but not exactly; for tho' the Difference be inſenſible in one Year, Dr. *Gregory* in his *Aſtronomy* ſaith, It becomes ſenſible enough in many Years.

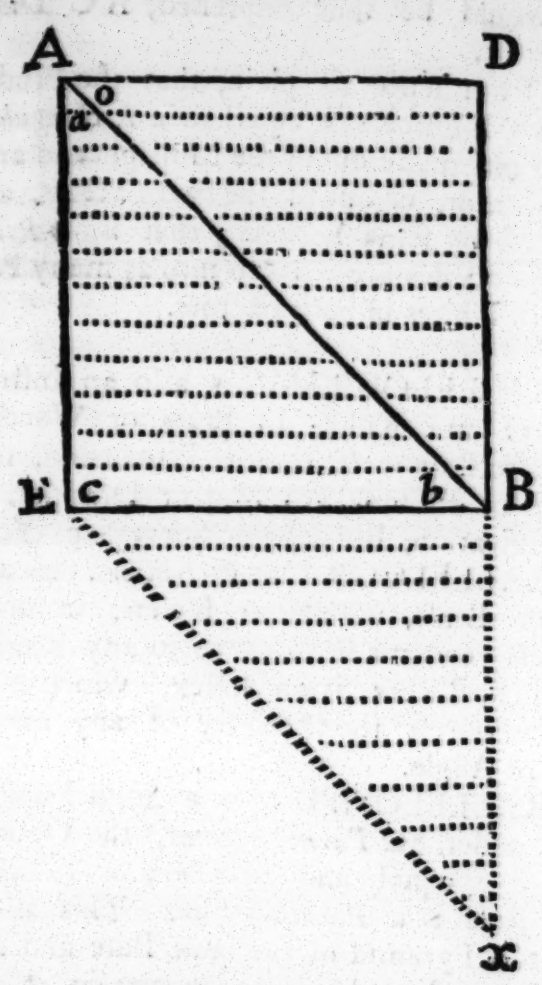
This *Parallelifm* he ſhews to be the neceſſary Reſult of the two Motions of the Earth, that is round its Axis, and its Annual one, and that there needs no third Motion be feigned to explain it, or account for it: For as the Earth moves Annually round the Sun (without the Diurnal Motion) it moves only according to its Centre of Gravity; and each Point and Line in it keeps always the ſame Poſition. Let its Axis be one of thoſe Lines; the Diurnal Revolution of the Earth round this (which as to that Motion is ſuppoſed immoveable)

able) cannot change the Poſition of it; and therefore it will be always the ſame, *i. e.* always Parallel to it ſelf.

PARALIPSIS (a Figure in *Rhetorick*) is a pretended deſire in us of omitting what we ſay; as if one ſhould ſay, *I am willing to forget the Wrong that my Enemy has done me; I will not ſpeak of the Injury that I have received from him*, &c.

PARALLELOGRAM in *Geometry*, is a Right Lined Quadrilateral Figure, whoſe Oppoſite Sides are Parallel and Equal. To find its Superficial Content: See *Area*.

The Formation, or Generation of all Parallelograms, Squares, *and* Rectangles, *may be thus conceived.*



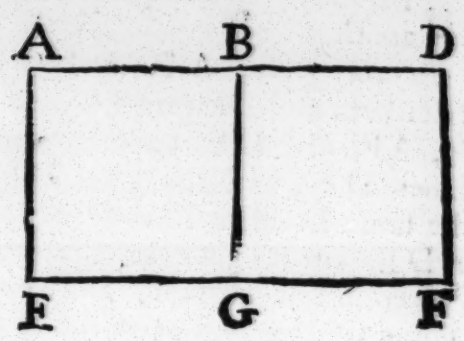
If a Right Line, as A D, having one of its Ends or points in the Top (or Vertex A) of the Angle E A B, be ſuppoſed to move downwards, with a Motion always Parallel to its ſelf in its firſt ſituation: And as it moves thus, always keep its ſaid end A in the Line A E; till at laſt it be moved down ſo low, as that it is all of it gotten within the Legs of the Angle, and is come to lie in the Situation E B: Tis plain, this Line A D. will by its Motion downwards have deſcribed the Quadrilateral Figure A D B E. And as in its Deſcent, the Line A D continually cuts the Line A B, ſo it will deſcribe alſo on each ſide of A B the two equal Triangles A D B and A E B. The Parts of the former of which, do continually decreaſe, as thoſe of the latter A E B do increaſe.

Alſo, if either Leg of an Angle E A D, as ſuppoſe the Leg A D, or any part of that Leg A B, be conceived to move along the other A E, with a Motion Parallel to its firſt Situation, it will alſo deſcribe a Quadrilateral Figure, which if the *Deſcribent* Line A B, be equal to the *Dirigent* A E, (for ſo thoſe two Lines may be called) will be an Equilateral one. But when the Dirigent is either longer or ſhorter than the Deſcribent Line, then the oppoſite Sides of the Figure only will be equal.

From which Formation of Quadrangles, (and alſo of Triangles) theſe Corollaries may be deduced.

COROLLARY I.

That all Quadrilateral Figures thus formed, muſt alſo be *Parallelograms*, or have their oppoſite Sides equal and parallel. The Reaſon of which is becauſe the Moving Line, or Deſcribent A D, is always ſuppoſed to be carried Parallel to it ſelf; and the Diſtance between A and D, or A and B the Deſcribent Points, are always the ſame. 33. *è* 1.



COROLLARY II.

Since the Angles A and E are together equal to two Right Angles, if one be a Right Angle, the other muſt be ſo alſo; and then all the Angles of the Figure will be Right ones, and ſo 'twill be a Rectangle as A F; and if the Deſcribent be equal to the Dirigent, the Figure will be a Square, as A G. *Cor.* 29. *è* 1. *Eucl.*

Hence alſo 'tis plain, That the Oppoſite Angles of every *Parallelogram* are equal; becauſe they do each of them, with the Angle between them, make two Right Angles.

COROLLARY III.

Whence it appears, That every Diagonal A B, Divides, the *Parallelogram* into two equal Parts. 34. *è.* 1 *Eucl.*

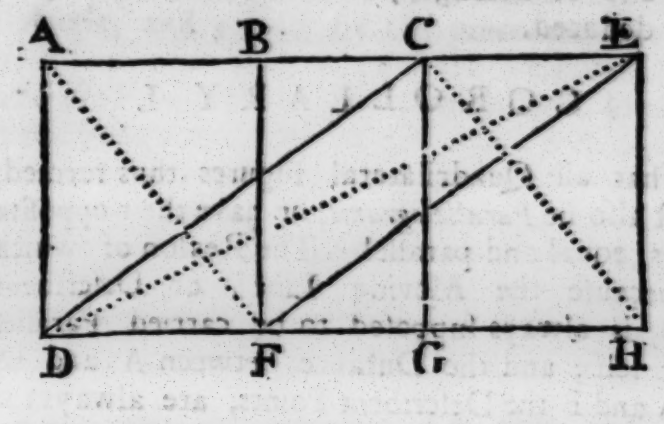
COROLLARY IV.

As alſo, That every *Parallelogram* muſt be Double to a Triangle, having the ſame, or an equal Baſe and Height. 41 *è* 1 *Eucl.*

For every Triangle that can be drawn on the Baſe E B, or on a Baſe equal to it, and having the ſame Height, or being between the ſame Parallel Lines, will be equal to the Triangle A E B, which is half the *Parallelogram* A B, *per Cor.* 3.

COROLLARY V.

Hence all *Parallelograms* that are between the ſame Parallel Lines, and on one and the ſame, or equal Baſes, muſt be equal.



I ſay, The *Parallelograms* A F, D E, G E, having the ſame Baſe D F, or its equal G H, muſt be equal to one another.

For the *Parallelograms* A F, and G E, have both the Deſcribent and Dirigent Lines equal.

And alſo, A F, and D E, have the ſame Deſcribent Lines D F; and the Line D F, tho' it go not in the ſame Dirigent Line to form the *Parallelogram* D E, yet it goes in the whole but the ſame Perpendicular Altitude, and only moves ſlower for going Obliquely, but all the Indiviſibles or Component Lines in one, muſt be equal to thoſe in the other.

COROLLARY VI.

Hence alſo follows, That Triangles on the ſame, or equal Baſes muſt be equal if they are between the ſame Parallels; becauſe they are the Halves of equal *Parallelograms*.

COROLLARY VII.

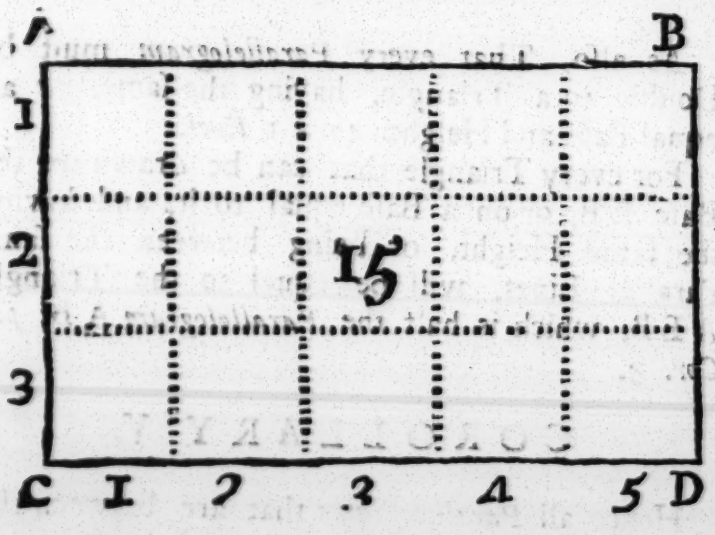
Alſo from hence is eaſily proved, That the three Angles *a*, *b*, *c*, of any Triangle, are equal to two Right Angles. (See *Fig.* 1.)

For ſince the Angle $c + a + o = 2 \angle$, (becauſe A D is Parallel to E B.)

And that $b = o$, for the ſame Reaſon.

Therefore $b + c + a = 2 \angle$. *Q. E. D.*

COROLLARY VIII.



If the Line A C, ſtanding at Right Angles with C D, be divided into Three Parts, as C D is into Five; and being made a Deſcribent, be moved along the Dirigent C D, till it come at laſt to the End of it, and ſtand in the Poſition B D; the *Rectangle* A D will by this means be divided into as many little Rectangles as the Unites both in the Deſcribent and Dirigent Line will produce, by being multiplied one by another, that is 15; for 3 times 5 is 15. And this is what is called a *Rectangle* made between any two Lines, or the Product ariſing from the Parts of the one multiplied by the Parts of the other.

And this is uſually in the *Latin* Tongue expreſs'd by the Verb *ducere*, which ſignifies to *lead* or *guide along*. As, for Inſtance, if the Line A C were to multiply C D, they would ſay in that Language, *Duc* A C in C D; that is, ſet your Line A C perpendicular to C D; and then keeping it always in that Poſition, lead or guide it along till it comes to the End of C D, and it will by its Motion have formed the Rectangle A D; and by its Three Parts, the 15 little ones within it. And therefore in *Latin* Mathematical Books the Product would be thus expreſſed, A C *Ducta in* C D = 15.

And from hence 'tis plain, that the Product of any two Numbers is equal to a *Rectangular Parallelogram*, made out of the Multiplicand and the Multiplicator, or out of the two Factors, as they are called by ſome Writers; that is, a *Rectangle* whoſe two Sides are divided into as many Parts as there are Unites in both Factors.

PARALLELOGRAM, is alſo an Inſtrument made of five Rulers of Braſs or Wood, with Sockets to ſlide or ſet to any Proportion, uſed to enlarge or diminiſh any Map or Draught, either in Fortification, Building or Surveying, *&c.*

PARALLELOGRAM *Protractor*, is a Semi-circle of Braſs, with four Rulers, in form of a *Parallelogram*, made to move to any Angle: one of which Rulers is an Index, which ſhews on the Semi-circle the Quantity of any inward or outward Angle.

PARALLELOPIPED, is a Solid Figure contained under Six *Parallelograms*, the Oppoſites of which are equal and parallel; or 'tis a Priſm, whoſe Baſe is a *Parallelogram*. This is always triple to a Pyramid of the ſame Baſe and Height, as is demonſtrated under *Proportion of Solids*; which ſee.

PARALLELOPLEURON, a Word uſed by ſome Geometricians for an Imperfect *Parallelogram*, or kind of Trapezium, having unequal Angles and Sides, yet not all ſo, in regard that at leaſt ſome of them anſwer to one another, obſerving a certain Regularity and Proportion of Parallels; ſo that they do not extend ſo largely as Trapeziums, which are any Irregular Four-ſided Figures; nevertheleſs, like them, they are capable of being variouſly diverſify'd.

PARALOGISM, is a pretended Demonſtration or Method of Arguing, but which is in reality fallacious and falſe.

PARALYSIS, the *Palſey*, is an entire Loſs of voluntary Motion or Senſe, or both, either in all the Body, or only in ſome Part. It comes by either an Obſtruction, Obſciſſion, Contuſion, or preſſing of the Nerves, or by an Indiſpoſition, or ill Conformity of the Muſcles. *Blanchard.*

PARAMESUS, is the next finger to the Middle one, called the Ring-finger.

PARAMETER, by ſome, as *Mydorgius* and others, called the *Latus Rectum* of a *Parabola*, is a Third Proportional to the *Abſciſſa* and any *Ordinate*: So that the Square of the *Ordinate* is always equal to to the Rectangle under the *Parameter* and *Abſciſſa*. See the Demonſtration under *Parabola*.

This

This Word *Parameter*, or *Latus Rectum*, is alſo uſed as to the *Ellipſe* and *Hyperbola*; but in thoſe it hath another Proportion, as you will find under thoſe Words.

PARAMOUNT, in our Law, ſignifies the Supream Lord of the Fee: For there may be a Tenant to a Lord, that holdeth himſelf another Lord; the former of which is called *Lord Meſne*, and the ſecond *Lord Paramount*. And a *Lord Paramount* conſiſteth only in Compariſon, as one Man may be *great*, being compared to a *leſs*; and *little*, being compared with a *greater*. So that none ſimply ſeemeth to be *Lord Paramount* but only the King, who is *Patron Paramount* to all the Benefices in *England*.

PARAPET, in Fortification, is an Elevation of Earth and Stone upon the Rampart, behind which the Soldiers ſtand ſecure from the Enemies Great and Small Shot, and where the Cannon is planted for the Defence of the Town or Fortreſs. Every *Parapet* having its *Embraſures* and *Merlons*, is about Six Foot high on the Side of the Place; and from Four to Five on that towards the Country. So that this Difference of Heights forms a kind of *Glacis* above, from whence the Musketeers mounting the *Banquet* of the *Parapet*, may eaſily fire into the Moats, or at leaſt upon the Counterſcarp. It ought alſo to to be from 18 to 20 Foot thick, if made of Earth; and from 6 to 8 if of Stone. The Earth is much better than Stone, becauſe Stone will fly to pieces when battered, and do miſchief.

This Word *Parapet* is alſo given to any Line that covers Men from the Enemies Fire: So there are *Parapets* of Barrels, of Gabions, of Bags filled with Earth, *&c.*

PARAPHANALIA, or, according to the Civil Law, *Parapharnalia*, are thoſe Goods which a Wife, beſides her *Dower* or *Jointure*, is after her Husband's Death allowed to have; as Furniture for her Chamber, Wearing Apparel, (and Jewels, if ſhe be of Quality) which are not to be put into her Husband's Inventory, eſpecially in the Province of *York*.

PARAPHIMOSIS, is a Fault of the Yard, when the *Præputium*'s too ſhort; alſo a Narrowneſs and Contraction of the Womb.

PARAPLEGIA, is a Palſie which ſeizeth all the Parts of the Body below the Head, thro' an Obſtruction of the Spinal Marrow. *Blanchard.*

PARAPHRENITIS, is madneſs accompanied with a continual Fever, through the Inflammation of the *Diaphragm*, with Difficulty of Breathing, as the Ancients dream'd. But Doctor *Willis* has confuted this Opinion of it, and ſays the Matter of it lies in the *Cerebellum*, whereby the Animal Spirits cannot flow, and thence the Midriff and Lungs are troubled. *Blanchard.*

PARAPHROSYNE, is a ſlight ſort of Doting in the Imagination and Judgment. *Blanchard.*

PARASELENE, a *Mock Moon*, is occaſion'd by the ſame Means as the *Parhelia* are about the *Sun*; tho' not ſo frequent.

PARASITICAL *Plants*, are thoſe which ſome call *Epidendra*, becauſe they grow not on the Ground, but on the Arms or Limbs of Trees, as our *Viſcum* or *Miſletoe* doth.

PARASTATÆ. See *Epididymis.*

PARASYNANCHE, is an Inflammation of the Muſcles of the Upper part of the *Oeſophagus*, with a continued Fever.

PARAVAILE, in Common Law, ſignifies the loweſt Tenant, or him that is Tenant to one who holdeth his Fee over of another; and is called *Tenant Paravaile*, becauſe it is preſumed he hath Profit and *Avalye* by the Land.

PARBUNCLE, is the Name of a Rope in a Ship, almoſt like a pair of Slings: 'tis ſeized both Ends together, and then put double about any heavy thing that is to be hoiſed in or out of the Ship; having the Hook of the Runner hitched into it to hoiſe it up by.

PARCENERS, is a Word taken either according to the Courſe of the Common Law, or according to Cuſtom. *Parceners*, according to the Courſe of the Common Law, are, Where one ſeized of an Eſtate of Inheritance, hath Iſſue only Daughters, and dies, and the Lands deſcend to the Daughters, then they are called *Parceners*, and are but as one Heir. The ſame Law is, If he have not any Iſſue, but that his Siſters be his Heirs.

Parceners, according to Cuſtom, are, Where a Man is ſeized of Lands in *Gavel-kind*, as in *Kent*, and other Places Franchiſed, and hath Iſſue divers Sons, and dies, then the Sons are *Parceners* by the Cuſtom.

PARCENARY, in Law, ſignifies a holding or occupying of Land *pro indiviſo*, by Joint-Tenants, or otherwiſe called *Co-parceners*: For if they refuſe to divide their common Inheritance, and chooſe rather to hold it jointly, they are ſaid to hold in *Parcenary*.

PARCO *Fracto*, is a Writ that lies againſt him that violently breaketh a Pound, and taketh out Beaſts thence, which for ſome Treſpaſs done upon another Man's Ground, are lawfully impounded.

PARCELLING *of a Ship*, is laying of Pieces of Canvaſe of about a Hand's breadth, over the Seams, when ſhe is newly Calked.

PARCEL-*Makers*, are two Officers in the *Exchequer* that make the *Parcels* of the *Eſcheators* Accounts, wherein they charge them with every thing they have levied for the King's Uſe within the Time of their Office, and deliver the ſame to one of the *Auditors* of the Court to make an Account with the *Eſcheator* thereof.

PARENCEPHALOS, the ſame as the *Cerebellum*.

PARENCHYMOUS *Parts of the Body*, by the Old Anatomiſts, are reckoned ſuch Fleſhy Parts of it as fill up the Interſtices between the Veſſels, and not conſiſting of Veſſels themſelves. But by the Help of the Microſcope, and more accurate Obſervations, it hath ſince been diſcovered, that there is no part of an Animal Body but what is a kind of Net-work of an innumerable Quantity of ſmall Capillary Veſſels.

PARENCHYMATA, are the Intrails thro' which the Blood paſſes for its better Fermentation and Perfection, as the Lungs, Liver, Heart, and Spleen, *&c.*

Sometimes the Word *Parenchyma* is taken in a large Senſe for all the Intrails. *Blanchard.*

PARIETAL *Bones*, or the Bones of the *Sinciput*, are the thinneſt Bones of the *Cranium*, in Form almoſt ſquare, ſomewhat long; they are joined to the *Os Frontis* by the *Sutura Coronalis*, to one another in the Crown of the Head by the *Sutura Sagittalis*, to the *Os Occipitis* by the *Lambdoidalis*, and to the *Oſſa Temporum* by the *Sutura Squamoſa*. They are ſmooth and equal

on their Out-side, but on their Inside they have several Furrows made for the Passage of the Veins of the *Dura mater*. They have each a small Hole near the *Sutura Sagittalis*, through which there pass some Veins which carry the Blood from the Teguments to the *Sinus Longitudinalis*.

PARISTMIA, or *Amygdalæ*, are two Glandules of the Mouth tied together by a broad slender Production; they have one common Cavity large and oval, opening into the Mouth. The Use they serve for is, to transmit a certain slimy or pituitous Matter into the Jaws and Mouth. They are called also *Tonsillæ*, which see. *Blanchard.*

PARK *of the Artillery*, is a certain Place in a Camp without Cannon-shot of the Place besieged, where the Cannon, Artificial Fires, Powder, and other Warlike Ammunition are kept, and guarded only by Pike-men, to avoid Casualties which may happen by Fire. Every Attack at a Siege hath its *Park of Artillery*.

PARK *of Provisions*, is another Place in the Camp on the Rear of every Regiment, which is taken up by the Sutlers, who follow the Army with all sorts of Provisions, and sell them to the Soldiers.

PARONYCHIA, a *Whitlow*, is a preternatural Swelling in the Fingers, and very troublesome: It arises from a sharp malign Humour, which sometimes gnaws the Tendons, Nerves, the Membrane about the Bone, and the very Bone it self. *Blanchard.*

PAROTIDES, are glandules behind the Ears; also a preternatural Swelling of those Glandules.

PAROXYSM, a *Fit*, is Part of the Period of Diseases, whereby they encrease and grow worse. It is either Regular, which returns at certain Times, as in a Tertian or Quartan Ague; or Irregular, that hath no certain Times, but comes sometimes one Day, sometimes another, as the Erratick Ague. *Blanchard.*

PARRELS, in a Ship, are Frames made of Trucks, and Ribs, and Ropes, which having both their Ends fastened to the Yards, are so contrived as to go round about the Masts, that the Yards by their means may go up and down upon the Masts. These also, with the Breast Ropes, do fasten the Yards to the Masts.

PARRICIDE, signifies properly him that kills his Father, and may be applied to him that murders his Mother.

PARSON, *Persona*, is the Law Term for the Rector of a Church; because for his Time he represents his Church, and sustaineth the Person thereof, as well in suing, as in being sued in any Action Touching the same. Formerly he who had a Church by Institution and Induction only for his own Life, was called *Parson Mortal.*

But any Collegiate or Conventual Body, to whom the Church was for ever appropriated, was called *Parson Immortal.*

In the New book of Entries, *Verb.* Aid in Annuity, are these Words: *Et Prædictus A. dicet quod ipse est Persona Prædictæ Ecclesiæ de S.* Impersonata *in eadem ad Præsentationem F. Patronissæ.* By which it seems that *Persona* or *Parson* anciently was the Patron, and *Persona Impersonata* the Rector to whom the Benefice was given by the Patron's Right; which also *Dyer* sheweth, *fol.* 221. So that in Law, the *Parson Impersonæ* is he that hath the Possession of a Benefice or Rectory, be it appropriate, or otherwise, by the Act of another.

PARSONAGE, or *Rectory*, is a Spiritual Living composed of Glebe-Land, Tythe, and other Oblations of the People, separate or dedicate to God in any Congregation, for the Service of his Church there, and for the Maintenance of the Minister to whose Charge the same is committed.

PARTES *Finis nihil habuerunt*, &c. in the Common Law, is an Exception taken against a Fine levied.

PARTIES, in Law, are those which are named in a Deed, or Fine, as Parties to it; as those that Levy the Fine, and to whom the Fine is levied: So those that make any Deed, and they to whom it is made, are called *Parties in the Deed.*

PARTITIONE *Facienda*, is a Writ that lies for those that hold Lands or Tenements *pro indiviso*, and would sever to every one his Part, against him or them that refuse to join in *Partition* as *Copartners*, &c.

PARTITION, is a dividing of Land descended by the Common Law, or by Custom, among *Co-heirs* or *Parceners*, where there are two at least; and this Partition is made Four ways, whereof Three are by Agreement, the Fourth by Compulsion. The First *Partition* by Agreement is, When they divide the Land equally themselves into so many Parts as they are Coparceners, and each to choose one Share or Part, according to Order. The Second is, when they choose some of their Friends to make the Division for them. The Third is by drawing Lots, thus: Having first divided the Land into as many *Parts* as there are Parceners, they write every part severally in a distinct Scroll, and wrapping it up, throw each of them into a Hat, Bason, or such like thing, out of which each Parcener draws one, according to their Superiority; and so the Land is severally allotted. The Fourth *Partition*, which is by Compulsion, is, When one or more of the Parceners, by reason of the Refusal of some other, sues out a Writ of *Partitione facienda*; by Force whereof they shall be compelled to part.

In *Kent*, where Land is of *Gavel-kind* Nature, they call their Partition, *Shifting*.

Partition also may be made by Joint-Tenants, or Tenants in Common, by Ascent, by Deed, or by Writ.

PARTY-*Jury*. See *Medietas Linguæ*.

PARTNERS, in a Ship, are strong pieces of Timber bolted to the Beams incircling the Masts, to keep them steady in their Steps, and also keep them from rowling (that is falling) over the Ship's Sides. There are also of these *Partners* at the Second Deck, to the same End; only the Missen-mast hath only one pair of *Partners* in which that Mast is wedged so firm, as that it can by no means budge. Some Ships sail not well, unless their Masts are loose, and have leave to play in the Partners: But in a Storm this is dangerous, lest the Partners should be *wronged*, (as they say) *i. e.* forced out of their places; for then there is no Help, but to cut the Mast by the Board.

PARTNERSHIP, a Rule in Arithmetick; the same with the *Rule of Fellowship*, which see.

PART *Proportional*, is a Part or Number agreeable and analagous to some other Part or Number; or a Medium to find out some Number or Part unknown by Proportion and Equality of Reason.

PAR *Vagum*, a pair of Nerves arising below the *Auditory* ones, from the Sides of the *Medulla Oblongata*, behind the *Proceſſus Annularis*, by ſeveral Threads which join together, and go out by the ſame Hole that the *Sinus Laterales* diſcharge themſelves into the *Jugulares*. It is joined by a Branch of the *Nervus Spinalis*, or *Acceſſorius Willisii*, and by a ſmall Branch of the *Portio Dura*: Immediately after it comes out of the Scull, it gives a ſmall Branch to the *Larynx*, as it goes down the Neck, above the Intercoſtal Nerve, by the Side of the Internal *Carotide*. At the Axillary Artery it caſts back the *Recurrent Nerves*, of which the Right embraces the Axillary Artery, and the Left the *Aorta*. Theſe two Branches aſcend on each ſide of the *Trachea*, or *Aſpera Arteria*, to the *Larynx*, where they are ſpent on the Muſcles of the *Larynx* and Membranes of the *Trachea*. This Pair, after it has entred the Cavity of the *Thorax*, ſends out ſeveral Branches to the *Pericardium*, Heart, Lungs, and Concave ſide of the Liver.

This Pair of Nerves was formerly accounted the Sixth, but is now uſually reckoned the Eighth.

There is a notable Fibre, or rather Nerve, coming from the Spinal Marrow, about the Sixth or Seventh *Vertebra* of the Neck, which is ſo joined to this *Par Vagum*, as if they grew into one Nerve; being covered with it, with the ſame Coat, from the *Dura mater*, but appears diſtinct when that is taken off. This Nerve they call the *Acceſſory Nerve*, which runs to the Muſcles of the Neck and Shoulder-Blade.

Out of the Trunks of this Eighth Pair ſpring two Nerves that they call the *Recurring Nerves*; the Right of which riſes higher, and winds about the *Axillary Artery*; the Left ſprings lower, and twiſting about the Trunk of the deſcending *Aorta*, recurrs or returns back from thence.

Dr. *Willis* thinks this *Recurrent Nerve* to be really a diſtinct one from the very Original, to be no Branch of the *Par Vagum*, but only is included in the ſame Coat or Cover with it, for Safety and Convenience of Paſſage.

About the firſt or ſecond Rib this Pair hath a kind of *Plexus* or Knot, which is called *Plexus Cardiacus*, becauſe it ſends out Twigs which go to the Heart and its Appendages.

PARVO *Nocumento*, is a Writ of Nuſance; which ſee.

PARVUM & *Craſſum*, is the Fourth Pair of Muſcles of the Head; ſo called, becauſe it is but a little one, yet pretty thick. It lieth under the *Complexum Trigeminum*, or Third Pair, and riſes Nervous from the Tranſverſe Proceſſes of the Six uppermoſt *Vertebræ* of the Neck, and is inſerted into the hinder Root of the Mamillary Proceſs.

PARYLIS, is an Inflammation, Rottenneſs, or Excreſcency among the Gums. *Blanchard.*

PASCHA *Clauſum*, ſignifies the *Octaves* of *Eaſter*, or *Low-Sunday*, which cloſes or concludes that Solemnity. *Die* (*tali*) *poſt paſcha clauſum*, is a Date in ſome of or our Old Deeds. And the firſt Statute of *Weſtminſter*, *Anno* 3 *Edw.* 1. is ſaid to have been made *lendes menda de la cloſe de Paſche*, that is, *the Monday after Eaſter-Week.*

PASCHAL *Rents*, are Rents or Annual Duties paid by the Inferior Clergy to the Biſhop, or Archdeacon, at their *Eaſter Viſitations*. They are alſo called *Synodals*; which ſee.

PAS *de Souris*, a *French* Term in Fortification, the ſame with *Berme*; which ſee.

PASSANT. The Term in Heraldry for a Lion born in any Eſcutcheon in a walking Poſture. But this in moſt other Beaſts, they call *Tripping.*

PASSAGIO, is a Writ directed to the Keepers of the Ports, to permit a Man to paſs over Sea that hath the Kings Licenſe.

PASSARADO, is a Rope in a Ship, whereby all the Sheet-Blocks of the Main and Foreſails are haled down after; the *Clew* of the Mainſail to the *Cubbrige-head* of the Main-maſt, and the *Clew* of the Fore-ſail to the *Cat-head*. This is to be done when the Ship goes large; and they are alſo kept firm down, and hindred from flying up, by this *Paſſarado-Rope.*

PASSPORT, ſignifies a Licence made by any one that hath Authority, for the ſafe Paſſage of any Man from one Place to another.

PASSIVE *Principles*. So the Chymiſts call *Water* and *Earth*, becauſe either their Parts are at reſt, or elſe at leaſt not ſo rapidly moved as thoſe of Spirit, Oil, and Salt, and ſo do ſerve to ſtop and hinder the quick Motion of the *Active Principles*. Beſides if theſe Principles could be drawn pure, they would have nothing in them but bare Bulk, Figure, Colour, and Weight; the one in a Fluid, the other in a Solid Form; and would be without either Smell, Taſte, &c. or any Active Operations.

PASTILIS, are Odoriferous *Tablets*, or *Trochiſks* made up of Perfumes or Odorous Bodies, with Mucilage or Gum *Tragacanth.*

PATE, in Fortification, is a kind of Platform like what they call an Horſeſhoe, not always regular, but generally oval, encompaſſed only with a Paraper, and having nothing to flank it. It is uſually erected in Marſhy Grounds to cover a Gate of a Town.

PATEE, a Term in Heraldry for a *Croſs* of this Figure. The Field is *Sable a Croſs Patee Argent*, by the Name of *Croſs*. This Form of a *Croſs* is called alſo *Formee.*

PATELLA. See *Mola genu*, the Knee Pan.

PATENTS. See *Letters Patent.*

Note, That *Patents* differ from Writs, and that a Coroner is made by Writ, and not by *Patent.*

PATENTEE, is he to whom the King grants his Letters Patent.

PATHETICK *Nerves*, are the Fourth pair ariſing from the Top of the *Medulla Oblongata*, (and ſo is different from all others, which ariſe either from its Baſe or Sides) behind the round Protuberances, called by Anatomiſts the *Nates* and *Teſtes* of the Brain; whence bending forwards by the Sides of the *Medulla Oblongata*, they preſently hide themſelves under the *Dura Mater*; under which proceeding a while, they paſs out of the Skull, each in a ſingle Trunk, at the ſame Hole with the Optick Nerves, (and they communicate with no other in their whole Paſſage) and are beſtowed entirely, as *Willis* ſaith, on that Muſcle of the Eye which they call *Trochlearis*, becauſe it ſerves to rowl the Eye round about; which being a Motion that is uſually conſequential upon ſome Paſſion of the Mind, ſuch as Love, &c. theſe

Nerves

Nerves are therefore very properly called *Oculorum motores pathetici.*

PATH *of the Vertex*, a Term frequently uſed by Mr. *Flamſteed* in his *Doctrine of the Sphere*, and ſignifies a Circle deſcribed by any Point of the Earth's Surface, as the Earth turns round its Axis. This Point is conſidered as Vertical to the Earth's Centre, and is the ſame with what is called the *Vertex* or the *Zenith* in the *Ptolemaick* Projection.

The Semi diameter of this *Path of the Vertex* is always equal to the Complement of the Latitude of the Point or Place that deſcribes it; that is, to that Places Diſtance from the Pole of the World.

PATHOGNOMONICK, a Term in the Art of Medicine, is a proper inſeparate Sign which agrees only to ſuch a thing, and to all of that kind, and tells the Eſſence of its Subject, and alſo laſts from the Beginning to the End; as in a true Pluriſie there's always a continual Fever, hard Breathing, and Stiches, with a Cough. *Blanchard.*

PATHOLOGY, is a part of Phyſick that teacheth us the preternatural Conſtitution of a Man's Body, ſo as thereby to diſcover the Nature and Cauſes of Diſeaſes.

PATONCE. The Heralds Term for one of their Croſſes of this Figure.

Gules, a Croſs Patonce, Argent, by the Name of *Latimer.*

PATRIMONY, is an Hereditary Eſtate, or Right, deſcended from Anceſtors. The Legal Endowment of a Church, or Religious Houſe, was called *Eccleſiaſtical Patrimony.*

PATRON, is uſed in the Civil Law for him that hath manumitted a Servant, and thereby is both juſtly accounted his great Benefactor, and challengeth certain Reverence and Duty of him during his Life.

In the Canon and Civil Law it ſignifies him that hath the Gift of a Benefice; and the Reaſon is, Becauſe the Gift of Churches and Benefices belonging unto ſuch good Men as either built, or elſe endowed them with ſome great part of their Revenue.

PATROUILLE, or *Patroul*, as we generally pronounce it, is a Round of Soldiers, to the Number of Five or Six, with a Serjeant to command them: Theſe ſet out from the *Corps de Gards*, and walk round the Streets of a Garriſon, to prevent Quarrels, Miſchief, *&c.* and to keep all in Order, Peace and Quietneſs.

PAUPER. See *Forma pauperis.*

PAUSE or *Reſt*, in Muſick, is a Silence or Artificial Intermiſſion of the Voice or Sound, proportioned to a certain Meaſure of Time, by the Motion of the Hand or Foot.

Theſe *Pauſes* or *Reſts* are always equal to the Length or Quantity of the Notes whereto they are annex'd, and are therefore called by the ſame Names, as a *Long-reſt*, *Breve-reſt*, *Semi-breve-reſt*, &c.

Odd Reſts are thoſe which take up only ſome part of a *Semi-breve*'s Time or Meaſure, and have always reference to ſome *Odd Note*: for by thoſe two *Odds* the Meaſure is made even.

PAUNCH, or *Panch*, is thoſe Matts made of Sinnet, which in a Ship are made faſt to the Main and Fore-yards, to keep them from galling againſt the Maſts.

PAWLE, in a Ship, is a ſmall piece of Iron bolted to one End of the Beams of the Deck, cloſe to the Capſtan, but yet ſo eaſily as that it can turn about. Its Uſe is to ſtop the Capſtan from turning back, by being made to catch hold of the Whelps: Therefore they ſay, *Heave a Pawle!* That is, Heave a little more for the *Pawle* to get hold of the Whelps: And this they call *Pawling the Capſtan.*

PAYING. The Seamen call laying over the Seams of a Ship a Coat of hot Pitch, *paying her*; which when 'tis done with Canvaſs, is called *Parcelling.* Alſo, when after ſhe is *Graved*, and her *Soil* burned off, a new Coat of Tallow and Soap, or one of Train-Oil, Roſin and Brimſtone, boiled together, is put on upon her, that is called *Paying of a Ship.* They ſay alſo ſometimes, when in tacking about, a Ship's Sails being backſtay'd, fall all flat againſt the Maſts and Shrouds, *ſhe is payed.*

PEAN, in Heraldry, is when the *Field* of a Coat of Arms is *Sable*, and the Powderings are *Or.*

PECTEN *Arboris*, is the Grain of the Wood of any Tree.

PECTINEUS, is a Muſcle of the Thigh; ſo called from its Beginning at the *Os Pubis* or *Pectinis.* It has a thick, broad, and fleſhy Origination from the External part of the ſaid Bone, between the *Pſoas Magnus* and the *Iliacus Internus*, and ſecond Head of the *Triceps*; and deſcending obliquely backwards, it becomes a flat ſtrong Tendon near its Implantation to the Aſperity on the Poſterior part of the *Os Femoris*, immediately below the leſſer *Trochanter*, at the Inſertion of the *Pſoas Magnus* and *Iliacus Internus.*

This acting together with the *Pſoas Magnus* and *Iliacus Internus*, doth not only draw the *Os Femoris* upwards, but direct it outwards, by its Curve Deſcent from its Origination to its Inſertion at the Poſterior part of the *Os Femoris*; which is a Provident Contrivance of Nature in walking, ſince the Thigh-Bones by their oblique Poſition do thereby render the Toes liable to turn inwards.

PECTINIS, or *Pubis Os*, the Share-Bone, is the lower and inner, or fore-part of the *Os Innominatum*; and even before, is joined to its Fellow by a Cartilage, called *Synchondroſis*, which is much thicker, but looſer and ſofter in Women than in Men; for in Women, one Bone can a little recede from the other in Travail, to make way for the *Fœtus.* It has a very large *Foramen* between the *Sinus* of the *Coxendix*, and that part whereby it is joined to its Fellow, making room for two Muſcles of the Thigh; and above this *Foramen* is a *Sinus*, by which the Crural Veins and Arteries paſs to the Thighs. The Upper part of this Bone is called its *Spine*, into which the Muſcles of the *Abdomen* are inſerted.

PECTORALS, or *Pectoral Medicines*, are ſuch as are uſed in Diſeaſes of the Breaſt, by attenuating, or thickning, or allaying the Heat thereof, and render the Matter which cauſes coughing, fit to be expectorated or ſpit out. *Blanchard.*

PECTORALIS, a Muſcle of the Arm, ſo called from its Situation. This hath a broad ſemi-

circular

circular fleshy beginning above, from near half the Inferior part of the *Clavicula*: Below, from the *Os Pectorale*, and all the Cartilaginous Endings of the Six superior Ribs, and from the Bony part of the Seventh, it hath a distinct *Fasciculus* of fleshy Fibres, (which sometimes is confounded with the *Obliquus Descendens Abdominis*.) From this large Origin it marcheth transversly, and becometh narrower but thicker, and lessens it self as it passeth over the upper part of the *Biceps Cubiti*, and is inserted by a short, but broad, strong Tendon, to the Superior part of the *Os Humeri*, above the Termination of the *Deltoides*. The Fibres of this Muscle decussate each other, near their Implantation to the *Os Humeri*; those of the Superior part running downwards, and those of the Inferior marching up, intersect the former in Acute Angles. When it acts it moves the Arm either obliquely upwards, or directly forwards, or obliquely downwards, according to the various Direction of its *Series* or *Fibres*.

PECULIAR, signifies a particular Parish or Church that hath Jurisdiction within it self, for *Probat* of Wills, *&c.* exempt from the Ordinary, and the Bishops Courts.

The King's Chapel is a Royal *Peculiar*, exempt from all Spiritual Jurisdiction, and reserved to the Visitation and immediate Government of the King himself, who is Supreme Ordinary.

It is an Ancient Privilege of the See of *Canterbury*, That wheresoever any Mannors or Advowsons do belong to it, they forthwith become exempt from the Ordinary, and are reputed *Peculiars*.

PEDESTAL, in Architecture, is that part which supports a Pillar or Column, having its proper Base and Cornice different, according to the several Orders of Architecture.

The *Tuscan Pedestal*, being the most simple of all, hath only a *Plinth* for its Base, and an *Astragal* crown'd for its *Cornice*.

The *Dorick Pedestal*, (according to *Palladio*) borrowing the *Attick* Base, ought to have for its Height 2 ½ Diameters of the Column taken below. But no *Pedestals* to this *Order* are seen among the Ancient Buildings.

The *Ionick Pedestal* is Two Diameters and about Two thirds high.

The *Corinthian Pedestal* hath the Fourth part of the Column for its Height, being divided into Eight parts; whereof one must be allowed for the *Cymatium*, two others for the Base, and the rest for the Dye or Square.

The *Composit Pedestal* ought to have the Third part of the Pillar for its Height.

PEDICULARIS *Morbus*. See *Phthiriasis*.

PEDICULUS, in Botany, is the Foot-stalk of any Leaf, Flower, or Fruit.

PEDIMENT, a Term in Architecture; the same with *Fronton*, which see.

PEDIUM. See *Tarsus*.

PEDRERO, or, as it is usually called by the Seamen, *Petterero*, is a small piece of Ordnance, most used on board of Ships to fire Stones, Nails, broken Iron, or Partridge-shot, on the Enemy, when he attempts to board you. Most of these are open at the Breech, and have the Chamber to take out, and to be loaded that way, and not at the Muzzle.

PEEK, a Sea-word, used in these Senses: An Anchor is said to be *a-peek*, when a Ship being about to weigh, comes so over her Anchor, that the Cable is perpendicular between the Hawse and the Anchor; and to bring the Ship thus, is called *Heaving a-peek*.

They say also, *Peek the Missen*; that is, Put the Missen-yard right up and down by the Mast.

A Ship is said to *Ride a peek*, where she lies with her Main and Fore-yards hoised up; and then having one end of the Yards brought down to the Shrouds, the other is raised up an end: And this is done to contrary Sides; (*i. e.*) the Starboard Yard-arm of the Main-yard comes down to the Starboard side, and so doth the Larboard end of the Fore-yard; so that the Yards appear a cross each other like St. *Andrew*'s Cross. The Way to do this, is, To let go the Starboard Top-sail-sheets from the Main-yard, and then topping up the Larboard-lifts: And so quite contrary for the Fore-yard.

To *Ride a-broad peek* is much after the same manner, only the Yards are raised up but half so high.

The Reason why they thus *peek* up their Yards is, left lying in a River (and they hardly ever use it but then) with their Yards a-cross, another Ship should be foul upon them, and break their Yards.

Their is also a Room in the Hold of a Ship, that is called the *Peek*: 'Tis from the Bitts forwards to the Stem. Here Men of War keep their Powder; and Merchant-men, Outward-bound, place their Victuals here.

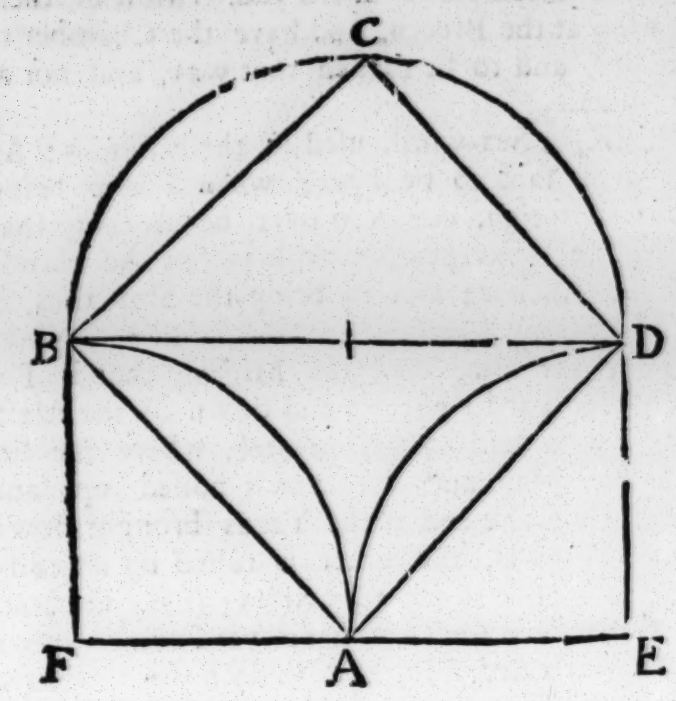
PEGASUS, a Constellation in the Northern Hemisphere, containing 23 Stars.

PEIRCED. When any *Ordinary* or *Charge*, in Heraldry, hath an Hole in it, so that the *Field* appears through, they say that *Ordinary* or *Charge* is *pierced*.

PELAGIÆ, is a Term used by the Writers of Natural History, to express such Sea Shell-fishes, as never or very rarely are found near the Shores, but always reside in the Deep, in those parts of the Bottom of the Sea which are most remote from Land.

PELICOIDES, is the Name given by some to the Figure B C D A, contained under the two

inverted



inverted Quadrantal Arks A B and A D, and the Semi-circle B C D, whoſe Area is = to the Square A C, and that to the Rectangle E B.

'Tis equal to the Square A C, becauſe it wants of the Square on the Left Hand the two Segments A B and A D, which are equal to the two Segments B C and C D, by which it exceeds it on the Right Hand.

PELIDNUS, is a Black-and-blue Colour in the Face, frequent in Melancholick Men.

PELLETS, a Bearing in Heraldry. See *Balls.*

PELLICAN, is the Chymiſts Term for a kind of Double Veſſel, uſed in Circulations. See *Double Veſſels.*

PELLICLE, a little Skin. When any Solution in Chymiſtry is in a gentle Heat evaporated ſo long till a thin Skin or Film ariſe on the top of the Liquor, 'tis call'd an *Evaporation to a Pellicle*; and then there is very little more Liquor left than what will juſt ſerve to keep the Salts in Fuſion.

PELVIS, is the Place at the Bottom of the Belly, wherein the Bladder and Womb are contained.

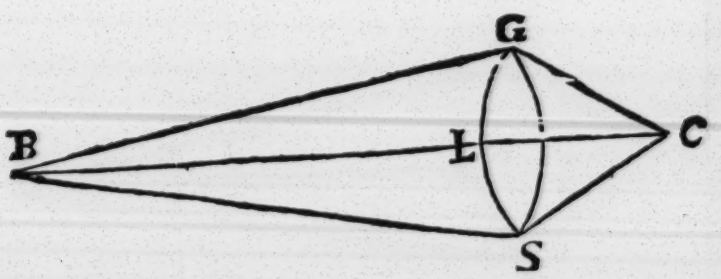
PELVIS *Aurium.* See *Cochlea.*

PELVIS *Cerebri.* See *Choana.*

PELVIS *Renum*, is a Membranous Veſſel or Receptacle in either Kidney, which receives the Urine, and pours it into the Bladder.

PEMPHIGODES *Febris*, is a Spotted Fever; ſome ſay a Windy or a Flatulent Fever.

PENCIL of Rays in *Opticks*, is a double Cone of Rays joined together at the Baſe; one of which hath its Vertex in ſome one Point of the Object, and the Glaſs G L S for its Baſe; and the other hath its Baſe on the ſame Glaſs, but its Vertex in the Point of Convergence, as at C.



Thus: B G S C is a Pencil of Rays, and the Line B L C, is called the Axis of that Pencil.

PENINSULA, in Geography, is a Portion of Land, which being almoſt ſurrounded with Water, and is joined to the *Continent* only by an *Iſthmus*, or narrow Neck of Land; as *Africa*, the greateſt *Peninſula* in the World, is joined to *Aſia*; that of *Morea* to *Greece*, &c.

PENETRATION *of Dimenſions*, is a Philoſophical way of expreſſing, That two Bodies are in the ſame Place, ſo that the Parts of one do every where penetrate into, and adequately fill up the Dimenſions or Places of the Parts of the other; which is manifeſtly impoſſible, and contradictory to Reaſon.

PENUMBRA, in Aſtronomy, is a faint kind of Shadow, or the utmoſt edge of the perfect Shadow, which happens at the Eclipſe of the Moon; ſo that it is very difficult to determine where the Shadow begins, and where the Light ends.

PENDANTS of a Ship, are of two kinds.

1. Thoſe long Colours, or *Streamers*, cut pointing out towards the end, and there divided into two parts, and which are hung out at the Heads of the Maſts, or at the Yard-Arm ends, are called Pendants; and are uſed for ſhew, and ſometimes for Diſtinction of Squadrons.

2. That ſhort Rope is called a *Pendant*, which at one end is faſtened to the Head of the Maſt, or to the Yard, or to the Clew of the Sail, and at the other end hath a Block and Shiver, to reeve ſome running Rope into. Thus the Pendant of the *Tackle* is made faſt to the Head of the Maſt; and the Pendants to the *Back Stays* are faſtened to, and hang down on the Inſide of the *Shrowds*. Alſo all the Yard-Arms, except the Miſſen, have of theſe Pendants, into which the Braces are reeved.

PENDULUM, is a Weight hanging at the end of a String, Chain, or Wire, by whoſe *Vibrations* or *Swings* to and fro, the Parts or Differences of Time are meaſured.

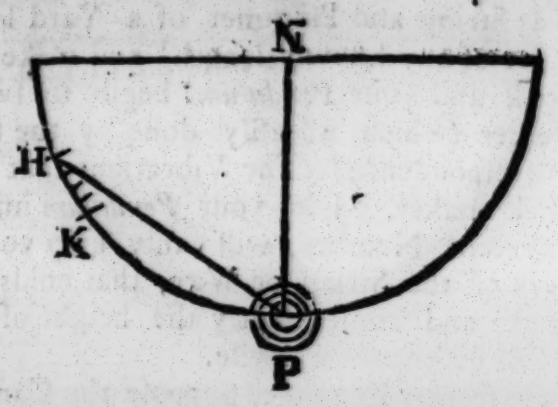
The Velocities of *Pendulums* in their loweſt Points are as the Chords of the Arks they fall from or deſcribe.

Thus if the *Pendulum* N P be let fall from the Height H, its Velocity at P will be expounded by the Chord H P. (*In the Figure following.*)

'Tis ſaid that *Ricciolus* was the firſt that attempted to meaſure Time by the *Pendulum*, and therein he was followed, tho' near about the ſame time, by *Langrenus Vendelinus, Merſennus, Kircherus*, &c. ſome of which declare they knew nothing of *Ricciolus*'s Attempt: But the firſt that applied it to a Movement, Clock, or Watch, was Mr. *Chriſtopher Hugens*, and who brought it alſo to a good degree of Perfection.

The Learned Sir *Iſaac Newton*, in his Accurate Experiments on *Pendulums*, found that the Matter of all Bodies is exactly proportionable to their Weight.

If



If the *Pendulum* P, be let fall from the Height H, and then at its return that way come up again as far as K, the Ark HK repreſents the Retardation ariſing from the Reſiſtance of the Air.

The ſhorter Arks any *Pendulum* deſcribes, the equaller will the Vibrations be to one another; and when the Arks are exceeding ſmall, the Vibrations will be nearly equal as if the *Pendulum* did ſwing in a *Vacuum*. Wherefore it ſeems to be a Miſtake in thoſe who admire a Clock or Watch for its *Pendulums* ſwinging far, or taking a great Compaſs as they call it.

PENDULUMS, *Merſennus* found the length of a *Pendulum* that wou'd ſwing Seconds to be 3 Feet 6 Inches, and ſince 'tis agreed that in our Latitude, it is juſt 39 Inches, 2 Tenths.

A *Pendulum* of 10 Inches, wanting about one Tenth of an Inch, will very near ſwing half Seconds, or the 120th part of a Minute of Time; which is 7200th part of an Hour.

The Lengths of *Pendulums* (which are always accounted from the Centre of Oſcillation, to the Centre of the Ball or Bob) are to each other in a Duplicate Proportion of the Times in which their Vibrations are reſpectively performed; or are as the Squares of the Vibrations performed in one and the ſame time. Wherefore the Times muſt be in Subduplicate Proportion to the Lengths. Sir *Iſaac Newton* demonſtrates, *Cor.* 2. *Prop.* 54. *Princip.* That if the Force of the Movement of a Clock required to keep a *Pendulum* in Motion, could be ſo compounded with the gravitating force of the *Pendulum*, that the whole Force or Tendency downwards, ſhall be as the Line which ariſes by dividing the Rectangle under the Semi-ark of the Vibration and the Radius, is to the Sine of that Semi-ark, then all the Oſcillations ſhall ſtill be made in the ſame ſpace of Time.

PROBLEMS.

I. *To find the Length of a* Pendulum *which ſhall make any Aſſigned Number of Vibrations in a Minute.*

Let the Number of *Vibrations* be 50, the Length of a String counted from the *Point of Suſpenſion*, to the Centre of *Oſcillation*, or of the Bullet or Round Ball at the end of it, is required.

Since *the Lengths of Pendule's* are to each other as the *Squares* of their *Vibrations*. And that a Pendule Vibrating Seconds (or 60 times in a Minute) is by Experience found to be of the length of 39 Inches and $\frac{2}{10}$ of an Inch.

I here uſe Sir *Jonas Moor's* Computation.

Say, as the Square of 50, (which is 2500): to the Square of 60 (which is 3600) : : So is 39, 2 : to the Length of the *Pendulum* required: which will be found to be 56, 4 Inches. See the Work.

As 2500 to 3600 : : ſo 39, 2 to
39,2

7200
32400
10800

25 | 00) 14112 | 00 (56,4
125

161
150

112
100

12

But for ready Practice; ſince in theſe Queſtions the Product of the mean Terms will always be 1411200 (that is the Product of the Square of 60 Multiplied by 39,2.) *i. e.* 3600 × 39,2. You need only divide that Number by the Square of the Number of Vibrations aſſign'd, and the Quotient will give the Length of a *Pendulum*, that ſhall Vibrate juſt ſo many times in a Minute.

PROBLEM II.

The Length of a String and Plummet being known (reckoned as before from the Point of Suſpenſion to the Centre of the Weight;) To find the Number of Vibrations ſuch a Pendulum *ſhall make in a Minute.*

This is the Reverſe of the former Problem; therefore ſay, As the Length given ſuppoſe 56,4, to the Length of the Standard Pendulum ſwinging Seconds, *viz.* 39,2. So is the Square of the Vibrations of the *Standard Pendulum* to the Squares of the Vibrations ſought. See the Work.

As 56,4 : 39,2 : : 3600 : 2500, as will be found by working the *Golden Rule* as before. And the Square Root of 2500, will be 50, the Number of Vibrations ſought.

But for uſe (here as in the former Problem) you need only to divide 1411200 by the Length, and it gives the Squares of the Vibrations, as there you divided by the Square of the Vibrations to find the Length.

USE.

And theſe two Problems may be of excellent uſe, both to regulate the Motion of a Clock or Watch, and exactly to meaſure Time without either; which may gratifie and aſſiſt the Curious in obſerving *Eclipſes*, eſpecially thoſe of the *Satellites* of *Jupiter*, and in the Tranſits of the Moon under the fix'd Stars, and her Occultations of them: Whoſe Duration may be thus eaſily meaſured, without Clock, Watch, or any ſuch way of diſtinguiſhing Time.

As for Inſtance, Suppoſe you were on a Journey or Voyage, or ſome place where you cannot

have the conveniency of a good Clock or Watch, &c. and yet you would willingly observe the Duration of an Eclipse; which by your Table you know will happen such a Night, and near such a time of it.

Hanging up a String and Weight on a fine Pin, and letting it swing just at the Entrance of the Shadow on the Moon's Orb; let a Correspondent or Servant carefully count the Vibrations, and marking them down with a Pencil, or some such way; (moving the *Pendulum* dexterously also that way that 'tis going, when 'tis almost at rest, by a gentle push of his Hand, and by that means keeping it in constant Motion;) the Number of the Vibrations will be known, during the whole Eclipse; which note down on a piece of Paper, and measuring exactly the Length of your String in Inches, and Decimal parts of an Inch: Divide (by this Problem) 141120 by the Length of your *Pendulum*, and the Quotient will afford you a Number, whose Square Root is the Number of Vibrations, the *Pendulum* you employ'd made in one Minute. Divide therefore the Number of all the Vibrations, during the whole time of Observation, by 60, and the Quotient will be the Number of Minutes the Eclipse lasted.

N. B. 'Twill be best to use a pretty long String, because the Vibrations being by that means slower, they may be the more distinctly counted. If at such a time you are furnished with a good Foot Rule, you may let your *Pendulum* be just 39, 2, and then each Vibration will be a Second: But if you are destitute of such an Advantage, you may, as before, hang up a *Pendulum* at a venture, and by another String, or some such way, taking its exact Length, you may keep it by you. with the Number of all the Vibrations, and compute the Time afterwards at your Leisure.

PROBLEM III.

To find the Length of any String which hath a Weight hanging at it, without coming to measure it; or without making use of any Quadrant, or such like Instruments, to take Heights.

Let the String and Weight annex'd be made to swing; and at the same time hang up a *Pendulum* of any known Length, (as suppose a Yard) and set it a Vibrating likewise, so that both the *Pendulums* may swing together; to effect which, you must let the *Pendulum* you hang up go away just when the other you would measure is beginning to make any Vibration: This done, stay till the *Pendulum* you hung up hath made a Competent Number of Vibrations (as suppose about 50 or 60;) and let a Correspondent count how many Vibrations the *Pendulum*, whose length is sought, made in the same time: And let us suppose, that *That* made 10 Vibrations while your String and Plummet made 60; since, as was said before, *The Lengths of* Pendulums *are to each other as the Squares of their Vibrations*: If you divide 3600 (the Square of 60) by 100, (the Square of 10) the Quotient will be 36, which will shew you that the String sought was 36 times as long as that which you hung up; *i. e.* was in length 36 Yards, or 108 Foot.

And thus you may easily find the height of any Church or Theatre, by means of a Branch-Candlestick which hangs from the Roof: For if you hang up a String and Plummet of a Yard long, suppose, (~~or of any known length~~) and make this Candlestick and your *Pendulum* begin to swing both together (which is easily done by the help of a Correspondent:) The Vibrations that the Candlestick makes, while your *Pendulum* makes any Competent Number, will easily help you to the Length of the String or Wire, that holds the Candlestick, and consequently the height of the Church will be known likewise.

As in the former Example, Suppose the Candlestick made 10 Vibrations, while your *Pendulum* of a Yard made 60, then it is 36 Yards, or 108 Foot from the Centre of the Candlestick, to the end of the Rope or Wire that holds it to the Roof; to which, adding the height of the Centre of the Candlestick above the Ground, you have the whole height of the Church.

PROBLEM IV.

According to these Principles and Experiments on Pendulums, *it will not be difficult to estimate nearly the Depth of a deep Well, by the fall of a Stone into the Water from the Mouth: Or the Distance that any Ship at Sea, or that any Fort is off, by the Time between seeing the Flash of the Powder, and hearing the Report of the Gun: Or the Distance that any Thunder-Cloud is off,* &c.

For Sir *Isaac Newton* hath found that a Sound moves 968 Feet in a Second of Time.

'Tis asserted also by Mr. *Hugens*, and now generally agreed to, That a heavy Body descends in the first Second of Time after its beginning to fall, very near 16 Feet.

An Example to find the Depth of a Well, may serve for all.

Suppose you hang up a short *Pendulum*, that will Vibrate Quarter Seconds, (the way to find its Length hath already been shewn) and letting go the Stone and the *Pendulum* together, you find the *Pendulum* hath made 16 single Vibrations before you hear the noise of the Stones fall into the Water. Then since 16 Quarters of a Second are equal to 4 Seconds, if you account the Acceleration of the Descent of heavy Bodies to be either as the Squares of the Times, or as the Encrease of the odd Numbers, either way will give you the Number 256 for the Depth of the Well.

For since, as it is elsewhere shewn, a Body descends 16 Feet in the first Second of Time, in the fourth Second it will descend 16 times 16 Feet; for the Times being 1 and 4, the Descent will be as their Squares; that is, as 1 to 16: Wherefore Multiplying 16 by 16, you have 256, the Depth of the Well.

Or, if according to *Galilæus*'s way, you account 16 Feet for the first Second, and then 3 time 16 for the next Second, 5 times 16 for the third Second, and 7 times 16 for the fourth Second; all these Numbers added together, will make 256, the Depth as before.

Indeed some Abatement must be allowed for the Time the Noise of the Stones fall into the Water takes to reach the Ear. Wherefore since a Sound moves 968 Feet in a Second, and 256 is a little more than $\frac{1}{3}$ of that Number, a little more than

than $\frac{1}{4}$ of 16 Foot muſt be taken out of the former found Depth 256. So that the Depth of the Well may roundly be accounted 250 Feet.

But in the other Eſtimations of the Diſtance of a Cloud, Ship, or Fort, there needs no ſuch Allowance; and the bare Multiplication of 968, by the Number of Seconds between the Flaſh and the Report, will give the Diſtance of the Cloud or Ship from the Obſerver.

That Night, (*viz. April* 12.) on which our late Mighty Monarch King *William* was buried, we counted oftentimes very accurately, That the Diſtance between ſeeing the Flaſh, and hearing the Report of the Tower Guns, (which were then fired very ſolemnly and diſtinctly) was always 7 Seconds of Time. Multiplying then 968 by 7, it produces 6775, which is to be accounted the Diſtance between *Amen-Corner* and the Tower of *London*; which is one Mile, and 1495 Feet, or ſomething more than a Mile and a Quarter.

PENDULUMS *Royal*, are thoſe Clocks whoſe *Pendulum* ſwings Seconds, and goes eight Days, ſhewing the Hour, Minutes, and Seconds.

The Numbers of ſuch a Piece are calculated thus:

Firſt, Caſt up the Seconds in 12 Hours, and you'll find them to be 43200 = 12 × 60 × 60. The Swing-wheel muſt needs be 30, to ſwing 60 Seconds in one of its Revolutions: Now let $\frac{1}{2}$ 43200 = 21600 be divided by 30, and you'll have 720 in the Quotient, which muſt be broken into Quotients; the firſt of them muſt be 12 for the Great Wheel, which moves round once in 12 Hours. 720 divided by 12, gives 60, which may alſo be conveniently broken into two Quotients, as 10 and 6, or 5 and 12, or 8 and $7\frac{1}{2}$; which laſt is moſt convenient: And if you take all your Pinions 8, the Work will ſtand thus:

8) 96 (12
8) 64 (8
8) 60 ($7\frac{1}{2}$
30

According to this Computation, the Great Wheel will go about once in 12 Hours, to ſhew the Hour, if you will; the Second Wheel once in an Hour, to ſhew the Minutes; and the Swing-wheel once in a Minute, to ſhew the Seconds.

PENNATA *folia, winged Leaves*, is a Term among the Botaniſts, for ſuch Leaves of Plants as grow directly one againſt another on the ſame Rib or Stalk; as thoſe of *Aſh*, *Wall-nut-tree*, &c.

PENSION, that which in the two *Temples* is called a *Parliament*, and in *Lincolns-Inn* a *Council*, is in *Grays-Inn* termed a *Penſion*: That is, An Aſſembly of the Members of the Society, to conſult of the Affairs of the Houſe. Alſo in the Inns of Court, *Penſions* are certain annual Payments of each Member to the Houſe, for certain Occaſions.

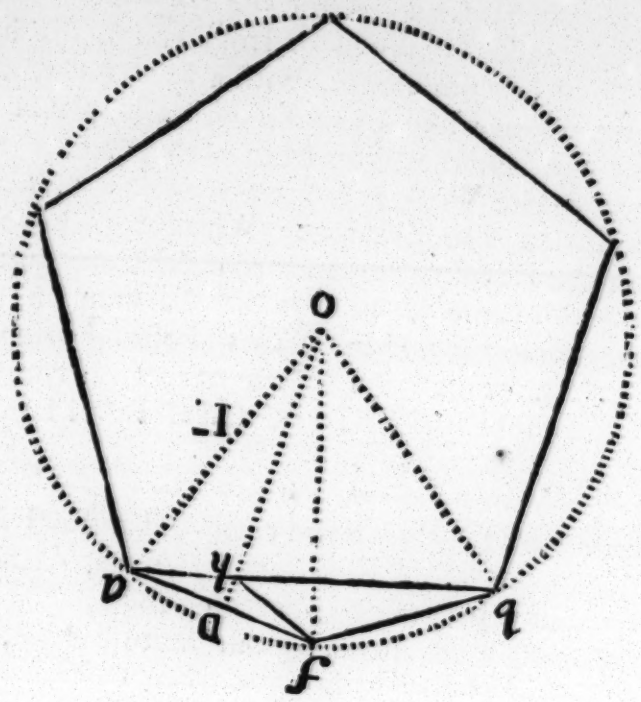
PENSION *Writ*, when a *Penſion Writ* is once iſſued, none ſued thereby in the Inns of Court ſhall be diſcharged, or permitted to come into Commons, till all Duties be paid.

PENSION *Order in* Grays-Inn, ſeems to be a peremptory Order againſt ſuch of the Society as are in Arrear for *Penſions*, and other Duties.

PENTAGON, in Geometry, is a Figure having five Sides, and five Angles: If all the Sides are equal, and conſequently the Angles, 'tis called *a Regular Pentagon*.

PROPOSITION.

The Side a b *of a* Regular Pentagon, *or which can be inſcribed in a Circle, is in Power equal to the Side of an* Hexagon *and* Decagon, *inſcribed in the ſame Circle: That is, The Square of* a b, *is equal to the Sum of the Squares of* a f *and* a o.



Let *a o*, the Side of the Hexagon, be called H; and *a f* (that of the Decagon) be called D; and *a b* be called P.

I ſay P P = H H × D D.

For the Angle at the Centre *b o a* being 72 Degrees, the equal ones, *b* and *a*, in the ſame Triangle, muſt be 54 Degrees each. Biſſect then the Angle *f o a* by the Prick'd Line *o h*; and then 'tis plain the Angle *b o h* will alſo be 54 Degrees, (*i. e.* 36 + 18 Degrees,) and conſequently the △ △ *a b o* and *o b h* are ſimilar. Wherefore *a b* : *b o* : : *b o* : *b h*: (*i. e.*) in our Notation, P : H :: H. $\frac{H H}{P}$.

Again, In the △ *b f a*, the Angles *b* and *a* are =; and alſo in the little △ *f h a*, the Angle *f* = *a*; and conſequently the 2 △ △ *b f a*: and *f h a*, are Similar; and conſequently *b a*: *a f* : : *a f* : *a h*. That is, P : D : : D : $\frac{D D}{P}$.

Wherefore of the whole Line *b a*, the 2 Parts are found to be by this Notation, $\frac{H H}{P}$ and $\frac{D D}{P}$: That is, the whole is $\frac{H H + D D}{P}$, but this Line *a b* is = P: Wherefore P P = H H + D D. *Q. E. D.*

PENTANGLE, a Figure having five Angles.

PENTAPOTES, (in Grammar,) are ſuch deficient Nouns as have but five Caſes, as *Nemo*.

PERACUTUM *Menſtruum*. See *Menſtruum Peracutum*.

PERAMBULATION *of the Foreſt*, is the Surveying or Walking about the Foreſt, or the Limits of it, by Juſtices, or other Officers thereto appointed, to ſet down the Metes and Bounds thereof, and what is within the Foreſt, and what without.

PERAMBULATIONE *facienda*, is a Writ that is ſued out by two or more Lords of Manners lying near one another, and conſenting to have their Bounds ſeverally known. It is directed to the Sheriff, commanding him to make *Perambulation*, and ſet down their certain Limits.

PERAMBULATOR, or *Walking-wheel*, is an Engine made of Wood or Iron, commonly half a Pole in Circumference, with a Movement, and a Face divided like a Clock, with a long Rod of Iron or Steel, that goes from the Centre of the Wheel to the Work: There are alſo two Hands, which (as you drive the Wheel before you) count the Revolution; and from the Compoſition of the Movement, and by the Diviſion on the Face, ſhew how many Yards, Poles, Furlongs, and Miles, you go. The Uſe of this Inſtrument is to meaſure Roads, Rivers, and all Level Lands, with great Expedition.

PERAVAYLE. See *Paravayle*.

PERCEPTION, is the clear and diſtinct Apprehenſion of any Object offered to us, without forming any Judgment concerning them.

PERCH, a Meaſure, by our Statute Law, of 16 Foot and a half in Length. See *Pole*.

PERDONATIO *utlagariæ*, is a Pardon for him who, for Contempts in not coming to the King's Court, is out-law'd, and afterwards of his own Accord, yieldeth himſelf to Priſon.

PEREMPTORY, in Law, ſignifies a final and determinate Act, without Hope of renewing or altering.

PERFECT *Concords*, in Muſick. See *Concords*.

PERFECT *Fifth*, the ſame with *Diapente*; which ſee.

PERFECT *Numbers*, are ſuch whoſe aliquot or even Parts, join'd together, will exactly return the whole Number, as 6, 28, &c. For of ſix, the half is three, the third Part two, and the ſixth Part one, which added together, make ſix; and it hath no more aliquot Parts in whole Numbers: So twenty eight, which has theſe Parts, *viz.* 14, 7, 4, 2, and 1, exactly return 28; which therefore is a Perfect Number, whereof there is but ten between one and one Million of Millions.

PERFORANS, is a Muſcle of the Fingers, ſo called becauſe its Tendons run thro' thoſe of the *Perforatus*; it's alſo called *Profundus* from its Situation; and *Tertii Internodii Digitorum Flexor*, from its Uſe. It riſeth fleſhy from near two Thirds of the Superior and Forepart of the *Ulna*, as alſo from the Ligament between the laſt named Bone and the *Radius*; and becoming a large thick bellied Muſcle, grows outwardly Tendinous, before it paſſes over the *Pronator Radii Quadratus*, and is divided into four round Tendons, which march under thoſe of the *Perforated* Muſcle, beneath the *Ligamentum Tranſverſale*; from each of theſe Tendons the *Muſculi Lumbricales* are ſaid to ariſe, after which they paſs thro' the *Fiſſures* of thoſe of the Perforated Muſcles, and proceeding over their Extremities, terminate in the Superior and Forepart of the third Bone of each Finger.

The Tendons of this Muſcle running through thoſe of the Perforated, is a no leſs uſeful than ſtupendous Artifice in Nature. For to the End the Fingers (like ſo many Leavers) ſhould be bended with great Force, it is abſolutely neceſſary the ſtrongeſt Muſcle ſhould be inſerted neareſt their Extremities, and fartheſt from their *Fulcimenta* the *Oſſa Metacarpi*: But in regard every Internode ſhould be attended with a particular Muſcle, the better to accommodate them to various Imployments, and the Origination of the Superior or *Perforatus*, is confined to the *Apex* of the Internal Extuberance of the *Os Humeri*, and upper Part of the *Radius* only; wherefore could not be a fit Inſtrument for ſo ſtrenuons an Action, and that not only in regard to its Magnitude, but by the Approach of its two Extreams when the *Cubit* or *Carpus* are bended; both which would be no ſmall Impediments in divers Actions; it's therefore neceſſary it ſhould be imployed in the Motions of the ſecond Internodes: But ſince theſe Superior Tendons would be hereby liable to interrupt the Inferior in their right Progreſs to the Extremities of the Fingers; it ſeems an Argument of great Counſel in traſmitting the latter through the Fiſſures of each of the former, whereby the Actions of both are not only diſtinctly performed, and the Extremities of the Fingers attended with the largeſt Muſcle, (whoſe Origin is below the *Os Humeri*, wherefore it's Extreams cannot approach in the Flexion of the *Cubit*,) but their Motions are preſerved, tho' the Superior Muſcle is totally divided; which indeed is a provident Contrivance of the Author of Nature, and is in it ſelf ſufficient to excite our Admiration.

PERFORANS, a Muſcle of the leſſer Toes; ſo called, becauſe its Tendons run thro' the Fiſſures in the Tendons of the *Muſculus Perforatus Pedis*: It is alſo called *Flexor tertii Internodii Digitorum Pedis*, from its Uſe. It hath an acute fleſhy Origination from the Backpart of the *Tibia*, immediately under the *Muſculus Subpoplitæus*, having a double Order of Fibres united in a middle Tendon like the *Flexor Pollicis Longus*, but ceaſeth to be Fleſhy as it paſſeth behind the *Malleolus Internus*, and running in a Channel over the Internal Part of the *Os Calcis*, under it, Imbanding Ligaments in half its Progreſs thro' the Sole of the Foot; it is divided into four Tendons, which march thro' the Perforations of the Tendons of the *Perforatus Pedis*, and are inſerted to the third Bone of every leſſer Toe.

PERFORATUS, is a Muſcle belonging to the Fingers; and ſo called, becauſe its Tendons are Perforated to admit thoſe of the Perforating Muſcles to paſs thro' them to their Inſertions: It is alſo called *Sublimis*, from its Situation, being above the Perforating Muſcles; and *Flexor ſecundi Internodii Digitorum*, from its Uſe: It riſeth Tendinous from the Internal Extuberance of the *Os Humeri*, between the *Flexores Carpi*: It alſo has a diſgregated Fleſhy Origination from the Forepart of the *Radius*, between the *Pronator Radii Teres* and *Flexor Follicis Magnus*, compoſing a Fleſhy Belly, leſſens it ſelf in leſs than half its Progreſs, where it's divided into four Fleſhy Portions, each of which ſoon becomes ſo many roundiſh Tendons, which are included in their proper Mucilaginous Membrane as they paſs under the *Ligamentum*

tum *Tranſverſale Carpi* thro' the Palm; near the firſt Internode of the Fingers each Tendon is divided to admit thoſe of the Perforated Muſcle thro' them; then joining and ſubdividing again immediately before they are inſerted to the Superior Part of the ſecond Bone of each Finger.

PERFORATUS *Pedis*, is a Muſcle of the leſſer Toes; ſo called, becauſe its Tendons are Perforated like thoſe of the Fingers. It is alſo called, *Flexor ſecundi Internodii Digitorum Pedis*, from its Uſe; and *Sublimis* from its Situation. It ſpringeth from the Inferior and Internal Part of the *Os Calcis*, between the *Muſculi Abductores* of the greater and leſſer Toes, dilating it ſelf to a Fleſhy Belly: After it hath paſſed the Middle of the *Planta Pedis*, it is divided into four Fleſhy Portions, which becoming ſo many Tendons, are divided near their Terminations, to admit the Tendons of the *Perforans* to paſs thro' them to their Inſertions: Theſe being united again, paſs underneath them to their Implantations at the upper Part of the ſecond Bone of each leſſer Toe.

PERFORATED, *i. e.* bored thro'. The Armoriſts uſe it to expreſs the paſſing or penetrating of one Ordinary (in part) thro' another; as thus:

He beareth *Or, a bend Ermine Perforated thro' a Chevron Gules.* But when there is only a Hole made thro' the Ordinary, and nothing in it to fill it up, they call it *Piercing*.

PERIAMMA, called alſo *Periapta*, is a Medicine, which being tied about the Neck, is believed to expel Diſeaſes, eſpecially the Plague. See *Appenſa*.

PERIAPTUM. *Vid. Periamma.*

PERICARPIUM, is a Medicine applied to the Wriſts, to cure an Ague, *&c.*

PERICARDIUM, is a double Membrane which ſurrounds the whole Subſtance of the Heart, and contains a Liquor to Moiſten, Lubricate, and, as ſome ſay, to Refrigerate the Heart: It hath five Holes, according to the Number of Veſſels which go out of the Heart. It adheres to the *Mediaſtinum* at the Baſis, and at the *Mucro* to the Centre, or Nervous Part of the *Diaphragma*.

PERICRANIUM, is a Membrane which infolds the Skull, ſeated next to the *Perioſtium*, covering the whole Skull, except juſt where the Temporal Muſcles lie. It is of exquiſite Senſe; and cauſes into'erable Pain when the Temporal Muſcle is wounded.

PERIÆCI, are thoſe Inhabitants of the Earth who live under the ſame Parallels, but under oppoſite Semi-circles of the Meridian, whence they have the ſame Seaſons of the Year, *viz. Spring, Summer, Autumn*, and *Winter*, at the very ſame Time, as alſo the ſame Length of Days and Nights; for 'tis in the ſame Climate, and at an equal Diſtance from the Equator: But the Changes of Noon and Midnight, are alternate one to the other.

PERIGÆON, or *Perigæum*, is a Point in the Heavens, wherein a Planet is ſaid to be in its neareſt Diſtance poſſibly from the Earth.

PERIHELION, is that Point of a Planet's Orbit, wherein it is neareſt to the Sun.

PERIMETER, is the Compaſs or Sum of all the Sides which bound any Figure, whether *Rectilineal* or *Mix'd*.

PERINDE *Valere*, a Term belonging to the *Eccleſiaſtical Law*, ſignifying a Diſpenſation granted to a Clerk, that being defective in his Capacity to a Benefice, or other Eccleſiaſtical Function, is *de Facto* admitted to it: And it hath the Appellation from the Words, which make the Faculty as effectual to the Party diſpenſed with, as if he had been actually capable of the Thing for which he is diſpenſed with at the Time of his Admiſſion. It is called a *Writ*.

PERINÆUM, is the Ligamentous Seam betwixt the *Scrotum* and the Fundament.

PERIOD, is a Full-ſtop at the End of any Sentence. A *Period* in Numbers, is a Diſtinction made by a Point or Comma after every ſixth Place or Figure; and is uſed in *Numeration* for the readier diſtinguſhing and naming the ſeveral Figures or Places: Which how to do, ſee under *Numeration*.

PERIOD, in Chronology, ſignifies a Revolution of a certain Number of Years; as the *Metonick Period*, the *Julian Period*, and the *Calippick Period*: Which ſee in their proper Places.

PERIODICAL, is the Term for whatever performs its Motion, Courſe, or Revolution, regularly, ſo as to return again, and to diſpatch it always in the ſame Period or Space of Time. Thus the *Periodical Motion* of the Moon, is that whereby ſhe finiſhes her Courſe round about the Earth in a Month; and this is in 27 Days, 7 Hours, 45 Minutes; and is called, The Moon's

PERIODICAL *Month*; which is the Space of Time that the Moon finiſhes her Revolution in.

PERIODUS *Sanguinis*, is a continued Circulation of the Blood thro' the Body; which is thus made: The Blood is carried out of the Arteries by Fibres, either of the Fleſh or of the Entrails, or the Membranous Parts, ſaith *Blanchard*; but 'tis certain it is by Capillary Arteries continued with the like ſmall Veins into the Mouth of the greater Veins, and implanted in them, as we ſee, many other little Channels in the Veins; ſo the Blood, paſſing thro' theſe out of the Arteries, is preſently ſent to the Veins, that it may be carried back again to the right Ventrincle of the Heart; and thence by the Arterious Vein to the Lungs; in which after the Blood has been accended by ſome Nitrous Particles, breathed in thither by the Air, it goes into the Venous Artery, thence into the left Ventricle of the Heart; which again empties it ſelf into the *Aorta*, or Great Artery; ſo that the Body may be nouriſhed and enlivened, it goes into every Part of it. This is *Blanchard*'s Account of the Matter. See more in the Word *Circulation of the Blood*.

PERIOSTIUM, is a Thin Membrane that incloſes immediately almoſt all the Bones in the Body, except the Teeth, Bones of the Ear, *&c.* It hath a moſt exquiſite Senſe, and probably is an *Expanſion* of the Nervous and Tendinous Fibres of the Muſcles. Its Uſe is to cover the Bones, and to ſuſtain the Veſſels which enter into them to nouriſh them. Dr. *Havers* in his Excellent Book, called, *Oſteologia Nova*, ſaith, That this Membrane conſiſts of two Sorts of Fibres, of which thoſe that lie next the Bone, are derived from the *Dura Mater*, and the others from the Tendons of the Muſcles.

PERIPATETICK *Philoſophy*, is named from thoſe, who from their Action of Walking while they *Studied* or *Taught* were called,

PERI-

PERIPATETICKS. The Chief of these was *Aristotle*; then his Successors; among whom you may reckon *Theophrastus*, *Cratippus*, *Boethius*, and all his very numerous Interpreters. But about 460 Years ago, there arose a new Set of Famous *Aristotelians*, which were called also *Peripateticks*; from them came the three chief Sects of the *Peripatetick Philosophy*. The *Thomists* from *Thomas Aquinas*, who flourished *A. D.* 1224. The *Scotists* from *Johannes Dun Scotus*, *A. D.* 1308. And the *Nominalists* from *Ocham*, who was born about *A. D.* 1310. And now a days by the *Peripatetick Philosophy*, we understand that which was founded on the Principles of *Aristotle* and his Commentators and Followers; and which therefore is as frequently called, *The Aristotelian Philosophy*.

PERIPHERY, in Geometry, is the Circumference of a Circle, or of any other *Regular Curvilineal Figure*.

PERIPHRASIS, is a Circumlocution used to avoid certain Words, whose Idea's are unpleasing; and to prevent the speaking of something that would produce ill Effects.

PERIPEUMONIA, is an Inflammation of the Lungs and Breast, accompanied with a sharp Fever, hard Breathing, a Cough, and an heavy Pain. *Blanchard*.

PERITERE, in Architecture, is a Place encompassed round with Columns, and with a kind of Wings about it; here the Pillars stand without, whereas in the *Peristyle* they stand within.

PERISCII, are the Inhabitants of the two *Frozen Zones*, or those that live within the Compass of the *Arctick* and *Antarctick* Circles; for as the Sun never goes down to them after he is once up, but always round about, so do their Shadows. Whence the Name.

PERISSOLOGY, is a Discourse fill'd up with unnecessary and superfluous Words.

PERISTALTICK *Motion*, is a *Vermicular* or *Wormlike* Motion of the Intestines, whereby the Excrements are voided. Also the Motions of the Vessels, whereby Humours, as Water, Chyle, the Blood, *&c.* ascend and descend, is sometimes so called.

PERISTIPHALINUS, *internus & externus*, are Muscles of the *Uvula*, the one pulling it forwards, and the other backwards.

PERISTYLE, in Architecture, is a Place or Building encompass'd with Pillars, standing round about within the Court: But this Word *Peristyle* is sometimes taken for a Row or Rank of Columns, as well without as within any Edifice; as in Cloysters and Galleries: Sometimes this was called *Antiprostyle*.

PERITONÆUM, is a Membrane (of an Oval Figure) which clothes the whole *Abdomen* on the Inside, and its Entrails on the Outside: It consists of two Tunicks, and adheres above to the *Diaphragma*, below to the *Os Ilium*; before to the Transverse Muscles, but chiefly to their Tendons about the *Linea Alba*; behind, it grows to the Fleshy Heads of these Muscles.

PERITROCHIUM, in Mechanicks is a kind of Wheel, or Circular Frame of Wood, placed somewhere upon an Axis, or Cylinder, round which a Rope is wound, in order to raise a Weight; and the Use of this *Peritrochium*, is to make the Cylinder or Axis be turned the more easily by the Means of Staves or Levers, which are fix'd in its Circumference. See *Axis* in *Peritrochio*.

PERJURY, is a Crime committed, when a lawful Oath is ministred by any that hath Authority, to any Persons in any Judicial Proceedings; who swear absolutely and falsly in a Matter material to the Issue or Cause in Question, either of their own Accord, or by the Subordination of others. *Note*, If a Man call me *Perjured Man*, I may have my Action upon the Case; but for calling me a *Forsworn Man*, no Action lies. And *Pejury* is excepted out of the Act of *General Pardon*.

PERMEATING, is penetrating into, and passing thro' the Pores of any Body. Mr. *Boyle* had a *Smoaking Liquor*, which he called, *The Peremeating Menstruum*, and its Operations, *The Penetrant*, or *Permeating Fumes*. It was made of equal Parts of *Flos Sulphuris*, *Sal Armoniack*, and good Quick Lime, all powdered, and well mingled together, and then distilled by Degrees of Fire in a Retort, till the Sand which contains the Retort, become almost red-hot; for then will come over a Liquor which will be continually smoaking, and consequently must be kept well stop'd. With this Fuming Liquor he made several Experiments to evince the Porosity of Bodies; by discovering, that tho' Coins, *&c.* were wrap'd up close in Leather, *&c.* yet the Fumes of this *Permeating Menstruum* would get thro' them, and discolour the Metal. *Vid. Essay of Porosity of Body*, p. 36, 37.

PERMUTATIONE *Archdiaconatus & Ecclesiæ eidem annexæ cum Ecclesia & præbenda*, is a Writ to an Ordinary, commanding him to admit a Clerk to a Benefice, upon Exchange made with another.

PER *my & per toute*, in Law, a Joint-Tenant is said to be seised of the Lands that he holds jointly *Per my & per tout*; that is, he is seised by every Parcel, and by the whole.

PERNIO, is a preternatural Swelling, caused by the Winter Cold, especially in the Hands and Feet, which at last breaks out.

PERONA, is also called *Fibula*, because it joins the Muscles of the Leg; whence the first and second Muscle in the Leg is called *Peronæus*. It is the less and slender Bone, which is fastened outwardly to the greater Bone of the Leg, called *Tibia*.

PERPENDICULUM *Chronometrum*, the same with the *Pendulum*.

PER *quæ Servitia*, is a Writ Judicial, issuing from the Note of a Fine, and lieth for Cognisee of a Mannor, Seigniory, chief Rent, or other Services, to compel him that is Tenant of the Land at the Time of the Note of the Fine levied, to Attorn unto him.

PERQUISITE, is any Thing gotten by a Man's own Industry, or purchased with his own Money, different from that which descends to him from his Father or Ancestors.

PERQUISITES *of Court*, in Law, signifies those Profits that grow to a Lord of a Mannor, by vertue of his *Court Baron*, over and above the certain yearly Profits of his Land, as Fines of Copyholds, Hariots, Amerciaments, Waifes, Strays, *&c.*

PERSICK *Order of Architecture*, is where the Bodies of Men serve instead of Columns to support the *Entablature*, or rather the Columns are in that Form.

The

The Riſe of it was this; *Pauſanias* having defeated the *Perſians*, the *Lacedæmonians*, as a Mark of their Victory, erected Trophies of the Arms of their Enemies, and then repreſented the *Perſians* under the Figures of Slaves ſupporting their *Porches*, *Arches*, or *Houſes*.

PER MINIMA, a Term uſed in Chymiſtry and Phyſick, expreſſing the perfect Mixture of any two or more Bodies: *v. gr.* If Silver and Lead be melted together, they will mingle and be united with one another *per minima*: That is, all the ſmalleſt Particles of one Metal will be mingled and united with thoſe of the other.

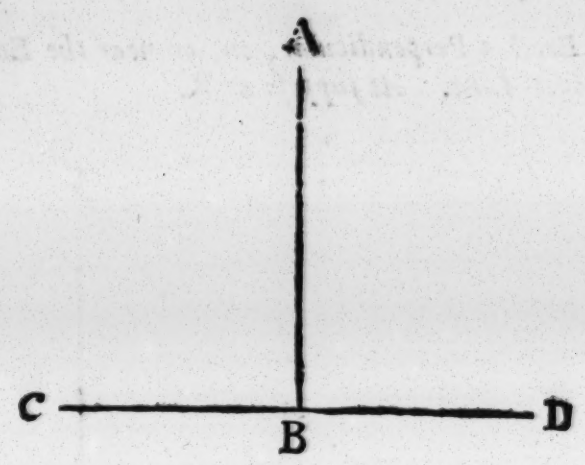
PERNICITY, a Word uſed by ſome Philoſophick Writers of *Celerity*, or extraordinary ſwiftneſs of Motion.

PERONÆUS *primus*, a Muſcle of the *Tarſus*, by ſome it is called *Longus*, it being the firſt that offers it ſelf to view, and the longeſt Muſcle ſeated on the *Fibula* or *Os Peronæ*.

It ariſes Externally Tendinous, and Fleſhy Internally from above half the Superior part of the ſaid Bone, and marching ſomewhat backwards, becomes a ſtrong, flat Tendon, four Fingers breadth in length above the Inferior Appendage of the ſaid *Fibula*, called *Malleolus Externus*; paſſing behind which in a Channel, like a Rope in a Pulley; and from thence being inflected forwards, together with the Tendon of the following Muſcle, they paſs under an imbanding Ligament as they run over the *Os Calcis*, but this Tendon declining from its Companion, marches over the *Os Cuboides*, under the *Muſculus Abductor Minimi Digiti*, and over the *Oſſa Cuneiformia*, in the Bottom of the Foot, and under the Tendons and Muſcles bending the Toes, and is Inſerted to the Superior and Hindmoſt part of the *Os Metatarſi* of the Great Toe. The Tendon of this Muſcle being conveyed over the Hindmoſt part of the *Malleolus Externus*, as on a Pulley, is an Elegant Contrivance in Nature, whereby the Ball of the Great Toe (as that part is commonly called to which it is Inſerted) is directed towards a Perpendicular bearing of the Weight of the Body on the Leg, in ſtanding on Tip-toe, by pulling the Foot and Toes ſomewhat outwards.

PERONÆUS *ſecundus*, a Muſcle of the *Tarſus*, by ſome called *Semi-fibulans*: It has an Acute Fleſhy beginning above the middle of the External part of the *Fibula*, under the Fleſhy Belly of the *Peronæus primus*; it alſo continues its Fleſhy beginning from the Poſterior ſharp edge of the ſaid *Fibula*, and becoming a Fleſhy Belly, grows Tendinous as it runs under the *Malleolus Externus*, together with the Tendon of the *Peronæus primus*, and is Inſerted to the Superior and External part of the *Os Metatarſi* of the Little Toe. The proper Action of this Muſcle, is to pull the Foot and Toes outwards.

PERPENDICULAR, in Geometry; when a Right Line ſtandeth ſo upon another, that the Angles on either ſide are equal; then this Right Line which ſo ſtandeth erected, is *Perpendicular* to that upon which it ſtandeth.



Thus: The Line A B, is *Perpendicular* to the Line C D, when the Angles on either ſide are equal: That is, If the Angle A B C = to the Angle A B D, and either of theſe Angles is equal to a Right one.

A Right Line is ſaid to be

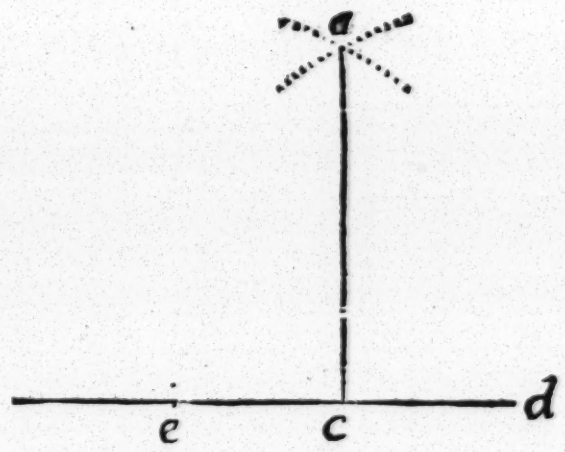
PERPENDICULAR *to a Plane*, when 'tis Perpendicular to all the Lines it meeteth with in that Plane.

One Plane is

PERPENDICULAR to another, when a Line in one Plane is Perpendicular to the other Plane.

PROBLEM I.

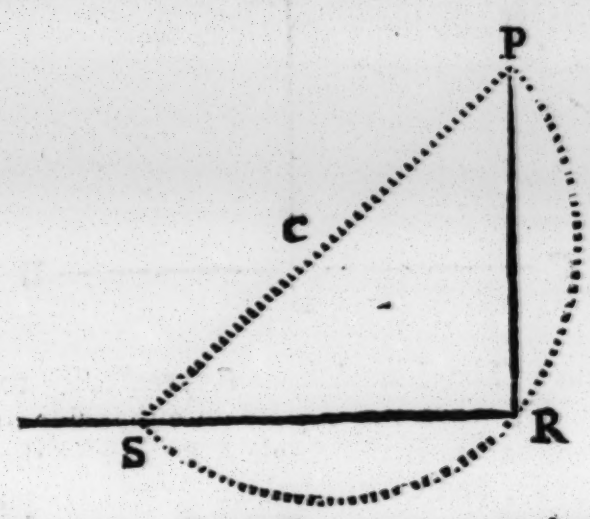
To Erect a Perpendicular on any aſſigned Point of a given Right Line. As ſuppoſe on the Point c.



On each ſide of the given Point *c*, cut off *c e* = *c d*; and with the Diſtance *d e*, (or any other greater than *d c*) deſcribe two Arches from *d* and *e*, interſecting each other in *a*, join *a c*; which ſhall be the *Perpendicular* required. 11 *Euclid.*

PROBLEM II.

To Erect a Perpendicular, on, or near the End of a given Line. As ſuppoſe at R.

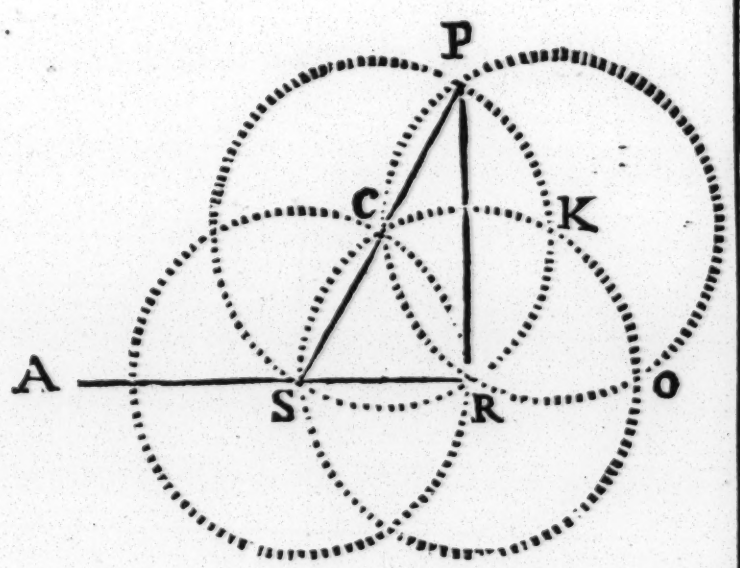


Open your Compaſſes to any convenient diſtance, and ſetting one Foot in C, draw the Circle P R S. Lay a Ruler from S, thro' C, it will find the Point P in the Circumference; from whence draw P R, and 'tis done.

For the Angle P R S, being in a Semi-circle, muſt be a Right one; (by 31 *è* 3 *Eucl.*) and conſequently P R muſt be *Perpendicular* to S R.

The ſame may be otherwiſe performed thus:

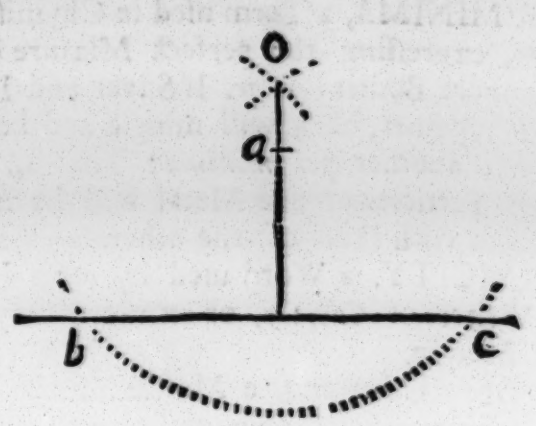
Suppoſe on A R, *the Perpendicular* P R *were to be Erected at the End* R.



With any convenient opening of your Compaſſes, one Foot being placed in R, draw the Circle O C S; then with the ſame Diſtance, ſet one Foot in S, and croſs the Circle in C, as alſo in K; then on the Centres C and K, draw (with the ſame Diſtance) two more Circles cutting each other in P; I ſay P R, will be Perpendicular to A R. For the Angle P R S, is a Right one, being in the Semi-circle P K R S.

PROBLEM III.

To let fall a Perpendicular on a given Line, from a given Point. As a



Set one Foot of the Compaſſes in *a* the Point given, and with the other croſs the given Line in the Points *b* and *c*: Then ſetting the Compaſſes in *b* and *c*, draw two Arks, croſſing each other below in *o*: Then lay a Ruler from *a* to *o*, and 'tis done.

The Demonſtration depends on the 9th *è* 1 *Euclid.*

PERPENDICULAR, or *Right Plane*, is where a *Plane*, (like a well made Wall) inclines and leans on one ſide, no more than it doth on the other.

PERPENDICULAR, to a Parabola, is a Right Line cutting the Parabola in the Point in which any other Right Line touches it, and which is alſo its ſelf Perpendicular to that Tangent.

PERPETUAL *Cauſtick*. See *Infernal Stone*.

PERPETUITY, a Term uſed in Law, where an Eſtate is ſo deſigned to be ſettled in Tail, *&c.* that it cannot be undone or made void.

PER SE, a Term of Art often uſed; as in Logick, we ſay a Thing is conſidered *Per ſe*, when 'tis taken in the Abſtract, and without Connexion with other things, which would confound the Notion, and hinder its being clear.

In Chymiſtry a Thing is ſaid to be Diſtilled *Per ſe*, when 'tis without the uſual Additaments of other things with it.

We ſay alſo a Man performs any Action, or Executes any Office *per ſe*, when he doth it *himſelf in Perſon*, and not by a *Deputy* or *Subſtitute*.

PERSEUS, a Conſtellation in the Northern Hemiſphere, conſiſting of 38 Stars.

PERSONAL *Verb*, in *Grammar*, is one that is Declined or Conjugated with all the Three Perſons, and in both Numbers; whereas an *Impersonal Verb* is only uſed in the Third Perſon Singular.

PERSONABLE, in Law, ſignifies as much as enabled to maintain Plea in a Court, thus: The Defendant was adjudged Perſonably to maintain his Action. Alſo the Tenant pleaded, that the Wife was an Alien Born in *Portugal*, without the Allegiance of the King; and Judgment was demanded, Whether he ſhould be anſwered: The Plaintiff ſaith, She was made *Perſonable* by Parliament;

liament; that is, as the *Civilians* would ſpeak it, *Habere perſonam ſtandi in judicio*. *Perſonable* is alſo as much as to be of Capacity to take any thing granted or given.

PERSONAL, in Law, when 'tis join'd with the Subſtances, Things, Goods, or Chattels; as Things *Perſonal*, Goods *Perſonal*, Chattels *Perſonal*, ſignifies any moveable Thing belonging to a Man, be it quick or dead: Thus, they ſay, Theft is an unlawful Felonious Taking-away another Man's moveable *Perſonal* Goods.

PERSONAL *Tythes*, are *Tythes* paid of ſuch Profits as come by the Labour of a Man's Perſon, as by Buying and Selling, Gains of Merchandize and Handicrafts, *&c.* See *Tythes*.

PERSONALITY, is an Abſtract of *Perſonal*: the Action is in the *Perſonality*, *viz.* It is brought againſt the right Perſon, or the Perſon againſt whom in Law it lies.

PERSONS *ne Prebendaries ne ſeront chargeé as quinſim*, &c. is a Writ that lies for *Prebendaries*, or other Spiritual Perſons, being diſtrained by the Sheriff or Collectors of Fifteens, for the Fifteenths of their Goods, or to be contributary to Taxes.

PERSPECTIVE, is that Part of the Mathematicks which give Rules for the repreſenting of Objects on a plain Superficies, after the ſame Manner as they would appear to our Sight, if ſeen thro' that Plain, it being ſuppoſed as tranſparent as Glaſs.

Perſpective is either *Speculative* or *Practical*.

Speculative Perſpective, is the Knowledge of the Reaſons of the different Appearance of certain Objects, according to the ſeveral Poſitions of the Eye that beholds them.

Practical Perſpective, is the Method of Delineating that which is apparent to our Eyes, or that which our Underſtanding conceives in the Forms that we ſee Objects. See Vol. II.

PERSPECTIVE *Lineal*, is the Diminution of thoſe Lines in the Plan of a Picture, which are the Repreſentation of other Lines very remote.

PERSPECTIVE *Aereal*, is a proportional Diminution of the Teints and Colours of a Picture, when the Objects are ſuppoſed to be very remote.

PERSPECTIVE *Military*, is when the Eye is ſuppoſed to be infinitely remote from the Table or Plain.

PERSPICUOUS, is that which is clear and tranſparent, as that the Light may be ſeen freely thro' it. See *Diaphanous*.

PERSPIRATION, a breathing through, as Sweat through the Inviſible Pores of the Body.

PERTICA, a Sort of Comet, the ſame with *Veru*.

PESSARY, is an Oblong Medicine, which being made of the Length of the Middle-Finger, is thruſt up into the Neck of the Womb, and is good againſt ſeveral Diſeaſes incident to it.

PESSULUS, the ſame with *Peſſary*.

PESSUS, the ſame.

PESTILENTIAL *Fever*, is that which does not only afflict the Patient with a bare Diſtemper or Heat ariſing from Putrefaction, *&c.* but alſo with a Malignant and Venomous Quality. It differs from the Plague, as a Species or Sort from the Genus or Kind; becauſe a *Peſtilence* may ſometimes happen without a *Fever*. *Blanchard.*

PESTOLOIDES, is a Sort of Urine which ſeems to have little Leaves or Scales in it. *Blanchard.*

PETALA, is a Term in Botany, ſignifying thoſe fine coloured Leaves that compoſe the Flowers of all Plants. And from hence Plants are diſtinguiſhed into *Monopetalous*, whoſe Flower is all in one continued Leaf; and *Tripetalous*, and *Pentapetalous*, when the Flower conſiſts of three or five Leaves; and *Polypetalous* when of many, without determining the Number.

PETARD, in Fortification, is an Engine of Metal in the Form of an High-crown'd Hat, with narrow Brims, which being filled with very fine Powder, well primed, and then fix'd with a *Madrier* or Plank, bound faſt down, with Ropes running through Handles, which are round the Rim of the Mouth of it, to break down Gates, Port-cullices, Draw-bridges, Barriers, *&c.* This Engine is from 7 to 8 Inches deep, and 5 broad at the Mouth; the Diameter at the Bottom or Breech is an Inch and a half, and the Weight of the whole Maſs of Metal is from 55 to 60 Pounds, generally requiring about 5 Pounds of Powder for the Charge. They are alſo uſed in Countermines to break through into the Enemies Galleries, and to diſappoint their Mines.

PETECHIALIS, is a Malignant Fever, called alſo *Pulicaris*, becauſe it makes the Skin look as tho' it were Flea-bitten.

PETIGO. See *Lichen*.

PETIT *Cape*. See *Cape*.

PETIT *Larceny*. See *Larceny*.

PETIT *Treaſon*, in Common Law, is when a Servant kills his Maſter, a Wife her Husband, a Secular or Religious Man his Prelate or Superior, to whom he owes Faith and Obedience: In how many other Caſes it may be committed, ſee *Cromp. Juſtice of Peace*.

PETITIO *Principii*, *Begging of Principles*, is a precarious ſuppoſing a Thing to be true, or taking it for granted, when it really remains either dubious, or elſe is expreſly denied. This frequently is called *Begging the Queſtion*, when a Man ſuppoſes what he ſhould *prove*.

PETREFACTION, is properly the changing of a mix'd Body into a Stoney Subſtance, when it had no ſuch Nature before; and the Action by which this is performed, is called,

PETREFICATION, and the Thing ſo chang'd is ſaid to be *Petrefied*. 'Tis juſtly queſtionable, Whether there be any ſuch Thing as *this* in Nature, or not? *Petrefaction* indeed now-a-days is a mighty modiſh Word, for every Thing almoſt that is found upon the Surface, or dug out of the Earth, paſſes with ſome Perſons by this Name. But what is there that really and truly deſerves the Name of *Petrefaction*? When the *Petrefying* Waters, as they are called, (which are nothing but Waters impregnated with a great deal of Stoney Matter, which in their Paſſage through the Earth became diſſolved in them:) When theſe, I ſay, incruſtate Ruſhes, Graſs, or Sticks, all over with a Stoney Coat, by letting the Stoney Particles diſſolved in them by little and little fall down upon and adhere to them; or, it may be, inſinuate into their Pores, and depoſite themſelves there. And when after this the Vegetable Part incloſed rots and mou'ders away, and the Stoney Coat or Subſtance daily increaſes; this is not the Tranſmutation of a Vegetable Subſtance into a Stoney

or Mineral one; and therefore the new Body thus formed, is not properly a *Petrefaction* in the true Senſe of the Word.

And when many Bodies are found in the Earth, which by all poſſible ways of judging and diſtinguiſhing, approve themſelves to be Animal or Vegetable Bodies, ſuch as the Shells, Teeth, Bones, of Animals, the Foſſil-Trees, Pine-Cones, Hazel-Nuts, *&c.* which are every where found deep in the Earth. It appears odd to call theſe *Petrefactions*, and more odd to ſuppoſe them nothing but the *Sportings of Nature*; and to affirm all theſe Things to be nothing but meer *Formed Stones*, only becauſe we cannot account preſently how they came thus into the Earth, or ſolve all the Objections or Difficulties about them. But every one will have his own way of Expreſſion.

PETROSUM *Os*, is the Internal Proceſs of the Bones of the Temples, ſo called from its Hardneſs and Craggineſs: 'Tis pretty long, jetting out to the Inner Baſis of the Skull, within which it hath two Holes, and thro' one of them an Artery, and thro' the other the Auditory Nerve paſſes to the Inner Cavities of the Ear, that are excavated in this Proceſs, *viz.* the *Tympanum*, *Labyrinthus*, and *Cochlea*; and without the Skull it hath three Holes: The firſt of which is the *Meatus Auditorius*: The ſecond is narrow, ſhort, and oblique, near to the firſt, and thro' it the Jugular Vein enters the Inner Cavities: The third is ſeated betwixt the *Proceſſus Mammillaris*, and the *Styloides Appendix*, and ends in the Paſſage which goes from the Ear to the Mouth.

PETTERERO. See *Pedrero*.

PEVETTS, are the Ends of the Spindle of any Wheel in a Watch; and the Holes into which they run, are called *Pevett-Holes*.

PEYNT *fort & dure*. See *Payne fort & dure*.

PHACIA. *Vid. Lenticula*.

PHACOS, is a Spot in the Face like a Nit, whence it is called *Lenticula* and *Lentigo*.

PHAGADÆNA, is an exulcerate Cancer.

PHAGADENICK *Water*, is made by diſſolving a Dram of Sublimate Corroſive in a Pound of Lime-Water, on which it will immediately turn Yellow.

PHALACKOSIS, is the falling off the Hair.

PHALANGOSIS, is a Fault of the Eye-lids, when there are two Rows of Hair, or when the Hair grows inward and offends the Eyes.

PHALANX, according to ſome Writers, is the Order and Rank obſerved in the Finger-Bones.

PHANTASY is an Internal Senſe or Imagination, whereby any Corporeal Thing is repreſented to the Mind, or impreſſed on the Brain by its proper Image.

PHANTASTICAL *Colours*, are ſuch as are exhibited by the Rainbow, Triangular Glaſs Priſm, the Surface of very thin *Muſcovy* Glaſs, *&c.* They had this Name given 'em by the *Peripatetick Philoſophers*, who ſuppoſed them to be no real Colours. This *Kircher* well refutes in his *Mundus Subterraneus*, *Part* 2. *p.* 15, 16. and ſhews alſo the Cauſe of ſuch Colours.

PHARMACEUTIC, the ſame with *Pharmacum*.

PHARMACOPOEA, is the Doctrine or a Deſcription of Things Medicinal, in order to cure Diſeaſes.

PHARMACUM, is any Sort of Medicine againſt a Diſeaſe.

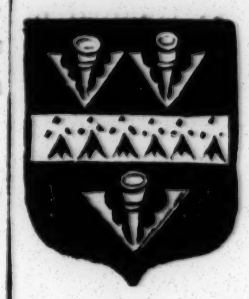
PHARMACY; is an Art of collecting, chuſing, and compounding Medicines, *viz.* the Apothecary's Art; to which may alſo be added the Chymical Analyſis of Bodies, in order to prepare good Medicines out of them.

PHARYNGETRUM is ſometimes uſed for the *Pharynx*, ſometimes for the Bone *Hyades*.

PHARYNX, is the upper Part of the Gullet, conſiſting of three Pair of Muſcles; to which ſome add another, making the Number ſeven: It is continued to the *Fauces*, (or indeed is the greateſt Part thereof,) reaching up behind to the *Uvula*, on the Sides to the *Tonſillæ*, and before to the *Epiglottis*: It is *Membranous*, but not entirely ſo, being in ſome Places Carnous and Thick. Three Pair of its Muſcles open it in the Action of ſwallowing; and the odd one is a *Sphincter* which ſerves to ſtraiten it.

PHÆNOMENON, in Natural Philoſophy, ſignifies any Appearance, Effect, or Operation of a Natural Body, which offers its ſelf to the Conſideration and Solution of an Enquirer into Nature.

PHASES, ſignifies the Appearance or the Manner of Things ſhewing themſelves, and therefore in Aſtronomy is uſed for the ſeveral Poſitions in which the Planets, (eſpecially the Moon) appear to our Sight; as obſcure, horned, half illuminated, or full of Light, which by the help of a *Teleſcope* may likewiſe be obſerved in *Venus* and *Mars*.



PHEONS, in Heraldry are the Barbed Heads of Darts or Arrows, and are uſually of this Figure.

Sable, a *Feſſe Ermine* between three *Phæons*, by the Name of *Egerton*.

PHILANTHROPY, is a generous Love for Mankind in general, or an Inclination to promote Publick Good.

PHILONIUM, is an Opiate Medicine; of which they reckon two Sorts, the *Philonium Romanum* and *Perſicum*.

PHILOSOPHICAL *Egg*, among the Chymiſts is a thin Glaſs Veſſel, or Bubble, of the Shape of an Egg, with a long Neck or Stem: 'Tis uſed in long Digeſtions.

PHILTRUM, is the Hollow Dividing the Upper Lip.

PHIMOSIS, is the ſame with *Paraphimoſis*; alſo the Inverſion of the Eye-lids through an Inflammation.

PHLEBORHAGIA, is the breaking of a Vein.

PHLEBOTOMY, opening of a Vein, or letting of Blood.

PHLEGM, or *Water*, the Fourth of the Five Chymical Principles. See *Water*.

The Inſipid Water that comes firſt in the Diſtillation of Acid Spirits, the Chymiſts call the *Phlegm*: And the more any ſuch Spirit is rectified, that is, diſtilled over again, to draw off ſtill more of this *Phlegm*, they ſay 'tis the better *dephlegmated*.

PHLEGM *of Vitriol*, is the Moiſture that is firſt drawn off when *Calcined Vitriol* is diſtilled, in order to get its Spirit and Oil, it comes off with a gentle Heat.

PHLEGMAGOGUES, are Medicines which purge or drain away that Humour which they call Phlegm.

PHLEGMON,

PHLEGMON. So the Surgeons call an hot Tumour, proceeding from an Over-affluxion of Blood to any Part.

PHLEGMONODES *Febris*, a Fever with an Inflammation of the Blood.

PHLOGOSIS, is a light Inflammation of the Eyes, with a ſmall Pain and Redneſs; which ſometimes turns into a true *Ophthalmy*, and is the Original thereof.

PHLYCTOENA, is a Pimple in the Skin, alſo a little Ulcer, like a Bubble or Bladder, in the Corneous Tunick of the Eye, and proceeding from a ſharp watry Humour. *Blanchard.*

PHONICKS, the ſame with *Acouſticks*; which ſee.

PHOSPHORUS, a Chymical Preparation, which being expoſed to the Light or Air, will ſhine in the Dark. Of this there are ſeveral Kinds whoſe Proceſs ſhall be briefly delivered.

To make the *Bolonian Phoſphorus*, ſee under the *Bolonian Stone.*

The moſt common Way (with us) is to make the *Phoſphorus* from Humane Urine. And the Hint came firſt by Chance thus:

One *Brand*, an Alchymiſt of *Hamburgh*, wiſely thinking to find the Philoſopher's Stone in Human Urine, work'd upon it in a Retort, and ſo forced over the *Phoſphorus* Matter; yet he would not communicate this Diſcovery to any one, and ſo the Secret died with him. After his Death, one *Kirkhelius*, a *Saxon* Chymiſt ſet himſelf to find it out, (having heard of ſuch a Thing,) and ſucceeded accordingly; and this Man ſhewed the Proceſs to ſeveral of his Friends.

The Honourable Mr. *Boyle* having (in part) had an Account of this *Phoſphorus*, from one *Daniel Kraff*, a *German*, about the Year 1680, publiſhed in *Engliſh* an Account of the Way of making this *Phoſphorus*, and ſeveral very Curious Experiments upon it, under the Title of *Noctiluca.* And ſince that, Mr. *Homberg* hath written largely about it, as you may ſee in the Memoirs (for the Months *March* and *April*) of the Royal Academy of Sciences at *Paris*, 1692.

The Way of Preparing it, is this:

Take a good large Quantity of the New-made Urine of Beer-drinkers, and evaporate it gently, to the Conſiſtence of Honey: Then put it in an Earthen Veſſel, cover, and place it in a Cellar for three or four Months, that it may throughly ferment and putrefie. Then mix a double Quantity of Sand, or Powder of Pots, with one part of this corrupted Urine, and put it into an Earthen Retort or Glaſs one Coated; and fitting it to a large long-neck'd Glaſs Receiver, in which was before put two or three Quarts of Water, diſtil it in a naked Fire, in a Reverberatory Furnace, gently at firſt, for about two Hours; afterwards augment the Fire gradually, 'till all the Volatil Salt and black Fœtid Oil be drawn off. Then raiſe the Fire to the higheſt Degree, and white Clouds will come into the Receiver, and fix it by little and little, on one Side of it, in the Form of a yellowiſh Skin, and another Part will precipitate to the Bottom in Powder. Keep the Fire thus violent for three Hours, 'till no more Fumes will come. Let all cool, and unlute the Veſſels; and throwing more Water into the Receiver, ſhake all well about to looſen what will ſtick to the Sides; and then pour it all into a large Glaſs Veſſel, where it will ſettle; the Volatile Salt will diſſolve in the Water, but the *Phoſphorus* and the Oil will ſink to the Bottom. Pour off the Water, and gathering the remaining Matter together, put it into a little Glaſs Veſſel, with a little freſh Water, and digeſt it in a Sand-heat, ſtirring the Matter about from Time to Time with a Wooden Spatula; the *Phoſphorus* by this Means will ſeparate from the Oil, and ſink to the Bottom. Pour away the Oil, and make the *Phoſphorus* up while hot, into little Sticks or Pieces, which muſt be kept in a Viol of Water cloſe ſtopt.

This is the *Solid Phoſphorus*, with which, if you write any Letters on Paper, or on a Wall, they will appear Luminous in the Dark, and continue ſo a good while. If you cut off a little Bit of it, and rub it ſtrongly along a Piece of Paper with a Knife, it will actually enkindle the Paper.

The *Liquid Phoſphorus* is made by digeſting in Horſe-dung a little Bit, or ſome Scrapings, of the Solid, for two Days, in Oil or Eſſence of Cloves, Oil of Turpentine, *&c.* For after it is diſſolved in the Oil, it will impregnate it ſo, that as ſoon as ever you open the Bottle, the Matter will appear all in a Flame.

If you put a little of the *Solid Phoſphorus* into a Viol, with a little Oil of Vitriol, that is very ſtrong and well dephlegmated, and then add to it about half as much common Water as there was Oil of Vitriol, the Mixture will grow very hot, and ſmoak; and if you carry the Viol into the Dark, you will ſee the *Phoſphorus* enkindled, and ſparkle in many Places of the Viol, like Meteors, or little Falling ſtars: And if a ſmall Quantity of Oil of Turpentine be added, it will produce an actual Flame.

Lemery mentions a New-invented *Phoſphorus* of Mr. *Homberg*'s being made of one Part of Salt Armoniack, and two of Quick-lime ſlack'd by the Air; which are fluxed together in a Crucible, into a kind of Gray Glaſs, which when it is ſtruck with a Hammer, appears preſently of a light Fire.

Phoſphorus Balduini, called the *Hermetick Phoſphorus*, is thus made:

Heat read-hot about two Pounds of Chalk, let it cool, and powder it. Then take a Pint of *Aqua-fortis*, and put into it a Spoonful of your powdered Chalk; a great Ebullition will ariſe: Repeat this 'till the throwing in of the Powder makes no Ebullition at all. After this, let the Liquor ſettle, and decant it into an Earthern Pan placed in Sand, and evaporate all the Liquor, ſo there will remain a kind of Salt at the Bottom. Put this Salt into a Coppel, or a ſtrong Earthen unglazed Pan; ſet it in a gentle Sand-heat, and the Matter will ſwell. Continue this gentle Fire 'till it be ſunk down a little towards the Bottom; then cover the Pan or Coppel with a Lid that hath two or three Holes in it, and encreaſe the Fire gradually, 'till it be ſtrong enough to melt the Matter; and when 'tis melted, a yellow Vapour will exhale through the Holes in the Cover. Then take the Veſſel preſently off the Fire, and putting on another Earthen Lid, which hath no Holes in it, ſet it by to cool. Round about the

ſides of the Pan you will find a Cruſt of yellow Matter; that is the *Phoſphorus*. It muſt be kept in a Box well ſtopp'd, in a dark place. When 'tis deſign'd to be render'd Luminous, you muſt expoſe it, like the *Bolonian Stone*, to the Light, for a ſmall Space; and then removed into the Dark, it will ſhine there. If it be left in the Dark, expoſed to the Air for about Fifteen Days, it will ſhine all that while; but after that go out, and never be Luminous more.

Mr. *Boyle*, in his *Aereal Noctiluca*, p. 102. deſcribes a *Phoſphorus Balduini* much like this; and in *Phil. Tranſ.* N° 199, there is of his a yet more accurate Proceſs for this Thing.

The Learned Dr. *Slare*, in *Phil. Tranſ.* N° 150, makes an Ingenious Compariſon between *Lightning*, and the Flaſhes which in warm Weather he had often obſerved (by Night) to ariſe from ſome Pieces of the *Solid Phoſphorus*, kept in long Glaſs Bottles of Water about ¾ filled.

PHRENES. See *Diaphragma*.

PHRENESIS, the ſame with *Phrenitis*.

PHRENETICK *Nerves*, are thoſe which are called alſo *Stomachick*, and ſpring from Dr. *Willis*'s Eighth Pair, or from the common reckoned Six Pair: Thoſe deſcend between the Membranes of the *Mediaſtinum*, and ſend forth Branches into them.

PHRENICK *Veſſels*, are the Veins and Arteries that run through the *Diaphragm*, *Mediaſtinum*, and *Pericardium*.

PHRENITIS, or *Phrenzy*, is a Dotage with a continued Fever, often accompanied with Madneſs and Anger; proceeding from too much Heat in the Animal Spirits, not from the Inflammation of the Brain, as the Ancients thought. *Willis* thus defines it, namely, an Inflammation of the whole Senſitive Soul and Animal Spirits.

PHRICODES, is a dreadful Fever, in which Men are apt to fancy terrible Things.

PHROCYON, a Fix'd Star of the Second Magnitude, in the Conſtellation *Canis minor*, whoſe Longitude is 111 Degrees 23 Minutes, Latitude 15 Degrees 57 Minutes.

PHTHARTICUM, is a Corrupting Medicine.

PHTHIRIASIS, is the Louſy Diſeaſe; alſo a Scaly Scab on the Eye-brows. *Blanchard.*

PHTHISIS, is a Conſumption of the whole Body, riſing from an Ulcer in the Lungs, accompanied with a ſlow continued Fever, ill ſcented Breath, and a Cough. *Blanchard.*

PHTHOE, the ſame with *Phthiſis*.

PHYGETHLON, is a Swelling proceeding from an Inflammation of the Glandules, wherein Nature expels ſomething; as in the Plague, about the Groins. *Blanchard.*

PHILOSOPHERS *Tree*. See *Diana's-Tree*.

PHYMA, is a Swelling: There are five Sorts, *Verrucæ*, *Calli*, *Vari*, *Furunculi*, and *Hydroa*, or *Deſudationes*; of which, ſee under thoſe Words. Others reckon it a Tumour in the Glandules only, which quickly ſeparates. *Blanchard.*

PHYSEMA, an Inflammation in any part of the Body, as a Tympany. *Blanchard.*

PHYSICKS, or Natural Philoſophy, is the Speculative Knowledge of all Natural Bodies, (and Mr. *Lock* thinks, That God, Angels, Spirits, &c. which uſually are accounted as the Subject of *Metaphyſicks*, ſhould come into this Science,) and of their proper Natures, Conſtitutions, Powers, and Operations. See *Phyſiology*.

PHYSIOGNOMICKS, is a Term uſed by ſome Phyſicians and Naturaliſts for ſuch Signs as are taken from the Countenance of Perſons, to judge of their Diſpoſitions and Tempers.

PHYSIOLOGY, *Phyſicks*, or Natural Philoſophy, is the Science of Natural Bodies, and their various *Affections*, *Motions*, and *Operations*. This is either

General, which relates to the Properties and Affections of Matter or Body in general. Or,

Special and Particular, which conſiders Matter as formed or diſtinguiſhed into ſuch and ſuch Species, or determinate Combinations.

PHYSIOLOGY, is by ſome alſo accounted a Part of Phyſick, that teaches the Conſtitution of the Body ſo far as it is ſound, or in its Natural State; and endeavours to find Reaſons for its Functions and Operations, by the Help of Anatomy and Natural Philoſophy.

Mr. *Keil*, in his *Introductio ad Phyſicam*, reckons Four Claſſes or Sorts of Philoſophers which have treated of Phyſicks or Natural Philoſophy.

1. Thoſe who delivered the Properties of Natural Bodies under Geometrical and Numeral Symbols; as the *Pythagoreans* and *Platoniſts*.

2. The *Peripateticks*, who explained the Natures of Things by Matter, Form, and Privation; by Elementary and Occult Qualities; by Sympathies, Antipathies, Faculties, and Attractions, &c. And theſe did not ſo much endeavour to find out the true Reaſons and Cauſes of Things as to give them proper Names and Terms; ſo that their Phyſick is a kind of Metaphyſicks.

3. The *Experimental Philoſophers*, who by frequent and well-made Trials and Experiments, as by Chymiſtry, &c. ſought into the Natures and Cauſes of Things: And to theſe almoſt all our Diſcoveries and Improvements are due; and much more wou'd they have done, if they had not fallen into *Theories* and *Hypotheſes*, which they forced oftentimes their Experiments to maintain, whether they could or not.

4. The *Mechanical Philoſophers*, who explicate all the *Phænomena* of Nature by *Matter* and *Motion*, by the Texture of Bodies, and the Figure of their Parts; by *Effluvia*, and other ſubtile Particles, &c. And in ſhort, would account for all Effects and *Phænomena* by the known and eſtabliſhed Laws of *Motion* and *Mechanicks*: And theſe are, in Conjunction with the laſt named, *The Only True Philoſophers*.

PIA *Mater*. See *Mater tenuis*.

PICA. See *Citta*.

PICATIO. See *Dropaciſmus*.

PIEDOUCHE, in Architecture, is a little Square Baſe ſmoothed, and wrought with Mouldings, which ſerves to ſupport a *Buſt* or Statue drawn half way, or any ſmall Figure in Relief.

PICKET, in Fortification, is ſometimes uſed for a Stake, ſharp at one End, to mark out the Ground and Angles of a Fortification, when the Engineer is laying down the *Plan* of it; theſe are uſually pointed with Iron. There are alſo larger *Pickets*,

Pickets, which are drove into the Earth, to hold together *Faſcines* or Faggots, in any Work caſt up in haſte. And *Pickets* alſo are Stakes drove into the Ground by the Tents of the Horſe in a Camp, to tie their Horſes to. And *Pickets* are alſo drove into the Ground before the Tents of the Foot, where they reſt their Muskets or Pikes round about them in a Ring. When an Horſeman hath committed ſome conſiderable Offence, he is often ſentenced to *ſtand on the Picket*; which is, to have one Hand drawn up as high as it can be ſtretch'd, and then he is to ſtand on the Point of a *Picket* or Stake only with the Toe of his oppoſite Foot; ſo that he can neither ſtand or hang well, nor eaſe himſelf by changing Feet.

PICRA. See *Hiera picra*.

PIED-DROIT, in Architecture, is a Square Pillar, differing from a *Pillaſter* in this reſpect, that it hath no Baſe nor Capital: It is taken alſo for Part of the Jaumbs of a Door or Window.

PIE-*Powder-Court*, is a Court held in Fairs, to yield Juſtice to Buyers and Sellers, and for Redreſs of all Diſorders committed in them.

PIGMENTS, are ſuch prepared Materials as Painters, Dyers, *&c.* make uſe of, to impart to Bodies, or to imitate particular Colours. When Glaſs is ſtained or coloured, as in Painting on Glaſs, or for the Counterfeiting of Gems or Precious Stones, the *Pigment* is uſually of a Metaline or a Mineral Nature.

PILE, in Heraldry, ſignifies an *Ordinary*, conſiſting of a Two-fold Line, formed after the Manner of a Wedge; being probably ſomething like the Figure of the *Roman Pilum*, which was a tapering Dart, about five Foot long, and ſharpened at the Point with Steel. The *Pile* is born *invected*, *engrailed*, &c. like other *Ordinaries*, and iſſues indifferently from any Point of the Verge of the *Eſcocheon*.

He beareth a *Piles Gules*, by the Name of *Shandois*.

PILLAR, or *Column*, in Architecture, is one of the principal Things in which the Beauty and Proportion of a Fabrick doth conſiſt. A *Pillar* hath three Parts, the *Pedeſtal*, the *Shaft* or *Pillar* it ſelf, and the Ornaments: And each of theſe is again ſubdivided into three other Parts; the *Pedeſtal* hath its *Baſe*, *Dye*, and *Cornich*; the *Pillar* its *Baſe*, *Shaft*, and *Capital*; and the *Ornaments* have their *Architrave*, *Frieze*, and *Cornich*.

PILLASTERS, in Architecture, ſignify Square Pillars, that uſually ſtand behind Columns to bear up Arches: They have the very ſame Dimenſion, Chapiter, and Baſe, with the Columns, according to their ſeveral *Order*. When theſe *Pillaſters* do not ſtand alone by themſelves, they are uſually made to jet out of the Wall, a third part or a quarter of their Breadth, with reſpect to the Variety of different Works: So that ſome of them project out only a ſixth or an eighth part, and they are generally as broad at top as at bottom.

PILLOW, is that Piece of Timber in a Ship whereon the Boltſprit beareth or reſteth at its coming out of the Hull, aloft, cloſe by the Stem.

PINEALIS *Glandula*. See *Conarium*.

PINGUEDO, the ſame with *Adeps*, or the Fat of *Animals*. See *Adeps*.

PINION, in a Watch, is that leſſer Wheel which plays in the Teeth of another. Its Notches (which are commonly 4, 5, 6, 8, *&c.*) are called *Leaves*, and not *Teeth*, as in other Wheels.

PINION of *Report*, is that *Pinion* in a Watch, which is commonly fixed on the Arbor of the Great Wheel, and in old Watches uſed to have commonly but four Leaves: It driveth the *Dial Wheel*, and carrieth about the *Hand*.

The Quotient or Number of Turns to be laid upon the *Pinion of Report* is found by this Proportion: As the Beats in one Turn of the Great Wheel, to the Beats in an Hour: So are the Hours of the Face of the Clock, (*viz.* 12 or 24.) to the Quotient of the Hour-Wheel, or Dial-Wheel, divided by the *Pinion of Report*, *i. e.* the Number of Turns which the *Pinion of Report* hath in one Turn of the Dial-Wheel; that is, in Numbers.

26928 : 20196 : : 12 : 9.

Or rather thus:

As the Hours of the Watch's going, are to the Numbers of the Turns of the Fuſy : : ſo are the Hours of the Face, to the Quotient of the *Pinion of Report*.

If the Hours be 12, then 16 : 12 : : 12 : 9.

But if 24, the Proportion is 16 : : 12 : 24 : 18.

N. B. This Rule may ſerve to lay the *Pinion of Report* on any other Wheel, thus:

As the Beats in one Turn of any Wheel to the Beats in an Hour : : ſo are the Hours of the Face, or Dial-Plate of the Watch, to the Quotient of the Dial-Wheel, divided by the *Pinion of Report* fixed on the Spindle of the aforeſaid Wheel.

PINNA *Auris*, is the upper and broader Part of the Ear called the Wing.

PINNATA *Folia*, in Botany are ſuch Leaves of Plants as are deeply jagged, cut, or indented in, and which have their Parts reſembling Feathers.

PIONEERS, are ſuch Kinds of Labourers as are taken up for uſe of an Army, to caſt up Trenches, and undermine Forts.

PIPE, in Law, is a Roll in the Exchequer, otherwiſe called the *Great-Roll*. See *Clerk of the Pipe*.

PITHIAS, or *Pithites*, with ſome Writers, is the Name of a Comet, or rather Meteor, of Form of a Tub: Of theſe there are divers Kinds, *viz.* ſome of an *Oval* Figure, others like a Tun or Barrel ſet Perpendicular, and ſome like one inclined, or cut ſhort off; others having a Hairy Train or Buſh, *&c.*

PINTLES in a Ship, are thoſe Hooks by which the Rudder hangs to the Stern-poſt.

PIN-*Wheel*. See *Striking-Wheel*.

PISCES, is the twelfth and laſt Sign of the *Zodiack*, being a Conſtellation conſiſting of 35 Stars.

PISCES

PISCES *Meridianus*, a Southern Conſtellation, containing 12 Stars.

PITUITA. *Vid. Phlegma.*

PITUITARIA *Glandula.* Vid. *Glandula Pituitaria.*

PITIROIDES, a Settling in the Urine like Bran. *Blanchard.*

PLACARD, is a Licenſe whereby a Man is permitted to ſhoot in a Gun, or uſe Unlawful Games.

PLACE, is that Part of Space which any Body takes up; and with relation to Space is either abſolute or relative. As Mr. *Lock* obſerves.

PLACE alſo is ſometimes taken for that Portion of Infinite Space, which is poſſeſſed by, and comprehended within the Material World, and which is thereby diſtinguiſhed from the reſt of the *Expanſion.*

PLACE is uſually diſtinguiſhed into *Internal Place*, which properly ſpeaking, is that Part of Space which any Body takes up or fills; and *External Place*, which according to *Ariſtotle*, is determined by the Surfaces or Confines of the Adjoining or Ambient Bodies: But it is better divided into *Abſolute*, which is the former *Internal Place*; and into *Relative Place*, which is the Apparent Secondary or Senſible Poſition of any Body, according to the Determination of our Senſes, with reſpect to other Contiguous or Adjoining Bodies.

PLACE *of Arms*, when taken in the general, is a ſtrong City which is pitch'd upon for the Magazine of an Army. But a

PLACE in Fortification uſually ſignifies the Body of a Fortreſs. And a

PLACE *of Arms in a Garriſon*, is a large open Spot of Ground in the Middle of the City, where the great Streets meet, or elſe between the Ramparts and the Houſes, for the Garriſon to rendezvous in, upon any ſudden Alarm, or other Occaſion. And the

PLACE *of Arms of a Trench, or of an Attack*, is a Poſt near it, ſhelter'd by a *Parapet* or *Epaulement*, for Horſe and Foot to be at their Arms, to make good the Trenches againſt the Sallies of the Enemy. Theſe Places of Arms are ſometimes covered by a *Rideau* or Riſing-ground, or elſe by a *Cavin* or Deep Valley, which ſaves the Trouble of fortifying them by Means of Parapets, Faſcines, Gabions, *&c.* They are always open in the Rear, for their better Communication with the Camp. When the Trench is carried on as far as to the *Glacis*, they make it very wide, that it may ſerve for a Place of Arms. Alſo the

PLACE *of Arms of a Camp*, is a ſpacious Piece of Ground at the Head of the Camp, to draw out the Amy in Order of Battle. But the

PLACE *of Arms* of a Troop of Horſe, or of a Company of Foot in the Camp, is that Spot of Ground on which the Troops or Company draws out.

PLACE *Geometrick*, is a certain Bound or Extent wherein any Point may ſerve for the Solution of a *Local* or *Indetermined Problem.* All the Points of a *Geometrick Place*, have the ſame Relation to the Points of the Right Line correſpondent thereunto.

PLACE *Plane*, is when the Point reſolving the Problem, is in the Periphery of a Circle: And then 'tis called, *Locus ad Circulum.* Thus, v. gr. *A Circle and any one of its Diameters being given, to find a Point without it, but on the ſame Plane with it; from whence a Right Line being drawn to one of the Ends of the Diameter, that Line ſhall be biſſected by the Circumference of the Circle.*

PLACE *ſimple*, or *Locus ad Lineum rectum*, as the Geometers call it, is when the Point that reſolves any Problem is in a Right Line. As, *To find the Centre of a Circle, whoſe Periphery ſhall paſs thro' the Ends of a Right Line given in Magnitude and Poſition:* For ſuch Centre will be in a Right Line. But a

PLACE *Solid*, is when the Point is in one of the *Conick Sections:* Thus, *To find the Centre of a Circle which ſhall touch both a Line given in Poſition, and alſo another Circle given in Poſition and Magnitude:* There muſt be a Point found in the Periphery of a *Parabola*, the *Focus* of which, is the Centre of the Circle given, when the given Line and Circle touch one another. Laſtly, a

PLACE *Surſolid*, is when the Point is in the Circumference of a Curve of an higher Gender than the *Conick Sections*; as having a Point and a Right Line given on a Plane, to find on that Plane another Point beyond that given Line; ſo that a Right Line drawn thro' thoſe 2 Points, ſhall have its Part comprehended between the ſecond Point and the given Line, alſo given it ſelf.

PLACE *of the Sun, Star, or Planet*, is the Sign of the Zodiack, and Degree of it, which the Planet is in; or it is that Degree of the Ecliptick reckoned from the Beginning of *Aries*, which the Planets or Stars Circle of Longitude cutteth; and therefore is often called, The *Longitude* of Sun, Planet, or Star:

And 'tis found by this Proportion:

As Sine of Sun's greateſt Declination is 23° 30'. — — — —	9.6006997
To Sine of this preſent Decl. 23° 15' —	9.5963154
So is Radius — — — — — —	10
To the Sine of his Longitude 81° 52'	9.9956157

Which if the Declination were North, will be in 20° 52' of *Gemini*; but if the Sun had South Declination, his Place would be in 20° 52' of *Capricorn.*

PLACENTA *Uterina*, called by ſome *Hepar Uterinum*, from its Colour, which is like that of the Liver, as it is alſo ſomething in Subſtance: But in comes nearer to that of the Spleen. It is ſoft, and hath innumerable Fibres, and ſmall Veſſels, and its Parenchyma is Glandulous almoſt every where. In Women it is Circular, but with ſome Inequality in its Circumference; in the Middle it is about two Fingers thick, but is thinner towards the Edges, and is about a Span, or a quarter of a Yard over, from one Side to the other, when the *Fœtus* is mature for the Birth: It is hollowed and ſmooth within, next the *Fœtus*, and grows every where firmly to the Chorion; but without, next the Womb, 'tis very unequal, having many Protuberances, by which it adheres to the Womb, tho' to what Part of it, is not agreed. When there is more than one *Fœtus*, 'tis ſometimes double, trebble, *&c.* and ſometimes but one with ſo many diſtinct Partitions in it. It grows

grows not from the Womb originally, but its Riſe is from the *Chorion*, which about the 9th Week, in Women, ſends forth a downy Subſtance, which ſoon grows into Knobs, turns reddiſh, and then adheres to the Womb conſpicuouſly, about the twelfth or thirteenth Week.

It hath Veſſels from a double Original, ſome from the Womb, and ſome from the *Chorion*, immediately and mediately from the *Fœtus*. From the Womb it receives Arteries, Veins, Nerves, and Lymphæducts; all which, tho' they be very large and conſpicuous in the Womb, and even in that Place where the *Placenta* joins to it, yet they are but very ſmall Capillaries in the *Placenta* it ſelf, and are diſperſed only thro' that Side of it which is next the Womb. The Veſſels that come from the *Chorion* are Arteries and Veins; and, as Dr. *Wharton* ſaith, Lymphæducts alſo. From the *Fœtus*, thro' the *Corion*, it receives the Umbilical Veſſels of the *Fœtus*: For the firſt Months of the Pregnancy it ſticks moſt firmly to the Womb; but as the *Fœtus* grows mature for the Birth, it looſens by Degrees, and at laſt, like ripe Fruit from the Tree, falls off from the Womb, and makes Part of the After-burden or Birth.

PLADAROSIS, are little ſoft Tumors which grow under the Eye-lids.

PLAIN *Chart*, is the Plat or Chart that Seamen ſail by, whoſe Degrees of Longitude and Latitude are made of the ſame Length.

PLAIN *Sailing*, is the Art of finding all the Varieties of the Ship's Motion on a Plain, where all the Meridians are made Parallel, and the Parallels at Right Angles with the Meridians, and the Degrees of each Parallel equal to thoſe of the Equinoctial; which, tho' notoriouſly falſe in it ſelf, ſuppoſing the Earth and Sea to be a Plain Flat, and each Parallel equal to the Equinoctial; yet by laying down Places accordingly, and breaking a long Voyage into many ſhort ones, a Voyage may pretty well be perform'd by it, near the ſame Meridian.

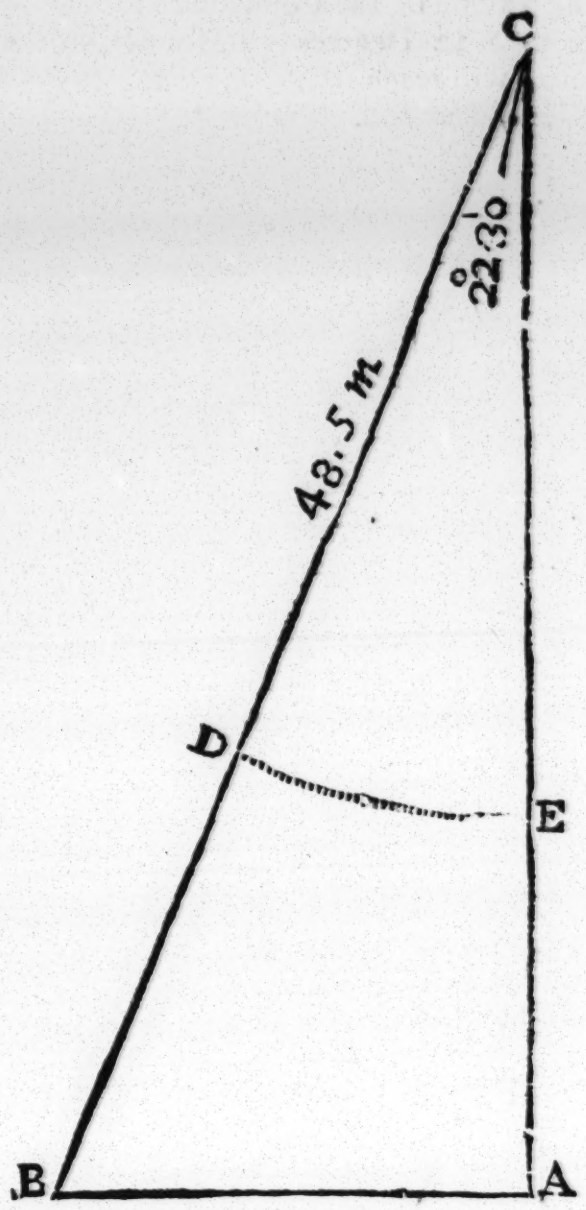
In *Plain Sailing* 'tis imagin'd, that by the *Rhumb-Line*, *Meridian*, and *Parallel of Latitude*, there always will be formed a Right-angled Triangle; and that ſo poſited, as that the Perpendicular may repreſent part of the Meridian or North and South Line, containing the *Difference of Latitude*: The Baſe of the Triangle repreſents the *Departure*; and the Hypothenuſe the *Diſtance ſailed*; the Angle at the Top is the *Courſe*, and the Angle at the Baſe the *Complement of the Courſe*: Any two of which, with the Right Angle being given, the Triangle may be protracted, and the other three Parts found: As in the following Examples.

CASE I.

The Courſe and Diſtance given, to find the Difference of Latitude, and Departure from the Meridian.

Admit a Ship from the Latitude 50° 10' North, ſails S. S. W. 48. 5 Miles: I require the Latitude ſhe is in, and her Departure or Separation.

Geometrically.



Draw A C the South and North Line, and with 60 Degrees from the *Line of Chords* from C, (becauſe the Ship ſails Southward) deſcribe D E, which make equal to 22 Degrees 30 Minutes the Courſe, and draw C B, which make alſo equal to 48.5 from any *Line of Equal Parts*: Then let fall from B, B A, perpendicular to the Meridian; ſo is the Triangle compleated, and the Lines C A, B A, may be meaſured from the ſame Scale.

By the Logarithms.

As the Radius — — — — —	10.00000
Is to the Diſtance run, B C 48.5 — —	1.68574
So is the Sine of the Courſe 22° 30 —	9.58283
To the Departure Weſting 18° 56 — —	1.26857

Then again:

As the Radius — — — — —	10.00000
Is to the Diſtance B C 48.5 Miles —	1.68574
So is Co-ſine of the Courſe S. 67° 30 —	9.96561
To the Difference of Latitude 44.8 —	1.65135

From the Departed Latitude	50° 10'	North.
Subſtract the Difference of Lat.	00 45	
Remainder is the preſent Latit.	49 25	

By Gunter's Scale.

The Extent of the Compaſſes from S. 90 Degrees, to S. 22 Degrees 30 Minutes on the *Line of Sines*, will reach from 48.5 back to 18.6, on the *Line of Numbers*.

And,

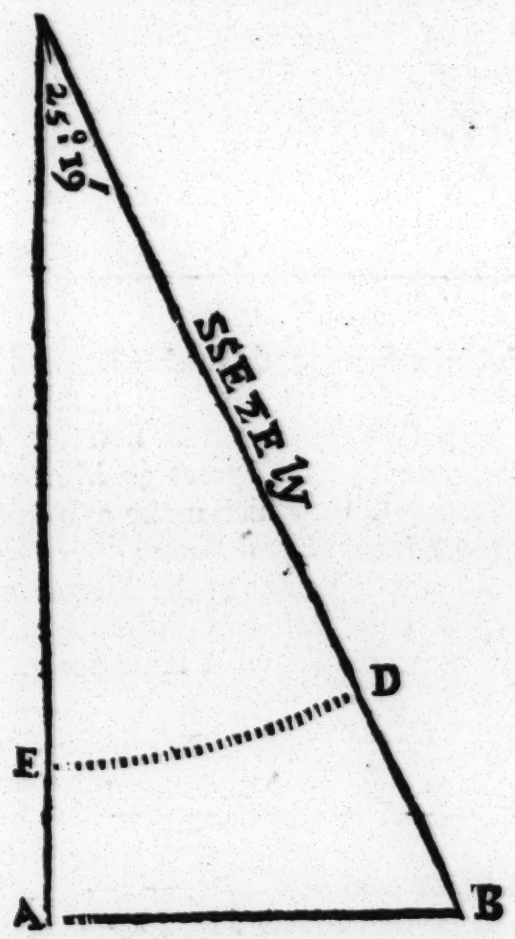
The Extent from S. 90 Degrees, 00 Minutes, to the S. 67 Degrees, 30 Minutes, on the *Line of Sines*, reaches from 48.5 backwards to 44.8, on the *Line of Numbers*.

CASE II.

The Courſe and Difference of Latitude being given; to find the Departure and Diſtance ſailed.

Admit a Ship ſail from Latitude 48 Degrees 30 Minutes S. S. E. ¼ Eaſterly till ſhe be in Latitude 47 Degrees 21 Minutes: I demand the Departure and Diſtance ſailed.

Geometrically.



Draw the North and South Line C. A. and ſubſtracting the Latitudes one from another, it leaves 69 Minutes for their Difference; makes C A equal to 69, from the *Line of Equal Parts*; from C. with 60 Degrees from the *Line of Chords*, deſcribe D E, which make equal to 25 Degrees 19 Minutes; draw C D, and raiſe the Perpendicular A B, which compleats the Triangle B A C, whoſe required Parts may be meaſured by the Scale.

By the Logarithms.

As Co-ſine of the Courſe S. 64° 41′ —	9.956148
Is to the Difference of Lat. 69 Miles —	1.838849
So is the Radius — — — —	10.000000
	11.838849
To the Diſtance ſailed B C 76.3 —	1.882701

Then,

As the Radius — — — — —	10.000000
Is to the Diſtance ſailed C B 76.3 —	1.882524
So is the Sine of the Courſe 25° 19′ —	9.631058
To the Departure A B 32.6 — — —	1.513582

By Gunter's Scale.

The Extent from S. 64 Deg. 41 Min. to S. 90 Deg. 00 Min. on the *Line of Sines*, will reach from 69 to 76.3 on the *Line of Numbers*.

And,

The Extent from S. 90 Deg. 00 Min. to S. 25 Deg. 19 Min. on the *Line of Sines*, will reach from 76.3 to 32.6 on the *Line of Numbers*.

CASE III.

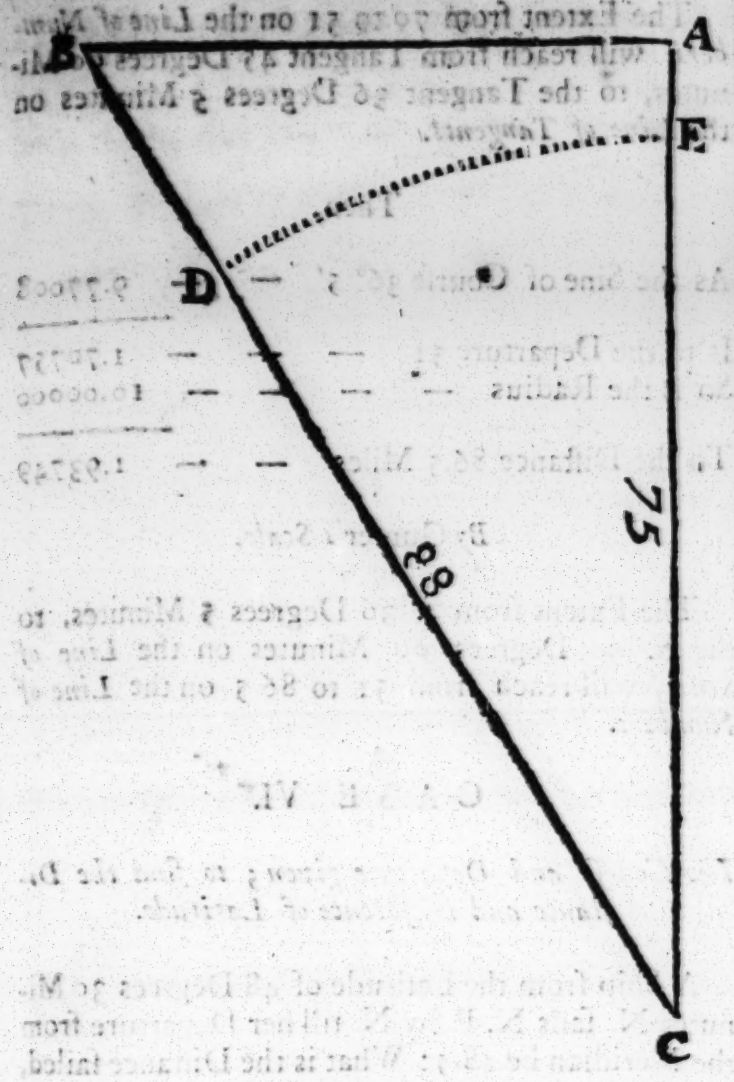
The Difference of Latitude and Diſtance ſailed given; to find the Courſe and Departure.

Admit a Ship ſail from Latitude 42 Degrees 15 Minutes North, on ſome Point between the North and Weſt 88 Miles, and then finds her ſelf in Latitude 43 Degrees 30 Minutes: I demand her Courſe and Departure.

From — — — —	43°	30′
Subſtract — — —	42	15
Remains — — —	1	15
	60	
	75 = Diff. Lat.	

Geometrically.

Geometrically.



Draw the Meridian A C, which let be made equal to 75, raiſe the Perpendicular B A; from C with 88 croſs B A in B; draw B C from C, with 60 from the *Chords* deſcribe D E, which meaſured on the *Chords* or *Rhumbs*, ſhews the *Courſe*; 2 ¾ Points from the North-weſtward, *viz.* N. N. W. ¾ Weſterly.

Note, That the Sides of Plain Triangles are meaſured by the Line of Equal Parts, but the Angles, by the Line of Chords.

By the Logarithms.

As the Diſtance run B C 88 — — —	1.94448
Is to the Radius — — — —	10.00000
So is the Difference of Lat. C A 75 —	1.87506
To the Co-ſine of the Courſe 58° 27′ —	9.933058

Whoſe Complement 31 Degrees 33 Minutes is 2 ¾ Points from the Meridian, which is N. N. W. ¾ Weſterly.

By Gunter's *Scale.*

The Extent from 88 to 75 on the *Line of Numbers*, reaches from S. 90 Degrees 00 Minutes, to 58 Degrees 27 Min. on the *Line of Sines.*

Then,

As the Radius — — — — —	10.00000
Is to the Diſtance run C B 88 — — —	1.94448
So is the Sine of the Courſe 31° 33′ —	9.71870
To the Departure A B 46 Miles Weſt —	1.66318

By Gunter's *Scale.*

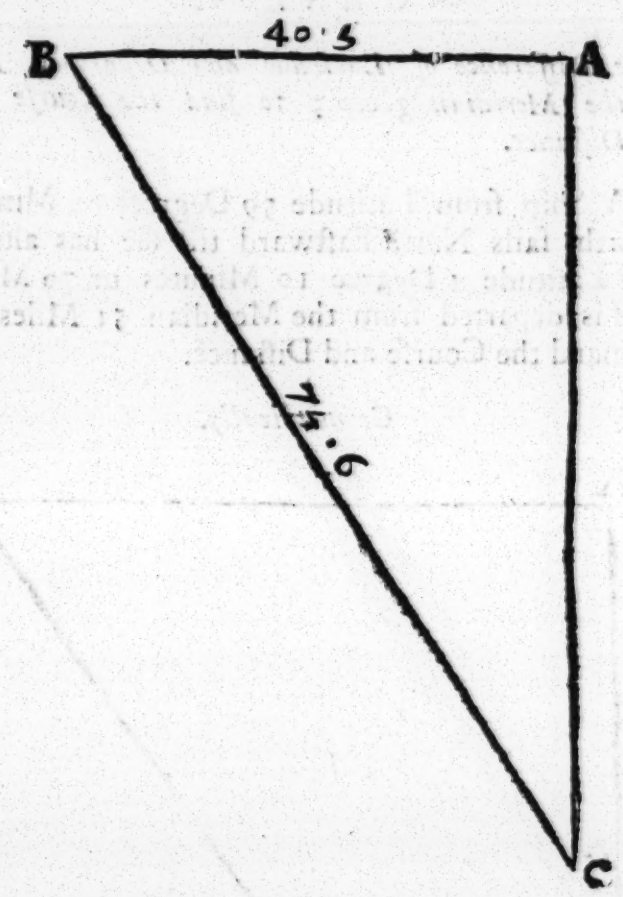
The Extent from S. 90 Degrees 00 Minutes to S. 31 Degrees 33 Minutes on the *Line of Sines*, will reach from 88 to 46 on the *Line of Numbers.*

CASE IV.

The Diſtance run, and Departure from the Meridian given; to find the Courſe and Difference of Latitude.

A Ship being in the Latitude of 59 Degrees 00 Minutes N. ſails North Weſtward till her Diſtance run be 74.6 Miles, and the Departure 40.5: I demand the Courſe and Difference of Latitude, and conſequently the Latitude the Ship is in.

Geometrically.



Draw the Meridian A C on A, (becauſe the Ship ſails Northward) raiſe the Perpendicular B A, laying thereon 40.5 Miles, the Departure from A to B; then take 74.6 in your Compaſſes, from B croſs the Meridian A C in C, and draw B C.

By Logarithms.

As the Diſtance run B C 74.6 Miles —	1.87273
Is to the Radius — — — — —	10.00000
So is the Departure B A 40.5 — —	1.60745
To the Sine of the Courſe 32° 53 —	9.73472

By Gunter's *Scale.*

The Extent from 74.6 to 40.5 on the *Line of Numbers*, reaches from S. 90 Degrees 00 Minutes, to S. 32 Degrees 53 Minutes on the *Line of Sines.*

Then

Then again:

As the Radius — — — — —	10.00000
Is to the Diſtance B C 74.6 — —	1.87273
So is the Co-ſine of the Courſe 57° 7′ —	9.92416
To the Difference of Latitude 62.6 —	1.79689

Which turned into Degrees, is 1 Degree 3 Minutes, and is to be added to 59 Degrees 00 Minutes, the Latitude ſhe departed from, becauſe ſhe raiſes the Pole; the Sum 60 Degrees 3 Minutes the Latitude the Ship is in.

By Gunter's *Scale.*

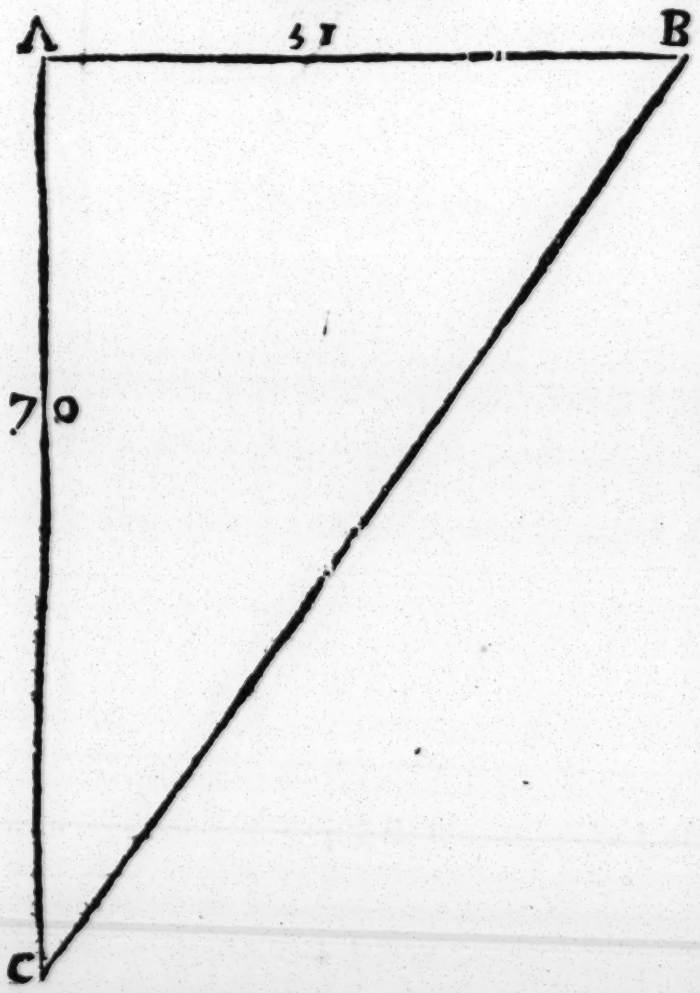
The Extent from S. 90 Degrees 00 Minutes, to S. 57 Degrees 7 Minutes, on the *Line of Sines*, will reach from 74.6 to 62.6 on the *Line of Numbers.*

CASE V.

The Difference of Latitude and Departure, from the Meridian given; to find the Courſe and Diſtance.

A Ship from Latitude 59 Degrees 00 Minutes North, ſails North Eaſtward till ſhe has altered her Latitude 1 Degree 10 Minutes or 70 Miles, and is departed from the Meridian 51 Miles: I demand the Courſe and Diſtance.

Geometrically.



Draw A C, which make equal to 70 Miles; raiſe the Perpendicular A B, which make alſo equal to 51 Miles, draw B C.

By the Logarithms:

As the Difference of Lat. A C 70 Miles	1.845098
Is to the Radius — — — —	10.000000
So is the Departure A B 51 Miles —	1.707570
To the Tangent of the Courſe 36° 5′	9.862472

By Gunter's *Scale.*

The Extent from 70 to 51 on the *Line of Numbers*, will reach from Tangent 45 Degrees 00 Minutes, to the Tangent 36 Degrees 5 Minutes on the *Line of Tangents.*

Then,

As the Sine of Courſe 36° 5′ — —	9.77008
Is to the Departure 51 — — —	1.70757
So is the Radius — — — —	10.00000
To the Diſtance 86.5 Miles — —	1.93749

By Gunter's *Scale.*

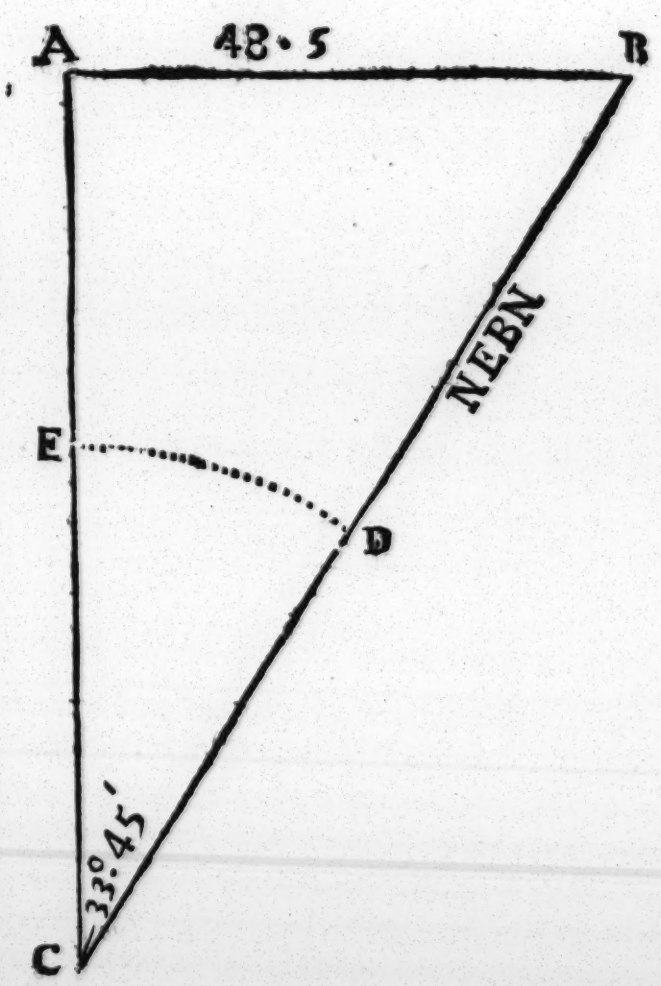
The Extent from S. 36 Degrees 5 Minutes, to the S. 90 Degrees 00 Minutes on the *Line of Sines*, will reach from 51 to 86.5 on the *Line of Numbers.*

CASE VI.

The Courſe and Departure given; to find the Diſtance and Difference of Latitude.

A Ship from the Latitude of 48 Degrees 30 Minutes N. ſails N. E. by N. till her Departure from the Meridian be 48.5: What is the Diſtance ſailed, and Difference of Latitude?

Geometrically.



Draw the Meridian A C, from C with 60 Degrees of the Chord deſcribe D E, which make equal to 33 Degrees 45 Minutes, and let the Perpendicular A B be 48.5 from the *Equal Parts.*

By

By the Logarithms.

As the Sine of the Courſe 33° 45′ — 9.744739

Is to the Departure A B 48.5 — — 1.685741
So is the Radius — — — — 10.000000

To the Diſtance C B 87.3 — — 1.941002

By Gunter's *Scale.*

The Extent from S. 33 Degrees 45 Minutes, to S. 90 Degrees 00 Minutes on the *Line of Sines*, will reach from 48.5 to 87.3 on the *Line of Numbers.*

Then,

As the Radius — — — — — 10.00000

Is to the Diſtance run 87.3 — — — 1.94101
So is the Co-ſine of the Courſe S. 56° 15′ 9.91984

To the Difference of Latitude 72. — 1.86085

By Gunter's *Scale.*

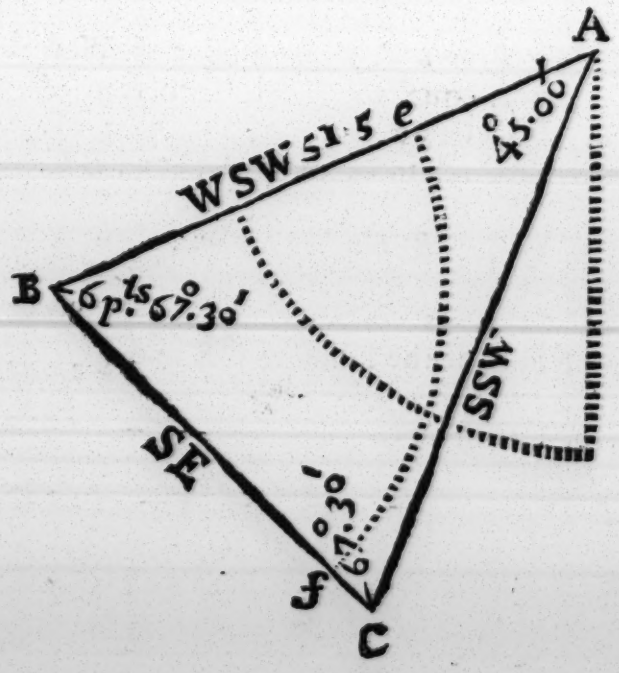
The Extent from S. 90 Degrees 00 Minutes, to S. 56 Degrees 15 Minutes, on the *Line of Sines*, reaches from 87.3 to 72.6 on the *Line of Numbers.*

Theſe are the Seven uſual Caſes of *Plain Sailing*, which you ſee are all performed by the Knowledge of Rectangl'd Plain *Trigonometry*. The Doctrine of *Oblique Plain Triangles*, is not of ſuch Neceſſary Uſe in Sailing, as that of Right-angled ones is: But however, I have here ſingled out ſome of the moſt Uſeful Caſes of it, as follows.

Plain Sailing, *where the Application of* Oblique Triangles *is required.*

Example.

Coaſting along the Shore, I ſet an Head land C, bearing off me S. S. W. I ſail W. S. W. 51.5 Miles to B, and then the Head-land C bears S. E. from me: I demand my ſeveral Diſtances to the Head-land.



Geometrically.

From A draw a S. S. W. Line, as A C, and a W. S. W. Line, as A B, and make A B = 51.5 Miles; then from B, with 60 Degrees of the Chords, deſcribe *e f*, which make equal to ſix Points, and draw *B f.*

By the Logarithms.

In the Triangle B A C, given B A 51.5 Miles and all the Angles, *viz.* The Angle A 45 Degrees, Angle B 67 Degrees 30 Minutes, and the Angle C 67 Degrees 30 Minutes; required B C and C A.

As the Sine of the Angle C 67° 30′ — 9.9656153

Is to the Diſtance A B 51.5 Miles — 1.7118072
So is Sine of the Angle at A 45° 00′ 9.8494850

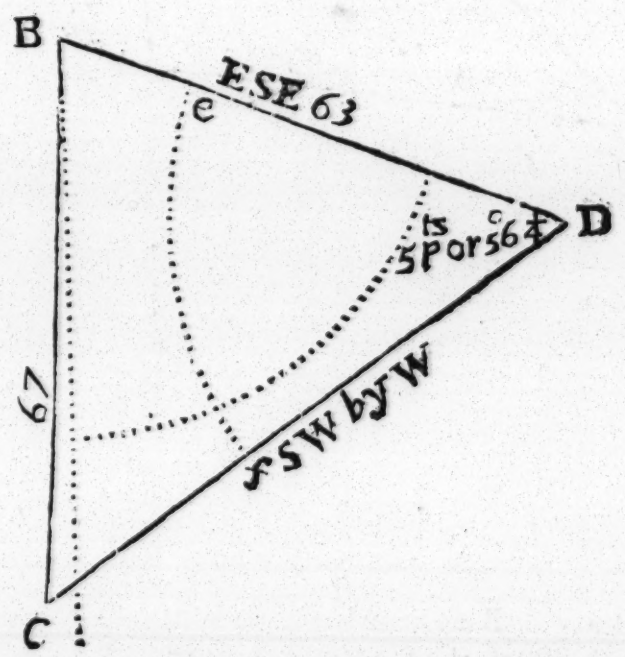
11.5612922

To the Diſtance B C 39.4 — — 1.5956769

And ſince the Angle B, is equal to the Angle C, the Side A C, will be equal to the Side A B.

Example II.

A Ship in the Parallel of 46 Degrees North at B, deſcries a Head-land at C, diſtant from her 67 Miles; ſhe Sails E. S. E. 63 Miles to D, and then the Head-land at C bears S. W. by W. from her: How did the Head-land bear from the Ship when ſhe was at B? And how far is it diſtant from her, now ſhe's at D?



Geometrically.

From B draw an E. S. E. Line B D, which make equal to 63, and from D with 60 of the Chords deſcribe *e f*, which make equal to 56° 15′, draw D *f* C: Then from B with 67 Miles, croſs D C in C, and draw B C,

By the Logarithms.

As the Diſtance B C 67 Miles *Ar. co.* —	8.17392
Is to the Sine of the Angle D 56° 15′ —	9.91984
So is the Diſtance ſailed B D, 63 Miles	1.79934
To the Sine of the Angle C 51° 26′ —	9.89310

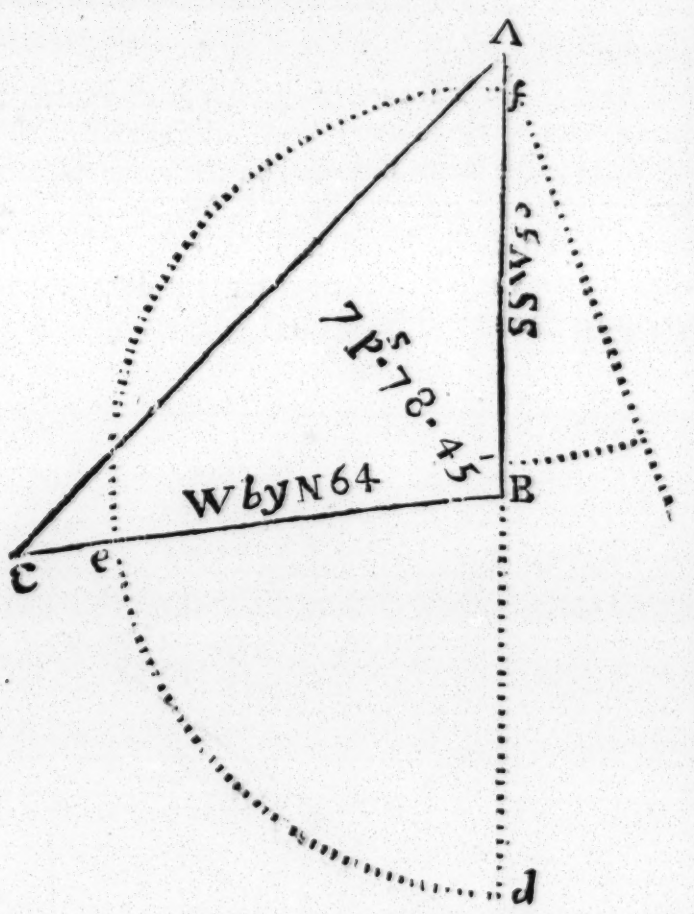
Now 56° 15′ + 51° 26′ = 107° 41′, whoſe Complement to 180°, is 72° 19′ = Angle B, 6 ½ Points, which added to E. S. E. gives the Bearng of C to be S. ½ Weſterly near.

Then,

As the Sine of the Angle D, 56° 15′ —	9.919846
Is to the Diſtance B C 67 Miles —	1.826074
So is the Sine of the Angle B 72° 19′ —	9.978978
	11.805052
To the Diſtance D C 76° 8′ — —	1.885206

Example III.

If I ſail S. S. W. 50 Miles, then W. by N. 64 Miles; I demand the Courſe and direct Diſtance from the Place of Departure?



Geometrically.

Draw A B = 50 M. a S. S. W. Line, and from B with 60 of the Chords deſcribed *d e f*; make *d e* = 7 Points, or *f e* = 9 Points, draw B C through *e*, which make equal to 64 M.

By the Logarithms.

In the Triangle C B A, there's given the two Sides C B and B A, and the contained Angle C B A, 7 Points, to find the Angles A and C, and the third Side C A.

C B =	64
A B =	50
Sum. =	114
Diff. =	14

As the Sum of the two Sides A B and B C 114 — — — — —	2.056904
Is to their Difference 14 — — —	1.146128
So is the T. of ½ Sum of the ∠ ∠ C and A, 50° 37′ — — —	10.085698
	11.231826
To the T. of ½ their Difference 80° 30′	9.174922

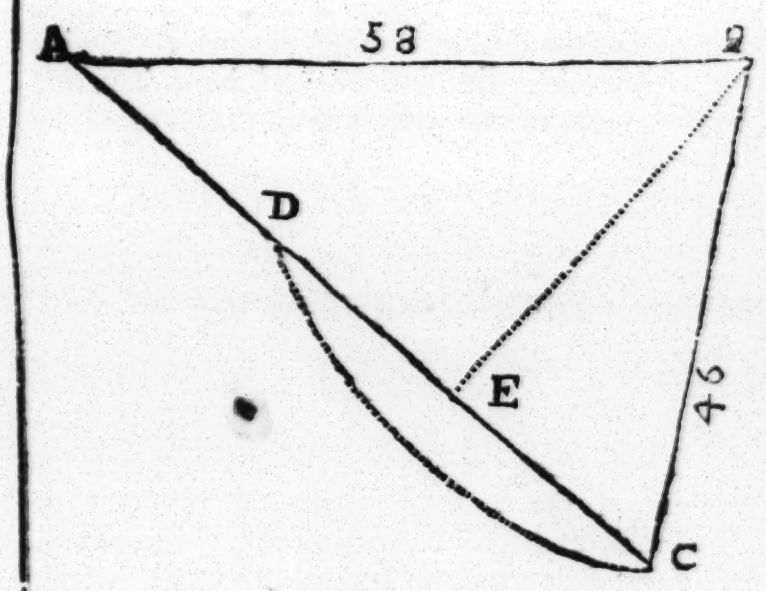
Which ſubtracted from 50 Deg. 37 Min. there remains 42 Deg. 7′ = ∠ C; but 8 Deg. 30 Min. added to 50 Deg. 37 Min. makes 59 Deg. 7 Min. = ∠ A; and ſince A B is a S. S. W. Line, A C is W. by S. ¼ Weſterly.

Then for the Diſtance A C, ſay,

As the Sine of the Angle A 59.7 =	9.9833595
Is to the Diſtance B C 64 M. — —	1.806180
So is the Sine of the ∠ B, or its Complement to 180°, 78° 45′	9.991573
	11.797753
To the Diſtance A C 73.2 M. — —	1.864158

Example IV.

Admit two Ports lying in the ſame Parallel or Latitude, to differ in Longitude 58 Miles; and a Ship having ſailed from the Weſtermoſt, between the South and Eaſt 65 Miles, to be then 46 Miles from the Eaſtermoſt: I demand the Courſe ſhe ſteered, and her Courſe to the Eaſtermoſt Port?



Geometrically.

Having drawn A B an Eaſt and Weſt Line, and made it equal to 58 M. then from A with 65 M. deſcribe an Arch, and with 46 M. from B croſs that Arch in C, draw A C and B C.

By the Logarithms.

As A C 65 Miles — — — —	8.187086
Is to the Sum of the Diſtance A B and B C 104 Miles — — —	2.017033
So is their Difference 12 Miles — —	1.079181
To A D 19.2 — — — —	1.283300

Which

Which added to A C 65, makes 84.2, whose half is 42.1 is A E.

Then,

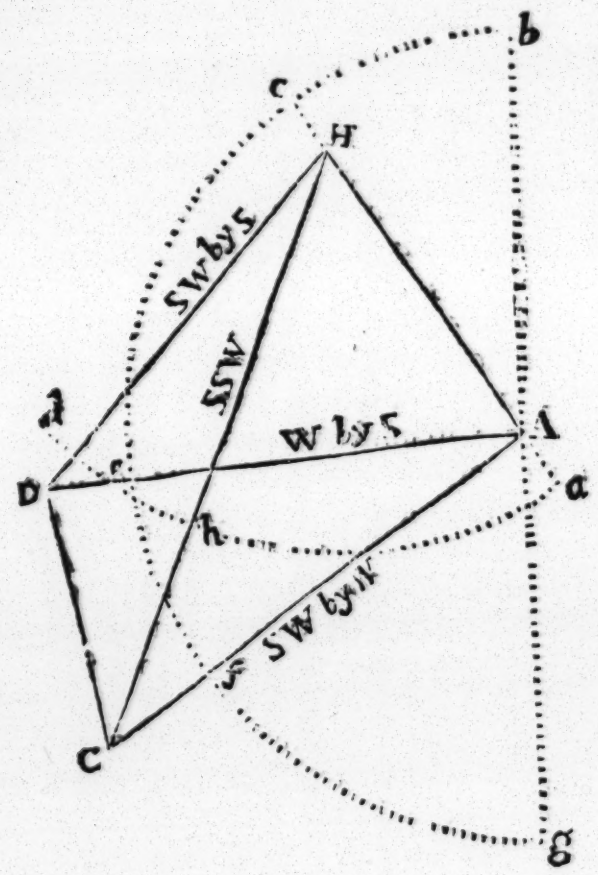
As A B 58 Miles, Ar. Compl. — —	8.236571
Is to the Radius — — — —	10.000000
So is A E 42.1. — — — —	1 624282
To the Co-sine of the Ang. A. 43° 28′	9.860853

That is,

S. E. 1 Deg. 32 Min. Easterly, the Course she steered.

Example V.

Coasting along the Shore, I set two Head-lands, the one at C, bearing S. W. by W. the other at D, bearing W. by S. I sail away N. W. by N. to H. 40 Miles, and then the Head-land at C bears S. S. W. and that at D S. W. by S. I demand how far these Head-lands are asunder, and how they bear one from another.



Geometrically.

First draw *b* A *g* a North and South Line, and with 60 of the Chords from A describe *b e g*; then make *g f* = 5 Points, *g e* = 7 Points, and *b c* = 3 Points; draw A *f* C, A *e* D, and A H *c*, make A H = 40 Miles.

Secondly, From H with 60 of the Chords describe *a d*, which make equal 6 Points; and also *a b* equal 5 Points; draw H *h* C, H *d* D, and D C. Then is D one Head-land, and C the other.

By the Logarithms.

In the Triangle H A C given the Angle H A C = 8 Points, the Angle A H C 5 Points, and the Angle A C H = 3 Points, together with the Side H A 40 Miles to find the Side C H.

Therefore,

As the Sine of the Angle H C A 33° 45′, Ar. Compl. — — —	0.255261
Is to A H 40 Miles — — —	1.602060
So is the Sine of 90° = ∠ H A C —	10.000000
To the Side H C 72 Miles — —	1.857321

Then in the Triangle D H A, there's given Angle H A D = 6 Points, the Angle A H D = 6 Points, and the Angle H D A = 4 Points, and the Side A H 40 Miles to find the Side D H. Thus:

As the Sine of the Angle H D A 45° 00′, Ar. Compl. — — —	0.150515
Is to the Side A H 40 Miles — —	1 602060
So is the Sine of the ∠ H A D 67° 30′	9.965615
To D H 52.3 Miles — — —	1.718190

Then in Triangle D H C there's given two Sides, C H = 72 Miles, and D H 52.3; and their contained Angle C H D = 1 Point, to find the other two Angles H D C, H C D, and the third Side.

As the Sum of the Sides, H C + H D 124.3, Ar. Compl. —	7.905528
Is to their Difference 19.7 — —	1.294466
So is the Tangent of half the Sum of ∠∠ H D C & H C D 84° 22′	11.005954
To the Tangent of half their Difference 58° 6′ — — —	10.209548

Now, 84 Deg. 22 Min. + 58 Degr. 6 Min. = 142 Deg. 28 Min. Angle H D C.

But 84 Deg. 22 Min. — 58 Deg. 6 Min. = 25 Deg. 16 Min. Angle H C D = N. one quarter Westerly.

Then,

As the Sine of the Angle H C D 25° 16′, Ar. Compl. — —	0.369743
Is to D H 52.3 Miles. — — —	1.718190
So is the Sine of the Angle D H C 11° 15′ — — — — —	9.290235
To D C 239 Miles the Distance between the Head-lands — —	1.378168

PLAIN *Scale*, is a thin Ruler, either of Wood or Brass, whereon are graduated the Lines of *Chords*, *Sines*, *Tangents*, *Secants*, *Leagues*, *Rumbs*, &c. and is of ready Use in most part of the *Mathematicks*, chiefly in *Navigation*: A Description thereof see under the Word *Scale*.

PLAIN *Table*, is an Instrument used in Surveying of Land.

1. The *Table* it self is a Parallelogram of Wood, 14 Inches and a half long, and 11 Inches broad, or thereabouts.

2. A *Frame* of Wood fixed to it, so as a Sheet of Paper being laid on the *Table*, and the *Frame* being forced down upon it, squeezeth in all the Edges, and makes it lie firm and even, so as a Plot

Plot may be conveniently drawn upon it. Upon one Side of this *Frame* ſhould be equal Diviſions for drawing Parallel Lines both long-wiſe and croſs-wiſe (as Occaſion may require) over your Paper; and on the other Side the 360 Degrees of a Circle, projected from a Braſs Centre conveniently placed in the *Table*.

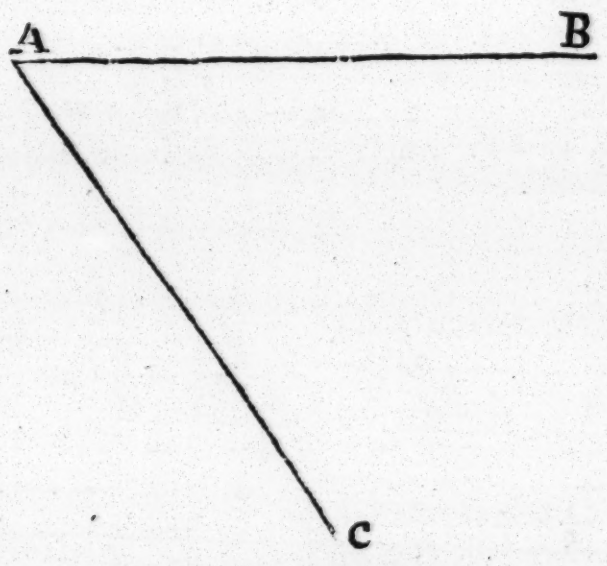
3. A *Box* with a *Needle* and *Card*, to be fixed with two Screws to the Table; very uſeful for placing the Inſtrument in the ſame Poſition upon every Remove.

4. A *Three-legged Staff* to ſupport it, the Head being made ſo as to fill the Socket of the *Table*, yet ſo as the *Table* may be eaſily turned round upon it, when 'tis not fixed by the Screw.

5. An *Index*, which is a large Ruler of Wood, (or Braſs,) at the leaſt 16 Inches long, and two Inches broad, and ſo thick as to make it ſtrong and firm; having a ſloaped Edge, called the *Fiducial Edge*, and two Sights of one Height, (whereof the one hath a Slit above, and a Thread below, and the other a Thread above, and a Slit below,) ſo ſet in the Ruler, as to be perfectly of the ſame Diſtance from the *Fiducial Edge*. Upon this *Index* 'tis uſual to have many Scales of equal Parts, as alſo Diagonals, and Lines of Chords.

To take Quantity of an Angle by the Plain Table.

As ſuppoſe A B and A C were two Hedges or Fences of a Field, and it were required to take the Angle A.



Plant your Table (fitted with the Sheet upon it) as nigh to the Angle as you can, the North End of the *Needle* hanging directly over the *Flower-de-Lis*; then make a Mark upon the Sheet of Paper at any convenient Place for the Angle A, and lay the End of the *Index* to the Mark, turning it about 'till through the Sights you eſpy B; then draw the Line A B by the Edge of the *Index*. Do the ſame for the Line A C, keeping the *Index* upon the firſt Mark: Then will you have upon your Table an Angle equal to the Angle in the Field.

When you have more Angles to take, the Method is the ſame.

The Diſtances from the Angles to the Inſtrument are meaſured by the *Chain*, and ſet off on the Table with a *Scale* and *Compaſſes*.

Whence 'tis ſo eaſie to take the Plot of a Field at one *Station*, by the *Plain Table*, that there needs no other Direction. See *Surveying*.

PLAINTIFF, is he that ſues or *complains* in an Aſſiſe, or in an Action Perſonal; as in an Action of Debt, Treſpaſs, Deceit, Detinue, and the like.

PLANCERE, in Architecture, is the under part of the Roof of the *Corona*; which is the ſuperior part of the Cornice, between two *Cymatiums*. See theſe Words.

PLANE *of a Dyal*, is the Surface on which any Dyal is ſuppoſed to be deſcribed. See a General Account of all ſuch *Planes* under the Word *Dyalling*.

PLANE *Horizontal*, in Perſpective, is a Plane which is parallel to the Horizon, and which paſſes thro' the Eye, or hath the Eye ſuppoſed to be placed in it.

PLANE *of Gravitation or Gravity*, in any heavy Body, is a Plane ſuppoſed to paſs thro' the Centre of Gravity of it.

PLANE, in Fortification, is the Repreſentation of a Work in its Height and Breadth.

PLANE *of the Horopter*, in Opticks, is that which paſſeth thro' the *Horopter*, and is perpendicular to the Plane of the two *Optical Axes*.

PLANE *Number*, is that which may be produced by the Multiplication of two Numbers one into another; thus, 6 is a *Plane Number*, becauſe it may be produced by the Multiplication of 3 by 2; for twice 3 makes 6. So alſo 15 is a *Plane Number*, ariſing from 5 being multiplied by 3: And 9 is a *Plane Number*, produced by the Multiplication of 3 by 3.

PLANE *Problem*, in Mathematicks, is ſuch an one as cannot be ſolved Geometrically, but by the Interſection either of a Right Line and a Circle; or of the Circumferences of two Circles: As, *Having the greateſt Side given, and the Sum of the other Two, of a Right-angled Triangle; to find the Triangle. To deſcribe a Trapezium that ſhall make a Given Area of Four Given Lines.* And ſuch a *Problem* can have but two Solutions, becauſe a Right Line can cut a Circle, or one Circle another but into Points. *Ozanam.*

PLANE *Geometrical*, in Perſpective, is a Plane Surface, parallel to the Horizon, placed lower than the Eye; wherein the viſible Objects are imagined without any Alteration, except that they are ſometimes reduced from a greater to a leſſer Size.

PLANE *of Reflection*, in Catoptricks, is that which paſſeth thro' the Point of *Reflection*, and is always perpendicular to the Plane of the Glaſs, or Reflecting Body.

PLANE *of Refraction*, is a Surface drawn thro' the Incident and Refracted Ray.

PLANE *Surface*, is that which lies even between its bounding Lines; and as a Right Line is the ſhorteſt Extenſion from one Point to another, ſo a *Plane Surface* is the ſhorteſt Extenſion from one Line to another.

PLANE *Vertical*, in Opticks and Perſpective, is a Plane Surface which paſſeth along the Principal Ray, and conſequently thro' the Eye, and is perpendicular to the Geometrical Plane.

PLANETS, are the *Erratick* or *Wandring Stars*, and which are not like the *Fixed ones* always in the ſame Poſition to one another. We now number the Earth among the *Primary*

Planets, becauſe we know it moves round the Sun, as *Saturn*, *Jupiter*, *Mars*, *Venus*, and *Mercury* do, and that in a Path or Circle between *Mars* and *Venus*. And the *Moon* is accounted among the *Secondary Planets*, or *Satellites* of the *Primary*, ſince ſhe moves round the Earth, as *Jupiter*'s Four *Moons* or *Satellites* do round him, and *Saturn*'s Five round about him; if *Caſſini*'s Eyes may be credited. But I could never ſee my ſelf, or meet with any elſe, who ever did ſee any but the *Hugenian Satellite*.

All the Planets, as far as we can find, have, beſides their Motion round the Sun, which makes their Year, alſo a Motion round their own Axes. which makes their Day; as the Earth's revolving ſo, makes our Day and Night.

It's more than probable that the Diameters of all the Planets are longer than their Axes: We know 'tis ſo in our Earth; and Mr. *Flamſteed* and Mr. *Caſſini* both found it to be ſo in *Jupiter*. And therefore 'twas a great Miſtake in the Ingenious Dr. *Burnet*, to aſſert, as he doth in his *Hypotheſis*, the Polar Diameter of the Earth to exceed the other.

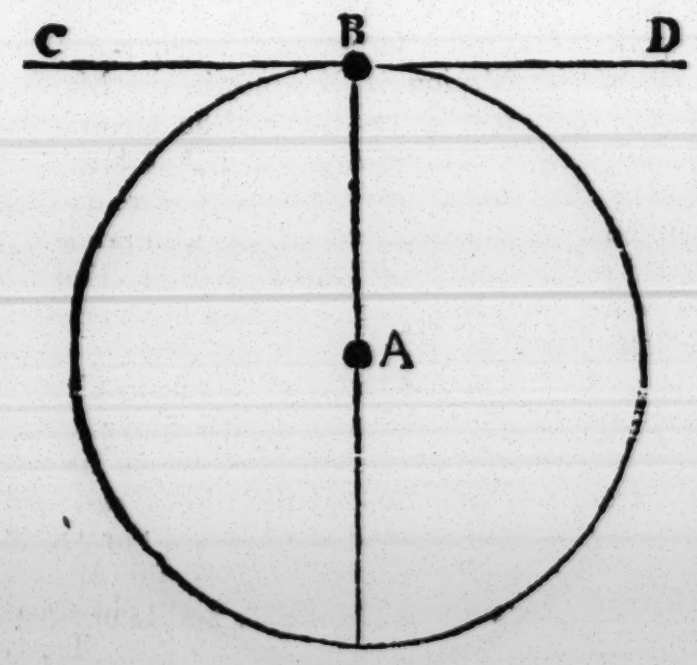
Sir *Iſaac Newton* aſſerts our Earth's Equatorial Diameter to exceed the other by about 34 Miles: And indeed elſe the Motion of the Earth would make the Sea riſe ſo high at the Equator, as to drown all the Parts thereabout.

The Learned Mr. Whiſton, *Profeſſor of Mathematicks in the Univerſity of* Cambridge, *in his New Theory of the* Earth, *accounts (from the Admirable Sir* Is. Newton's *Principles) for the Motion and Revolution of the Planets, thus:*

LEMMA X.

From the uniform Projectile Motion of Bodies in Straight Lines, and the univerſal Power of Attraction or Gravitation, the Curvilinear Motion of all the Heavenly Bodies does ariſe.

If a Body, as B, be moving uniformly along the Line D C, from D to C, and another Body A be preſent; this latter Body A muſt draw the former B from its Straight Line D C: And by doing ſo continually, while at the ſame time the Body B retains its Projectile Force along a Straight Line in in every Point of its Courſe, muſt make the Line of its real Motion become a Bent one, and change its Rectilinear into a Curvilinear Trajectory.



Hence may be learnt what is that *Conatus recedendi a centro motus* in revolving Bodies, and in what Senſe 'tis to be underſtood. For ſince all Bodies have a *Vis centripeta* or Propenſion towards one another, 'tis impoſſible they ſhould of themſelves, in as proper a Manner, have a contrary Propenſion, or *Vis centrifuga*, an Endeavour of avoiding one another. The true meaning therefore of this *Attempt* or *Endeavour* to get farther off the Centre of Motion is only this, That all Bodies being purely paſſive, and ſo incapable of altering their uniform Motion along thoſe Straight Lines or Tangents, to their Curves, in which they are every Moment, do ſtill tend onwards in the ſame Lines, and retain their Propenſion or Effort towards that Rectilinear Motion all the Time they are obliged to move in Curves; and conſequently at every Point of their Courſe, endeavour to fly off by their Tangents. Now the Parts of the Tangent, to which this Endeavour is, being farther from the Centre than thoſe of the Curves to which the Bodies are actually forced, an Attempt to go on in the Tangent may be, and is ſtiled an Attempt to go farther off, or recede from that Centre; tho' from no other Affection than that of Inactivity, or of perſevering in a Rectilinear Motion: So that tho' the *Vis centripeta*, or Power of Gravitation, be an Active and Poſitive Force, continually renew'd and impreſs'd on Bodies; yet the *Vis Centrifuga*, or *Conatus recedendi a centro motus*, is not ſo, but the meer Conſequence and Reſult of their Inactivity.

This is evident in Bodies revolving in *Ellipſes* about one of the *Foci*, in their Deſcent towards it; where the Tangent being oblique to the Radius, or Line from the Point of Contact to the *Focus*, this very *Conatus recendendi a centro motus* carrying it along the Tangent, will for ſome time make it approach nearer to the *Focus*; tho' not ſo much near as by its revolving in the *Ellipſes* it ſelf.

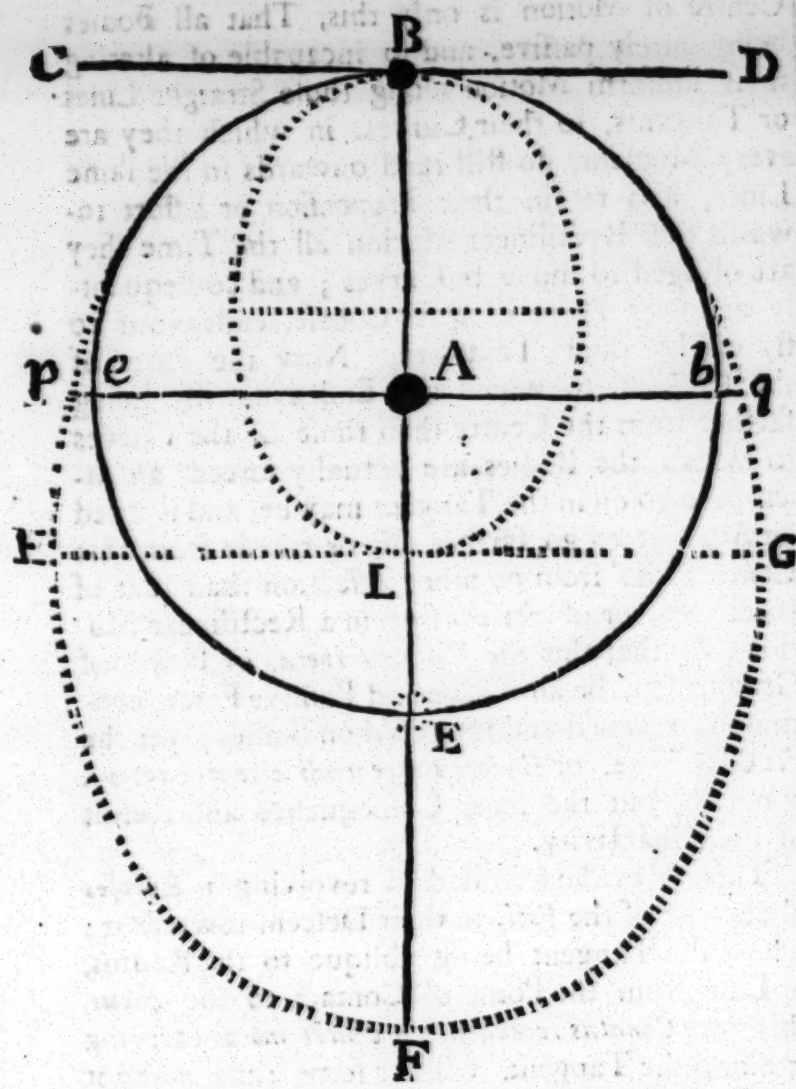
For let a Stone be let looſe from the Sling, or any Revolving Body be diſengaged from the Force which retained it in its Curve, and it will not go from the Centre, but only paſs along the Tangent in which it was moving, as if there were no ſuch Centre near it at all.

When the Projectile Motion of the *Planets* is in its Direction perpendicular to a Line from the Sun, and in its Degree of Velocity, ſo nicely adapted and contemper'd to the Quantity of the Sun's Attraction there, that neither can overcome the other, (the Force of Gravitation towards the Sun, and the Celerity of the Planets proper Motions, being perfectly *in æquilibrio*,) the Orbits of ſuch Revolving Planets will be compleat Circles; themſelves neither approaching to, nor receding from the Sun, the Centre of their Motions. And the Caſe is the ſame in the Secondary Planets about their Primary ones.

Thus 'tis ſuppoſable, That the Velocity of all the Planets about the Sun, was exactly accommodated originally to his Power of Attraction; and that their Primitive Orbits were Perfect Circles; from which at this Day they do not much differ. Thus, however, *Jupiter*'s Four Satellites or little Moons have their Motions ſo exactly proportionned to their Gravitation to him, that their Orbits, as far as the moſt nice Obſervations can judge, are perfect Circles, they keeping at an equal Diſtance from his Centre in all the Points of their Courſes about him.

When

When the Projectile Motion is not adapted to, but is either too ſwift or too ſlow for the Attraction towards the Central Body, the Orbits deſcribed will be *Ellipſes*; and in the former Caſe, when the Projectile Motion is too ſwift, the Orbit will be bigger than the Circle; and the nearer *Focus* of the *Ellipſis* will be coincident with the Central Body.



And in the latter Caſe, the Orbit will be leſs than the Circle, and the farther *Focus* of the *Ellipſis* will be Coincident with that Central Body. Thus, if the Celerity of B be exactly correſpondent to the Attractive Force of the Central Body A, neither will prevail; and the Body preſerving an equal Diſtance from the Centre, will deſcribe the Circle B *e* E *b*.

If the Celerity be greater, it will overcome the Attraction, and caſt it ſelf farther off the Centre for ſome time, and ſo revolve about it in the larger *Ellipſis* B H F G; the Central Body poſſeſſing that *Focus* A which is neareſt the Point B, where the Attraction began. But if the Celerity be ſmaller, the Attraction of the Central Body A will be too hard for it, will force it for ſome time to come nearer, and to deſcribe the leſſer *Ellipſis* B K L I; the Central Body poſſeſſing that *Focus* A which is fartheſt from the Point B, where the Attraction began: As will be very plain from the Conſideration of the Figure relating hereto.

'Tis indeed poſſible that the Celerity of Bodies may be ſo great, compared with the Force of Attraction to the Central Body, as to caſt them off with ſuch Violence, that the Attraction will never be able to bring them round, or make them revolve about it: In which Caſe the Orbits deſcribed will be one of the other Conick Sections, either *Parabola's* or *Hyperbola's*, according to the leſs or greater Violence with which the Bodies are thrown; and the Central Body will poſſeſs the *Focus* of ſuch a Figure. But no *Phænomena* of Nature perſwading us that *de facto* any of the Heavenly Bodies do deſcribe either of thoſe Lines, (tho' Comets *Ellipſes* come near to *Parabola's*;) ſeveral Bodies moving about the ſame Central one, tho' their Primitive Velocity were equal, and Direction alike, yet if they be at different Diſtances from it, they will deſcribe Figurers of different Species about it. For when that determinate Degree of Velocity, which at one Diſtance were juſt Commenſurate to the Central Bodies Attraction, and ſo would produce a Circular Orbit, muſt at a farther Diſtance be too hard for it, by reaſon of the Diminution of the Attraction there; an *Elliptical* Orbit muſt be deſcribed, whoſe nearer *Focus* would be coincident with the Central Body. In like manner, when the ſame determinate Degree of Velocity were at a nearer Diſtance, where the Central Attraction is augmented, it would be too little for the ſame; and an *Elliptical* Orbit muſt be deſcribed, whoſe fartheſt *Focus* would be coincident with the Central Body. This cannot be difficult, if you conſider that the Species of the Planetary Orbits depends ſolely on the Proportion between the Attraction towards the Central Body, and the Velocity of the Projectile Motion; as that Proportion remaining at any Diſtance whatſoever, the Bigneſs of the Orbits will be various, but the *Species* the ſame: So when that Proportion is changed, the *Species* of the Figures muſt be changed alſo; which being done, the Velocity given, by the various Force of Attraction in ſeveral Diſtances from the Centre, as well as by the various Velocities at a given Diſtance, of which before; 'tis evident the *Species* of the Orbits will be different in this as well as in the former Caſe.

And the greater Diſproportion there is between the Quantity of Attraction and the Velocity of the Revolving Bodies, the farther from a Circular; and the more Oblong and Eccentrical will the Orbits deſcribed be. And the greater Approach to Correſpondence there is, the nearer to Circular, and the leſs Oblong and Eccentrical will the ſame Orbits be.

The Circular Orbits of Planets depend not only on the exact Adjuſtment of the Projectile Velocity to the Attractive Power of the Sun, but upon the Direction of the ſame Projectile Motion, at the Original Commencing of the Attraction.

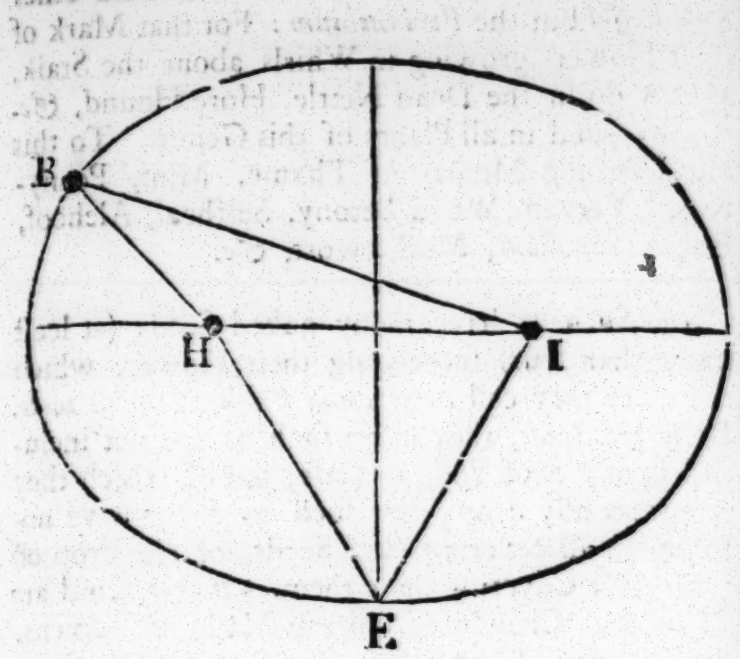
Thus where the Planet is in its own Tangent, neither Aſcending nor Deſcending, and the preceding Angle C B A is a Right one, which we have hitherto ſuppoſed; from the Correſpondence of the Velocity to the Attraction, the Orbits will be perfect Circles. Otherwiſe, when the Direction of the Motion is Oblique, in any Meaſure aſcending from or deſcending to the Central Body, and the preceding Angle C B A Obtuſe or Acute; the Planet, tho' its Velocity were exactly adapted to the Attraction of the Central Body, would revolve in an *Ellipſis*; and the Point B, where the Attraction began, would be the End of the leſſer Axis thereof.

If a Planet deſcribe an *Ellipſis* about its Central Body in the *Focus* thereof, it will move faſteſt when 'tis neareſt to, and ſloweſt when 'tis fartheſt from the ſaid Central Body or *Focus*, and agreeably in the intermediate Places. For ſeeing whereſoever the Revolving Body is, the Area is ſtill proportionable to the Time, and ſo in equal

Times

Times always equal; 'tis evident by how much the Diſtance is leſs, and the Line from the *Focus* is ſhorter, by ſo much muſt the Bodies Motion be ſwifter to compenſate the ſame; and *vice verſa*, by how much the former is longer, by ſo much muſt the latter be ſlower to allow for it.

If the Planet B deſcribe an *Ellipſis* about the Central Body in the *Focus* H, as the *Area* deſcribed by the Line BH, will be exactly Uniform and Proportional to the Time of Deſcription; ſo the Angular Motion, or Velocity of the Line from the other *Focus* B I, will be Proportional to the Time, and Uniform alſo, tho' not ſo Exactly and Geometrically.



The Law of Gravitation being ſuppoſed, if one Planet deſcribe an *Ellipſis* about the Central Body in the *Focus* H, and another deſcribe a Circle about the ſame in its Centre: If the Semi-diameter of the Circle be equal to H E, the middle Diſtance in the *Ellipſis* from the ſame Centre or *Focus*, their Periodical Times of Revolving will be the ſame; and when the Diſtances are equal, their Velocity will be ſo too.

Therefore, tho' the Planets revolve in *Ellipſes* of ſeveral *Species*, yet their Periodical Times may be as well compared with one another, and with their Diſtances from the Central Bodies, as if they all revolved in Compleat Circles.

PLANIMETRY, the ſame with *Planometria*; which ſee.

PLANISPHERE, ſignifies the Circles of the Sphere deſcribed *in Plano*, or on a Plane; or it is a Plane or Flat Projection of the Sphere. And thus the Maps either of Heaven or Earth are called *Planiſpheres*; as alſo all other Aſtrolabical Inſtruments. And all Charts or Maps for the Uſe of Mariners, are called by Mr. *Wright* the *Nautical Planiſphere*. See *Nautical*.

PLANOMETRIA, is the Menſuration of all *Plane* Surfaces or Figures.

PLANTARIS, is a Muſcle of the *Tarſus*, ſo called from its Tendon expanded in the

PLANTA *Pedis*, like that of *Palmaris* in the Palm of the Hand. It ariſes Fleſhy from the Back-part of the outermoſt Tubercle of the lower Appendage of the Thigh-Bone, immediately under the External Beginning of the *Gaſterocnemius Externus*; and deſcending obliquely between it and the *Gaſterocnemius Internus*, ſoon becomes a thin flat Tendon; and which paſſing out from between their Fleſhy Bellies, deſcends internally laterally, by their great Tendon; and marching over the *Os Calcis*, expands it ſelf on the Soal of the Foot, which it firmly adheres to, and to the Fleſhy Body of the *Muſculus flexor digitorum perforatus*, and is inſerted on both Sides the firſt Internode of each Leſſer Toe. The Action of this Muſcle is very obſcure.

PLANTS.

The Learned and Experienced Botaniſt, *Mr.* John Ray, *gives us the following Characteriſtick Notes of the chief Kinds of Plants; which make Twenty five Genders.*

1. The *Imperfect Plants*, which do either totally want both Flower and Seed, or elſe ſeem to do ſo; there having yet no Seed or Flower been diſcovered to belong to them, or at leaſt but to few of them; ſuch as Corals, Spunges, *Algæ Confervæ*, Duck-meat, or the *Lens paluſtris*, the *Fungi*, *Tubera Terræ*, the Moſſes, and ſome Liverworts.

2. Plants producing either no Flower at all, or an Imperfect one, and whoſe Seed is ſo ſmall as not to be diſcernable by the naked Eye: Some of theſe bear their Seeds on the Back-part of their Leaves; as the Maiden-hairs, Spleen worts, *Polypodium* and Ferns: Others bear it on the Stalk it ſelf, adhering there by ſmall ſingle Foot-ſtalks; as the *Lichen Terreſtris*, the *Licopodium*, or Wolfs-claw, the *Adiantum Aureum*, the *Lunaria*, *Equiſetum*, &c.

3. Thoſe whoſe Seeds are not ſo ſmall as ſingly to be Inviſible, but yet have an Imperfect or Stamineous Flower, *i. e.* ſuch an one as is without the *Petala*, having only the *Stamina* and the *Perianthium*; as Hops, Hemp, Mercurialis, Nettles, Docks, Sorrels, Arſeſmart, Knot-grais, Pondweed, Orach, Blite, Beet, Ladies Mantle, &c.

4. Such as have a Compound Flower, and emit a kind of White Juice or Milk, when their Stalks are cut, or their Branches broken off; ſuch as Lettuce, Sow-thiſtle, Hawkweed, Dendelion, Succory, Goats-beard, Nipplewort, &c.

5. Such as have a Compound Flower of a Diſcous Figure, the Seed *Pappoſe*, or winged with Down, but emit no Milk as the former do; as Colts-foot, Fleabane, Golden Rod, Ragweed, Groundſel, Cudweed, &c.

6. The *Herbæ Capitatæ*, or ſuch whoſe Flower is compoſed of many ſmall long Fiſtuloſe or hollow Flowers gathered together in a round Button, Ball, or Head, which is uſually covered with a Squammoſe or Scaly Coat, of which Kind are the Thiſtle, the greater Burdock, Blue-Bottle, Knapweed, Saw-worth, &c.

Theſe have all a Down adhering to their Seeds.

7. The *Corymbiferous Plants*, which have a compound Diſcous Flower, but their Seeds have no Down adhering to them: The Reaſon of the

Name you have under the Word *Corymbas*; of this kind, is Corn Marigold, Common Ox-Eye, Yarrow, the Daſie, Camomile, Tanſie, Mugwort, Scabious, Teaſel, Eryngo's, &c.

8. Plants with a perfect Flower, and having only one ſingle Seed belonging to each ſingle Flower; ſuch are Valerian, Corn-ſallet, Agrimony, Burnet, Meadow Rue, Fumitory, &c.

9. The *Umbelliferous Plants*, which have a *Pentapetalous Flower*, (*i. e.* one having juſt 5 ſmall *Petala* or Leaves,) and belonging to each ſingle Flower there are two Seeds lying naked and joined together. They are called *Umbelliferous*, becauſe the Plant, with its Branches and Flowers, hath an Head like a Ladies *Umbrella*, which they call *Umbella*.

This is a very large Genus of Plants, which therefore he thus ſubdivides into,

1. Such as have a broad flat Seed, almoſt of the Figure of a Leaf, or which are encompaſſed round about with ſomething like Leaves; as Cow-Parſnep, Wild and Garden Parſnep, Hogs Fennel, (*Pucedanum*,) &c.

2. Sucy as have a longiſh Seed ſwelling out in the middle, and larger than the former; as Shepherds Needle, Cow-weed, Wild Chervil, Common Speignel or Meu, &c.

3. Such as have a ſhorter Seed; as Angelica and *Alexanders*.

4. Such as have a Tuberous Root, as the Earth Nut, Kipper Nut, or Pig Nut, Water Dropwort, and Hemlock Dropwort.

5. Such as have a ſmall wrinkled channelled, or ſtriated Seed; as Stone Parſley, Water Parſnep, Burnet, Saxifrage, Caraways, Smallage, Hemlock, Meadow Saxifrage, Sampire, Fennel, Rock Parſley, &c.

6. Such as have rough, hairy, or briſtly Seed; as Mountain Stone Parſley, Wild Carrot, or Birdſneſt, Hedge and Baſtard Parſley, Hemlock, Chervil, Sea Parſnep.

7. Such as have their Leaves entire and undivided into Jags, &c. as *Perfoliata*, or Thorowwax, Sanicle, the leaſt Hares Ear, &c.

10. The *Stellate Plants*, which are ſo called, becauſe their Leaves grow on their Stalks, at certain Intervals or Diſtances, in the form of a Radiant Star. Their Flowers are really *Monopetalous*, but divided into four Segments, which look like ſo many diſtinct *Petala*, or four Leaves; and each Flower is ſucceeded by two Seeds which grow at the bottom of it.

Of this Kind is Croſs-wort, or Mugweed, with Madder, Ladies Bedſtraw, Woodruff, Cleavers, &c.

11. The *Aſperifoliæ*, or Rough-leav'd Plants: They have their Leaves placed alternately, or in no certain Order on their Stalks; they have a Monopetalous Flower cut or divided into five Partitions; and after every Flower there ſucceeds uſually four Seeds; ſuch as Cynogloſſa, or Hounds Tongue, Wild Bugloſſe, Vipers Bugloſs, Comfrey, Mouſe Ear, Scorpion Graſs, &c.

12. The *Suffrutices* or *Verticillate Plants*: Mr. *Ray*, in his laſt Edition of his *Synopſis Methodica Stirp. Britann.* ſaith, The more certain Marks or Characteriſtick Notes of this kind of Plants are, That their Leaves grow by Pairs on their Stalks, one Leaf right againſt another, their Flower is Monopetalous, and uſually in the form of an Helmet or Hood, there ſucceed four Seeds uſually to each Flower, and which have no other *Seed Veſſel* but the *Perianthium*: For that Mark of their Flowers growing in Whirls about the Stalk, as they do in the Dead Nettle, Hore Hound, &c. is not found in all Plants of this Genus. To this Head belong Mother of Thyme, Mint, Penny-Royal, Vervain, Wood Betony, Selfheal, Alehoof, Bugle, *Scordium*, Motherwort, &c.

13. Such as have many naked Seeds (at leaſt more than four) ſucceeding their Flower, which therefore they call *Polyſpermæ Plantæ Semine nudo*. By *naked Seeds*, they mean ſuch as are not included in any Seed Pod, or Caſe, out of which they ſpontaneouſly drop; but ſuch as either have nothing at all covering their Seeds, or elſe drop off with their Covering upon them. Of this Kind are Pilewort, Crowfoot, Marſh-Mallows, Avens, Strawberries, Cinquefoil, Tormentil, Meadow-ſweet, &c.

14. *Bacciferous Plants*, or ſuch as bear Berries; as Briony, Dwarf, Honyſuckle, Butchers-broom, *Solomon's* Seal, Lilly of the Valley, Nightſhade, Aſparagus, Whorts or Whortle-berries, &c.

15. *Multiſiliquous*, or *Corniculate Plants*; or ſuch as have after each Flower many diſtinct, long, ſlender, and many times crooked Caſes, or *Siliquæ*, in which their Seed is contained; and which, when they are ripe, open of themſelves, and let the Seeds drop out: Of this Kind is the Common Houſleek, Orpine, Navelwort, or Walpennywort, Bearsfoot, Marſh Marigold, Columbines, &c.

16. Such as have a Monopetalous Flower, either Uniform or Difform, and after each Flower a peculiar Veſſel, or Seed Caſe, (beſides the common Calix) containing the Seed, and this often divided or parted into many diſtinct Cells. Theſe by ſome are called *Vaſculiferous Plants*, ſuch as common Henbane, Marſh Gentian, Bindweed, Throatwort, Rampions, Toad Flax, Fox Glove, Yellow and Red Rattle, or Cock's-comb, Eyebright.

17. Such as have an uniform Tetrapetalous Flower, but bear their Seeds in Oblong Siliquous Caſes; as your Stock-gilliflower, Wall-flower, common Whitloe Graſs, *Jack* by the Hedge, or Sauce alone, common Muſtard, Charlock or Wild Muſtard, Radiſh, Wild Rocket, Ladies Smock, Scurvy-graſs, Woad, &c.

18. *Vaſculiferous Plants*, with a ſeemingly Tetrapetalous Flower, but of an Anomalous or Uncertain Kind: For this Flower, tho' it be deeply divided

divided in four Segments, is yet really Monopetalous, and falls off all together in one; ſuch as Speedwell or Fluellin, Wild Poppy, Yellow Poppy, Looſe Striſe, Spurge, and Plantain, (according to Mr. *Ray*.)

19. *Leguminous Plants*, (or ſuch as bear Pulſe,) with a *Papilionaceous Flower*. Their Flower is Difform, and almoſt in the Form of a Butterfly and Wings expanded, (whence the Name *Papilionaceous*,) conſiſting of four parts, joined together at the Edges; theſe are Peaſe, Vetches, Tares, Lentils, Beans, Liquorice, Birdsfoot, Trefoil, Reſtharrow, &c.

20. *Vaſculiferous Plants*, with a *Pentapetalous Flower*. Theſe, as the 16th and 18th Kind, have beſides the common Calyx or Cup of the Flower, a peculiar Caſe containing the Seed, and their Flower conſiſting of 5 Leaves; ſuch as Maiden Pinks, Campions, St. *John*'s-Wort, Male Pimpernel, Chickweed, Cranebill, Flax, Primroſe, Periwinkle, Centory, Wood Sorrel, Marſh Trefoil, &c.

21. *Plants with a true Bulbous Root*. A Bulbous Root conſiſts of but one round Ball or Head, out of whoſe lower Part or Baſis there go many Fibres or Strings to keep it firm in the Earth. The Plants of this Kind, when the firſt appear, come up with but one Leaf, and the Leaves are nearly approaching to thoſe of the Graſs Kind of Plants, for they have no Foot-ſtalk, and are long and ſlender: The Seed Veſſels are divided into three Partitions; their Flower is uſually *Hexapetalous*, or ſeemingly divided into ſix Leaves or Segments; ſuch as Garlick, Daffodil, Hyacinth, Saffron, &c.

22. Such as have their Roots approaching to a Bulbous Form. Theſe emit at firſt coming up but one Leaf, and in Leaves, Flowers, and Roots, reſemble the true Bulbous Plants; ſuch as *Flower de Lis*, Cuckoo-pint, Orchis, Broom-Rape, Baſtard Hellebore, Tway-blade, Winter-green, &c.

23. *Culmiferous Plants*, with a Graſſy Leaf, and an Imperfect Flower. Culmiferous Plants are ſuch as have a ſmooth hollow jointed Stalk, with one long ſharp-pointed Leaf at each Joint, encompaſſing the Stalk, and ſet on without any Foot-ſtalk: Their Seed is contained within a Chaffy Husk; ſuch as Wheat, Barley, Rye, Oats, and moſt Kinds of Graſſes.

24. Plants with a Graſſy Leaf, but not *Culmiferous*, with an Imperfect or Staminous Flower; as Cypreſs Graſſes and Ruſhes, Cats Tail, Burr Reed, &c.

25. Plants whoſe Place of Growth is uncertain and various, but chiefly Water Plants, as the Water Lilly, Water Millfoil, Water-wort, Peppergraſs, Mouſe-tail, Milkwort, Dodder, &c.

There is alſo another uſual Diviſion of Plants into *Trees*, *Frutices* or *Shrubs*, *Suffrutices* and *Herbs*; but this is rather Popular and Vulgar, than Juſt and Philoſophical.

PLASM, the ſame with a Mould in which any Metal, or ſuch like running Matter, which will afterwards harden, is caſt.

PLAT-*Baſtion*. See *Baſtion*.

PLAT-*Band*, in Architecture, is a Square-Mould which terminates the Architecture of the *Dorick Order*, or the *Faſcia* which paſſeth immediately under the *Triglyphs*, and ſerves for the ſame Uſe in this Order, as the *Cymatium* in the others. It is alſo the *Faſcia* of the *Chambranles*: And the ſame Name is alſo attributed to divers other Members of Architecture, which are deſtitute of Ornament, having only a certain Breadth without much Projecture.

PLATES, a Term in *Heraldry*. See *Balls*.

PLATFORM, in Fortification, is a Place prepared on the Ramparts for the raiſing of a Battery of Cannon; or it is the whole Piece of Fortification raiſed in a re-entring Angle. See *Battery*.

PLATFORM, in Architecture, is a Row of Beams that ſupport the Timber-Work of a Roof, and lie on the top of the Wall, where the Entablature ought to be raiſed. Alſo a kind of Terraſs Walk, or even Floor on the Top of a Building; from whence we may take a fair Proſpect of the adjacent Gardens or Fields. So an Edifice is ſaid to be covered with a *Platform*, when it hath no Arched Roof.

PLATFORM, or *Orlop*, in a Man of War, is a Place on the Lower Deck of her, abaft the Main Maſt, and round about the Main Capſtan, where, in the Time of Service, Proviſion is to take care of the Wounded Men; 'tis between the Main Maſt and the Cock-pit.

PLATISMA, is a broad Linen-cloth put upon Sores.

PLATONICK *Bodies*. See *Regular Bodies*.

PLATTOON, corruptly from the *French* Word *Pelaton*, is a ſmall Square Body of Muſqueteers, ſuch as is uſually drawn out of a Battalion of Foot, when they form the Hollow Square to ſtrengthen the Angles; and the Granadeers are generally thus poſted.

PLATTS in a Ship, are flat Ropes made of Rope-yarn, and weaved one over another; their Uſe is to ſave the Cable from Galling in the Hauſe, or to wind about the Flukes of the Anchors to ſave the Pendant of the Fore-ſheet from galling againſt them.

PLAYNT, in Law, is the propounding, or exhibiting of any Action Real or Perſonal in Writing; and the Party making this *Playnt*, is called *The Party Plaintiff*.

PLEA, in Law, ſignifies that which either Party alledgeth for himſelf in Court, and are either *Pleas of the Crown*, or *Common-Pleas*. *Pleas of the Crown*, are all of them Suits in the King's Name, againſt Offences committed againſt his Crown and Dignity, or againſt his Crown and Peace; and thoſe ſeem to be Treaſons, Felonies, Miſpriſions of either, and *Mathem*. *Common Pleas* be thoſe that are held between Common Perſons, yet by the former Definitions, they muſt compriſe all other, tho' the King be a Party. *Plea* may farther be divided into as many Branches as *Action*; which ſee, for they ſignify all one.

Then there is a *Foreign Plea*, whereby Matter is alledged in any Court, that may be tried by another.

PLEADINGS, in Law, are all the Sayings of the Parties to Suits after the Count or Declaration;

to wit; whatever is contained in the Bar, Replication, and Rejoynder, and not in the Count it ſelf; and therefore Defaults in the Matter of the Count, are not compriſed within *Miſpleading*, or inſufficient *Pleading*, but only *Miſpleading*, or inſufficient *Pleading*, committed in the Bar, Replication, or Rejoynder.

PLEDGES, in Common Law, are Sureties, either real or formal, which the Plaintiff finds to proſecute his Suit.

PLEGIIS *acquietandis*, is a Writ that lies for a Surety, againſt him for whom he is Surety, if he pay not the Money at the Day.

PLEIADES, the ſame with thoſe ſeven Stars in the Neck of the *Bull*, which are uſually thus called,

PLENA *foris factura, & plena vita*. See *Forfeiture*.

PLENARTY, in Law, is when a Benefice is full directly contrary to *Vacation*, which ſignifies the being void of a Benefice.

PLENITUDE, is when a Man has to much Blood; the ſame with *Plethora*.

PLEONSAMUS, is a Figure in Diſcourſe, when a Word not neceſſary is added, to expreſs a Vehemency in us, and a greater Certainty in the Thing; as when we ſay, I *ſaw it with theſe Eyes*: Here, *ſaw it*, is really enough in Grammar, but *with theſe Eyes*, is added, to ſhew both the Certainty of the Fact, and our Zeal and Vehemence in aſſerting it.

PLEROTICA are Medicines that breed Fleſh, and fill up Wounds.

PLETHORA, when there's more good Blood than is requiſite: It happens either to the Veſſels, when they are ſtretch'd out, and cannot hold all; or to the Strength, for ſometimes, tho' the Veſſels be not over full, the Strength is over-loaded.

PLEVIN, in Common Law, ſignifies a Warrant, or *Aſſurance*. See *Replevin*.

PLEURA, is the Skin or Membrane which covers the Inſide of the Thorax, adhering to the Ribs.

PLEURITIS, a *Pleuriſie*, is an Inflammation of the Membrane *Pleura*, and the Intercoſtal Muſcles, attended with a continual Fever, and Stitches in the Side, Difficulty of Breathing, and ſometimes Spitting of Blood; and it's either a true Pleuriſie, as this which we have deſcribed, or a Baſtard Pleuriſie, whoſe Symptoms are not ſo violent, and in ſome Things different from the former.

PLEXUS *choroides* ſeems to hang over the Pineal Glandule, as it were over a Button. It is an admirable Contexture of ſmall Arteries in the Brain like a Net.

PLEXUS *Nervoſus*, is when two or three Nerves meet together, and jut out.

PLEXUS *reticularis*. Vid. *Choroides*.

PLICA, is an Epidemical Diſeaſe in *Poland*, when their Hairs grow together like a Cow's Tail; beſides, they are Crooked-back'd, have looſe Joints, it wrenches their Limbs, and looſens them, breeds Lice, with other Symptoms.

PLINTHUS, or *Plinthis*, in Architecture, is taken for that Square Member which ſerves as a Foundation to the Baſe of a Pillar: But *Vitruvius* calls the upper part, or *Abacus* of the *Tuſcan* Pillar, a *Plinth*, becauſe it reſembles a ſquare Tile.

Moreover, the ſame Denomination is ſometimes attributed to a thick Wall, wherein there are two or three Rows of Bricks advanced in form of a *Plat-band*. This

PLINTH, *Palladio* calls the *Orle*, and *Blondell* the *Abacus*. The Word is alſo uſed for a like Member about the Capital of a Pillar; but then 'tis called always the *Plinth* of the *Capital*, and is placed juſt above the *Echinus* in the *Dorick*, and above the *Ovolo*, or quarter Round, in the other Orders.

PLOW, is an Inſtrument made of Box or Pear-tree, uſed by Seamen to take the Height of the Sun or Stars, in order to find the Latitude: It admits of the Degrees to be very large, and is much eſteemed by many Artiſts.

PLUMB-*Line*, the ſame with *Perpendicular*.

BLUMBUM *uſtum*, is a Compoſition of two Parts of Lead melted in a Pot or Crucible, with one Part of Sulphur then added to it, and kept o'er the Fire till they be burnt all out; the Matter will then be turned into a Black Powder, which they properly call by this Name *Plumbum Uſtum*.

PLUME, is the Term uſed by Botaniſts for that Part of the Seed of a Plant, which in its Growth becomes the Trunk; 'tis incloſed in two ſmall Cavities formed in the Lobes for its Reception; and is not like the *Radicle*, an entire Body, but divided at its looſe End into divers Pieces, all cloſely bound together like a Bunch of Feathers; whence Dr. *Grew* very properly gives it the Name of *Plume*. In Corn it is that Part, which, after the *Radicle* is ſhot forth, ſhoots out towards the ſmaller End of the Seed, and therefore is by ſome called the *Acroſpire*.

PLURIES, is a Writ that goeth out in the third Place, after two former Writs that had no Effect: For firſt the Original *Capias* iſſues, and if that ſpeed not, then goeth out the *Alias*, and if that alſo fails, then the *Pluries*.

PNEUMATICK *Engine*, the ſame with the *Air Pump*.

PNEUMATOCELE, is a Windy Rupture, when the Skin of the *Scrotum* is diſtended with Wind.

PNEUMATODES, is a ſhort Breathing.

PNEUMATONIPHALUS, is a Swelling in the Navel, got by Wind.

PNEUMATOSIS, is the Generation of Animal Spirits, which is performed in the Cortical Subſtance of the Brain; the little Arteries there are emptied, and the Spirits diſtil, which after they are come as far as the Middle of the Brain, they Actuate and Invigorate all the Nerves.

PODAGRA. *vid. Arthritis*, The Gout in the Feet.

POETICAL, *Riſing and Setting of the Stars*: This is peculiar to the Ancient Poetical Writers, for they refer the Riſign and Setting of the Stars, always to that of the Sun; and accordingly make three Sorts of Poetical Riſing and Setting. *Coſmical*, *Acronical*, (or as ſome write it, *Acronyctal*,) and *Heliacal*. See thoſe Words.

POINT, a Point in Geometry, is that which is ſuppoſed to have no manner of Dimenſions, but to be Indiviſible in every reſpect.

The *Ends* or *Extremites* of Lines are *Points*.

If a Point be ſuppoſed to be moved any way, it will by it Motion deſcribe a Line.

POINT *Blank*, a Term in Gunnery, ſignifying that a Shot or Bullet goes directly forward to the Mark, and doth not move in a Curve as Bombs and highly elevated Random Shots do.

POINT

POINT, in Navigation, ſignifies 11 Degrees 15 Minutes, or one 32d Part of the Compaſs: The half of which is 5 Degrees 38 Minutes, which they call a *Half Point*; and the half of this, which is 2 Degrees 49 Minutes, they call a *Quarter Point*.

The Seamen alſo call the Extremity of any Promontory (which is a Piece of Land running out into the Sea) *a Point*; which is of much the ſame Senſe with them as the Word *Cape*.

They ſay two Points of Land are one in another, when they are ſo in a Right Line one againſt another, as that the Innermoſt is hindered from being ſeen by the Outermoſt.

POINT *of Concourſe*, in Opticks, is that Point where the *Viſual Rays*, being reciprocally inclined, and ſufficiently prolong'd, meet together, are united in the middle, and croſs the Axis. This Point is moſt uſually called the *Focus*; and ſometimes the *Point of Convergence*.

POINT *of Concurrence*, a Term in Perſpective. See *Principal Point*.

POINT *of Divergence*. See *Virtual Focus*.

POINT *of Incidence*, in Opticks, is that Point on the Surface of a Glaſs, or other Body on which any Ray of Light falls: And as ſome alſo word themſelves, That Point of the Glaſs, which a Ray parts from, after its Refraction, and when 'tis returning into the *Rare Medium* again.

POINT *of Inflexion* of a Curve. See *Inflexion*.

POINT *Principal*, a Term in Perſpective. See *Principal Point*.

POINT *Senſible*, according to Mr. *Lock*, is the leaſt Particle of Matter or Space which we can diſcern; and to the ſharpeſt Eyes, is ſeldom leſs than thirty Seconds of a Circle, whereof the Eye is the Centre.

POINTING *the Cable*, is when the Strands about two Foot from the End are untwiſted, in order to make Sinnet of the Rope-yarn, and then to lay them one over the other again, making it leſs towards the End, where all is made faſt together with a Piece of Marlin, the Deſign of which is partly to keep the Cable from raveling out, but chiefly that none of the Cable may be cut off, and ſtole away.

POINT *In*, when two Piles are born in a Coat of Arms, ſo as to have their Points meet together in any part of the Eſcutcheon. They ſay, *He beareth two Piles in Point*.

POINTS *in Heraldry*, are ſeveral Places in an Eſcutcheon, diverſly named according to their Situation. See the Word *Eſcutcheon*.

POINT *Campion*,
POINT *Dexter*,
POINT *Plain*,
POINT *in Point*,
} All Abatements of Honour; which ſee under that Word.

POINTS *of Station*, in Aſtronomy, are thoſe Degrees of the Zodiack, in which a Planet ſeems to ſtand quite ſtill, and not to move at all.

POLAR *Circles*, are two Circles ſuppoſed to be drawn parallel to the *Equinoctial* or *Equator*, thro' 23 Degrees 30 Minutes Diſtance from the *Polar Points*; and that about the *North-Pole* is called the *Arctick Circle*, and the other about the *South-Pole*, the *Antarctick Circle*, becauſe oppoſite to the former.

POLAR *Dyals*, are thoſe whoſe Plane are parallel to ſome Great Circle that paſſes thro' the *Poles*, or parallel to ſome one of the Hours; ſo that the *Pole* is neither elevated above, nor depreſſed below the Plane, therefore the Dyal can have no Centre, and conſequently its *Stile*, *Subſtile*, and *Hour Lines*, are parallel. This therefore will be an Horizontal Dyal to thoſe who live under the *Equator* or *Line*.

In a *Direct Polar Dial*, the Hour Lines muſt be drawn all parallel to the Hour Line of Twelve.

The *Style* may be either a ſtrait Pin ſet upright, or a Wyer made to lie parallel to the Plane, and muſt ſtand over the Hour-Line of Twelve.

The Length of the Plane may be taken in any Inches, or Parts of Inches, reckoning the Inch to be divided into 10, or 100 Equal Parts.

Then for the *Height of the Style*, ſay,

As the Tangent of the Hour-Line 4 or 5, is to to the Logarithm of their Diſtance from the Meridian in Inches and Parts.

So is the Radius, to the *Height of the Style* in Inches and Parts.

For the *Hour-Lines*; ſay,

As the *Radius* is to the Logarithm of the *Styles Height*, in Parts of Inches.

So is the Tangent of any *Hour-Line*, to the Logarithm of the Diſtance thereof from the Meridian Line.

Example.

Suppoſe your *Polar Plane* be 12 Inches long, and it be required to put on all the Hour-Lines from 7 in the Morning unto 5 in the Afternoon.

Here you have 5 Hours and 6 Inches on either Side of the Meridian; and before you work the Operation, the Hours and Inches muſt be reduced into Degrees or Parts, allowing for every Hour or Inch 15 Degrees, or 100 Parts, ſo you'll have 75 Degrees, and 600 Parts.

Then for the *Styles Height*.

To the *Ar. Co.* of the Tangent 75° (= 5 Hours) — — — —	9.428053
Add the Logarithm of the Diſtance from the Meridian 600 Poles —	2.778151
Sum = the Logarithm of the *Styles Height*, 161 Parts. — — —	2.206204

That is, 1 Inch, and 61 Parts of an Inch.

For the *Hours Diſtance from the Meridian*.

To the Log of the *Stiles Heig.* 161 Pts.	2.206204
Add the Tang. 15° (for the 1ſt Hour)	9.428052
Sum = Radius = Logarithm of the Hours Diſtance = 43 Parts —	1.634256

After the ſame manner may you find the other *Hours Diſtance from the Meridian*.

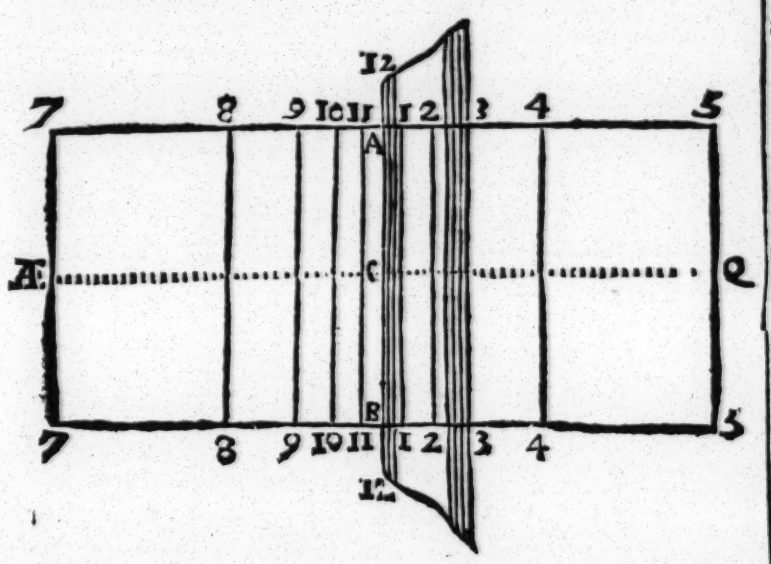
Then

Then draw them in a Table thus:

Hours.		Angles at the Poles		Tangent.	
H.	H.	G.	M.	Inch.	Parts.
12		00	00	00	00
11	1	15	00	00	43
10	2	30	00	00	63
9	3	45	00	1	61
8	4	60	00	2	79
7	5	75	00	6	00
6	6	90	00	*Infinit.*	

To project the Dyal.

First Draw on the Plane the *Meridian Line* A B, which croſs at Right Angles with Æ Q, the *Æquator*: Then from *c*, the Interſection of the *Meridian* and the *Æquator*, ſet off thoſe *Parts* from the Table both ways, and thro' theſe Points draw Lines parallel to A B, (or the Hour-Line of 12,) thoſe ſhall be the *Hour-Line I required.*



POLAR *Projection*, is a Repreſentation of the Earth, or of the Heavens, projected on the Plane of one of the *Polar Circles.*

POLARITY, is the Property of the Magnet, or of a Piece of Oblong Iron touch'd by a Magnet, to point toward the Poles of the World.

POLE, in Meaſuring, is the ſame with *Perch* or *Rod*, or as ſome call it, *Lugg*. By our Statute-Law, (*Ann.* 35 *Eliz. Cap.* 6.) this Meaſure is a Length of 16 Feet and an half, but it varies by the Uſage of ſome Countries, being in ſome Places of 18 Feet, which they call *Woodland Meaſure*; in ſome Places of 21 Feet, which is called *Church Meaſure*, (*i. e.* of ſuch Lands as did or do belong to the *Church*;) and in others of 24 Feet, and this is called *Foreſt Meaſure.*

POLE, in Mathematicks, is a Point 90 Degrees diſtant from the Plane of any Circle, and in a Line perpendicularly erected in its Centre; which Line is called the Axis. And from this *Polar Point* may Circles be deſcribed on the Globe or Sphere, as they are on the Plane from their Centre.

POLE *Star*, is a Star in the Tail of the *Little Bear*, (a Conſtellation of 7 Stars, which is called *Cynoſura*,) and is very near the exact *North Pole* of the World. The right Aſcenſion of this *Pole Star* for this Year, 1700, is 0 Hours 35 Minutes 0 Seconds of Time; and it increaſes 1 Minute 16 Seconds every 10 Years: Therefore having at any time this Star's Right Aſcenſion, and the Right Aſcenſion of the Sun, (both in time,) if you Subtract the latter from the former, (adding 24 Hours to the Right Aſcenſion of the *Pole Star* when it is leſs than the *Sun*'s,) the Remainder will be the Time when the *Pole Star* is in the Meridian. Then hang up two Strings and Plummets between the *Pole Star* and your Eye, and you will have a true *Meridian Line*, which will be of great Uſe to rectifie a Clock or Watch. And you may find the Meridian very nicely, if inſtead of the Strings above mentioned, you uſe the Sights of a good Circumferenter, or other Surveying Inſtrument.

Some Perſons have been might apt to imagine, That the Height or Elevation of the *Pole*, and alſo the Poſition of the *Circles* of the *Heavens*, in reſpect of thoſe on the Earth, hath much changed and varied: But Mr. *Caſſini* is doubtleſs right in his Aſſertion, That there is no juſt Ground for any ſuch Surmiſe: And that all the Difference which we find now in the Latitudes of Places, &c. in reſpect of the Ancient Accounts, ariſes from the former Obſervations not being well made; as indeed we may judge they cannot have been, ſince they had no ſuch good Inſtruments to do it withal, as the Modern Aſtronomers have.

Yet he thinks it very probable, that there may be ſome little Variation in the Height of the *Pole*, in one and the ſame Place; but this not exceeding two Minutes, and which will in Proceſs of Time quite vaniſh, after 'tis arrived to its higheſt Difference. Vid. *Memoires de Mathemat.* & *de Phyſique*, July, 1693.

POLE *of a Glaſs* (in *Opticks*) is the thickeſt part of a Convex, but the thinneſt of a Concave Glaſs, and if the Glaſs be truly ground, will be exactly in the middle of its Surface: This is ſometimes called, The *Vertex* of the Glaſs.

POLES *of the World*, are two Points in the Axis of the *Æquator*, each 90 Degrees diſtant from its Plane; one pointing *North*, which therefore is called, The *North* or *Arctick Pole*; the other *Southward*, which therefore is called, The *South* or *Antarctick Pole.*

Whether any People live directly under the Pole or not, is a Queſtion; but Mr. *Halley* hath proved, That the *Solſticial Day*, under the *Pole*, is as hot as under the Equinoctial, when the Sun is Vertical to them, or in their Zenith; becauſe for all the 24 Hours of that Day under the Pole, the Sun's Beams are inclined to the Horizon with an Angle of 23 ½ Degrees: Whereas under the Equinoctial, tho' he become Vertical, yet he ſhines no more than 12 Hours, and is abſent 12 Hours: And beſides, for 3 Hours 8 Minutes of that 12 Hours he is above the Horizon there, he is not ſo much Elevated as under the *Pole.*

POLES *of the Ecliptick* are Points in the *Solſtitial Colure* 23 Degr. 30 Minut. diſtant from the *Poles of the World*; and thro' theſe all Circles of Longitude in the *Heavens* do paſs, as the Hour Circles do thro' the *Poles* of the *Æquator.*

To find the *Pole* of any Circle. See *Spherick Geometry.*

POLEMICAL, is a Word uſed in reference to that part of Theology which relates to Controverſie; which becauſe of the Wars, Jars, and Squabbles, that uſually ariſe about Controverted Points, is called *Polemical Divinity.*

POLICY

POLICY *of Assurance*, is a Form of Security, mentioned in 43 *Eliz. cap.* 12, & 14; and also in 14 *Car.* 2. *cap.* 23. and given by a certain Society of Men formed into a kind of Corporation, to any Person to Insure the safe Return of the whole or any part of a Ship; to Insure Houses against Fire; so that if they are burnt down, they shall be Rebuilt at the proper Charge of the Insurers; and to Insure Mens Lives in Offices when they have paid great Sums for the same; and lastly, to Insure to Persons paying so much Money at once, or becoming constant Contributors to the Office or Society of Assurance, a Remainder of so much Money after the said Contributor or Subscriber's Death. This Policy of Assurance is under the Seal of the Office, and entitles the Person Benefitted by it, to make good his Claim according to the Tenor of the Articles or By-Laws of that Society of which he was a Member.

POLLUX, a fix'd Star in the *Twins*, of the Second Magnitude, whose Longitude is 108 Degrees 47 Minutes, Latitude 6 Degrees 38 Minutes.

POLYACOUSTICKS, are Instruments contrived to Multiply Sounds, as Multiplying-glasses or Polyscopes do Images of Objects.

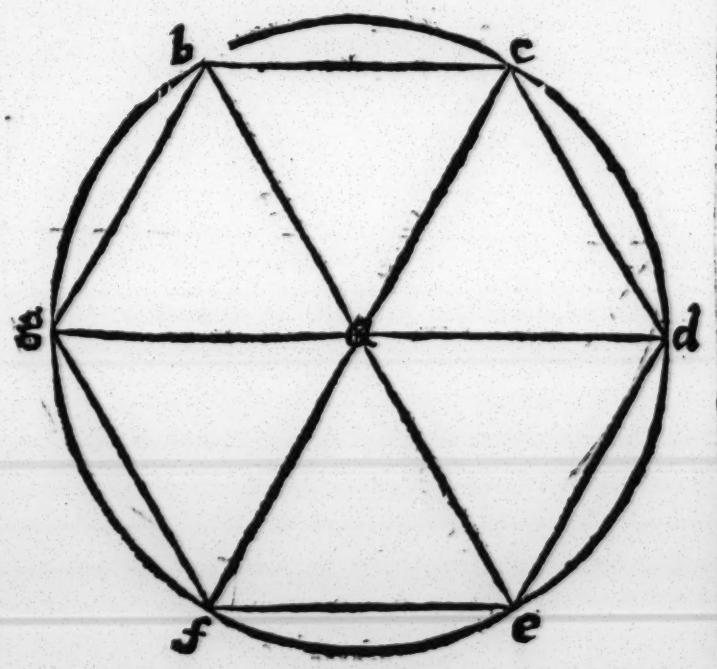
POLYEDRON, the same with *Polyhedron*.

POLYGON, a Term in Geometry, signifying in the general any Figure of many Sides and Angles; tho' no Figure is called by that Name, unless it have more than four or five Sides.

And if all the Sides and Angles be equal, then 'tis called a *Regular Polygon*.

For its Superficial Content, see *Area*.

Every *Polygon* may be divided into as many Triangles as it hath Sides.



If you take a Point, as *a*, any where within the *Polygon*, and from thence draw Lines to every Angle, *a b*, *a c*, *a d*, &c. for they shall make as many Triangles as the Figure hath Sides.

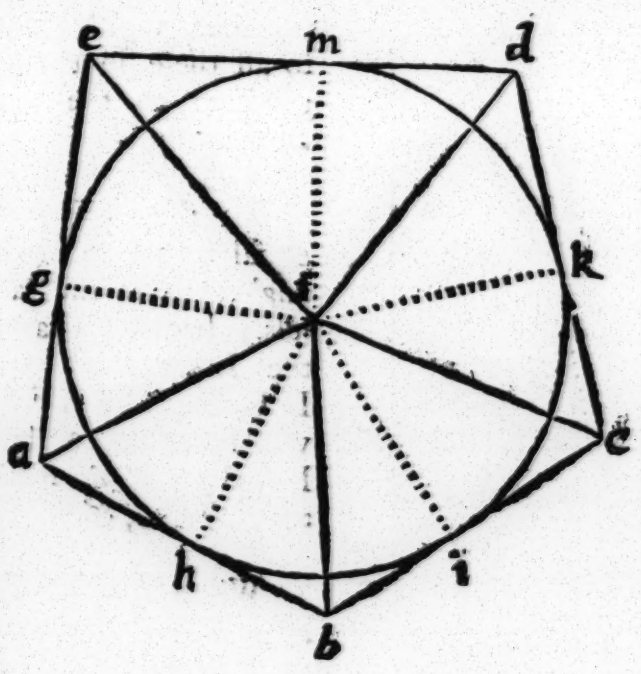
The Angles of any *Polygon* taken together, will make twice as many Right ones, except four, as the Figure hath Sides.

Thus, if the *Polygon* have six Sides, (as in the Figure above) the double of that is 12; from whence take 4, there remains 8. I say, that all the Angles *b*, *c*, *d*, *e*, *f*, *g*, of that *Polygon* taken together, are equal to 8 Right Angles.

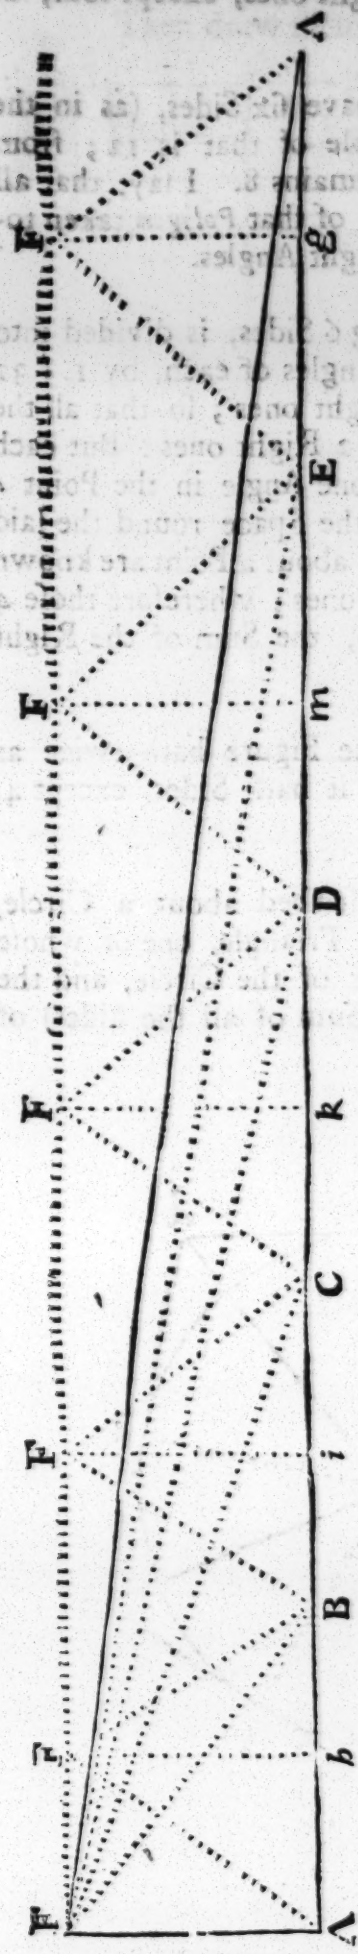
For the *Polygon* having 6 Sides, is divided into 6 *Triangles*; and the 3 Angles of each, by 1. & 32 *Eucl.* are equal to 2 Right ones; so that all the Angles together make 12 Right ones: But each of these *Triangles* hath one Angle in the Point *a* and by it they compleat the Space round the said Point; and all the Angles about a Point are known to be equal to 4 Right ones; wherefore those 4 taken from 12, leave 8, the Sum of the Right Angles of the *Hexagon*.

So that 'tis plain, the Figure hath twice as many Right Angles, as it hath Sides, except 4. *Q. E. D.*

Every *Polygon* circumscribed about a Circle, is equal to a Rectangled Triangle, one of whose Legs shall be the Radius of the Circle, and the other the *Perimeter* (or Sum of all the Sides) of the *Polygon*.



Let



Let the Line F A be equal to *Radius f h*, and to it at Right Angles draw the Infinite Line A B C D, &c. out of which take A *h* = to *a h*, *b* B = *b h*, B *i* = *b i*, and *i* C = *i c*, &c. So that the whole Line A B C D E A, may be equal to the whole Compaſs or *Perimeter* of the *Polygon a b c d e a*.

Alſo draw F F parallel to A A; ſo that all the Perpendiculars F *h*, F *i*, F *k*, &c. may be equal to the Radius *f h*, *f i*, &c.

'Tis then plain, That the Triangle A F B will be equal to the Triangle *a f b* in the *Polygon* and the △ B F C = △ *b f c*, alſo the △ C F D = △ *e f d*, &c. So that all theſe Triangles taken together, will be equal to all theſe in the *Polygon*, or to the whole *Polygon*.

But the △ F A A is equal to all the 5 Triangles within the Parallels; becauſe drawing the Lines B F, C F, D F, &c. The △ F A B, will be equal to the △ F A B; the △ F C B = △ F C B, &c.

Wherefore the Triangle F A A is equal to the *Polygon*, which was to be proved.

COROLLARY I.

Hence every *Regular Polygon* is equal to a *Rectangle Triangle*, one of whoſe Legs is the Perimeter of the *Polygon*, and the other a Perpendicular drawn from the Centre to one of the Sides of the *Polygon*.

COROLLARY II.

And every *Polygon* circumſcribed about a Circle, is bigger than it; and every *Polygon* inſcribed, is leſs than the Circle, as is manifeſt; becauſe the thing containing, is always greater than the thing contained.

COROLLARY III.

The Perimeter of every *Polygon* circumſcribed about a Circle, is greater than the Circumference of that Circle; and the Perimeter of every *Polygon* inſcribed is leſs.

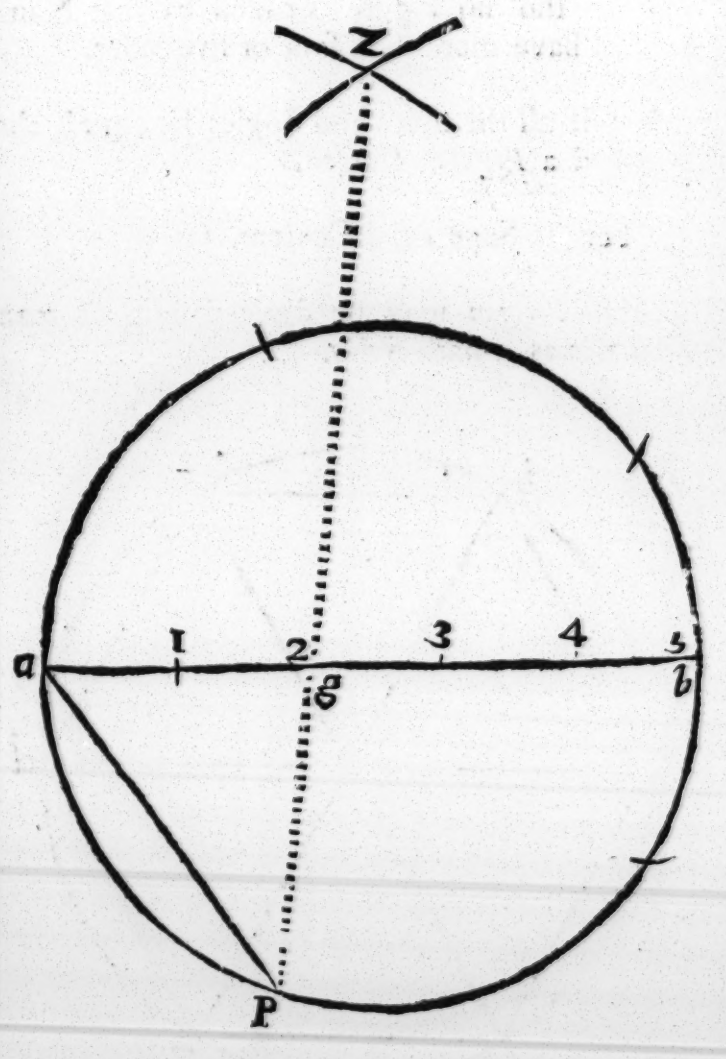
Hence,

A *Circle* is equal to a *Right Angled Triangle*, whoſe *Baſe* is the *Circumference* of the *Circle* and its Height the *Radius* of it.

For this *Triangle* will be leſſer than any *Polygon* conſcribed, and greater than any inſcribed, (becauſe the Circumference of the *Circle*, which is the Baſe of the *Triangle*, is greater than the Compaſs of any inſcribed:) Therefore it will be equal to the *Circle*. For if this *Triangle* be greater than any thing that is bigger than the *Circle*, and leſſer than any thing that is leſſer than the *Circle*; it follows, that it muſt be equal to the *Circle*.

This is called the *Quadrature* or *Squaring of the Circle*; that is, to find a Right-lined Figure equal to a Circle; upon this Suppoſition, That the *Baſis* given, is equal to the *Circumference* of the *Circle*, but actually to find the Right Line equal to the *Circumference* of a *Circle*, is not yet diſcovered *Geometrically*.

To inſcribe any Polygon *in a Circle.*



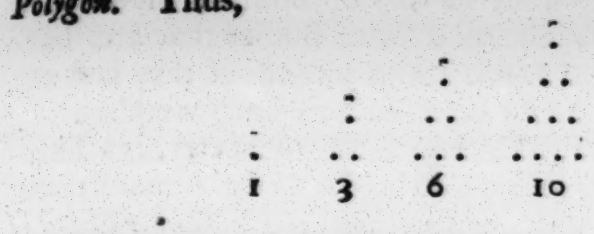
Divide *a b*, the Diameter of the Circle, into as many equal Parts as the *Polygon* is to have Sides; (viz. 5.) and then with the Length of that whole Diameter make two Arks interſecting each other above, as in *z*; and lay a Ruler from *z* thro' *g*, the ſecond Diviſion of the Diameter, which will find below the Point *p*. So is the Chord *a p* the Side of the *Polygon* required; which here is a *Pentagon*.

POLYGON,

POLYGON *Exterior*, in Fortification, is the Diſtance of one Point of a Baſtion from the Point of another, reckoned all round the Work.

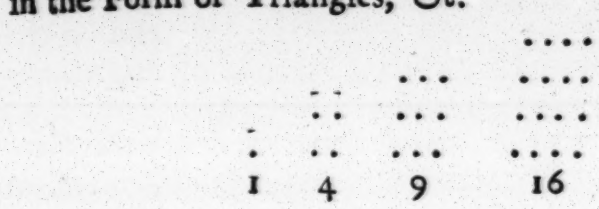
POLYGON *Interior*, is the Diſtance between the Centres of any two Baſtions, reckon'd all round as before.

POLYGONAL *Numbers*, are ſuch as are the Sums or Aggregates of *Series* of Numbers in Arithmetical Progreſſion, beginning with Unity; and ſo placed, that they repreſent the Form of a *Polygon*. Thus,



1 3 6 10

are Triangular Numbers, becauſe they are the Aggregates of a certain Number of Points placed in the Form of Triangles, *&c.*



1 4 9 16

are Quadrangular Numbers, *&c.*

POLYGRAM, is a Geometrical Figure conſiſting of many Lines.

POLYHEDROUS *Figure*, in Geometry, is a Solid contained under or conſiſting of many Sides; which, if they are *Regular Polygons*, all Similar and Equal, and the Body be inſcribable within the Surface of the Sphere, 'tis then called a *Regular Body*. See that Word.

POLYNOMIAL, or *Multinomial Roots*, in Mathematicks, are ſuch as are compoſed of many Names, Parts, or Members; as,

$$a + b + d + c.$$

In *Philoſ. Tranſ.* N. 230. you have a curious Method of raiſing an Infinite *Multinomial* to any Given Power; or of extracting any Given Root out of ſuch Power: Which was diſcovered from Sir *Iſaac Newton*'s Theorem for raiſing a *Binomial* to any Given Power, or Extracting the Root of the ſame, by that Ingenious and Excellent Algebraiſt Mr. *Abr. de Moivre*.

POLYPETALOUS *Flower*, is the Term in Botany for the Flower of a Plant which conſiſts of more than Six diſtinct Flower-leaves ſet round to form it; and which fall off ſingly.

POLYPUS, is a Swelling in the Hollow of the Noſtrils, and is Two-fold; either like a Tent, and then it goes by the general Name of *Sarcoma*; or ſuch an one that has a great many diſtinct Branches or Feet, which extend either to the Outſide of the Noſe, or the Inſide of the Mouth. Their Colour is White, oftentimes Reddiſh, and ſometimes Black and Livid.

Excreſcencies of this Nature happen not only in the Noſtrils, but ſometimes in the Heart, and in the Cavities of the thicker Membrane of the Brain. *Blanchard.*

POLYSCOPES, or *Multiplying Glaſſes*, are ſuch as repreſent to the Eye one Object as many.

POLYSPASTUM, a Term in Mechanicks, the ſame with the *Trochlea* or *Pully*.

POLYSPERMÆ *Plantæ*, are ſuch Herbs or Plants as have more than Four Seeds ſucceeding each Flower, and this without any certain Order or Number.

Theſe Mr. *Ray* makes to be a diſtinct kind of Herbs, calling them *Herbæ ſemine nudo Polyſpermæ*: Where by *Semine nudo* he means ſuch Seeds as do not put off, ſpontaneouſly the Integuments or Coverings which they either have, or appear to have, but fall covered with it from the Mother-Plant.

Theſe kind of Herbs he divides into Two ſorts.

I. Such as have a *Calyx* or *Perianthium* to their Flower; and this conſiſting either of,

1. *Three Leaves*; the Flower alſo being *Tripetalous*, or having but Three Leaves: As, the *Plantago Aquatica*, and the *Sagittaria*, both Water-Plants.

Or where the Flower is *Polypetalous*, and the *Calyx* falling together with the Flower; as in the *Chelidonium minus*; or remaining after the Flower is dropt, as in the *Hepatica Mobilis*.

2. *Five Leaves*; in ſome *Deciduous* with the Flower, as in the *Ranunculus*, In others *Perennial*, as in the *Helleborus niger ferulaceus*; or *Annual*, as in the *Flos Adonis*.

3. *Eight Leaves*; as the *Malva* and *Alcea*.

4. *Ten Leaves*; as the *Carrophylla, Fragraria, Pentaphyllum, Tormentilla, Argentina, Althæa*, and *Pentaphylloides*.

II. Such as have no *Calyx* or *Perianthium*; as the *Clematis, Pilipendula, Ulmaria, Anemone Nemorum, Pulſatilla*, &c.

POMIFEROUS *Herbs*, are (according to Mr. *Ray*) ſuch as have the largeſt of Fruit of any Plants whatever, and this covered with a thick hard Rind or Bark; by which they are diſtinguiſhed from the *Bacciferous Herbs*, which only have a thin Skin over the Fruit.

Theſe kind of Plants have a naked *Monopetalous* Flower, divided into Five Jaggs or Partitions, and growing on the top of the ſucceeding Fruit. And theſe either are,

1. *Capreolate*, or creeping along the Ground, *&c.* by means of their Tendrils, (*Capreoli*) as the *Cucurbita, Melo, Cucumis, Cepo, Belſamina, Anguria*, and *Colocynthis*. Or,

2. Without *Capreoli* or Tendrils; as the *Cucurbita Clypeata*, or *Melo-Cepo, Clypeiformis*.

POMIFEROUS *Trees*, ſee *Trees*) are ſuch as have their Flower on the top of the Fruit, and their Fruit in the Form of an Apple or Pear.

POMPHOLIGODES, Urine with many Bubbles upon it; which are frequent, if the Body be puft up or painted. *Blanchard.*

POMUM *Adami*, is a Protuberance in the Foreſide of the Throat; ſo called, becauſe 'tis fooliſhly thought a piece of the Apple ſtuck in *Adam*'s Throat, as part of his Puniſhment, and hence derived to his Poſterity. *Blanchard.*

In Reality 'tis only the Convex part of the firſt Cartilage of the *Larynx*, called *Scutiformis*. This is greater in Men than Women.

PONE, is a Writ, whereby a Cauſe depending in the County Court, or other Inferior Court, is removed into the Common-Pleas.

PONE *per Vadium*, is a Writ to the Sheriff to take Surety of one for his Appearance at a Day aſſigned.

PONENDIS *in Aſſiſis*, is a Writ founded upon the Statute of *Weſt.* 2 *cap.* 38. and upon the Statute *Articuli Super Chartas*, cap. 9. Which Statutes ſhew what Perſons Sheriffs ought to impannel upon *Aſſiſes* and Juries, and what not.

PONENDUM *in Ballium*, is a Writ commanding a Priſoner to be bailed, in Caſes Bailable.

PONENDUM *Sigillum ad exceptionem*, is a Writ whereby the King willeth the Juſtices, according to the Statute of *Weſtm.*2.to put their Seals to Exceptions laid in by the Defendant againſt the Plaintiff's Declarations, or againſt the Evidence, Verdict, or other Proceedings before the Juſtices.

PONS *Cerebri*, (by ſome) is a Congeries or Heap of innumerable Filaments divaricated out of the Solider Subſtance of the Brain, whence all the Nerves take their Riſe.

PONTAGE, is a Contribution towards the Maintenance or Re-edifying of Bridges. It may alſo ſignifie Toll taken to this Purpoſe of thoſe that paſs over Bridges.

PONTIBUS *Reparandis*, is a Writ directed to the Sheriff, *&c.* willing him to charge one or more to Repair a Bridge, to whom it belongeth.

PONTON, in Fortification, is a Bridge made of two Boats, at ſome Diſtance one from another, both covered with Planks; as alſo the Internal Space betwixt them. They have Props and Rails on each ſide; and the whole Structure ought to be ſo ſolid, as to be able to tranſport the Horſe, together with Cannon and Baggage, as well as the Infantry.

PONT *Volant*, or the *Flying Bridge*, uſed in Sieges, is made of two ſmall Bridges laid one over another; and ſo contrived, by the means of Cords and Pulleys placed along the ſides of the Under Bridge, that the Upper can be puſhed forwards 'till it joins the Place where it is to be fixed; But however the whole Length of both theſe Bridges muſt not be above Four or Five Fathom long, leſt they ſhould break with the Weight of the Men. Theſe are chiefly uſed to ſurpriſe Outworks or Poſts that have but narrow Moats.

POOP *of a Ship*, is the Floor or Deck over the Round-houſe or Maſter's Cabin, being the higheſt or uppermoſt part of her *Hull*, *a-ſtern*.

POPLITEA *Vena*, is the Vein of the Ham, and ſometimes reaches down the back of the Leg even to the Heel. This comes from the *Iliacal* Branches of the *Vena Cava*; which, after they deſcend as low as the Thighs, are called *Crurales*.

POPLITEUS, by ſome called *Subpopliteus*, is a Muſcle of the Leg, which ariſeth with a ſhort ſtrong Tendon from the External Head of the Inferior *Appendix* of the *Os Femoris*; from whence deſcending obliquely over the Juncture, becomes Fleſhy, and expanding it ſelf, is ſo inſerted to the Superior part of the *Tibia* internally, immediately below its Superior *Appendix*. This aſſiſts the other Muſcles in bending the *Tibia*, and alſo Antagonizeth the *Biceps*, by turning the Foot and Toes outwards when we ſit with our Knees bended.

PORES, are ſmall Interſtices, Spaces, or Vacuities between the Particles of Matter that conſtitute every Body, or between certain Aggregates or Combinations of them. Thus, for Inſtance, thoſe little imperceptible Holes in the Skin, thro' which the Sweat and Vapours inſenſible breath out of the Body, are called *Pores*; and the having of ſuch Holes or *Pores* in any Body, is called *Poroſity* or *Porouſneſs*.

The Honourable Mr. *Boyle* has written a Particular *Eſſay* on the *Poroſity* of Bodies; in which he proves, That the moſt Solid Bodies that are, have ſome kind of *Pores*. And indeed, if they had not, all Bodies would be alike *Specifically* weighty.

PORIME, (Gr. πόρισμα) in Geometry, is a Theorem or Propoſition ſo eaſie to be demonſtrated, that 'tis almoſt ſelf-evident; as, *That a Chord is all of it within the Circle*. And on the contrary they call that an *Aporime*, which is ſo difficult as to be almoſt impoſſible to be demonſtrated; as the *Quadrature of the Circle* is now, and as the Squaring of any Aſſigned Portion of *Hippocrates* his Lunes was, 'till a little while ago.

PORISME, *Proclus* and *Pappus* define this Geometrical Term to ſignifie a kind of Theorem, in the form of a Corollary, which is dependant upon, or deduced from ſome other Theorem already demonſtrated. And 'tis commonly uſed to ſignifie ſome General Theorem, which is diſcovered from finding out ſome Geometrical Place: As, for Inſtance, if a Man hath found out by Algebra, or any other Method how to Conſtruct a *Local Problem*; and from that Place ſo conſtructed and demonſtrated, hath deduced ſome General Theorem, that Theorem is by the Geometrick Writers called a *Poriſm*. Of theſe *Poriſms*, Mr. *Ozanam*, in his *French Mathematical Dictionary*, gives many uſeful Inſtances; which ſee.

PORISTICK *Method*, in Mathematicks, is that which determines *when*, *by what way*, and *how many different ways*, a Problem may be reſolved.

POROCELE, is a Rupture proceeding from Callous Matter, or the Stone. *Blanchard*.

POROTICA, are Medicines, which, by drying, thickening, and aſtringent Qualities, turn part of the Nouriſhment into Brawny, Callous Matter. *Blanchard*.

POROSITY. See *Pores*.

PORTA, the ſame with *Vena Portæ*.

PORT *the Helm*, a Sea-Term, ſignifying to put the Helm to the Left or *Larboard* ſide of the Ship; but however they never ſay *Larboard the Helm*, but always *Port it*; tho' they ſay *Starboard the Helm*, when it is to be put to the Right ſide of the Ship. A Ship is ſaid to *Heel a-port*, when ſhe ſwims not upright, but leans to the Left ſide. The Word

PORT, alſo ſignifies a Haven or Harbour; as alſo the Holes in a Ship's ſide thro' which her Great Guns are put out.

PORT-*Laſt*, the ſame as the *Gun-wale* of a Ship; therefore they ſay a *Yard is down a Port-Laſt*, when it lies down on the Deck.

PORTABLE *Barometer*, was firſt invented by the Honourable Mr. *Boyle*, and was effected by making the *Torricellian* Experiment in a long Glaſs Tube, ſealed at the top, and bent near the bottom up again, parallel to the longer Leg: For by this means the Quick-ſilver in the open and ſhorter Leg, ſupplied the Place of the ſtagnant Mercury in the Baſon or Ciſtern. The Inſtrument

ment was all of one piece, and might eaſily be carried from Place to Place without ſpilling the Mercury. By which means, Obſervations of the Weight of the Atmoſphere might be readily made on the Tops of Hills, Bottoms of Mines, &c.

But this open Tube could not be carried about with ſo much Eaſe and Safety as thoſe *Portable Barometers* which are *now* in Uſe, and which are made by Mr. *John Partrick*, Torricellian Operator in the *Old Baily*, with very great Exactneſs and Neatneſs: For in theſe there is an Invention to ſcrew the Mercury quite up to the Sealed end of the Tube, by which means it will not ſwag up and down in the Carriage, and ſo by its great Weight endanger the breaking of the Tube.

PORTCULLICE, *Herſe*, or *Sarazine*, in Fortification, ſignifie ſeveral great Pieces of Wood laid or joined acroſs one another like an Harrow, and at the Bottom it is pointed at the end of each Bar with Iron. Theſe formerly uſed to hang over the Gate-ways of Fortified Places, to be ready to let down in Caſe of a Surprize, when the Enemy ſhould come ſo ſoon, as that there is no Time to ſhut up the Gates. But now a-days the *Orgues* are more generally uſed, as being found to be much better. See *Orgues*.

PORTICO, or *Porch*, in Architecture, is a long Place cover'd either with a vaulted Roof, or an even Floor, ſupported by Pillars. But this Word may be applied to ſignifie all manner of Diſpoſitions of Columns in a Gallery.

PORTIONER, where a Parſonage is ſerved ſometimes by two, or ſometimes by three Miniſters alternately. The Miniſters are called *Portioners*, becauſe they have but their Portion, or Proportion of Tythes or Profits of the Living.

PORTMOTE, ſignifies a Court kept in Haven Towns, as *Swainemote* in the Foreſt, and is called the *Portmote Court*.

PORUS *Bilarius*, or *Meatus Hepaticus*, is a Pipe or Channel paſſing directly from the Liver to the *Ductus Communis*, and which tranſmits the Bile from the Liver, by the Intervention of ſome ſmall Glandules. Within the Liver, its Trunk and Branches are inveſted with a double Coat: A *Proper* one which it retains alſo without the Liver; and another common to it and the *Porta*, called *Capſula Communis*, which it hath from the Membrane of the Liver. In this Common Coat, this *Porus* and the *Porta* are ſo cloſely enwrapped, that at firſt they appear but one Veſſel; but if you hold them up to the Light, you will diſcover Veſſels of two Colours; and then you may dexterouſly rip up the *Capſula*, and ſo lay them open. Its Roots within the Liver are equally divided with thoſe of the *Porta* every where, except in that little Space where the Roots of the *Veſica* are ſpread in the Right ſide of the Liver; and they are both larger and more numerous than thoſe of the *Veſica*, drawing Choler from all Parts of the Liver almoſt. And this *Porus Bilarius* ſeems to be a more neceſſary Part than the Gall-Bladder, or *Veſica*; becauſe in many Creatures, as Red and Fallow Deer, Horſes, &c. the *Veſica* is wanting, but none want this. Without the Liver, 'tis as wide again as the *Meatus Cyſticus*, with which it joins at two Inches Diſtance from the Liver; and ſo both make up the *Ductus Choledochus Communis*. The *Porus* hath no Valve in its whole Progreſs; only the *Ductus Communis*, at its Entrance into the Inteſtines, having pierced the Outer Coat, paſſes between *that* and the Middlemoſt Coat, for about the 12th part of an Inch; and then piercing *that* alſo, marches down farther between it and the Inner Coat of the Gut, for about half an Inch, and at laſt opens with a round Mouth into the Inteſtine: So that this Oblique Inſertion (like that of the Ureters into the Urinary Bladder) ſerves inſtead of a *Valve*, to hinder any thing from Regurſitating out of the Guts into this Duct: And this is farther prevented alſo by the flaggy, looſe Conſtitution of the Inner Tunick of the Guts; which, when any thing would enter, the Mouth of the *Porus* claps cloſe upon it, and ſtops it. There are no *Anaſtomoſes* between the Roots of this Duct and thoſe of the *Porta*, as have been often ſaid; For the Extreme Capillary Twigs of the *Porus* terminate in the *Parenchyma* of the Liver, out of whoſe Glandules they imbibe the Choler, there ſeparated from the Blood.

POSITION, or *Site*, is an Affection of Place, and expreſſes the Manner of any Bodies being in a Place: This therefore is not *Place*, nor indeed hath it any Quantity; as Sir *Iſ. Newton* well obſerves in *Princip. Mathem.* p. 6.

POSITION, or the *Rule of Poſition*, otherwiſe called the *Rule of Falſhood*, is a Rule in Arithmetick, wherein any Number is taken to work the Queſtion by, inſtead of the Number ſought; and ſo by the Error or Errors found, we find the Number required.

This *Rule of Falſe Poſition* is of two kinds, *viz.* *Single* and *Double*.

POSITION *Single*, is when there happens in the Propoſition ſome Partition of Numbers into Parts Proportional; and then at one Operation the Queſtion may be reſolved, by this Rule.

Imagine a Number at pleaſure, and work therewith according to the Tenor of the Queſtion, as if it were the true Number; and what Proportion there is between the Falſe Concluſion and the Falſe Poſition, ſuch Proportion hath the Given Number to the Number ſought: Therefore the Number found by Argumentation ſhall be the firſt Term of the *Rule of Three*, and the Number ſuppoſed ſhall be the ſecond Term, and the Given Number ſhall be the third Term.

Example.

Three Men, *A.* *B.* and *C.* conſent to buy a Ship for 220 *l.* So that *B.* muſt pay twice as much as *A.* and *C.* four times as much as *B.* How much muſt each Man pay?

Anſwer. Suppoſe *A.* paid 8 *l.* then (according to the Queſtion) *B.* muſt pay 16 *l.* and *C.* four times as much, *i. e.* 64 *l.* But all theſe Numbers added together, make no more than 88 *l.* whereas there ſhould be 220 *l.* Yet by the help of this Number, I ſay, If 88 *l.* come of 8 *l.* of what comes 220 *l.* wherein the Work is gain'd 20 *l.* for the Part of *A.* Then *B.* muſt pay 40 *l.* and *C.* 160; which added together, give 220 *l.* the Number propounded.

		Position falſe.	*Concluſ. true.*
Poſition	8	88 *l.* : 8 *l.* : : 220 *l.* : 20 *l.*	*A.*
Double	16	40	*B.*
Quadruple	64	160	*C.*
	88	220	Proof.

If there be a Fraction or Fractions in the Queſtion, then for more Facility in Proceeding take ſuch a Number for the *Poſition* as may be equally parted by the Parts expreſt in the Queſtion.

In Queſtions propounded, it happens ſometimes that a Number ſtands unalterable by the Fractions given, and ſo may be ſubſtracted from the Sum given, and ſet by 'till the Operation be made with the reſt, and then reſtored again.

POSITION *Double*, is when there can be no partition in the Numbers to make a Proportion: Therefore you muſt make a Suppoſition twice, proceeding therein according to the Tenor of the Queſtion; and if either of the ſuppoſed Numbers happens to ſolve the Propoſition, the Work is done; but if not, obſerve the Errors, andwhether they be greater or leſſer than the Reſolution requireth, and mark the Errors accordingly, with the Signs + or −

Then multiply contrariwiſe the one *Poſition* by the other Error; and if the Errors be both too great, or both too little, ſubſtract the one Product from the other, and the one Error from the other, and divide the Difference of the Products by the Difference of the Errors.

But if the Errors be unlike, as the one +, and the other −, add the Products, and divide the Sum thereof by the Sum of the Errors added together: For the Proportion of the Errors is the ſame with the proportion of the Exceſſes or Defects of the Numbers ſuppoſed, to the Numbers ſought.

Example.

Two Men, *A.* and *B.* diſcourſing of their Money; *A.* ſays to *B.* *If I had two of your Pieces, I ſhould have twice as many as you have*; to which *B.* replies, *If I had two of yours, I ſhould have juſt as many as yau have*: How many had each?

Suppoſe *A.* had 16, to which 2 being added makes 18, which is twice 9; but having taken 2 from thence, it muſt be by this Suppoſition that *B.* had 11: Wherefore 2 taken from 16, and added to 11, makes 13 for *B.* and *A.* 14. But they ſhould be equal; therefore the Poſition is erroneous, and the Error too much by 1.

Again, Suppoſe *A.* had 20, then 20 + 2 = 22. that is twice 11; but from thence 2 being taken, *B*, muſt have 13. Now 2 from 20, and put to 13, gives 15 for *B.* and leaves 18 for *A.* which is not equal; therefore the Error again is 3 too much.

Then multiplying 16 the firſt Poſition, by 3 the ſecond Error, and alſo 20 the ſecond Poſition, by 1 the firſt Error; the Product 20 is taken from the Product 48, (becauſe the Errors are both + and the remainder 28 is the Dividend; and the leſſer Error 1 ſubſtracted from the greater Error 3, leaves 2 for the Diviſor; the Quotient of which Diviſion will be 14, the Number ſought for *A.* and then by conſequence *B.* muſt have 10: For 2 taken from 10, and added to 14, make 16 = twice 8; 2 taken from 14, and put to 10, makes 12 both alike.

First		Second
Poſition	16 \ / 20	*Poſition.*
Error	1+ 3+	*Error.*
	20 48	

Products 48 − 20 = 28 (14 *A.*
Errors 3 − 1 = 2 (10 *B.*

Proof.

14 + 2 = 16 } half.
10 − 2 = 8 }
14 − 2 = 12 } equal.
10 + 2 = 12 }

If the Suppoſitions had been 12 and 10, the Errors being both −, the Operation would have ſtood thus, as before, becauſe the Errors are alike.

First		Second
Poſition	12 \ / 10	*Poſition.*
Error	1− 2 −	*Error.*
	10 24	

Products 24 − 10 = 14 (14 *A.*
Error 2 − 1 = 1 (10 *B.*

But if the Suppoſitions are 20 and 10, then the Errors being found unlike; the Sum of the Products muſt be the Dividend, and the Sum of the Errors the Diviſor.

First		Second
Poſition	20 \ / 10	*Poſition.*
Error	3+ 2 −	*Error.*
	30 40	

Product 30 + 40 = 7 (14 *A.*
Errors 3 + 2 = 5 (10 *B.*

Note, 1. That as well in the *Single* as in the *Double Rule of Poſition*, tho' the Number ſuppoſed be never ſo falſe, a Reſolution may be had thereby: Yet for more Eaſe in the Operation, ſuppoſe a Number that may be parted equally into ſo many Parts as are neceſſary to the Reſolution of the Queſtion.

2. Let the Second *Poſition* be always *Homogeneal*, or of the ſame kind with the firſt; that is, belong both to one Man, one Thing, &c.

3. If both the Errors be equal in Numbers, and yet their Signs unlike, half of both the *Poſitions* is the Sum deſired.

4. All the Propoſitions reſolved by *Single Poſition*, will be reſolved by *Double Poſition*.

POSI-

POSITIVE of Degree of Comparison in Grammar, is that which signifies the Thing simply and absolutely, without comparing it with others; it belongs only to *Adjectives*.

POSITIVE *Levity*. See *Levity*.

POSITIVE *Quantities* in *Algebra*, are such as are of a Real and Affirmative Nature, and either have, or are supposed to have the Affirmative or Positve Sign + before them, and 'tis always used in opposition to the *Negative Quantities*, which are defective, and have this Sign— before them.

POSSE *Comitatus*, a Term in Law, signifying the Aid and Attendance of all Knights, Gentlemen, Yeomen, Labourers, Servants, Apprentices, and all others, above the Age of Fifteen Years within the County; except Women, Ecclesiastical Persons, and such as are decrepid, or labour of an Infirmity: And the Statute of 2 *H.* 5. *cap.* 8. says, *That Persons able to Travel, shall be assistant in this Service*, which is used where a Possession is kept upon a Forcible Entry, or any Force of Rescue used, contrary to the Command of the King's Writ, or in opposition to the Execution of Justice.

POSSESSION, in a Legal Sense, is taken twofold, *Actual* and *in Law*: *Actual Possession* is, when a Man actually enters into Lands and Tenements to him descended. *Possession in Law*, is when Lands or Tenements are descended to a Man, and he hath not as yet actually entred into them. As for Example.

Before or until an Office be found of Lands Escheated by an Attainder, the King hath only a *Possession in Law*, and not in *Deed*: There is also a Unity of *Possession*, which the *Civilians* call *Consolidationem*. If the Lord purchase the Tenancy held by *Heriot Service*, then the *Heriot* is extinct by Unity of *Possession*; that is because the Seigniory and the Tenancy are now in one Man's *Possession*.

POSSESSIVES, in Grammar, are such *Adjectives* as signifie the Possession of, or Property in some Thing.

POSTEA in Law, is the Return of the Proceeding by *Nisi prius*, into the Court of *Common-Pleas*, after a Verdict, and there afterwards Recorded.

POST-*Brachiale*, vid. *Metacarpus*.

POST *Diem*, is the Return of a Writ after the Day assigned, for which the *Custos Brevium* hath four Pence, whereas he hath nothing if it be return'd at the Day; sometimes it is taken for the Fee it self.

POST *Disseisin*, is a Writ given by the Statute of *Westminst.* 2. *cap.* 26. and lies for him that having recovered Lands or Tenements by *Præcipe quod reddat* upon the Default or Reddition, is again disseised by the former Disseisor.

POST *Fine*, in Law, is a Duty belonging to the King, for a Fine, formerly acknowledged before him in his Court, which is paid by the Cognisee, after the same is fully passed, and all things performed touching the same; the Rate thereof is so much, and half so much as was paid to the King for the Fine, and is Collected by the Sheriff of the County, where the Land, *&c.* lies whereof the Fine was levied, to be answered by him into the Exchequer.

POST *Terme*, is a Return of a Writ, not only after the Day assigned for the Return thereof, but after the *Term* also; for which, the *Custos brevium* takes the Fee of Twenty Pence; sometimes also it is taken for the Fee it self.

POSTERN, in Fortification, is a false Door usually made in the Angle of the *Flank*, and of the *Curtain*, or near the *Orillon* for private Sallies.

POSTICUM, is the *Postern-Gate*, or *Back-Door* of any Fabrick.

POSTULATES, or *Demands* in *Mathematicks*, &c. are such easy and self-evident Suppositions as need no Explication or Illustration to render them Intelligible. As,

That a Right Line may be drawn from one Point to another.

That a Circle may be described on any Centre given, of any Magnitude, &c.

POSTULATION, (in the Law) is made upon the Unanimous Voting of any Person to a Dignity or Office, of which he is not capable by the Ordinary Canons or Statutes, without special Dispensation.

POTANS, or *Potence*, a Part of a Watch; see under *Balance*.

POTENT, or *Potence*, the Term for a Cross in Heraldry, formed into this Figure.

He beareth *Sable*, *a Cross Potent*, *Or*, by the Name of *Aleyn*.

This form represents the upper end of a Crutch; for Anciently Crutches were called *Potents*.

POTENT, *Counter Potent*, a Term in Heraldry: See *Vairy Copy*.

POTENTIAL *Coldness*, is a Relative Quality which some Drugs, Simples, or Compound Medicines are supposed to be endowed with: And therefore you will find frequently in some Old Books, or in the Writings of such as follow the Old Physicians, that such a Plant or Drug, is cold in the 2d or 3d Degree: The meaning of which, is, not that such a Plant is actually Cold to the Touch, but that it is Cold in its Effects and Operations, if taken Inwardly. And whenever such an Effect doth follow the taking of such Medicine, Mr. *Boyle* thus accounts for it according to the Mechanical Philosophy, *viz.* That this Body, which they call *Potentially Cold*, is made up of *Corpuscles* of such a Size, Shape, *&c.* that being disjoined and resolved by the *Menstruum* of the Stomach, or the Fluids it may elsewhere meet with, they do so intimately associate themselves with the small parts of the Blood and other Liquors, as by clogging and impeding them to lessen their wonted Agitation; and perhaps also to make them act in a peculiar way, as well as less briskly on the Nervous and Fibrous parts of the Body: The Perception of which *Imminution*, or perhaps *Change* of Motion in the Organs of Feeling, is that, which being referred to the Body that produced it, is called *Potential Coldness*.

Hence, if it be supposed that in Agues some Morbifick Matter of a viscous, or not easily dissipable Texture, be harboured in some part of the Body, and requires such a Time to be made fluid and resolvable, which is an *Hypothesis* generally received, the Cold Fits in these Diseases, will be plausibly accounted for.

Also the Shiverings and Cold arising from the taking of most Poisons, may hence be solved; and that lesser Degree of it which seizes *Hypochondriack* and *Hysterical* Persons.

POTENTIAL *Mood in Grammar*, is the same in form with the *Subjunctive*; but differs in this

That

That it hath always Implied in it, either *Possum, Volo*; or *Debeo*; as *Roget Quis*, that is, *Rogare potest*, a Man may ask. 'Tis sometimes called, The *Permissive* Mood, because it implies often a Permission or Concession to do a thing: As

Habeat, valeat, vivat cum illa. Terent.

POUR *fair proclamee, que null inject fimes ou ordures en fosses, on rivers pres Cityes*, &c. is a Writ directed to the Mayor, Sheriff, or Bailiff, of a City or Town, commanding them to proclaim, That none cast Filth into the Ditches or Places near adjoyning, and if any cast already, to remove it.

POUR *Party*, is a Term in Law, contrary to *pro indiviso*; for to make *Pour party*, is to divide and sever the Lands that fall to *Parcener*, which before Partition they hold jointly, and *pro indiviso*.

POUR *Seisir Terres la feme que tient en Dower*, &c. was a Writ whereby the King Seised upon the Land, which the Wife of his Tenant that held *in Capite*, deceased, hath for her Dowry, if she Married without his Leave; and is grounded upon the Statue of the King's Prerogative.

POUR *Suivant*, signifies the King's Messenger attending upon him in his Wars, or at the Council Table, Exchequer, in his Court, or his Chamber, to be sent upon any Occasion or Message; as for the Apprehending of a Person Accused, or Suspected of any Offence: Those that be used in Martial Causes, are called *Pursuivant at Arms*, others are used upon Messages in time of Peace, and especially in Matters touching Jurisdiction.

POURVEYANCE, is the providing, Corn, Fuel, Victual, and other Necessaries for the King's House.

POURVEYOR, signifies an Officer of the King or Queen, or other great Personage, that provideth Corn and other Victual for their House.

POWCHES, so the Seamen call small Bulkheads made in the Hold of a Ship, to stow Corn, Goods, or the like, that it do not shoot from one side to the other.

POWERS in *Algebra*, are Numbers arising from the Squaring or Multiplication of any Number or Quantity by it self, and then that Product by the Root or first Number again; and this Third Product by the Root again; and so on *ad Infinitum*; as, 2, 4, 8, 16, 32, 64, 128, 256, &c. Where 2 is called the Root or First Power, 4 is the Square or Second Power, 8 is the Cube or Third Power, 16 is the Biquadrate or Fourth Power, &c. And these Powers in Letters or Species, are expressed by repeating the Root as often as the Index of the Power expresses, thus; a is the Root or First Power, $a\,a$ the Square or Second Power, $a\,a\,a$ the Cube, $a\,a\,a\,a$ the Biquadrate or Fourth Power. And to avoid the tediousness of repeating the Root so often when the Powers are high, we only put down the Root with the Index of the Power over it, thus: a^9, that is the ninth Power of a; b^{16}, b^{94}, are the sixteenth or the ninety fourth Powers of b.

POWERS, *Mechanicks*, are the Six Mechanical Faculties; the Ballance, the Leaver, the Wheel, the Pulley, the Wedge, and the crew; which are usually stiled the Six *Mechanick Powers*. The Force also or Strength brought for the moving of any Weight by any Engine, is called the *Power*. And the design of Mechanicks, is to teach Men how to add such a fitting Supplement to the Power, as that it may move any Weight required, with facility and cheapness, and in as little room as may be. See Vol. II.

POWERS *of Lines*, or Quantities are their Squares, Cubes, &c. or other Multiplications of the parts into the whole, or of one part into another.

POYNING's *Law*, is an Act of Parliament made in *Ireland* by *Hen.* 7. and so called, because Sir. *Edward Poyning* was Lieutenant there, when it was made; whereby all the Statutes in *England* were made of Force in *Ireland*, which before that time were not, neither are any now in force there which were made in *England* since that time.

PRACTICE in Arithmetick, is a Rule which expeditiously and commodiously answers Questions in the *Rule of Three*, when the first Term is 1, or Unity, and 'tis so called from its readiness in the *Practice* of Trade and Merchandise.

Of this Rule there are several Ways of Operation; As by

Reduction, or bringing the Price of the Pound, Ell, Yard, &c. into the Lowest Denomination of usual Money: The way to do which, see under the Word *Reduction*. And this way of Practice will be clear from these two Examples.

1. *At* 1 s. 2 d. *the Pound, what comes* 152 *Pounds to?*

Bring all into Pence, and say, 1 : 14 :: What shall 152 give?

Answer.

$152 \times 14 = 2128$ *d*, which reduced, gives 8 *l.* 17 *s.* 4 *d.*

2. *If* 1 *Pound cost* 3 s. 6. *d. what shall the Great Hundred and* 5 *Pound cost?*

Reduce 3 *s.* 6 *d.* into Six-pences, *i. e.* 7 Six-pences; and because the Great Hundred is 112 *l.* the Pounds will be 117. Then the Question will stand thus.

1 : 7 : : 117 : $117 \times 7 = 819$ Six-pences; that is, 20 *l.* 9 *s.* 6 *d.*

The other more usual way of *Practice*, is by Aliquot Parts. For if the Price fall out to be the Aliquot Parts, or even parts of a Pound, or a Shilling, then the Work may be shortened much; thus.

The Even parts of a Shilling are these: 6 *d.* the $\frac{1}{2}$, 4 *d.* the $\frac{1}{3}$, 3 *d.* the $\frac{1}{4}$ part, 2 *d.* the sixth part, 1 *d. ob.* the $\frac{1}{8}$ part, and 1 *d.* the $\frac{1}{12}$ part.

Therefore if any Question, wherein 1 is in the First place, be proposed, and if any of these parts be in the Second; you may find the Fourth Term, by taking the one part of the Third, as in this Example.

At 6 d. *the Yard, Pound or Ounce, what comes* 74 *Yards to?*

Answer.

Answer.

1 *l.* 17 *s.* By taking the half of 74, which is 37 *s.* or 1 *l.* 17 *s.*

At 3 d. *the Yard, what comes* 74 *Yards to?*

Answer.

18 *s.* and 6 *d.* By dividing 74 by 4.

But if the Queſtion fall not right upon any of theſe aliquot Parts, then you muſt work oftner; as,

At 10 d. *the Pound, what will* 133 *Pound give?*

Answer.

5 *l.* 10 *s.* 10 *d.* By dividing 133 by 2 (for 6 *d.*) 'twill be 66 *s.* and 6 *d.* And then by 3 (for 4 *d.*) which makes 44 *s.* 4 *d.* in all 110 *s.* 10 *d.* or 5 *l.* 10 *s.* 10. *d.*

And ſo for 8 *d.* take 4 *d.* twice; for 9 *d.* take 3 *d.* thrice; for 11 *d.* take 6 *d.* 3 *d.* and 2 *d.*

The ſame may be done with the Aliquot Parts of a Pound: And to make this more plain and eaſie, you have here a compleat Diviſion of the even and uneven Parts of a Pound; as alſo the even and uneven Parts of a Shilling.

Even Parts of a Pound.		Parts.	Uneven Parts of a Pound.	Divided into Even Parts.			Parts.

The Uſe of this Table *is eaſily known from what hath been ſaid before.*

PRÆCIPE *in Capite*, was a Writ iſſuing out of the Court of *Chancery*, for a Tenant holding of the King in Chief, as of his Crown, and not as of any Honour, Caſtle, or Mannor.

PRÆCIPE *Quod reddat*, is a Writ of great Diverſity, both in its Form and Uſe; for which, ſee *Ingreſſus* and *Entry*. This Form is extended as well to a *Writ of Right*, as to other Writs of *Entry* or *Poſſeſſion*. It's ſometimes called a *Writ of Right Cloſe*, as a *Præcipe in Capite*, where it iſſueth for a Tenant holding of the King in Chief, as of his Crown; and not of the King, as of any Honour, Caſtle, or Mannor: And ſometimes a *Writ of Right Patent*, as when it iſſues out of the *Chancery*

very Patent, that is open to any Lord's Court, for any of his Tenants deforced againſt the Deforcer, and muſt be determined there.

PRECARIÆ, are Days Works, which the Tenants of ſome Mannors are bound, by reaſon of their Tenure, to do for their Lord in Harveſt; called in ſome Places *Bind-days*, or *Bidden-days*.

RPÆCORDIA, are all the Intrails in the Cheſt or Thorax.

PRÆDICAMENT, in Logick, is a certain Claſs or Determinate Series or Order, in which Simple Terms or Words are ranged: Of theſe they uſually account Ten Heads, *viz.* Subſtance, Accident, Quantity, Quality, Action, Paſſion, Relation, the Situation of Bodies as to place, their Duration as to Time, their Site or Poſition, and their Habit or External Appearance

PRÆMUNIRE, is a Writ that lies where any Man ſues another in the Spiritual Court for any thing that is determinable in the King's Court; for which great Puniſhment is ordained by divers Statutes, *viz.* That he ſhall be out of the King's Protection, and put in Priſon without Bail or Mainpriſe, 'till he have made Fine at the King's Will, and that his Lands and Goods ſhall be forfeited if he come not within two Months: And his Proviſors, Procurators, Attorneys, Executors, Notaries, and Maintainers, ſhall be puniſhed in the ſame manner. See the *Statute*. And upon divers other Offences is impoſed, by Statutes lately made, the Penalty they incur who are attainted in *Præmunire*: As by 13 *Eliz.* cap. 8. they who are aiding to make a corrupt bargin, whereupon Uſury is reſerved for above Ten Pound in the Hundred for a Year, *&c.*

PRÆPARANTIA *Vaſa*, in Anatomy, the Preparing Veſſels, are the Spermatick Veins and Arteries which go to the Teſticles and *Epididymes*: (which ſee.) They were ſo called by the Ancients, as thinking they prepared the Seed.

The Arteries are two, and ſpring from the Trunk of the *Aorta*, about two Fingers Breadth uſually, beneath the *Emulgents*; and not from its Side, but out of its Fore-part: The Right whereof climbing over the Trunk of the *Vena Cava*, runs obliquely to the Vein on the ſame ſide; and the Left marches to the Vein of that ſide.

The Veins alſo are Two: The right ariſes uſually from the Trunk of the *Vena Cava*, a little below the *Emulgent*; the Left from the *Emulgent* it ſelf; for otherwiſe it muſt have gone over the *Aorta*, whereby it might have been in danger of being broken; or at leaſt, by the continual Pulſe of the Artery, the Recourſe of the Venal Blood might have been hindred or retarded.

Both theſe Arteries and Veins, a little after their Origin, do meet together, and are included in one common Membrane made of the *Peritonæum*; and then they run ſtraight through the Region of the Loins above the Muſcles *Pſoæ* on each ſide, and above the Ureters; and as they go, they beſtow little Slips here and there on the *Peritonæum*, between whoſe Duplicatures they deſcend, and ſo arrive at its Proceſſes.

The Veins divide very often into many Branches, and then inoſculate and unite again; but the Arteries go along by one Pipe only on each ſide, until within three or four Fingers breadth of the Teſticles, where each is divided into two Branches; the Leſs whereof runs to the *Epididymis*, the Larger to the Teſticle: And as they came down between the Membranes of the *Peritonæum*, ſo they paſs into the *Scrotum* between them; not perforating the Inner in the Proceſſes, as in Dogs and other Creatures, (wherein the Proceſſes of the *Peritonæum* are hollow like a Quill) but in Man the inner Membrane of the *Peritonæum* ſhuts the Hole, leſt the Inteſtines ſhould fall down through it into the *Scrotum*.

It hath been formerly believed, that there are divers Inoſculations between theſe Veins and Arteries in their Paſſage, whereby the Venal and Arterial Blood are mixed together; but ſince the Circulation of the Blood hath been known, that is diſcovered to be impoſſible, becauſe the Blood in the Arteries deſcends, and that in the Veins aſcends. And indeed the Blood for the Elaboration of the *Semen*, and for the Nouriſhment of the Teſticles, flows down by the Arteries only, and that in an even and undivided Courſe without any of thoſe Vine-like Tendrils, thoſe Turnings and Windings which have formerly ſo much been ſpoken of; as *De Graef* by his own frequent Inſpection teſtifies. And the Veins bring back from the *Teſtes* what remains of the Blood after this; which Veins indeed do come out from their innermoſt Membrane with almoſt innumerable Roots, by which they imbibe the refluent Blood; and they are moſt admirably interwoven and inoſculated with one another 'till about four Fingers breadth above the Teſticles, which Space is called *Corpus, Pyramidale, Plexus, Pampiniformis*, and *Varicoſus*: But theſe Veins are ſo far from Preparing the *Semen*, that they only bring back what is Superfluous from the making of it. Nor indeed can the Arteries juſtly merit the Name of *Preparing Veſſels*, becauſe the Blood they convey to the Teſticles acquires no ſenſible Alteration 'till it come thither. However the Old Names are continued, but 'tis neceſſary to give this Caution about the Uſe of theſe Veſſels.

PRÆPOSITION, in Grammar, is an Indeclinable Word, by which a Noun and a Verb are joined together, in order to ſignifie the Cauſe of any thing, the Time, Place, Conjunction, Privation, *&c.* 'Tis called *Præpoſition*, becauſe 'tis moſt frequently in the Latin Tongue placed before other Words; and this either ſeparately, as *Ad patrem*; or conjunctively, as *Admiror*.

PRÆSEPIA, the Holes of either Jaw, wherein are contained the Teeth.

PRAGMATICAL. A Word commonly in *Engliſh* taken in an ill Senſe, and is ſpoken of a Medler, Buſie body, or fooliſh Prater and Tatler about Impertinent Things that do not belong to him. But in Phyſicks, or Natural Philoſophy, the Word is ſometimes uſed in a good Signification, and ſignifies the ſame as Practical, Mechanical, or Problematical. Thus *Stevinus*, in his *Hydroſtatical Elements* calls ſome Mechanical or Practical Experiments, which he pretends to inſtruct his Reader how to make, by the Name of *Pragmatical Examples*; and in the ſame Senſe 'tis ſometimes uſed by other Naturaliſts.

PRAY-*Age*. See *Age-prior*.

PREAMBLE, in the General, is taken for the Introduction or Beginning of any Diſcourſe: And by the Lawyers, the Beginning of an Act is called *The Preamble*.

PREBEND, is the Portion which every Member or Canon of a Cathedral Church receiveth in the Right of his Place for his Maintenance: And

And these *Prebends* are either *Simple*, or *with Dignity*. *Simple Prebends* are those that have no more but the Revenue towards their Maintenance. *Prebends with Dignity*, are such as have Jurisdiction annex'd to them, according to the divers Orders in every several Church.

PREBENDARY, is he that hath a *Prebend*, and is so called, *a Præbendo auxilium aut consilium Episcopo vel Decano.*

PRECE *Partium*, is when a Suit is continued by the Assent or Agreement of both Parties.

PRECEPT, in Law, is diversly taken, as sometimes for a Commandment in Writing sent out by a Justice of Peace, or other like Officer, for the bringing of a Person or Records before him. Sometimes it is taken for the Provocation, whereby one Man incites another to commit a Felony, as Theft, Murder, *&c.*

PRECESSION *of the Equinox*: In the New Astronomy, the Fix'd Stars are supposed to be immovable, and that the Earth turns round the Sun by its Annual Motion; so that its Axis makes always an Angle of 66 Degrees and an half with the Plane of its Orbit. Now if this Axis were always exactly directed to the same Point of the Heavens, or moved always precisely parallel to it self, as it doth nearly; then the Fix'd Stars would appear to have no other Motion but the Diurnal one. But because in Reality the Axis of the Earth doth a little vary from such an exact Parallelism, and doth not point always precisely to the same Star when it is in the same Place of its Orbit, but makes a small Angle with a Line imagined to lie in the Position it had formerly in the same Place: Hence it happens that the Equinoctial Points, or the common Intersections of the Equator and Ecliptick, do retrocede or move backwards from East to West, about 50 Seconds each Year; and this Motion backwards is by some called the *Recession of the Equinox*, by others the *Retrocession*; and the advancing of the Equinoxes forward by this means is called the *Procession* of them.

PRECIPITATE. Whatever is gotten out of the Pores of a Menstruum, in which it was dissolved, and by some means is precipitated or made fall down to the bottom of the Vessel, may properly be called *Precipitate*. See *Precipitation*. But the Chymists and Writers of Pharmacy commonly give this Name by way of Eminence to the Mercury dissolved in Acid Menstruums, and then afterwards precipitated down to the bottom in fine Pouders, of which they reckon these following;

1. *White Precipitate*, which is Mercury dissolved in *Aqua-fortis*; or, which is better, Spirit of Nitre; and then precipitated to the bottom with Salt Water, and a little Spirit of Sal-Armoniack. But if instead of Salt Water, and that Volatile Spirit, you had used hot Urine, a Pouder would have fallen down, which may be called,

2. *Rosie Precipitate*, since it will be of a Pale Rose Colour.

3. *Red Precipitate*, is Mercury dissolved in Spirit of Nitre, and then the Moisture is evaporated in a Sand-Heat; and then the Fire being gradually encreased to the Third Degree, the Matter turns Red. Tho' this be called a *Precipitate*, 'tis improperly so here, being no Precipitation at all. If the Spirit of Vitriol be dropt into a little of this *Red Precipitate*, it presently turns it White; but Spirit of Sal-Armoniack will turn it Grey.

There is also another sort of *Red Precipitate* which the Chymists call *Philosophical Precipitate*, and often *Precipitate per se*; which is by including Running Mercury in a Matrass, which is set in a Sand-Heat for Forty Days; or 'till all the Mercury be reduced to a Red Pouder.

4. *Green Precipitate*, is made by mingling the Dissolutions of Mercury and Copper together, both made in Spirit of Nitre; the Mixture is evaporated to Driness, and then the Mass at the bottom is poudered, and hath distilled Vinegar poured upon it, and digested with it for Twenty four Hours, or 'till the Liquor looks Green, and a little Bluish; then the Liquor is poured off, and more Vinegar put on, and so repeated 'till all be dissolved: Then all these Dissolutions are mixed and evaporated in a Sand-Heat 'till the Matter be of the Consistence of Honey; then taken off the Fire, it will harden as it cools, and grow pulverizable. The Pouder of it is this *Green Precipitate*, as improperly so named as the other *Red ones.*

5. *Yellow Precipitate.* See *Turbith Mineral.*

If Sublimate Corrosive be dissolved in Water, a little Oil of Tartar, *per Deliquium*, poured into the Solution, will make a *Red Precipitate*; and Spirit of Sal-Armoniack will give from some more of the same Solution a *White Precipitate*; and Lime-water will give the Solution a Yellow Colour, as you may see in the *Phagædenick Water*: And a little Spirit of Vitriol will clear off these Precipitates and Colours, and render the Liquor greatly transparent and colourless like Fair Water.

All these Precipitates, or any other, may easily be revived into Running Mercury, by mixing them with Quick-lime, and then distilling, as in Reviving Mercury from *Cinnabar*; which see.

PRECIPITATION, in Chymistry, signifies the Falling-down of the Particles of any Metalline or Mineral Body, which are kept suspended in that Menstruum which dissolved it, by the pouring in of some *Alkalizate*, or other contrary Liquor; or by putting something else into it, which is more easie for the *Menstruum* to dissolve. Thus if Silver be dissolved, and its Particles kept suspended in *Aqua-fortis*, Spirit of Nitre, *&c.* some Oil of Tartar *per Deliquium*, or even Salt Water, will presently make the Acid let go the Silver, and it will fall down or precipitate to the bottom in a White Pouder: Or if into the Solution of Silver you had put a Plate of Copper, this Metal being easier to work upon than the Silver, the Acid will fall to dissolving of it, and consequently let go the Silver, which will soon precipitate or fall down to the bottom, and cover the Copper Plate all over with White Scales. See the Word *Depart.*

Mr. *Boyle* defines Precipitation in General to be an Agitation or Motion of an Hetrogeneous Liquor, which in no long time will make the Parts of it subside, and that usually in the Form of a Pouder or other Consistent Body.

This Noble Gentleman proposes, That the Corpuscles contained or kept suspended in any

Solvent or Menſtruum, may be precipitated down by either or both of theſe two General ways: 1. By adding to the Weight or Bulk of the diſſolved and floating Particles, and thereby rendering them unfit any longer to accompany the Particles of the Menſtruum in their Inteſtine Motion: Or, 2dly, by weakening the Suſtaining Power of the Menſtruum, and thereby diſabling it to keep the diſſolved Particles from ſwimming any longer in it. See more in his Excellent Diſcourſe upon the Mechanical Cauſes of Precipitation.

PREDIAL *Tythes*, are thoſe which are paid of Things ariſing and growing from the Ground only, as Corn, Hay, Fruit of Trees, *&c.*

PREDICABLE, in Logick, is a common Term or Word that may be attributed to more than one Thing. Thus the Word Triangle refers to any Figure having but three Sides and Angles, whether it be Rectilineal or Spherical.

PREDY, a Sea-word, ſignifying the ſame with *Ready*. *Predy the Ship*, or *Predy the Ordnance*, is, as much as to make Things ready for a Fight. *Predy the Hold*, is lay or ſtow every thing there in its due order and proper place.

PRIEST's *Cap*, a Term in Fortification. See *Bonnet a Preſtre*.

PRELUDE, in Muſick, ſignifies any Flouriſh that is Introductory to Muſick which is to follow after.

PREMISSES. See *Habendum*.

PREMIUM. A Term uſed by Merchants for that Sum of Money which the Enſured gives the Enſurer for the Enſuring the Safe Return of any Ship or Merchandiſe.

PRENDER, is the Power or Right of taking a Thing before it is offered.

PRENDER *de Baron*, is uſually taken in Law for an Exception, to diſable a Woman from purſuing an Appeal of Murder againſt the Killer of her former Husband.

PREPENSED, in Law, is when a Man is ſlain upon a ſudden Quarrel; yet if there were Malice *prepenſed* formerly between them, it makes it *Murder*; as it is called in ſome Statutes *prepenſed Murder*.

PREROGATIVE *Court*, is the Court wherein all Wills are proved, and all Adminiſtrations taken that belong to the Archbiſhop by his *Prerogative*; that is, in Caſe where the Deceaſed had Goods of any conſiderable Value out of the Dioceſs wherein he died; and that Value is commonly 5 *l.* except it be otherwiſe by Compoſition between the ſaid Archbiſhop and ſome other Biſhop, as in the Dioceſs of *London* it is 10 *l.*

And if any Contention grow between two or more, touching any ſuch Will or Adminiſtration, the Cauſe is properly debated in this Court; the Judge whereof is termed *Judex Curiæ Prærogativæ Cantuarienſis*, the *Judge of the Prerogative Court of Canterbury*.

The Archbiſhop of *York* hath alſo the like Court, which is termed *His Exchequer*; but far Inferior to this in Power and Profit.

PRESBITÆ, are thoſe Men who by Old Age, or other Accidents, have the Globe of the Eye ſo flat, that the produced Viſual Rays paſs the *Retina* before they unite; whereby there can be no diſtinct Viſion, ſince the diſtinct Baſe falls too far off beyond the *Retina*: Therefore this Defect is to be helped by Convex-Glaſſes or Spectacles, which will make the Rays converge ſooner, and, if they are well fitted, exactly on the *Retina*.

PRESCRIPTION, in Law, is when a Man claims any thing, becauſe he, his Anceſtors or Predeceſſors, or they whoſe Eſtate he hath, have had or uſed it all the time whereof no Memory is to the contrary. But one cannot preſcribe againſt a Statute, except he have another Statute that ſerves for him.

PRESENTATION, a Term in Law, properly uſed for the Act of a Patron, offering his Clerk to the Biſhop, to be inſtituted in a Benefice of his Gift.

PRESENTEE, is the Clerk that is ſo preſented by the Patron. Alſo the King's *Preſentee* is he whom the King preſents to a Church.

PRESENTMENT, in Law, is a meer Denunciation of the *Jurors* themſelves, or ſome other Officer, as *Juſtice*, *Conſtable*, *Searcher*, *Surveyor*, &c. (without any Information) of an Offence Inquirable in the Court whereunto it is preſented.

PRESSING *to Death*. See *Peine fort & dure*.

PREST, is uſed for a Duty in Money to be paid by the Sheriff, upon his account, in the *Exchequer*; or for Money left or remaining in his Hands.

PRESUMPTION, in Law, is of Three ſorts; 1. *Violent*, which is many times a full Proof; as if one be killed in a Houſe, and a Man is ſeen to come out of the Houſe with a bloody Sword, and no other Perſon was at that time in the Houſe: This, tho' but a *Preſumption*, is as a Proof. 2. *Probable*, which hath but a ſmall Effect. 3. *Levis, ſeu temeraria*, which is of no Prevalency at all. So in caſe of a Charter or Feoffment, if all the Witneſſes to the Deed be dead; the *Violent Preſumption*, which ſtands for a Proof, is Continual and Quiet Poſſeſſion.

PRETENCE. See *Eſcutcheon of Pretence*.

PRETENSED *Right or Title*, is where one is in Poſſeſſion of Lands or Tenements, and another who is out, claims and ſues for it: Here the *Pretenſed Right and Title* is ſaid to him who doth ſo claim and ſue.

PREVARICATE, in Law, is when a Man falſly and deceitfully ſeems to undertake a Thing, *ea intentione*, that he may deſtroy it.

PRICK. To *prick* the Chart or Plot at Sea, ſignifies to make a Point in their Chart whereabout the Ship is now, or is to be at ſuch a time, in order to find the Courſe they are to ſteer, *&c.*

PRIMA *Naturalia*, the ſame with *Atoms*, or *Minima Naturalia*; which ſee,

PRIMARIUM *Latus*, in Geometry, is a Right Line in any Conick Section, drawn through the Vertex of the Section, and parallel to the Baſe of the Cone.

PRIMARY *Planets* (according to ſome) are the Three Superior Planets, *viz*, *Saturn*, *Jupiter*, and *Mars*; but more properly a *Primary Planet* is one that moves round the Sun, as its Centre; whereas a *Secondary Planet* moves round ſome other Planet.

PRIME *Figure*, is that which cannot be divided into any other Figures more ſimple than it ſelf; as a *Triangle in Planes*, the *Pyramid in Solids*: For all Planes are made of the Firſt, all Bodies or Solids compounded of the Second.

PRIME *Numbers*, in Arithmetick, are thoſe made only by *Addition*, or Collection of Unites, and

and not by *Multiplication*: So an Unite only can measure it; as 2, 3, 4, 5, *&c.* and is by ſome called a *Simple*, by others an *Uncompound* Number.

PRIME *of the Moon*, ſignifies the *New Moon*, at her firſt Appearing, or about three Days after the *Change*, at which time ſhe is ſaid to be *primed*.

PRIME *Verticals*, or *Direct Erect North or South Dials*, are thoſe whoſe Planes lie parallel to the *Prime Vertical Circle*. But ſince every Plane hath that Pole raiſed or depreſſed thereon, which lieth open to it: Therefore this Plane (if a *Direct South*) hath the South Pole elevated, and conſequently the Style (whoſe Height muſt be the Complement of the Latitude of the Place) will point downwards.

Wherefore, *To find the Hour's Diſtance from the Meridian upon this Plane*, the Proportion is,

As the *Radius* is to the Sine of the Style's Height, or Co-Latitude;
So is the *Tangent* of the Hour, or Angle at the Pole.
To the *Tangent* of the ſeveral Hours Diſtance from the *Meridian*.

By this *Canon*, the Hours requiſite for the Plane, as alſo the Half Hours, Quarters, *&c.* being calculated and ſet in a Table; the *Dial* is deſcribed after the ſame manner as the *Horizontal Dial*; which ſee.

North Direct Erect Dials, are but the Backſide of the *South*, becauſe lying in the ſame *Azimuth* with it: Therefore, 'tis no more but turning the *South Dial* upſide down, and leaving out the Superfluous Hours between 5 and 7, and 4 and 8, and the *North Dial* is made. Only note, That the Style muſt point upwards to the North Pole.

PRIMER *Seiſin*. The Firſt Poſſeſſion or *Seiſin* was heretofore uſed as a Branch of the King's Prerogative, whereby he had the Firſt Poſſeſſion; that is, the entire Profits for a Year of all the Lands and Tenements whereof his Tenant (that held of him *in Capite*) died *ſeiſed* in his Demeſne as of Fee, his Heir then being at full Age, until he do his Homage; or if under Age, until he were of Age. But all the Charges ariſing by *Primer Seiſin*, are taken away by the Statute made 12 *Car.* 2. cap. 24.

PRIMING *Iron*, is a ſmall ſharp Iron which is thruſt into the Touch-hole of a Great Gun, and pierces into the Cartridge that holds the Pouder, that ſo they may put in the Prime-pouder or Touch-powder to fire off the Piece.

PRIMOGENITURE, in Law, is the Title of an Elder Brother in Right of his Birth.

PRIMORES *Dentes, ſeu Inciſivi Dentes*, are the Four Foremoſt Teeth in each Jaw; they are pretty-broad, ſharp at their Ends, a little convex outwards, and hollow inwards: They have each a pretty long Root, a little crooked, and divided into two, by which means they have the greater Force in cutting off the Aliments, which is their proper Uſe.

PRIMUM *Mobile*, in the *Ptolemaick Aſtronomy*, is ſuppoſed to be a vaſt Sphere, whoſe Centre is that of the World, and in Compariſon of which the Earth is but a Point: This they will have to contain all other Spheres within it, and to give Motion to them, turning its ſelf and all them quite round in Twenty four hours.

PRINCIPAL, in Common Law, ſignifies the ſame with *Heirloome*.

PRINCIPAL *Ray*, in Perſpective, is the Perpendicular one which goes from the Spectator's Eye to the Vertical Plane or the Table. And the Point where this Ray falls on the Table, is called from hence the

PRINCIPAL *Point*, which ſome Writers call the *Centre of the Picture*, and the *Point of Concurrence*.

PRINCIPLE, a Word very commonly and very variouſly uſed; ſometimes it ſignifies the ſame as a Maxim, an Axiom, or a good Practical Rule of Action: Thus we ſay, a Perſon is *a Man of Principles*, when he always acts according to the Eternal Rules of Morality, Virtue and Religion.

Sometimes it ſignifies a Thing Self-evident, and as it were Naturally known, and then 'tis uſually called, a *Firſt Principal*; as that, *Nothing can Exiſt and not Exiſt at the ſame time*: That, *Where there is no Law, there is no Tranſgreſſion*: That *a Whole is greater than a Part*.

Sometimes it hath the ſame ſenſe with Rudiments or Elements; as when we ſay, the *Principles* of *Geometry*, *Aſtronomy*, *Algebra*; we mean the Doctrine or Rules of thoſe Sciences.

And in Chymiſtry particularly, 'tis taken for firſt Conſtituent and Component Particles of all Bodies, out of which they are made, and into which they are by Fire, as they ſay, reſolvable again. Thus *Salt*, *Sulphur*, and *Mercury* are the three Famous Chymical Principles, which they call *Hypoſtatical*; and the Chymiſts did formerly pretend, that they could by their Art reſolve all Natural Bodies into theſe; and that theſe Principles could be drawn Simple, Pure, and Uncompounded from Metals, *&c.* But ſince this Art hath been more commonly ſtudied and conſequently much better known, it is found to be a Falſity, as Mr. *Boyle* excellently ſhews in his *Sceptical Chymiſt*; and *Lemery* hints in many places of his good *Courſe of Chymiſtry*.

The Modern Chymiſts agree that there are five kinds, or different ſorts of Bodies, which may by Fire be drawn from many mix'd Natural Bodies, and therefore which may in a large ſenſe be called *Principles*; as *Earth*, *Salt*, *Spirit*, *Phlegm*, and *Oil*, tho' theſe can never be drawn, perfectly Pure and Unmix'd; nor have we any reaſon to believe they are the Conſtituent Principles of the Bodies they are drawn from; and out of many Bodies hardly ever a one of them can be drawn; and therefore they are not truly and properly the Elements or Conſtituent Principles of natural Bodies, nor indeed do we know any ſuch.

Of theſe the *Spirit*, *Oil* and *Salt*, are called the *Active* Principles; and the *Water* and the *Earth*, the *Paſſive* ones.

Mr. *Boyle* ſheweth by many Experiments in his *Sceptical Chymiſt*, in the Diſcourſe about the *Producibleneſs of Chymical Principles*, in his Chymical Paradox at the end of his *Noctiluca*, and in many other places that theſe Chymical Principles are Producible and Deſtructible, and that they are manifeſtly Tranſmutable into one another. For

by diſtilling what the Chymiſts call Eſſential Oil of Aniſeeds 36 times over, and ſome other Oils of Vegetable above 50 times, he found that there would be produced above half the firſt Weight of the Oil in the form of a Black Pitch. That an acid and volatile Spirit and Salt were to be gained in a conſiderable quantity; and upon the whole it appeared that theſe Reſulting Bodies of ſuch very different Forms were produced by the Action of the Fire tranſmuting part of the very Subſtance of the Oil into them.

That in general may be called a Principle which is the firſt cauſe of any Things *Exiſtence*, or *Production*, or of its becoming *Known* to us.

The Ariſtotelian or Peripatetical Principles are the Four Elements, *Earth*, *Water*, *Air*, and *Fire*.

The *Epicurean Principles*, are Magnitude, Figure, and Weight.

Mr. *Boyle* thinks as the World now is (for they can't account for its Creation) that the Mechanical Principles, Matter, Motion, and Reſt, are Principles ſufficient to ſolve all the Phænomena of Nature.

The *Carteſian Principles* are theſe three following; *Firſt*, A moſt Subtle Matter very ſwiftly agitated, fluid, and keeping to no certain Figure but which ſuits it ſelf to the Figure of thoſe Bodies that are about it; The *Second* are very ſmall Globules, that is, Bodies exactly round, and very ſolid, continually whirling about, and which do not only like the Firſt *Principles*, fill up the Sores of Bodies, but alſo conſtitute the pureſt Subſtance of the *Æther* and *Heaven*. The *Third Principle* is a Matter conſiſting of more thick and Branchy Parts, full of Angles and unfit for Motion, of which the Earth, Water, Air, and all mixed Bodies do conſiſt.

Now they ſuppoſe theſe Three Elements to be thus produced: The whole World being a Plenum and the Particles, or Atoms, of all Matter ſolid, as ſoon as Motion was ſuperinduced into the World, theſe Atoms being of ſeveral Shapes, and Sizes, would begin to rub and grind one againſt another.

By which means, ſome would come to be ground or turn'd round Globules; and theſe conſtitute their Second Element. The ſmall Chips, Shavings, or Duſt, that comes off in the forming of theſe Globules, is the Matter of their Firſt Element; and theſe muſt needs be in every ripid Motion. But thoſe Particles which are not yet turned into Globular Figures, will be variouſly angled, and not ſo fit for Motion as the others; and therefore will conſtitute a Third Element very different from the others.

PRIORITY, in Law, ſignifies an Antiquity of Tenure, in compariſon of another not ſo ancient, as to hold by Priority, is to hold of a Lord more anciently than of another.

PRISAGE, is that Cuſtom or Share that belongs to the King, out of ſuch Merchandice, as are taken at Sea by way of Lawful Prize.

PRISM, is a ſolid Figure, contained under ſeveral Planes, whoſe Baſes are Polygons, equal, parallel, and alike ſituated. Alſo a Triangular ſolid glaſs, thro' which the Sun's Rays being tranſmitted are refracted into the vivid Colours of the Rain-bow.

The Surface of a Right *Priſm*, is equal to a Parallelogram of the ſame height, having for its Baſe a Right Line equal to the Periphery of that *Priſm*. The ſame may be ſaid of a Cylinder, becauſe it is but a *Priſm* of Infinite Sides.

The Solid Content of a *Priſm*, is found by Multiplying the Area of its Baſe by its Perpenddicular Altitude.

A *Priſm* is a Triple of a Pyramid of the ſame Baſe and Height. See *Proportion of Solids*, where 'tis demonſtrated.

PRISMOID, is a ſolid Figure, contained under ſeveral Planes whoſe Baſes are rectangular Parallelograms, parallel and alike ſituate.

PRIVILEDGE, is by *Cicero* defined to be *Lex private homini irrogata*. Others ſay it is, *Jus ſingulare*, whereby a private man, or a particular Corporation, is exempted from the rigour of the Common Law. It is uſed ſometimes in the Common Law, for a place that hath any ſpecial Immunity.

PRIVILEDGE, is either Perſonal or Real: A *Perſonal Priviledge*, is that which is granted to any Perſon either againſt or beyond the Courſe of the Common Law: As for Example, A Member of Parliament may not be arreſted nor any of his Servants, during the ſitting of the Parliament; nor for a certain time before and after. A *Priviledge Real*, is that which is granted to a place, as to the *Univerſities*, That none of either may be called to *Weſtminſter-Hall*, upon any Contract made within their own Precincts, or proſecuted in other Courts. And one belonging to the Court of Chancery cannot be ſued in any other Court, certain Caſes excepted; and if he be, he may remove it by *Writ of Priviledge*.

PRIVY, in Law, ſignifies him that is partaker, or hath an Intereſt in any Action or Thing, as *Privy of Blood*, be thoſe that are linked in Conſanguinity; every Heir in Tail is *Privy* to recover the Land intailed. The Author of the *New Terms of Law*, maketh divers ſorts of *Privies*, *viz.* Privies *in Eſtate*, Privies *in Deed*, Privies *in Law*, Privies *in Right*, and Privies *in Blood*. Others mention four kinds of *Privies*, viz. *Privies in Blood*, as the Heir to his Father. *Privies in Repreſentation*, as Executors or Adminiſtrators to the deceaſed. *Privies in Eſtate*, as he in the Reverſion, and he in the Remainder, when Land is given to one for Life, to another in Fee, for that their Eſtates are created both at one time. The fourth is *Privy in Tenure*, as the Lord by eſcheat, that is, when the Land eſcheateth to the Lord for want of Heirs.

PRIVY-SEAL, is a Seal that the King uſeth to ſuch Grants, or other things, as paſs the *Great Seal*; firſt they paſs the *Privy-Signet*, then the *Privy-Seal*; and laſtly the *Great-Seal of England*. The *Privy-Seal* is ſometimes uſed in things of leſs conſequence, that never paſs the *Great-Seal*, no Writs ſhall paſs under the *Privy-Seal*, which touch the Common Law.

PROBATE, *of Teſtaments*, is the exhibiting and proving Wills and *Teſtaments* before the Eccleſiaſtical Judge, delegated by the Biſhop, who is Ordinary of the Place, when the party dies. And the Ordinary is known by the quantity of Goods that the deceaſed hath out of the Dioceſs wherein he departed; for if all his Goods be in the ſame Dioceſs, then the Biſhop of the Dioceſs, or the Archdeacon, according as their compoſition leads, hath the *Probate of the Teſtament*: But if the Goods be diſperſt in divers Dioceſſes, ſo that there be any ſum of note (as five pounds ordinarily) out of the Dioceſs where the party lived; then is the

the Archbiſhop of *Canterbury* the Ordinary by *Prerogative*.

This *Probate* may be made in two ſorts, in *Common form* or *per teſtes*. *The proof in common form* is only by the Oath of the Executor or Party exhibiting the Will, who ſweareth upon his belief, that the Will exhibited by him, is the laſt Will and *Teſtament* of the deceaſed. The proof *per teſtes* is when over and beſides his own Oath, he alſo produces Witneſſes, or makes other proof to confirm the ſame, and that in the preſence of ſuch as may pretend any intereſt in the Goods of the deceaſed, or at leaſt in their abſence, after they have been Lawfully ſummoned to ſee ſuch a Will proved, if they think good. And the latter courſe is taken moſt commonly when there is fear of ſtrife or diſpute about the deceaſed's Goods. For ſome hold that *a Will proved in common form* only may be called in queſtion any time within thirty Years after: And where a will diſpoſes of Lands and Tenements of Freehold, it is now frequently *proved by Witneſſes* in *Chancery*.

PROBATOR, in Law ſignifies an Accuſer, or Approver, or one who undertakes to prove a crime charged upon another.

PROBE, a Chirurgical Inſtrument to ſound the Depth and Circumſtances of Wounds or Ulcers.

PROBLEM, is a Propoſition which relates to Practice; or which propoſes ſomething to be done; As to make a Circle paſs through three given Points not lying in a Right Line: To find the Compaſs, *&c.*

PROCATARCTICA, is the pre-exiſtent Cauſe of a Diſeaſe, which co-operates with others that are ſubſequent; whether it be external or internal, as Anger, or Heat in the Air, which beget ill Juice in the Blood and cauſe a Fever. *Blanchard.*

PROCEDENDO, is a Writ whereby a Plea or Cauſe formerly called from a Baſe Court to the *Chancery*, *Kings-Bench*, or *Common-Pleas*, by *Writ of Priviledge* or *Certiorari*, is releaſed and ſent down again to the ſame Courts to be proceeded in there, after it appeareth that the Defendant hath no cauſe of *Priviledge*, or that the matter compriſed in the Bill not well proved.

PROCESSE, in Law, is the manner of proceeding in every Cauſe, being the Writs and precepts that go forth upon the Original upon every Action, being either Original or Judicial. Sometimes that only is called the *Proceſs*, by which a man is called into the Court, becauſe it is the beginning or principal part thereof, by which the reſt of the buſineſs is directed. The difference between *Proceſs* and *Precept*, or *Warrant* of the Juſtices, is this, the *Precept* or *Warrant* is only to attach and convent the party before any Indictment or Conviction, and may be made either in the name of the King or the Juſtice: But the *Proceſs* is always in the King's Name, and uſually after an Indictment.

PROCESS, in Chymiſtry ſignifies the whole exact Courſe of any Operation or Experiment.

PROCESSION, in Cathedral and Conventual Churches, the Members formerly had their ſtated Proceſſions, wherein they walked two and two in their moſt Ornamental Habits, with Hymns, Muſick and other ſuitable expreſſions of Solemnity, and reſpect to the occaſion. In every Pariſh there was a Cuſtomary *Proceſſion* of the Pariſh Prieſt, the Patron of the Church with the Chief *Flag*, or Holy Banner, and the other Pariſhioners in *Aſcenſion Week*, to take a Circuit round the Limits of the Mannor, and pray for a Bleſſing on the Fruits of the Earth. To this we owe our preſent Cuſtom of *Perambulation*, which is ſtill in moſt places called *Proceſſioning*, and going in Proceſſion, tho' we have loſt the Order, and almoſt the Devotion, as well as the Pomp and Superſtition of it.

PROCESSUM *continuando*, is a Writ for the continuance of a *Proceſs*, after the Death of the Chief Juſtice, or other Juſtice in the Writ of *Oyer* and *Terminer*.

PROCESSUS, *vid. Apothyſis.*

PROCESSUS *Ciliaris*. See *Ciliare Ligamentum.*

PROCESSUS *Memmillares*. See *Papillarum Proceſſus.*

PROCESSUS *Peritonæi*, are as it were two oblong Pipes, or Channels, one on each ſide the *Os Pubis*, reaching to the Skin of the *Scrotum*, thro' the Holes of the Tendons of the Oblique and Tranſverſe Muſcles, in which Production, or *Didymi*, as the Ancients called them, the Seminary Veſſels deſcend, and beſtowing one Tunicle on the *Teſtes*, they contain them like a Bag. By the Holes of theſe Proceſſes, the Muſcles called *Cremaſteres* do alſo deſcend.

PHROCESSUS *Styliformis*, or *Styloides*, is a kind of External Proceſs of the *Oſſa Temporum*, being ſmall and long, having the Horns of the *Os Hyoides* tyed to it, it is a ſlender and long Appendix, and in Infants is Cartilaginous, but in Adult Perſons, Bony.

PROCESSUS *Zygomaticus* or *Jugalis*, is an External Proceſs of the *Oſſa Temporum*, which runs forward, and is joined with the Bone of the upper Maxilla, from which juncture is formed that Bridge called the *Zygoma*, reaching from the Eye to the Ear, under which lie the Tendons of the Crotaphite Muſcle.

PROCHEIN *amy*, in Common Law, ſignifies him that is next of Kin to a Child in his Nonage, and is in that reſpect allowed by Law to deal for him, in the managing his Affairs, as to be his Guardian, if he hold any Land in *Socage*, and in Redreſs of any Wrong done to him, and is in the Proſecution of any Action at Law *per Guardianum*, where the Plaintiff is an Infant, *&* *per proximum amicum*, where the Infant is Defendant.

PROCIDENTIA *Ani*, is a falling out of the Lower end of the *Rectum inteſtinum*, and is very uſual in Children.

PROCIDENTIA *uteri*, is a relaxing of the inner Tunick of the *Vagina* of the Womb, and was cut off by Phyſicians formerly, and even ſtill, ſome think the Womb it ſelf may fall down; but the Ligaments are ſo ſtrong as to hinder any ſuch Fall. *Blanchard.*

PROCLAMATION, is a Notice publickly given of any thing, whereof the King thinks fit to advertiſe his Subject.

PROCLAMATION *of a Fine*, is a notice openly and ſolemnly given at all the Aſſizes held in the County, within one Year after the engroſſing it. And theſe Proclamations are made upon Tranſcripts of the Fine, ſent by the Juſtices of the Common-Pleas, to the Juſtices of Aſſize, and the Juſtices of Peace.

PROCLAMATION *of Rebellion*, is a Publick Notice given by the Officer, That a Man not appearing upon a *Subpœna*, nor an Attachment in the Chancery

Chancery, ſhall be reputed a Rebel, unleſs he render himſelf by a Day aſſigned in this Writ.

PROCONDYLI are the Bones of the Fingers next the back of the Hand.

PRO *confeſſo*, in Law, is when upon a Bill exhibited in Chancery, the Defendant appears, upon a *Habeas Corpus* (which is granted by order) to bring him to the Bar, the Court Aſſigns him a Day to Anſwer; which being expired, and no Anſwer put in, a ſecond *Habeas Corpus* is granted, and a further Day aſſign'd; by which Day, if he anſwer not, the Bill upon the Plaintiff's Motion, ſhall be taken *pro confeſſo*, unleſs cauſe be ſhewed by a Day, which the Court uſually gives, and for want of ſuch cauſe ſhew'd upon Motion, the Subſtance of the Plaintiff's Bill ſhall be decreed, as if it had been confeſſed by the Defendant's Anſwer.

PROCTOR, is he who undertakes to manage another Man's Cauſe in any Court of the Civil or Eccleſiaſtical Law, for his Fee.

PROCTORS *of the Clergy*, are thoſe who are choſen and appointed to appear for the Cathedral and other Collegiate Churches; as alſo for the Common Clergy of every Dioceſs at the Parliament, to ſit in the Lower-houſe of Convocation.

PROCURATORY, is the Inſtrument by which any Perſon or Community did conſtitute or delegate their Proctor or Proctors to repreſent them in any Judicial Court or Cauſe.

PRODROMUS *Morbus*, is a Diſeaſe that comes before a greater, as the ſtraitneſs of the Breaſt predicts a Conſumption, or the Rickets. *Blanchard.*

PRODUCE, a Term in Geometry, ſignifying to continue a Right Line, or draw it out farther, till it have any aſſigned Length.

PRODUCT, is the Quantity Ariſing from, or *Produced* by the Multiplication of two or more Numbers, Lines, *&c.* into one another, thus, If 6 be multiplied by 8, the Product in 48. In Lines, 'tis always, (and ſometimes in Numbers) called the Rectangle between the two Lines that are multiplyed one by another. See *Rectangle.*

PROEGUMENA, is an Antecedent Internal Cauſe of a Diſeaſe in the Body, occaſioned by another, and ſo cauſing the Diſeaſe, that if it be taken away, the Diſeaſe may ſtill continue; as a *Plethora*, or ill Juice in the Blood, produced by an ill way of Diet, whence proceeds an Obſtruction of the Entrails. *Blanchard.*

PROFIL (*French*) a Term in Painting, ſignifying properly a Face or Head ſet ſideways, as uſually on Medals, and ſuch a Face is ſaid to be in *Profil*, or in a Side View. 'Tis alſo ſpoken of the View of a Building, or City, *&c.* in Oppoſition to the Plan or Ground-plot of it; and ſo appears to have much the ſame ſenſe as a Proſpect of any Place, City, or Piece of Architecture, viewed ſideways, and expreſſed according to the Rules of *Perſpective.* This is called the *Profil* of ſuch a Place, City, *&c.* Some call the Out-lines of any Figure its *Profil*, but that way of ſpeaking is improper.

PROFUNDUS, a Muſcle, which bends the Fingers.

PROGNOSIS *&* *Signa Prognoſtica*, are Signs whereby we know what will become of the Patient, as to Recovery or Death.

PROGRESSION *Arithmetical*, or Continual *Proportion Arithmetical*, is when Numbers (or other Quantities) or proceed by equal differences (either increaſing or decreaſing.) As,

2, 4, 6, 8, 10, 12, 14, *&c.*
3, 5, 7, 9, 11, 13, 15, *&c.*
16, 14, 12, 10, 8, 6, 4, *&c.*

In the two former, is a continual Increaſe, in the latter a continual Decreaſe, by two in all of them; which is called the *Common Difference*, or *Common Exceſs.*

1. If three Quantities are in *Arithmetical Proportion Continued*, the Sum of the *Extreams* is equal to the Double of the *Mean.*

Let a be the firſt Term, and x the Common Difference; then will the three Quantities be $a, a+x, a+2x$; or $a, a-x, a-2x$, if the Progreſſion deſcend.

Now $a+x$, doubled, is $= a+a+2x = 2a+2x$. *Q. E. D.*

2. If four Quantities are ſo, the Sum of the *Extreams* is equal to the Sum of the *Means.*

Let the four Terms be $a, a+x, a+2x, a+3x$.

'Tis plain, that the Sum of the *Means*, and of the *Extreams*, is $2a+3x$.

3. If never ſo many Quantities are ſo proportional, the Sum of the *Extreams* is always equal to the Double of the *Mean*, if the Number of the Terms be odd, or to the Sum of any two Terms equally diſtant from the Extreams.

Thus, in the following Series,

2	4	6	8	10	12	14
$a.$	$a+x.$	$a+2x.$	$a+3x.$	$a+4x.$	$a+5x.$	$a+6x.$

16	18	20	22
$a+7x.$	$a+8x.$	$a+9x.$	$a+10x.$

The Sum of the Extremes $2a+10x$ is equal to $a+5x$ multiplied by 2; that is, the Double of the middle Term: As it is alſo to the Sum of any Two of them equally diſtant from both Extremes.

And this muſt ever be, becauſe the laſt Term contains in it the firſt, and alſo the common Difference ſuper-added as often as the Number of its Place is diſtant from the firſt Term: But the firſt Term hath no Addition of the Difference at all; and as the ſecond Term hath one Difference or Ratio more than the firſt, the third one more than the ſecond, *&c.* ſo the laſt ſave one, hath one leſs than the laſt of all; the laſt ſave two, one leſs than the laſt ſave one, *&c.* So that the Sum of any two of theſe equally diſtant from the *Extremes*, muſt be equal to the Sum of the *Extremes*; becauſe one encreaſes as much as the other decreaſes.

Hence 'tis plain,

COROLLARIES.

1. That the Sum of any Number of Terms in ſuch a Progreſſion may be had, *if the Sum of the Extremes be multiplied by half the Number of the Terms*, or half that Sum by the whole Number of the Terms.

2. To

2. To gain the Sum of never ſo many Quantities in this *Progreſſion*, there is nothing neceſſary to be given but the Extremes and the Number of Terms: So that if by having the *Firſt Term* and *Common Exceſs*, one could get the *Laſt*, 'twould ſtrangely diſpatch Queſtions in *Progreſſion*.

3. Which laſt Term in ſuch a *Progreſſion* may be had eaſily, by multiplying the Number of the Terms, leſſened by one, into the Common Exceſs, and then to that Product adding the firſt Term.

Thus, if the laſt Term, in a *Progreſſion* of 52 Places were deſired, where the Common Difference is 3, and the firſt Term 5:

Multiply 51 by 3, it produces 153; to which adding 5 the firſt Term, you have 158 equal to the laſt Term in ſuch a *Progreſſion*.

4. Wherefore if the *Progreſſion* begin with a Cypher, (which is the moſt Natural and Simple *Progreſſion*; for when it begins with any other Term, 'tis in reality a Compound of two *Progreſſions*; one of Equals, as of *a*, *a*, *a*, *a*, &c. and the other of Arithmetical Proportionals, as *o. x. 2 x. 3 x. 4 x.* &c.) then I ſay, *the Sum of all the Terms* will be equal to half the Product of the laſt Term multiplied by the whole Number of the Terms: For by the Firſt Corollary, the Sum of all the Terms will be equal to the Sum of the Extremes multiplied by half the Number of Terms.

Thus, ſuppoſe

o. 2. 4. 6. 8. 10. 12. 14. 16. 18. 20.

Or,

o. x. 2 x. 3 x. 4 x. 5 x. 6 x. 7 x. 8 x. 9 x. 10 x.

20 the laſt Term, multiplied by 11 the Number of the Terms, gives 220; the half of which, 110, is the Sum of all the Terms.

For, by *Corollary* the Firſt, 20, the Sum of the Extremes, multiplied by 5. 5 half the Number of Terms, produces 110, the Sum of all the Terms.

5. Hence this very uſeful Theorem may be deduced, that the Sum of all the Terms in any ſuch *Progreſſion*, beginning from o, is *Subduple* of the Sum of ſo many Terms, all equal to the greateſt. For let the firſt Term be o, and the laſt *x*, and the given Number of the Terms *n*; then (by N° 1.) will the Sum of all the Terms of the *Progreſſion* be $\frac{1}{2}$ *n x*, which is half or *ſubduple* of *n x* equal to the Number of ſo many Terms equal to the greateſt. *Q. E. D.*

6. The Sum of a Simple Arithmetical Progreſſion, (*i. e.* aſcending by the Cardinal Numbers) continued from Unity *ad Infinitum*, is ſubduple the Sum of the ſame Number of Terms, each of which is equal to the greateſt; or, on the contrary, this latter Sum is double of the former. By prefixing a Cypher before unity, this would be but a Caſe of the laſt Corollary, the Sum of the *Progreſſion* remaining ſtill the ſame.

But that this is true in an infinite Series beginning from Unity, (for in a Finite or Determinate one, the Proportion of the Sum is always leſs than double; tho' it always approaches to it, and comes ſo much the nearer by how much greater the Series is) we ſhall now thus demonſtrate:

To the Sum of Three Terms, 1, 2, 3, *i. e.* 6, the Sum of as many equal in Number to the greateſt, *i. e.* 9, has the ſame Proportion as 3 to 2; but to the Sum of Six Terms, 1, 2, 3, 4, 5, 6, *i. e.* 21, the Sum of as many equal to the greateſt, *i. e.* 36, has the ſame Proportion as 3 to $1 + \frac{3}{4}$ that is 3 to $2 - \frac{1}{4}$, the Decreaſe being $\frac{1}{4}$; but to the Sum of Twelve Terms, which may be found by *Coroll.* 1. equal 78, the Sum of ſo many equal to the greateſt, *viz* 144, has the ſame Proportion, (dividing both ſides by 48) as 3 to $1\frac{30}{48}$ *i. e.* 3 to $1 + \frac{1}{2} + \frac{1}{8}$, (for 24 make $\frac{1}{2}$, and the Remainder $\frac{6}{48}$ is the ſame as $\frac{1}{8}$) that is, as 3 to $2 - \frac{1}{4} - \frac{1}{8}$, the Decrement being now $\frac{1}{8}$. Since therefore, by doubling the Number of Terms onwards, you'll find the Decrement to be $\frac{1}{16}$, and ſo onwards in double Proportion; the Sum of an Infinite Number of ſuch Terms, in Arithmetical Progreſſion, equal to the greateſt, will be to the Sum of the *Progreſſion*, from 1 *ad infinitum*; as 3 to $2 - \frac{1}{4} - \frac{1}{8} - \frac{4}{16}$, &c. that is, by *Coroll.* 1 and 2, as 3 to $2 - \frac{1}{2}$, that is, as 3 to $1\frac{1}{2}$, or as 2 to 1. *Q. E. D.*

7. The Sum of any Duplicate Arithmetical Progreſſion, continued from Unity *ad infinitum*, is ſubtriple of the Sum of as many Terms equal to the greateſt, as is the Number of Terms: For any ſuch Finite Progreſſion is greater than the Subtriple Proportion, but approaches nearer and nearer to it continually, but how much the farther the Series of the Progreſſion is carried on. Thus the Sum of Three Terms, 1, 4, 9, = 14, is to thrice 9 = 27, as $1\frac{5}{9}$ or $1\frac{10}{18}$, or $1 + \frac{1}{2} + \frac{1}{18}$ to 3, (dividing both ſides by 9) the Sum of Six Terms, 1, 4, 9, 16, 25, 36, &c. *viz.* 91 to Six times 36, *i. e.* to 216, (dividing both ſides by 72) is as $1 + \frac{1}{4} + \frac{1}{72}$ to 3, and the Sum of Twelve Terms 650, to 12 times 144, *i. e.* 1728, (dividing both ſides by 576) is as $1 + \frac{1}{8} + \frac{1}{288}$ to 3, &c. the Fraction adhering to them thus conſtantly decreaſing, ſome by their Half parts, others by Three quarters: (for $\frac{1}{8}$ is $\frac{1}{72}$; therefore the firſt Decrement is $\frac{3}{72}$, and $\frac{1}{72}$ is $\frac{4}{288}$; therefore the ſecond Decrement is $\frac{3}{288}$, &c.) Wherefore the Sum of the Infinite Progreſſion will be to the Sum of the like Number of Terms equal to the greateſt; as,

$$\begin{array}{l} 1 + \frac{1}{2} + \frac{1}{8} \\ - \frac{1}{4} - \frac{5}{72} \\ - \frac{1}{8} - \frac{3}{288} \\ - \frac{1}{16}, \&c. - \frac{2}{1152}, \&c. \end{array}$$

to 3, by *Coroll.* 2d and 4th, in *Progreſſion Geometrical.*

But the Sum of a Triplicate Arithmetical Progreſſion, (*i. e* aſcending by the Cubes of the Cardinal Numbers) proceeding from 1 thro' 27, 64, &c. *ad infinitum*, is ſubquadruple of the like Number of Terms equal to the greateſt: For the Sum of Four Terms, 1, 8, 27, 64, *i. e.* 100, to 4 times 64, *i. e.* 256, (dividing both ſides by 64) will be found to be as $1 + \frac{1}{2} + \frac{1}{16}$ to 4; but the Sum of 8 Terms, 1, 8, 27, 64, 125, 216, 343, 512, *i. e.* 1296 to 8 times 512, *i. e.* 4096, (dividing both ſides by 1024) will be found to be as $1 + \frac{1}{4} + \frac{1}{64}$ to 4, &c. The adhering Fractions thus conſtantly decreaſing, the one by their Half part, the others by Three quarters, (for $\frac{1}{64}$ is $\frac{4}{256}$ and $\frac{1}{256}$ is $\frac{4}{1024}$, &c. Wherefore the Sum of the

Infi-

Infinite Progreſſion will be to the Sum of a like (Infinite) Number of Terms, equal to the greateſt; as,

$1 + \frac{1}{2}$ $+ \frac{1}{4}$
$--- \frac{1}{2}$ $--- \frac{1}{4}$
$--- \frac{1}{1}$, &c. $--- \frac{1}{2}$, &c. to 4, by *Coroll.* 2d and 4th, as 1 to 4. *Q. E. D.*

PROGRESSION *Geometrical*, or *Geometrical Proportion Continued*, is when Numbers, or other Quantities, proceed by equal Proportion or *Ratio's*, (properly ſo called) that is according to one Common Multiplier, or *Exponent* of the Common *Ratio*, whether Increaſing or Decreaſing. As,

2. 4. 8. 16. 32. 64. &c. : :

Or in Species, ſuppoſing *a* the Firſt Term, and *r* the *Ratio*, here equal to 2.

a. ra. rra. rrra. rrrra. rrrrra, &c. : :

For, every Term (but the firſt) ariſes from the multiplication of the *Ratio*, or ſome Power of it, into it.

The following Numbers are Continual Proportionals decreaſing, according to the Common *Ratio*, 2 or *r*.

128. 64. 32. 16. 8. 4. 2. &c. : :

ar^6. ar^5. ar^4 $ar.^3$ ar^2. ar. a. &c.

And as in the former Rank of Numbers 2 was the Common Multiplier, in this 2 is the Common Diviſor; or, which is in effect the ſame, the Common Multiplier is $\frac{1}{2}$.

The moſt Natural and Simple Geometrical Progreſſion, is when it begins with Unity; as,

2	4	8	16	32	
1.	*r.*	*rr.*	*rrr.*	*rrrr.*	*rrrrr.* &c.

When it begins with any other Term, as *a* in the former Progreſſion, it is in effect but ſuch a Progreſſion as this latter, multiplied into that firſt Term all along.

PROPOSITION I.

If there are Three Quantities continually Proportional, the Rectangle of the Extremes is equal to the Square of the Mean Term.

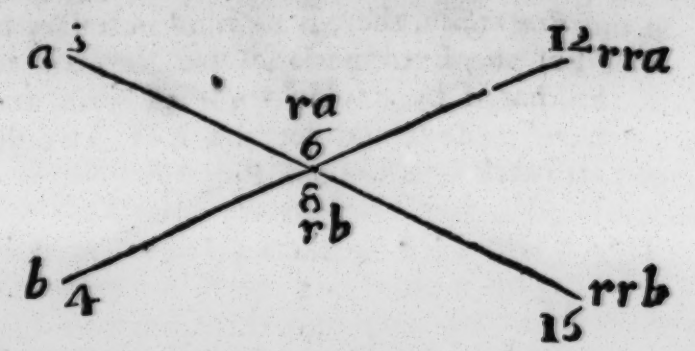
As, Suppoſe

a, ra, rra, : : Or, 3. 6. 12. : :

Its plain that the Extremes *a, rra*, multiplied into one another, are equal to the Mean *ra* multiplied into it ſelf, or in Numbers, that 3 times 12 is equal to 6 times 6.

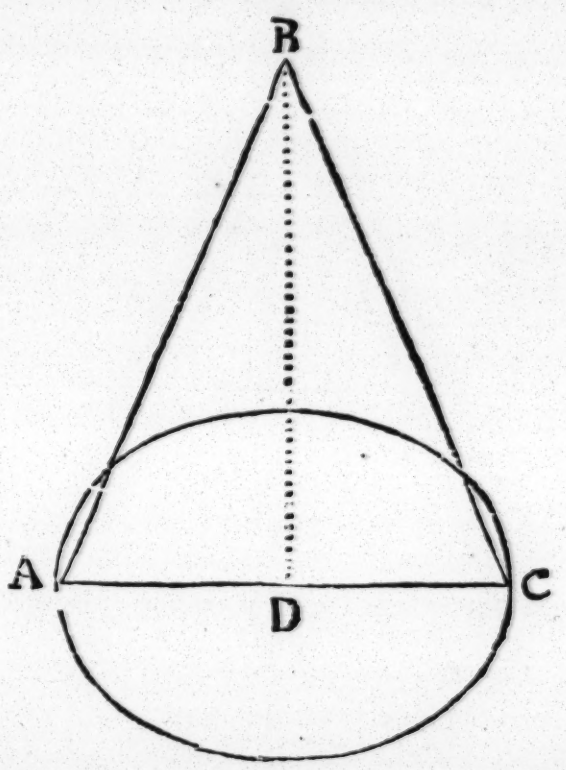
SCHOLIUM.

Alſo, If Three Quantities on each ſide are in the ſame Continual Proportion as.

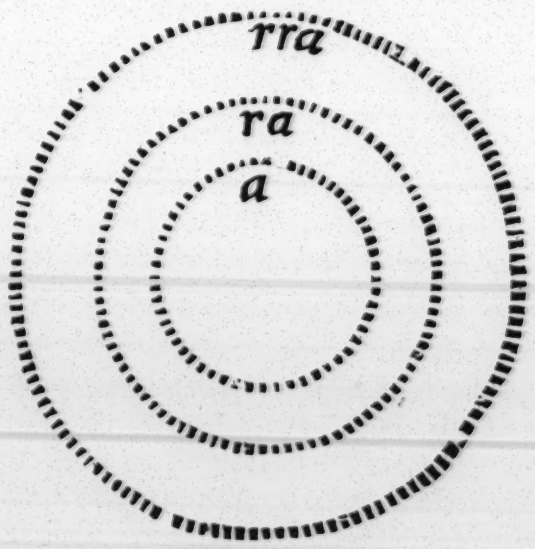


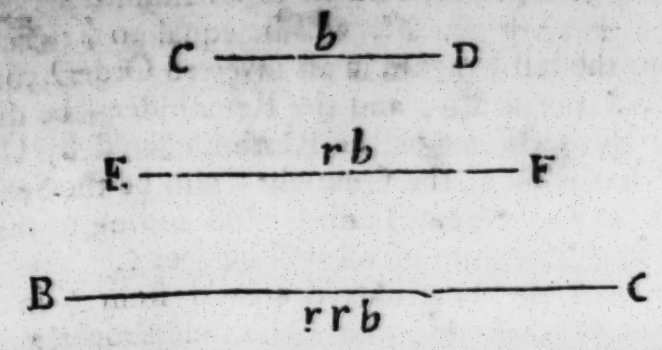
the Rectangles of the Extremes made croſs-ways are equal to the Rectangle of the Mean Term, being every way *r r a b*, or 48.

And from hence, *Sturmius*, in his *Matheſis Enucleata*, Prop. 17. of Book 1. *Schol.* very briefly demonſtrates that Propoſition of *Archimedes*, *that the Surface of a Right Cone is equal to a Circle whoſe Radius is a Mean Proportion between the Side of that Cone and the Semi-diameter of its Baſe.*



Let E F (or *r b*) be a Mean Proportional between the Side of the Cone B C, (or *r r b*;) and the Radius of the Baſe C D, (or *b*;) and let there be an equal Number of Peripheries, *r r a*, *r a*, and *a*, anſwering to an equal Number of *Radii* in the ſame proportion; then will half the firſt Radius, B C, (or *r r b*) multiplied into the Periphery *a*, (that is $\frac{1}{2}$ *r r a b*) be equal to half the Product of the middle Line into the middle Periphery,





phery, that is (as before) half *r r a b*: The former of which is equal to the Surface of the Given Cone, by the 4th *Conf.* of his *Def.* 18.) and the latter to the Area of the Circle, whoſe Radius is the Mean Proportion E F, (by the 2d *Conf.* of his *Def.* 15.) Q. *E. D.*

And from hence alſo flows naturally this other Propoſition, *That the Surface of the Cone, half* r r a b, *is to its Baſe half* a b; *as the Side of the Cone* r r b, *is to the Radius of the Baſe* b. For

$$\tfrac{1}{2} r r a b : \tfrac{1}{2} a b :: r r b : b.$$

PROPOSITION II.

If four Quantities are proportional, either continually or diſcreetly, the Product of the Extremes is equal to the Product of the Means.

For if *a*, *ra*, *rra*, *rrra*, ≒, or 2. 4. 8. 16. ≒ 'tis plain the Product of the *Extremes* and of the *Means*, is the ſame Quantity *r r r a a* or 32.

In diſcreet Proportionals, let $a : ra :: b : rb$; that is, 2 : 4 :: 15 : 30. The Product of the *Extremes* and of the *Means* can here be no other than $rab = 60$.

On which Proportion is grounded the *Golden Rule*, or *Rule of Three* in Arithmetick; ſo called, becauſe having Three Numbers, (as 2. 4. 15.) it teaches how to find an unknown Fourth Proportional: For altho' this Fourth be unknown, yet its Product by 2 the Firſt Term is known, becauſe 'tis the ſame with the Product of the Means 4 and 15. Wherefore the Rule directs us to multiply the Third by the Second, that you may thereby obtain the Product of the *Extremes*; which divided by one of the *Extremes*, *viz.* the Firſt, muſt needs give the other, that is, the Fourth ſought.

COROLLARY.

Hence 'tis plain, That if two Products ariſing from the Multiplication of any two Pairs of Quantities, are equal; thoſe four Quantities will be at leaſt diſcreetly proportional.

PROPOSITION III.

If there are never ſo many continual Proportionals, the Product of the *Extremes* is equal to the Product of any two of the Means that are equally diſtant from the *Extremes*, as alſo to the Square of the Mean or Middle Term, if the Number of the Terms be odd.

Thus in this Progreſſion,

2 4 8 16 32 64 128.
a. ra. rra. rrra. rrrra. rrrrra. rrrrrra. &c.

It's plain the Product of the Extremes, and of any two Terms equally diſtant from them, and the Square of the middle Term, muſt always be r^6aa.

At the laſt Term but one, is multiplied into a Degree or Power of the Ratio leſs by one than the laſt; ſo the ſecond Term is multiplied into one more than the firſt: And therefore the Rectangle of the Extremes muſt ſtill be the ſame Quantity with that of the Product of any two Terms equally diſtant from that; and this alſo equal to the Square of the Middle Term, if the Number of them be odd.

PROPOSITION IV.

Having the firſt and laſt Terms, and the Ratio. *To find the Sum of all the Terms in any Geometrical Progreſſion*, Mr. *Oughtred* gives this Method.

Let *a* be the firſt Term, and *y* the laſt; then let $z - y =$ all the *Antecedents*, and $z - a =$ all the *Conſequents*. Therefore, by Compoſition of Proportion, it plainly follows, That $a. ra :: z - y. z - a$. That is, the firſt Term is to the ſecond :: as the Sum of all the Antecedents is to the Sum of all the Conſequents: Wherefore by Multiplication of the Extreams and Means, $za - aa = raz - ray$. Wherefore transfer za, and it will be $-aa = raz - ray - za$. Tranſpoſe ray, then will $ray - aa = raz - za$. Divide each Part by $ra - a$, and z will be equal to $\frac{ray - aa}{ra - a}$. That is, *Multiply the ſecond and laſt Terms together, and from the Product ſubſtract the Square of the firſt Term; and then divide the Remainder by the Difference between the firſt and ſecond Term, and the Quotient will be the Sum of all the Terms.*

Example, in this Series 2. 4. 8. 16. 32. 64. 128.

	2
	4
128	8
4	16
	32
512	64
4	128
2) 504 (254 = 254	

The z of all the Terms but the laſt, may be found very eaſily thus: From the laſt take the firſt, and divide the Remainder by the *Ratio* leſſened by Unity; the Quotient is the Sum of all the Terms but the laſt, as will very eaſily appear if you multiply and divide Algebraically: Which Rule is in ſome Caſes more ready than the former, and therefore 'tis ſometimes referred to in the following *Conſectaries*, under the Name of *Rule* 2.

PROPOSITION V.

Having the Ratio of the Terms in any Geometrical Progreſſion, *To find any of the other Terms, or to find any Term ſought.*

As for Inſtance: In Progreſſion, whoſe Ratio is 2, to find the 24th Term; or to anſwer expeditiouſly the common Queſtion of the Price of an

Horſe ſold at a Farthing a Nail (of his Shooe) and doubled every time.

Begin and double, as 'tis eaſie to do, for 6 or 8 times, thus,

0	1	2	3	4	5	6	7	8
1.	2.	4.	8.	16.	32.	64.	128.	256.

And then over the Geometrical Numbers place a Series of Arithmetical ones, beginning with 0, as you ſee: Theſe are Indexes or Exponents of the other, and ſhew every where how often the Ratio is multiplied into its ſelf, to produce any particular Term. Thus over 64, the 7th Term, there ſtands the Index or Exponent 6; which ſhews that 64 is the 6th Power of the Ratio 2, (ſince the Series begins with Unity.) Now the Addition and Subſtraction of the Indexes anſwers to the Multiplication and Diviſion of the Numbers they ſtand over: For $3 + 5 = 8$, which is the Index of 256, the Product of 8 into 32; and $7 - 4 = 3$, which is the Index of 8, the Quotient of 128 divided by 16. This being the admirable Property and vaſt Uſe of theſe Indices, (which is the Reaſon and Foundation of the whole Buſineſs of the *Logarithms*, as you may ſee under that Word) 'tis very eaſie by their help to come at any Term, tho' never ſo remote either way. For ſuppoſing I would have the 16th Place in this Progreſſion, ſince $8 + 8 = 16$, I find, that if I multiply 256 by it ſelf, or ſquare it, it will give me 65536, which is the 16th place; and ſince $16 + 7 = 23$, if I multiply that Number by 128, it will produce 8388608, which is the 24th Place or Nail; (for the Indices begin with 0) and therefore that doubled, according to the Condition of the Queſtion, will give 16777216 Farthings, which reduced, is 17476 *l.* 5 *s.* 4 *d.*

From which *Propoſitions* about *Geometrical Proportionals*, theſe wonderful *Corollaries* may be deduced.

1. That 'tis poſſible by theſe Rules to collect an *Infinite Series* of Proportional Terms into one Sum, altho' it is impoſſible to run over all the Terms ſeparately, becauſe Infinite. Thus, in a continu'd Series of Fractions decreaſing in a double Proportion, $\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \frac{1}{32}$, &c. *ad infinitum*, if you take them backwards, you may juſtly reckon a Cypher, or 0, for the firſt Term; (for between $\frac{1}{2}$ and 0, there may be an Infinite Number of ſuch Terms) and the Infinite Sum of theſe Terms will be preciſely equal to Unity: For ſubſtracting the firſt 0 from the laſt $\frac{1}{2}$, and the Remainder $\frac{1}{2}$ being divided by the Name of the Reaſon leſſen'd by 1, that is by 1, which divides nothing; the Quotient $\frac{1}{2}$ is the Sum of all the Terms, excepting the laſt, (by *Rule* 2.) and ſo the laſt $\frac{1}{2}$ being added, the Sum of all in that Series will be 1. Now if the laſt is not $\frac{1}{2}$, but 1, the Sum of all will neceſſarily be 2; and if 2 be the laſt, the Sum of all will be 4: In a Word, it will be always double the laſt Term.

2. And ſince in this Caſe the Sum of all the precedent Terms is equal to the laſt Term, the one being ſubſtracted from the other, there will remain nothing, *i. e.* $\frac{1}{2} - \frac{1}{4} - \frac{1}{8} - \frac{1}{16} - \frac{1}{32}$, &c. *in Infinitum*, is $= 0$; and alſo, $1 - \frac{1}{2} - \frac{1}{4}$, &c. or $2 - 1 - \frac{1}{2} - \frac{1}{4} - \frac{1}{8}$, &c. $= 0$.

3. In like manner the Sum of Infinite Fractions decreaſing in tripple Reaſon in an Infinite Series, ($\frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \frac{1}{81}$, &c. will be equal to $\frac{1}{2}$: For if from the laſt $\frac{1}{3}$ (again in an inverted Order) you ſubſtract the firſt 0, and the Remainder $\frac{1}{3}$ be divided by the Name of the Reaſon leſſen'd by Unity, that is by 2, the Quotient $\frac{1}{6}$ will be the Sum of all the Antecedent Terms; and adding to this laſt $\frac{1}{3}$ or $\frac{2}{6}$, the Sum of all will be $\frac{3}{6}$ or $\frac{1}{2}$.

But had the Fractions decreas'd from $\frac{1}{4}$ in a Quadruple, or from $\frac{1}{5}$ in a Quintuple Proportion, &c. the Sum of the whole Series would have been accordingly $\frac{1}{3}$ or $\frac{1}{4}$, and ſo any Series of this kind is equal to a Fraction, whoſe Denominator is leſs by an Unite than the Denominator of the laſt Fraction in that Series, (ſuppoſing the Series to be numbred backward, as before.)

4. Generally alſo, any Infinite Series of Fractions decreaſing according to the Proportion of the Denominator of the laſt Term, and having a common Numerator leſs by an Unite than the Denominator of the laſt Term, (as $\frac{2}{3} + \frac{2}{9} + \frac{2}{27}$, &c. or $\frac{3}{4} + \frac{3}{16} + \frac{3}{64}$, &c. or $\frac{4}{5} + \frac{4}{25} + \frac{4}{125}$, + &c. is equal to Unity, after the ſame way as the Series, *Coroll.* 1. which may be comprehended under this kind, and which may be demonſtrated in all its particular Caſes by the ſame Method we have hitherto made uſe of, or alſo barely ſubſumed from *Coroll.* 3. For ſince $\frac{1}{3} + \frac{1}{9} + \frac{1}{27}$, &c. is equal to $\frac{1}{2}$; $\frac{2}{3} + \frac{2}{9} + \frac{2}{27}$, &c. will be equal to $\frac{2}{2}$ or 1; and ſo in the reſt.

And particularly the Sum $\frac{7}{27} + \frac{7}{288} + \frac{7}{1152}$, &c. decreaſing in a Quadruple Proportion, is equal to $\frac{1}{18}$; and the Sum of $\frac{3}{64} + \frac{3}{256} + \frac{3}{1024}$, &c. is equal to $\frac{1}{16}$; and the Sum of $\frac{7}{64} + \frac{7}{512} + \frac{7}{4096}$, &c. decreaſing in an Octuple Proportion, is equal to $\frac{1}{8}$: For ſubſtracting the firſt Term 0, and dividing the Remainder by the Name of the Ratio leſſen'd by Unity, that is by 3, the Quotient $\frac{1}{72}$, gives the Sum of all, except the laſt.

This therefore (*viz.* $\frac{7}{72}$) being added, the Sum of all will be $\frac{4}{72}$ or $\frac{1}{18}$: In like manner $\frac{7}{64}$ being divided by the Name of the Reaſon leſſen'd by Unity, the Quotient will give $\frac{1}{64}$; and adding the laſt, the Sum of all will be $\frac{8}{64}$, *i. e.* $\frac{1}{8}$: So that hence 'tis evident, that $\frac{1}{18} - \frac{3}{72} - \frac{3}{288} - \frac{3}{1152}$, &c. or $-\frac{1}{18} + \frac{3}{72} + \frac{3}{288} + \frac{3}{1152}$, &c. *in infinitum*, will be equal to nothing; and $\frac{1}{8} - \frac{7}{64} - \frac{7}{512} - \frac{7}{4096}$, &c. $= 0$.

5. The Sum of an Infinite *Progreſſion*, whoſe greateſt Term is a Square Number, the others decreaſing according to the odd Numbers 1, 3, 5, 7, &c. is in *Subſequialteran* Proportion of the Sum of the like Number of equal Terms, *i. e.* as 2 to 3. For the Sum of three ſuch Terms, as 9, 8, 5. *i. e.* 22 to thrice 9, *i. e.* 27, is (dividing both ſides by 9) as $2\frac{4}{9}$, *viz.* $\frac{8}{18}$ to 3, or $2 + \frac{1}{2} - \frac{1}{18}$ to 3. But the Sum of Six ſuch Terms, 36, 35, 32, 27, 20, 11, *i. e.* 161, to ſix times 36, *i. e.* 216 (dividing both ſides by 72) is as $2 + \frac{1}{4} - \frac{1}{72}$, &c. the adhering Fractions thus always decreaſing, ſome by half, others by three Quarters, as in *Coroll.* 7. *Progreſſion Arithmetical*: Wherefore the Sum of the Infinite *Progreſſion* will be to the Sum of the like Number of Terms equal to the greateſt, as,

$$\begin{array}{l} 2 + \frac{1}{2} - \frac{1}{18} \\ -\frac{1}{4} + \frac{3}{72} \\ -\frac{1}{8} + \frac{3}{288}, \text{ &c. to } 3; \end{array}$$

that is, by *Coroll.* 2d and 4th, as 2 to 3. *Q. E. D.*

PROHI-

PROHIBITIO *de vaſto directa parti*, is a Writ Judicial directed to the Tenant, prohibiting from making Waſt upon the Land in Controverſie, during the Suit. It is ſometimes made to the Sheriff.

PROHIBITION, is a Writ to forbid any Court, either Spiritual or Secular, to proceed in any Cauſe there depending, upon Suggeſtion that the Cogniſance thereof belongeth not to the ſame Court: But is now moſt uſually taken for that Writ which lieth for one that is impleaded in the *Court Chriſtian*, for a Cauſe belonging to the Temporal Juriſdiction, or the Conuſance of the King's Court; whereby as well the Party and his Council, as the Judge himſelf, and the Regiſter, are forbidden to proceed any further in that Cauſe.

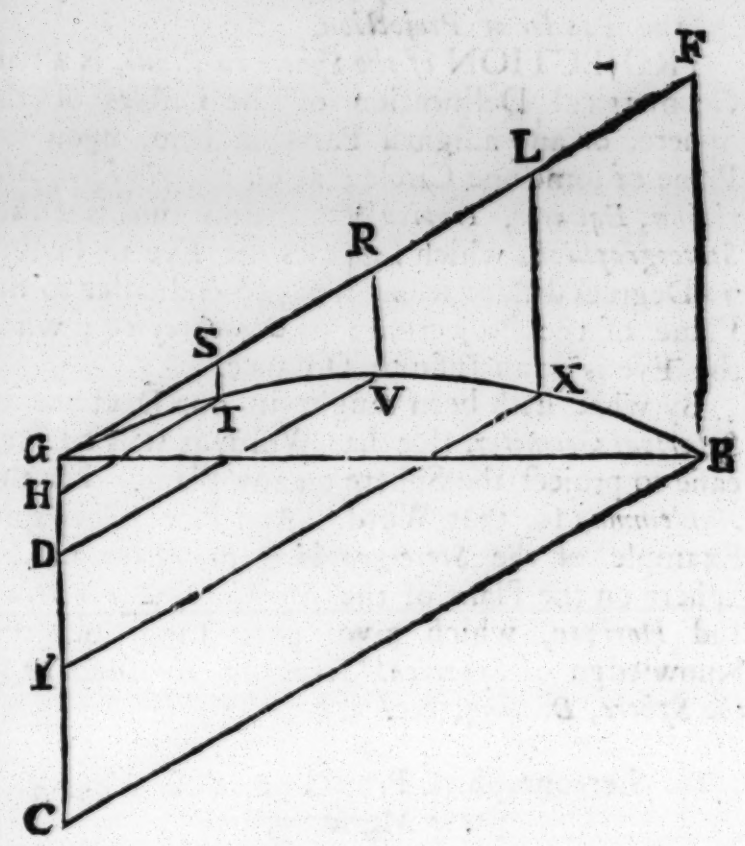
PROJECTILES, are ſuch Bodies, as being put into a violent Motion by any great Force, are then caſt off or let go from the Place where they received their Quantity of Motion, and do afterwards move at a Diſtance from it; as a Stone thrown out of ones Hand, or by a Sling, an Arrow from a Bow, a Bullet from a Gun, *&c.*

There hath been a great Diſpute about the Cauſe of the Continuation of the Motion of *Projectiles*, or what it is that makes them move after they part from the Force that began the Motion. The *Peripateticks* will needs have it, That the Air being by the Motion of the Hand of the Slinger, *&c.* put into a moſt violent Agitation, and forced rapidly to follow the Motion of the Stone, while 'tis accelerated in the Hand of the Slinger, doth to prevent a *Vacuum*, preſs with all due Velocity after the Stone when it parts from the Hand, and thruſts it forwards as long as it can. But this Account ſeems very unconceivable; and there needs nothing more to ſolve the Motion of *Projected Bodies*, but only to conſider, That all Bodies being indifferent to Motion or Reſt, will neceſſarily continue the State which they are put into, unleſs they are forced to change if by ſome other Force impreſſed upon them. Thus if a Body be at reſt, ſo it will eternally abide, if nothing move it; or if it be in Motion, ſo it will eternally move uniformly on in the ſame right Line, if nothing ſtop it. Wherefore, when a Stone is put into any Degree of Motion, by the Rotation of the Arm of the Man that ſlings it, whatever Degree of Velocity it had acquired when it parted from the Hand, the ſame would it ever after keep if it moved in *Vacuo*, and had no Gravity: But becauſe it hath a Tendency, as all Bodies (by the Law of Nature) have, towards the Centre of the Earth, and is alſo reſiſted by the Air all along as it goes, in proportion to its Velocity; it plainly follows, that it muſt needs be both continually drawn downwards, and alſo continually retarded in its Progreſſive Motion forwards, and conſequently at laſt fall down to the Earth, and ſtop.

The Line of Motion which a Body *projected* deſcribes in the Air, (abſtracting from the Reſiſtance of the Medium) is, as hath been proved by *Galilæus*, and many Others, and particularly by our Sir *Iſaac Newton*, *Prop.* 4. *Cor.* 1. of his Second Book, the Curve of a Parabola: Which Line is alſo deſcribed by every Deſcending Body.

He ſhews alſo, That if the Line of Direction of the Projectile Motion of any Body, the Degree of its Velocity, and at the Beginning, the Reſiſtance of the Medium being given, the Curve which it will deſcribe may be diſcovered, and *vice verſa*; he ſaith alſo in *Schol. Prop.* X. *Lib.* 2. That the Line which a *Projectile* deſcribes in a Medium uniformly reſiſting the Motion, rather approaches to an *Hyperbola* than a *Parabola*.

The Learned Capt. *Halley* proves all *Projectiles* to deſcribe a *Parabola* thus:



Let the Line G R F be the Line in which the *Project* is directed, and in which, by the firſt *Axiom*, under the Word *Deſcent*, it would move equal Spaces in equal Times, were it not deflected downwards by the Force of *Gravity*. Let G B be the *Horizontal Line*, and G C a Perpendicular thereto. Then the Line G R F being divided into equal Parts, anſwering to equal Spaces of Time, let the *Deſcents* of the *Project* be laid down in *Lines parallel* to G C, proportioned as the Squares of the Lines, G S, G R, G L, G F, or as the Squares of the Times; (*i. e.*) let them be drawn from S to T, from R to U, from L to X, and from F to B, and draw the Lines T H, V D, X Y, B C, parallel to G F; I ſay, the Points T, V, X, B, are Points in the *Curve* deſcribed by the *Project*, and that That *Curve* is a *Parabola*.

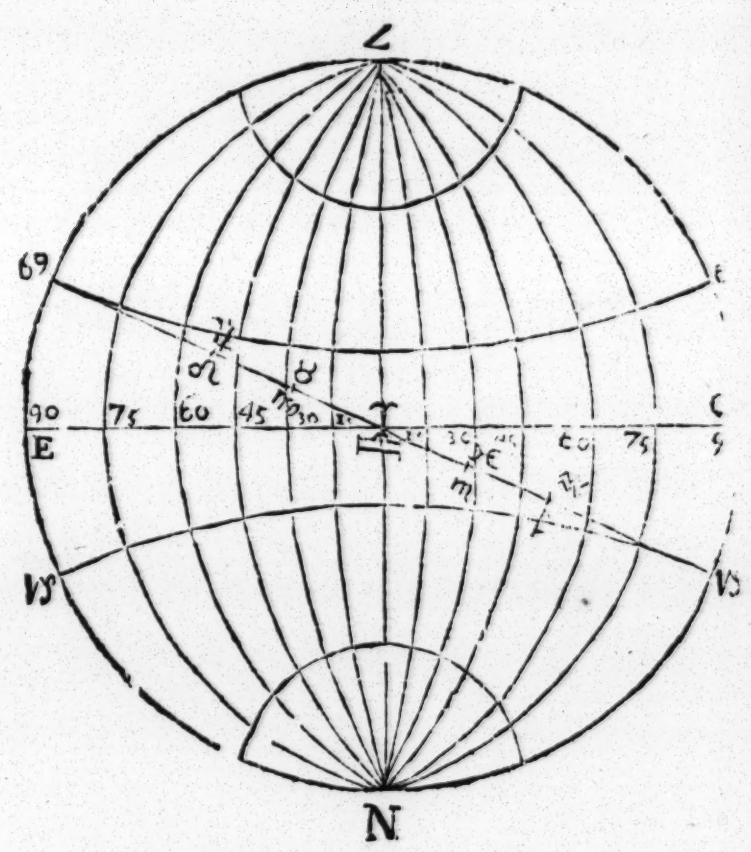
That the Points are in the *Curve*, is evident by *Axiom* 2. under the Word *Deſcent of Heavy Bodies*: and the Parts of the *Deſcent* G H, G D, G Y, G C = S T, R V, L X, F B, being as the Squares of the Times, (by *Prop.* 2. under the Word *Deſcent*) that is as the Square of the *Ordinates* H T, D V, Y X, B C = G S, G R, G L, G F, the *Spaces* meaſured in thoſe *Times*; and there being no other *Curve* but the *Parabola*, whoſe Parts of the *Diameter* are as the Squares of the *Ordinates*, it follows that the *Curve* deſcribed by a *Project* can be no other than a *Parabola*: And ſaying, as R V the *Deſcent* in any *Time*, as R G or V D the *direct Motion* in the ſame *Time*; ſo is V D to a *Third* Proportional, or the *Parameter* of the *Parabola* to the *Diameter* G C, which is always the ſame in *Projects* caſt with the ſame *Velocity*: And the *Velocity* being defined by the Number of *Feet* moved in a *Second* of *Time*, the *Parameter* will be found by dividing the *Square* of the *Velocity* by 16 *Foot* 1 *Inch*, the *Fall* of a *Body* in the *ſame Time*.

PROJECTION, in Chymiſtry, is putting any Matter to be *calcined* or *fulminated* into the Crucible Spoonful by Spoonful. The pretended Caſting of the Powder of the Philoſopher's Stone into a Crucible of melted Metal, in order (as they boaſt they can do) to tranſmute it into Gold or Silver, is called alſo *Projection*; and the Matter they caſt in, the *Powder of Projection*.

PROJECTION *of the Sphere in Plano*, is a true Geometrical Delineation of the Circles of the Sphere, or any aſſigned Parts of them, upon the Plane of ſome one Circle; as on the *Horizon*, *Meridian*, *Equator*, *Tropick*, &c. And this is either *Stereographick*, which ſuppoſes the Eye to be but 90 Degrees diſtant from, and perpendicular to the Plane of the Projection; or *Orthograpick*; when the Eye is at an Infinite Diſtance.

By what hath been taught in our Doctrine of *Spherical Geometry*, (ſee that Word) it will be very eaſie to project the Sphere on any Plane. For the *Analemma*, ſee that Word. And here follows an Example of the *Stereographick Projection* of the Sphere on the Plane of the *Meridian*, *Equinoctial*, and *Horizon*, which gives good Light into the Knowledge of *Spherical Triangles*, *the Doctrine of the Sphere*, *Dialing*, &c.

The Stereographick Projection *on the Plane of the* Meridian.



Let Z Q N E be the *Meridian*.
- Z and N the *Poles*, as alſo the *Zenith* and *Nadir*.
- E Q the *Equinoctial* and *Horizon*.
- Z N the *Equinoctial Colure*, and *Prime Vertical Circle*.
- Z 15 N, Z 30 N, Z 45 N, &c. are *Hour-Circles* or *Meridians*, and alſo *Azimuths*, becauſe the *Pole* is in the *Zenith*.

And to deſcribe theſe Circles, find the Points 15, 30, 45, 60, &c. in the *Equinoctial*, by ſetting the Half Tangent of their Diſtance from ♈; and then their Centres are found by ſetting their Coſecants both ways from their Points of Interſection with the *Equator*.

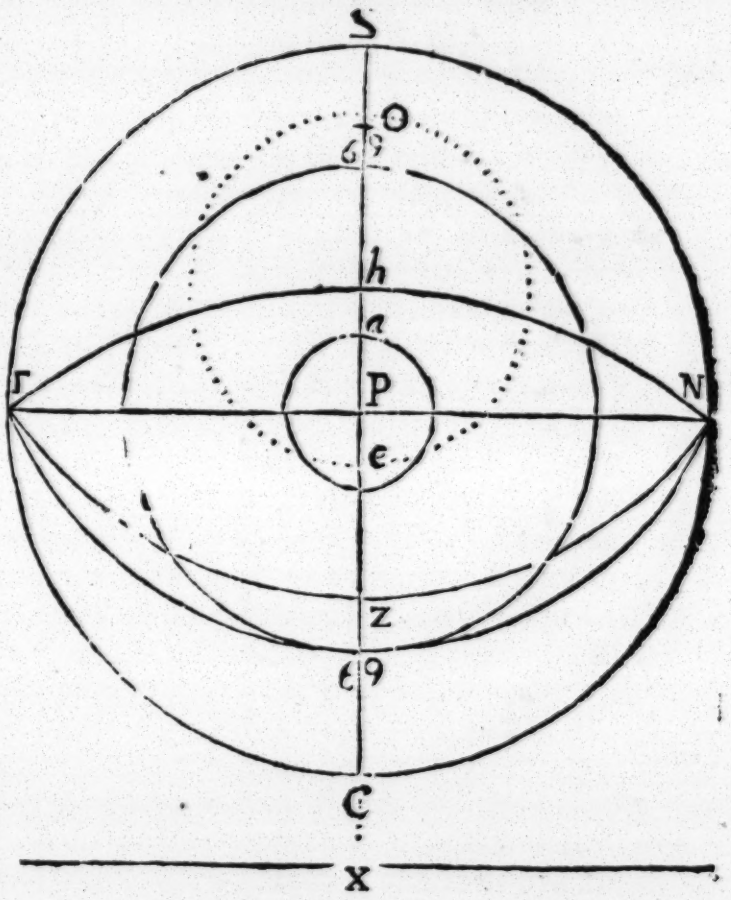
♋, ♋, and ♑, ♑, are the Northern and Southern *Tropicks*, which are deſcribed by ſetting the Half Tangent of 23 Deg. 30 Min. from ♈ each way: Then the Tangent of its Complement, *viz.* 66 Deg. 30 Min. each way from thence on the *Colure* produced, gives their Centres. By this Method all Parallels, of Declinations may be drawn.

Or you might have ſet the *Co-ſecant* of the *Parallel* from the Centre of the *Primitive*, which would have alſo found the ſame Point for the Centre of the Parallel, whoſe *Radius* is equal to the *Tangent* of its Diſtance from its *Pole*, by *Cor.* 1. and 2. of *Probl.* 2. of *Spherick Geometry*.

Theſe *Parallels* in this *Projection*, are alſo *Almicanters*, or *Parallels of Altitude*.

♋, ♑, is the *Ecliptick*, which muſt be divided from the Diviſion on the Scale of *Half Tangents*, but denominated according to the *Signs* of the *Zodiack*, reckoning 30 Degrees to each Sign.

The Stereographick Projection *on the Plane of the* Equinoctial.



Let S C be the *Meridian* and *Solſticial Colure*,
- E N the *Equinoctial Colure* and *Hour-Circle* of 6.
- P the *North Pole*.
- ♋ ♋ the *Northern Tropick*.
- E ♋ N the *Northern Half of the Ecliptick*, (whoſe Centre is found by ſetting off the *Secant* of 23 Deg. 30 Min. from ♋) And its *Pole* is at *a* the Interſection of the *Polar Circle* and *Meridian*; and is the Place through which all Circles of Longitude muſt paſs.
- E Z N the *Horizon* of *London*, which is deſcribed thus: Set the *Half Tangent* of the *Co-latitude* from P to Z; then the *Tangent* of the ſame, ſet from P to O, or its *Secant* from Z to O, gives its Centre; and its *Pole* will be at *h*, 38 Deg. 30 Min. (in the *Half Tangents*) diſtant from F, where *h* is at the *Zenith*.

To draw any other Circles in this Projection.

1. For *Circles of Longitude*, which muſt all paſs thro' *a*, and the ſeveral *Degrees* of the *Ecliptick*; ſet therefore the *Tangent* of 66 Deg. 30 Min. from *a*, downwards, on the *Meridian*, produced; which will find a Point, through which a Perpendicular drawn to the *Meridian*, ſhall contain in it the Centres of all the Circles of Longitude, whoſe Diſtances ſet off to the *Radius P x*, ſhall be the *Tangents* of the Degrees of their Diſtances from the *Meridian*, S P C, (which is that belonging to 180. Deg.)

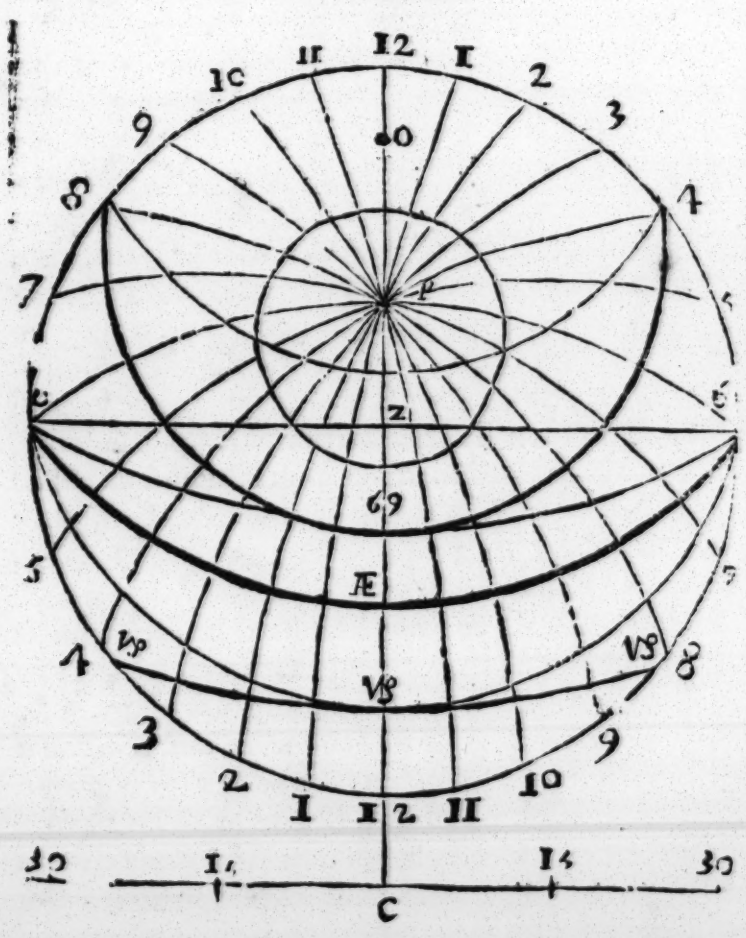
2. All *Parallels of Declination* are drawn by ſetting the *Half-Tangents* of their Diſtances from P.

3. All *Azimuths*, or *Vertical Circles*, muſt paſs thro' *h* at the *Zenith*; Since therefore the *Zenith* is 38 Deg. 30 Min. diſtant from P, ſet the *Co-ſecant* of that (or the Secant of 51 Deg. 30 Min.) from *h* on the *Meridian* extended below, and that ſhall find the Point *x*, the Centre of the *Azimuth* of Eaſt and Weſt, *viz*, E *h* N; and the Centres of all the reſt are in a Line that's perpendicular to the *Meridian*, and drawn through *x*.

4. *Circles of Altitude*, or *Almicanters* are leſſer Circles, whoſe *Poles* are not in the Plane of the *Projection*, and may be deſcribed by our Third Caſe of *Probl.* 9. of *Spherick Geometry*. Thus the Circle O *e* is a *Parallel of Altitude* 50 Degrees above the *Horizon*.

5. All *Hour-Circles* are ſtrait Lines from the Centre to the Limb.

The Stereographick Projection *on the Plane of* the *Horizon*.



First, Draw a Circle repreſenting the *Horizon*, and quarter it with two Diameters.

Then will

ζ be the *Zenith* of the Place.
12 ζ 12 the *Meridian*.
6 ζ 6 the *Prime Vertical*, or *Azimuth* of E, & W.

Make

ζ P = ½ Tangent of 38° 30′ (or Tangent of 19° 15′)
P ſhall be the *Pole of the World*.

Make

ζ Æ = 1 Tangent of 51° 30′ (or Tangent of 25° 45′)

And

Æ *o* = Secant } of 38 Deg. 30 Min.
ζ *o* = Tang. }

Then ſhall

o be the *Centre of the Equinoctial*, 6 Æ 6.

In this *Projection*, *Almicanters* are all parallel to the Primitive Circle.

And *Azimuths* are all Right Lines, paſſing thro' (ζ) the Centre of the Primitive, to the equal Diviſions in the Limb.

Parallels of Declination, are all Leſſer Circles, and parallel to the *Equinoctial*; and their Interſection with the meridian are found by ſetting the Half Tangent of their Diſtance from the *Zenith* Southward and Northward, or both ways from ζ.

Their Centres are found by biſecting the Diſtance between thoſe two Points; for the Middle ſhall be the Centre of the Parallel.

Thus,

ζ ♋ = ½ Tangt. of 28° 00′ = Diſtance of the Tropick of ♋ from the *Zenith*, } to the Southw. or downward from ζ.
And
ζ ♑ = ½ Tangt. of 75° 00′ = Diſtance of the Tropick of ♑ from the *Zenith* } to the Southw. or downward from ζ.

And the Interſection again with the North of the *Meridian*, is at

105° 30′ } for { ♑ } to the Northwards, or upwards from ζ.
152° 0′ } for { ♋ } to the Northwards, or upwards from ζ.

For the *Hour-Circles*,

Make ζ *c* = Tangent of 51° 30′, or P *c* = Secant of 51° 30′. Draw G C T perpendicular to the produced *Meridian*. Wherefore, if from *c*, with the Radius ζ *c*, you ſet off the Tangents of 15°, 30°, 45°, &c. both ways, you'll have the Centres of the ſeveral *Hour Circles*, 7 and 5, 8 and 4, &c.

Note, *In all* Stereographick Projections, *all Diameters are meaſured on the Scale of* Half Tangents: *The Reaſon of which you have in* Prop. 2. *of our* Spherick Projection. *And this is the* Ground of all Dyalling, *or the True Projection of the Hour-Circles of the Sphere on any Given Plane.*

PROJECTURE, a Term in Architecture ſignifying the Jutting or Leaning-out of any Part of a Building, the Coping of a Wall, &c. Theſe the *Italians* call *Sporti*, and the *Greeks*, *Echphoras*; and in the General, all *Margents* which hang over beyond

yond the *Scapus* of a Column, are called *Projectures.*

PRO *in Diviſo*, is a Poſſeſſion or Occupation of Lands or Tenements, belonging to two or more Perſons, whereof none knows his ſeveral Portion, as *Co-parceners* before Partition.

PROLABIA, the utmoſt prominent Parts of the Lips.

PROLEPSIS, is a Figure in Rhetorick, by which we prevent what might be objected by the Adverſary.

PROLAPSUS *Uteri*. See *Uteri Prolapſus.*

PROLEPTICUS, is a Diſeaſe always anticipating; ſo as if the Ague came to day at Four of the Clock, then to Morrow one Hour ſooner, and ſo on. *Blanchard.*

PROLOCUTOR *of the Convocation Houſe*, is an Officer choſen by Perſons Eccleſiaſtical, publickly aſſembled by Virtue of the King's Writ, for every Parliament: And as there be two Houſes of *Convocation*, ſo there are two *Prolocutors*, one of the Lower, and one of the Higher Houſe. He of the Lower Houſe, preſently upon the firſt Aſſembly, by the Motion of the Biſhops, being choſen by the Members of the ſaid Lower Houſe, is preſented to the Biſhops for *Prolocutor*, that is, the Perſon by whom they intend to deliver their Reſolutions to the Higher Houſe, and to have their own Houſe eſpecially ordered and governed. His Office is to cauſe the Clerk to call the Names of ſuch as are of that Houſe, when he ſees Cauſe to read all things propounded, gather Suffrages, and the like.

PROMOTERS, or *Promooters*, are thoſe who in Popular and Penal Actions do proſecute Offenders in their own Name and the King's; having Part of the Fines or Penalties for their Reward. They do belong eſpecially to the *Exchequer* and *King's Bench.*

PROMULGE *a Law*, is firſt to make a Law, and then to declare, publiſh, and proclaim the ſame to Publick View; and ſo *Promulgated.*

PRONOS, or *Pronaus*, a Term uſed by Architects for a Church-Porch, or a *Portico* to a Palace, great Hall, or ſpacious Building.

PRONATOR *Radii Quadratus*, is a Muſcle of the *Radius*, which ariſeth broad and fleſhy from the Lower and Inner part of the *Ulna*; and paſſing tranſverſly over the Ligament that joins the *Radius* to the *Ulna*, and is ſo inſerted to the Superior and External part of the *Radius*: It helps with the *Pronator Teres* to move the *Radius* inwardly.

PRONATOR *Radii Teres* is a Muſcle of the *Radius*, by ſome called *Pronator Superior Rotundus*: It ariſeth fleſhy from the Internal Extuberance of the *Os Humeri*, where thoſe bending the *Carpus* and Fingers do ariſe; and firmly adhering to the *Flexor Carpi Radialis*, it deſcends obliquely downwards to its fleſhy Inſertion, a little above the middle of the *Radius* Externally: Its Uſe is to move the *Radius* inwards.

PRONOTARY, or *Protonotary*, is a Chief Officer of the *Common Pleas* and *King's Bench.* He of the *King's Bench* records all Actions Civil ſued in that Court, as the *Clerk* of the *Crown-Office* doth all Criminal Cauſes. Thoſe of the *Common-Pleas* do enter and enrol all manner of Declarations, Pleadings, Aſſiſes, Judgments and Actions: Alſo they make out all Judicial Writs, as the *Venire facias*, after Iſſue joined; and *Habeas Corpus*, for bringing in of the Jury; and *Diſtringas Jurator.* They alſo make out Writs of Execution and Seiſin; Writs of *Superſedeas*, for Appearance to *Exigents*: as well as the *Exigents* and *Writ of Priviledge*, for removing Cauſes from other Inferior Courts of Record, where the Party hath Cauſe of Priviledge; Alſo Writs of *Procedendo* and *Scire facias* in all Caſes, and Writs to *enquire of Damages*, and all Proceſs upon *Prohibitions*, and upon Writs of *Audita Querela*, and *Falſe Judgment*; with many other. Laſtly, They enrol all Recogniſances acknowledged in that Court, and all Common Recoveries; and they make Exemplifications of any Record in the ſame Term, before their Rolls are made up and delivered into the Treaſury of the Records of that Court.

PRONOUN, in Grammar, is a Variable Word, often uſed as a Noun, and nearly of a like Signification with it: And theſe *Pronouns* they divide into ſuch as are,

1. *Finite*; as, *I, Thou, He,* &c.
2. *Infinite*; as *Quis, Cujus,* &c.
3. *Demonſtrative*, which ſhew a preſent Perſon or Thing; as, *I, You, He.* &c.
4. *Relative*, which refer to ſome Antecedent Word; as, *who, which, &c.*
5. *Interrogative*; as when *who* and *which*, &c. are uſed in asking Queſtions.
6. *Poſſeſſives*; as, *Mine, Thine,* &c.
7. *Gentiles*, which expreſs a Nation or Country; as, *Noſtras, Veſtras, Cujas* in the Latin Tongue.

PRO *Partibus Liberandis*, is a Writ for the Partition of Lands between Co-heirs.

PROPER *Fraction*, is ſuch an one as hath its Numerator leſs than the Denominator; as $\frac{3}{4}$, $\frac{5}{7}$, which is really leſs than Unity, and therefore properly ſpeaking, a Fraction.

PROPER *Navigation*, is the guiding of a Ship to any Port deſired, where the Voyage is to be perform'd in the vaſt Ocean; and requires not only the Lead-Line, and Ordinary compaſs, but *Azimuth Compaſs, Charts, Log-board*, and *Half Minute-Glaſs*; with Inſtruments for Celeſtial Obſervation, as the *Quadrant, Fore-ſtaff*, &c. And the Navigator muſt be able by theſe to find at any time in what Place the Ship is; which is done by comparing it with any known Place; that is, how much the ſame known Place is ſituate from the Ship, either towards the North or South, which is called the *Difference of Latitude*; or towards the Eaſt or Weſt, which if in proper Degrees, is called the *Difference of Longitude.*

PROPERTY, or *Propriety*, ſtrictly ſpeaking, is the higheſt Right that a Man hath or can have to any thing, and no ways depending upon any other Man's Courteſie: And this, none in our Kingdom can be ſaid to have in any Lands or Tenements, but only the King in the Right of his Crown; becauſe all the Land throughout the Realm is in the Nature of Fee, and held either mediately or immediately of the Crown.

This Word nevertheleſs, is uſed for that Right in Lands and Tenements that Common Perſons have, becauſe it importeth as much as *utile Dominium*, tho' not *Directum.* And there are Three manners of Rights of *Property*, that is, Property *Abſolute*, Property *Qualified*, and Property *Poſſeſſory.*

PROPHASIS, is a Fore knowledge in Diſeaſes, alſo an Occaſion or Antecedent Cauſe. *Blanchard.*

PRO-

PROPHYLATICA, is a Part of that Part of Phyſick called *Hygicina*, (or what reſpects the Preſervation of Health) which gives notice of future but imminent Diſeaſes. *Blanchard.*

PROPLASM, the ſame with a *Mould* in which any Metal or ſoft Matter, which afterwards will harden, is caſt.

PROPORCITAS, in Law, ſignifies the Declaration or Deliverance of an Aſſiſe; otherwiſe called *Veredictum Aſſiſæ*, the Verdict of an Aſſiſe; becauſe the Aſſiſors are ſworn to declare the Truth, and therefore are called *Juratores* or *Juorors.*

PROPORTION, 1. When two Quantities are compar'd one with another, in reſpect of their Greatneſs or Smallneſs, that *Compariſon* is called *Ratio*, *Reaſon*, *Rate*, or *Proportion*: But when more than two Quantities are compared, then the Compariſon is more uſually called the *Proportion* that they have to one another. The Words *Ratio* and *Proportion* are frequently uſed promiſcuouſly.

2. When two Quantities only are compared, the former Term is called the *Antecedent*, and the latter the *Conſequent.*

3. And the *Proportion* or Relation of two Numbers one to another, is found by dividing the *Antecedent* by the *Conſequent*; and the Quotient is the Exponent or Denominator of the Proportion.

As, if the Quotient be 2, the Proportion is Double; if 3, Treble; if 4, Quadruple; if $\frac{1}{2}$, Subduple, or one Half; if $\frac{1}{3}$, Subtriple, or one Third part; if $\frac{3}{2}$, or $1\frac{1}{2}$, Seſquilateral, or the Proportion denominated by one and an Half; if $\frac{4}{3}$, or $1\frac{1}{3}$, Seſquitertian, or once with a Third part; and univerſally, the Proportion of A to B, is that denominated by $\frac{A}{B}$, that is by the Quotient of A divided by B.

4. Theſe *Proportions*, ſo many of them as are Rational, or between Number and Number, have particular Names given them by *Greek* and *Latin* Writers.

If after the Antecedent be divided by the Conſequent, the Quotient be 1, it is called *Proportion of Equality*, or *Simple Proportion.*

If the Quotient be 2, 3, 4, (or ſuch other Integer Number) it is called *Multiple Proportion*, (viz. *Double*, *Treble*, *Quadruple*, &c.) And the Contrary to thoſe are called *Submultiple*, (viz. *Subduple*, *Subtriple*, *Subquadruple*, &c.) or *One half*, a *Third part*, *Fourth part*, or ſuch other *Aliquot* Part.

If the Quotient be 1, with one ſuch Part, as $1\frac{1}{2}$, $1\frac{1}{3}$, $1\frac{1}{4}$, &c. it is called *Superparticular*, (viz. *Seſquialteral*, *Seſquitertian*, *Seſquiquartan*, &c.) And the Contraries hereunto are called *Subſuperparticular*, (viz. *Subſequialteral*, *Subſequitertian*, &c.

If ſuch Quotient be 2, 3, 4, (or ſuch other Integer greater than Unity) with ſuch an *Aliquot* Part, it is called *Multiple-ſuperparticular*, (as $2\frac{1}{2}$, *Duple-ſeſquialteral*; $3\frac{1}{3}$, *Triple-ſeſquitertian*; $3\frac{1}{4}$, *Triple-ſeſquiquartan*, &c.) And the Contraries thereunto are *Submultiple-ſuperparticular*, as *Subduple-ſeſquialteral*, *Subtriple-ſeſquitertian*, &c.

If the Quotient be 1, with ſome Number of *Aliquot* Parts, as $1\frac{2}{3}$, $1\frac{3}{4}$, $1\frac{2}{5}$, &c. it is called *Superpartient*, (as *Superbipartiens tertias*, *Supertripartiens quartas*, *Superbipartiens quintas*, &c.) And the Contraries hereunto are *Subſuperpartient*, as *Subſuperbipartiens tertias*, &c.

If ſuch Quotient be ſome greater Integer Number, (as 2, 3, &c.) with ſuch Number of *Aliquot* Parts, as $2\frac{2}{3}$, $3\frac{3}{4}$, $3\frac{2}{5}$, &c. it is called *Multiple-ſuperpartiens*, (as *Dupla ſuperbipartiens tertiens*, *Tripla ſupertripartiens quartas*, *Tripla-ſuperbipartiens quintas*, &c.) And the Contraries thereunto, *Submultiple-ſuperpartient*, (as *Subdupla-ſuperbipartiens tertias*, *Subtriple-ſupertripartiens quartas*, &c.) As that of 31 to 7, (becauſe $\frac{31}{7} = 4\frac{3}{7}$) is *Quadruple ſupertripartiens ſeptimas*; and its Contrary, 7 to 31, is *Subquadruple-ſupertripartiens ſeptimas.*

And under ſome of theſe Compellations all Proportions will fall, which are as one Integer Number to another.

But notwithſtanding all this ado, (tho' that the Ancient Geometers may be underſtood, I thought fit to explain theſe long, barbarous, and hard Words here) tis much better, and more Intelligible, to expreſs theſe Proportions, as the uſual manner now is, by the Numbers themſelves, than by theſe Names; and briefly and clearly to ſay, as 31 is to 7, or as 7 is to 31, rather than to ſay *Quadrupla-ſupertripartiens ſeptimas*, or *Subquadrupla-ſupertripartiens ſeptimas.*

5. If when Four Quantities are conſidered, you find that the *Firſt* hath as much Greatneſs or Smallneſs, in reſpect of the *Second*, as the *Third* hath in reſpect of the *Fourth*: Thoſe Four Quantities are called *Proportionals*, and are thus expreſſed,

$$8 . 2 :: 16 . 4.$$
$$a . b :: c . d.$$

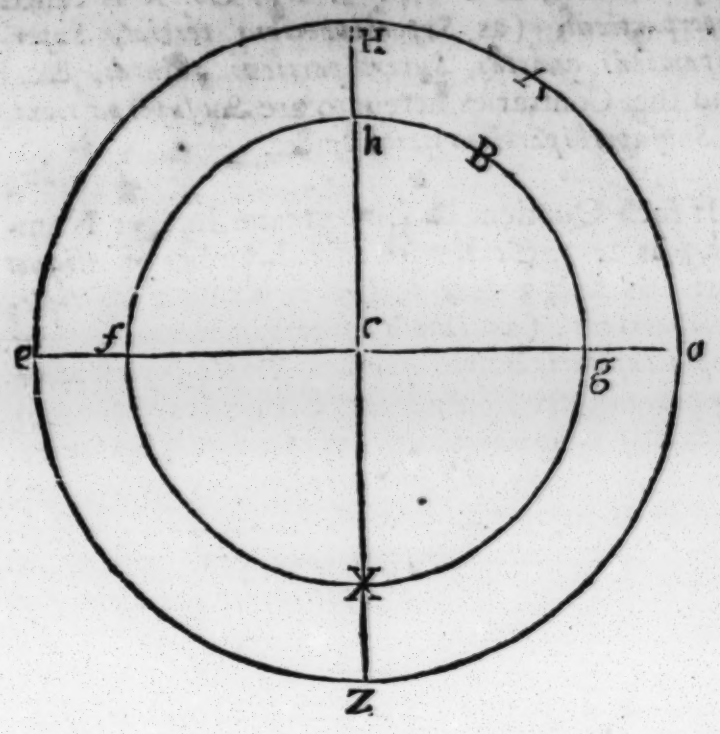
That is, As 8 contains 2 four times, ſo 16 contains 4 four times; and therefore 8 is juſt as big in reſpect of 2, as 16 is in reſpect of 4.

Here therefore, the *Ratio* between the Firſt Pair, is equal to the *Ratio* between the other Pair of Numbers; and conſequently, theſe Four having equal *Ratio's*, are *Proportionals.*

But if you encreaſe or diminiſh any one of theſe Four Numbers, the *Ratio* will grow unequal, and then they will not be *Proportionals*: As if inſtead of 8 you ſhould put 9 or 7, letting all the reſt remain as they were; 'twill then be plain, that 9 hath more Magnitude, and 7 hath leſs in reſpect of 2, than 16 hath in reſpect of 4; for 9 contains 2 above four times, and 7 doth not contain it ſo often as four times; whereas 16 contains 4 exactly four times: Wherefore theſe latter Numbers, 9, 2, 16, 4, or 7, 2, 16, 4, are not *Proportionals.* And 'twould be the ſame, if any other Member of the firſt Four Numbers had been altered; for the *Proportion* would neceſſarily be deſtroyed.

6. The annexed Figure will ſerve very well to explain *Proportion.*

Let



Let the *Radius e* C be ſuppos'd to move quite round on its Centre C, 'till the Point *e* come to the ſame Place it was at before it began to move; then will that Point *e* have deſcribed the Circumference of a Circle, which let be H *d* Z *e*. Then at the ſame time, any other Point of the *Radius*, as ſuppoſe *f*, will alſo have deſcribed the Inner Circle *f h g* X. Draw the two Diameters H Z, and *e d*, cutting each other at Right Angles in C, which will divide both Circles into four Quadrants. 'Tis plain from hence, that the ſame Proportion which the outer Circle (Z) bears to its fourth (or any other) part A; the ſame muſt the inner Circle (X) bear to B, alike Part of its Circumference. For when the longer *Radius e* C hath moved over the fourth part of the Circle Z, and the Point *e* is come to H; then will the Point *f* alſo be come to *h*, and will have gone over a Quadrant of its Circle X; and when *e* is come to *d*, *f* alſo will be come to *g*, and will as well as the other have deſcribed a Semi-circle: So that as the Circle Z is to any Part of its Periphery, or as it is to the Ark A; ſo will the Circle X be to a like Part of its Periphery, or to the Ark B. That is,

12 3 8 2
Z : A :: X : B.

7. And from theſe Conſiderations may all the ſeveral Species of Proportion be demonſtrated from the Nature of the Thing. For if

12 : 3 :: 8 : 2.
Z : A :: X : B.

It will certainly follow by *Inverſion*, that

A : Z :: B : X.

That is, If Z be as big in reſpect of A, as X is in reſpect of B; then muſt A be as little in reſpect of Z, as B is in reſpect of X.

Or if 12 contain 3 as often as 8 contains 2, then will 3 be contained in 12 as oft as 2 is contained in 8.

8. Since Z : A :: X : B, it will follow, by *Alternate* Proportion, that Z : X :: A : B; that is, Antecedent is to Antecedent, as Conſequent is to Conſequent: Which is plain, if the former Figure be well conſidered.

For ſuppoſe the outer Circle Z to be Double, Triple, Quadruple, &c. of the inner Circle X; then muſt the Ark A (or any other Part of it) be Double, Triple, &c. of the Ark B, a like Part of the Circle X. Therefore, as the Whole is to the Whole, ſo the Parts muſt be to the Parts; that is, Z : X :: A : B. *Q. E. D.*

9. If you compare the *Differences* (which is what remains when one is ſubtracted from the other) between the Antecedents and their Conſequents, with thoſe Conſequents; another Species of *Proportion* will be found, which is called *Proportion by Diviſion*, and ought to be thus expreſt,

$\overline{Z - A} : A :: \overline{X - B} : B.$

Now undoubtedly, if from the whole Circle Z you take a Quarter, (or any other Part) as A; and alſo from the whole Circle X you take a Quarter, or any like Part, as B; the remaining three Quarters of the outer Circle, muſt be to its other Quarter A, as the remaining three Quarters in the inner Circle are to its Quarter B. That is,

$\overline{Z - A} : A :: \overline{X - B} : B.$ *Q. E. D.*
9 . 3 :: 6 . 2

10. Or if you add the Antecedents and Conſequents together, and then compare the Sums with the former Conſequents; another Species ariſes, called *Proportion by Compoſition*; and 'tis thus expreſt,

$\overline{Z + A} : A :: \overline{X + B} : B.$

And 'tis certain, ſince Z : A :: X : B, by the Suppoſition, and alſo Z : X :: A : B. by *Alternate Proportion*: Z and A together will be to A, as X and B together are to B. That is,

$\overline{Z + A} : A :: \overline{X + B} : B.$ *Q. E. D.*
15 . 3 :: 10 . 2

11. If you compare the Antecedents with the Differences between them and their Conſequents, another Species of Proportion ariſes, which is called *Converſion of Proportion*: And is thus expreſt,

$\overline{12 \quad .9} :: 8. \overline{\quad 6}$
$\overline{Z. Z - A} :: X. \overline{X - B}$

Which is very plain from the Conſideration of the Figure; for no doubt the whole Circle Z is to its $\frac{3}{4}$ (*viz.* Z − A) as the whole leſſer Circle X is to $\frac{3}{4}$ (which is X − B.)

12 3 8 2
12. If when Z. A :: X. B, you compare the Conſequents A and B with two other Quantities, ſo as to make two Rows of Proportionals, ſtanding thus, Z . A :: X . B
A . *d* :: B . I.

12 9 :: 8 : 6
Then will Z be to *d* :: as X : I, which is another Species of Proportion by *Equality*, or *ex æquo ordinata*: And follows from this Figure very plainly,

plainly; for no doubt the whole Circle Z is to its $\frac{1}{4}$; which is 9 or 4 :: as the whole Circle X is to its $\frac{1}{4}$, which is 1. or 6.

13. If Z be taken as often as X, *ex. gr.* 3 Z and 3 X, you may conclude, That Z : X :: 3 Z : 3 X, or as 10 Z to 10 X; or alſo as 12 $\frac{1}{2}$ Z, to 12 $\frac{1}{2}$ X. And ſo on, in whatſoever Proportion the two Magnitudes Z and X are multiplied, ſo they are multiplied equally, or that you take one as often as you take the other. For then there will be the ſame Proportion between the Magnitudes thus equally multiplied, as there was between the Simple Magnitudes, before ſuch Multiplications.

And theſe Magnitudes thus equally multiplied, are called *Æqui-multiples* of the ſimple Magnitudes Z and X: Hence we ſay, that *Æqui-multiples* are in the ſame Proportion as ſuch ſimple Magnitudes, out of which they are compounded.

14. If Z be divided in the ſame manner as X is; and *ex. gr.* you take a fourth Part of Z, and the like of X; or the tenth, or any other Part of Z, and the ſame of X: Then will theſe Parts be proportional to their Wholes, Z : X :: $\frac{1}{4}$ Z (or $\frac{1}{10}$ Z) : $\frac{1}{4}$ or $\frac{1}{10}$ X. All which is ſelf-evident.

15. A *Proportion* is ſaid to be *Compounded* of other Proportions, when the Exponent of That is made by the Multiplication of the Exponents of Theſe, one into another. Thus, the *Compound of the Treble and Double*, (whoſe Exponents are 3 and 2) is the *Treble of the Double*, (whoſe Exponent is 3 × 2) that is, the *Sextuple* (becauſe 3 × 2 = 6) which is manifeſtly a Work of Multiplication.

16. The *Products*, or the *Quotients* of any Two Quantities or Numbers *Multiplied* or *Divided* by the ſame Third Numbers, are in the ſame Proportion as the Numbers were before they were *Multiplied* or *Divided*.

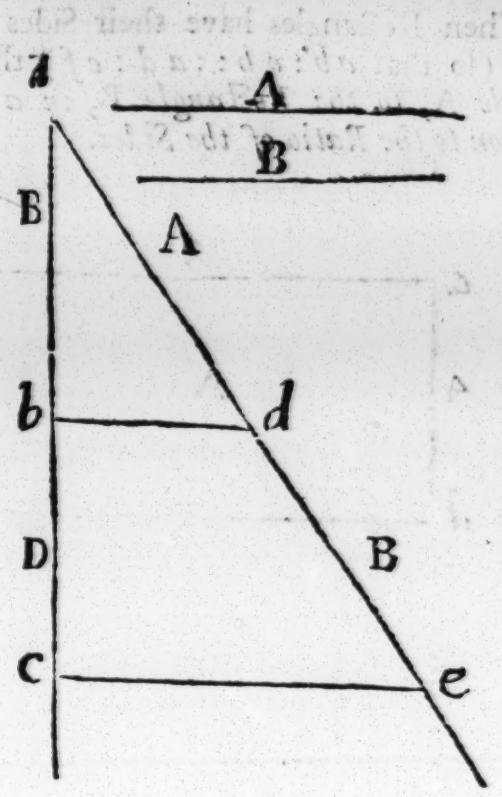
E. gr. 1. Let 8 and 12 be multiplied by 4; then will 8 : 12 :: 32 : 48.

2. Let 8 and 12 be divided by 4; then will 8 : 12 :: 2 : 3.

The Reaſon of which is very plain; becauſe one Number is juſt as much increaſed by Multiplication, or diminiſhed by Diviſion, as the other is.

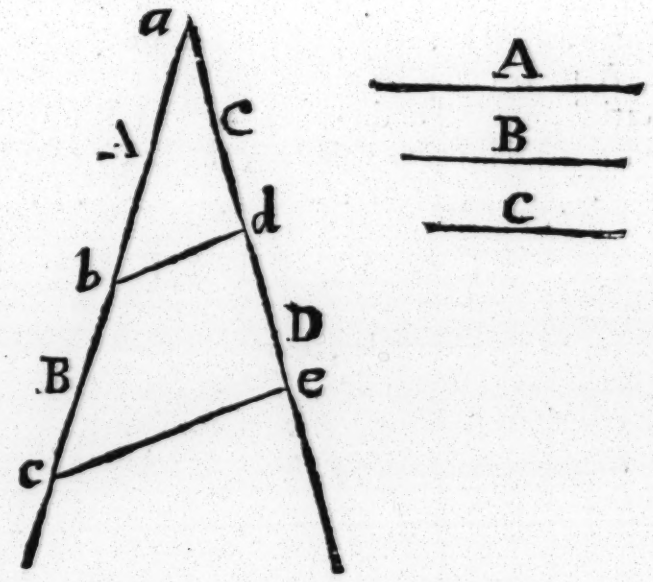
PROBLEMS.

To Two Lines A *and* B, *to find* D *a Third Proportional.*



Make any Right-lined Angle, as *c a e*. Then ſet off in it *a d* = A, and *a b* = B. Set off alſo B again from *d* to *e*; then join *b* and *d*, and to *b d*, draw a Parallel thro' the Point *e*, ſo ſhall *b c* be the Line ſought for, A. B :: B. D, by 2 *e* 6 *Euclid.*

To Three given Lines, A B *and* C, *to find a Fourth Proportional* D.



Make any Angle, as *a c e*; then from *a*, take *a b* = A, and *b c* = B, and *a d* = C, join *b d*, and thro' *c* draw a Parallel to *b d*; ſo ſhall *d e* be the Line ſought: For A. B :: C. D. 2 *è* 6 *Euclid.*

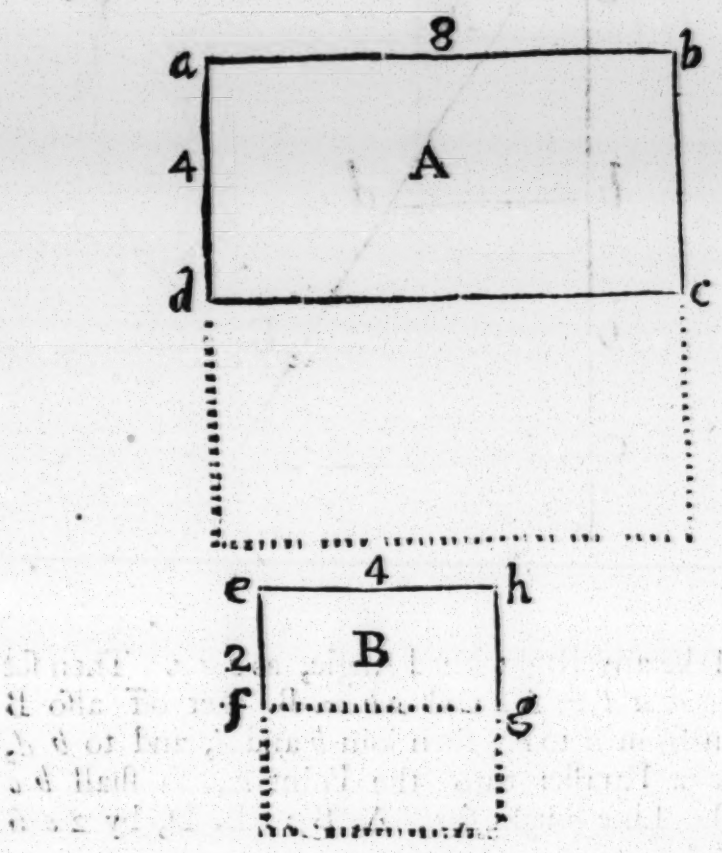
Of the Proportion of Figures.

1. To find the Proportion that one Rectangle hath to another, both Length and Breadth muſt be conſidered.

For Rectangles are to each other as the Products of their reſpective Lengths multiplied by their Breadths.

Thus, if there be two Rectangles, the former of which hath its Length 5 Inches, Yards, &c. and its Breadth 3 Inches, Yards, &c. and the latter had its Length 8 Inches, Yards, &c. and its Breadth 4 Inches, Yards, &c. Then the Rectangles will be to each other, as 3 x 5 (= 15) is to 4 x 8 (= 32) *i. e.* as 15 is to 32. So that all Rectangles are to one another in a Ratio compounded of that of their Sides.

2. When Rectangles have their Sides proportionable, (ſo that $a b : e h :: a d : e f$) then is the *Rectangle* A, *to the Rectangle* B, *in a duplicate Proportion to the Ratio of the Sides.*



For the Ratio of A to B, is compounded of the Ratio of $a b$ to $e h$, and of the Ratio of $a d$ to $e f$.

But in this Caſe $a b$ is to $e h$, in the very ſame Ratio as $a d$ is to $e f$; and therefore the Proportion of A to B being compounded of thoſe two equal Ratio's, muſt be duplicate of the Ratio of their Sides to each other; that is, duplicate of the Ratio of $a b$ to $e h$, or of $a d$ to $e f$. *Q. E. D.*

COROLLARY.

Hence all Triangles, Parallelograms, Priſms, Parallelopipeds, Pyramids, Cones and Cylinders are to one another reſpectively compared, *in a Proportion compounded of that of their Heights and Baſes.*

3. All Triangles, and Parallelograms, Pyramids, Priſms, and Parallelopipeds; alſo all Cones and Cylinders, each Kind compared among themſelves: If they have equal Altitudes, are in the ſame Proportion as their Baſes: If they have equal Baſes, are as their Heights.

For the Baſes, or Heights, will ſeverally be common Efficients or Multipliers; and therefore muſt make the Products be in the ſame Proportion as the Multiplicand was before.

Thus, if the equal Altitude of any two Triangles, Parallelopipeds, Cones, *&c.* be called a, and their unequal Baſes b and d: Then by the 13th of Proportion (above) $b. d :: a b. a d$.

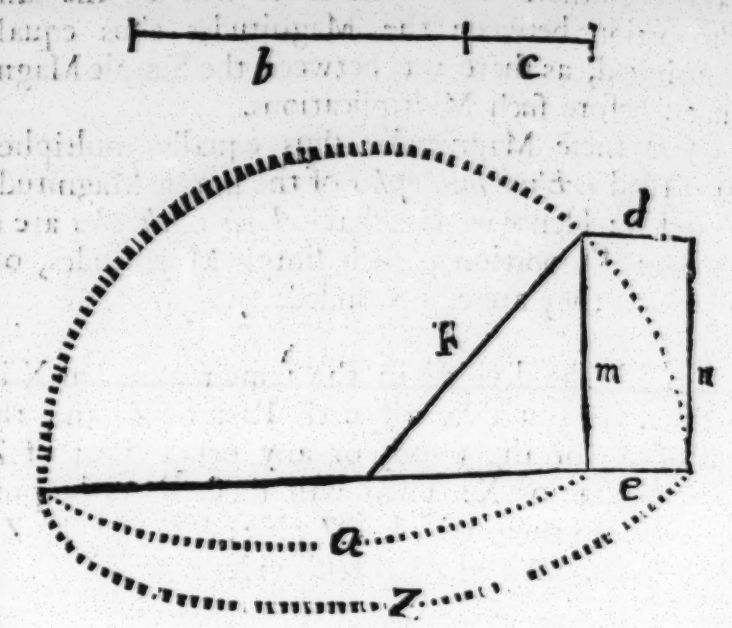
This *Problem* being of conſtant Uſe, ought to be placed among the Elements of *Geometry*.

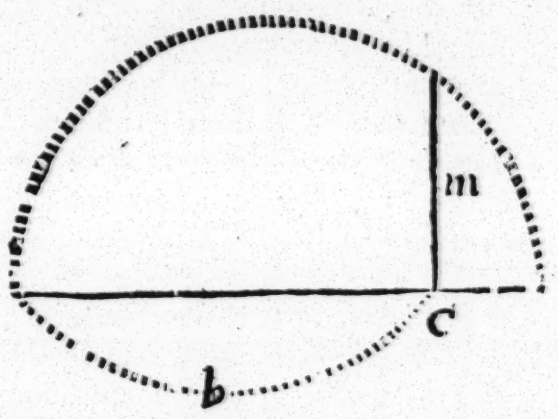
CASE I.

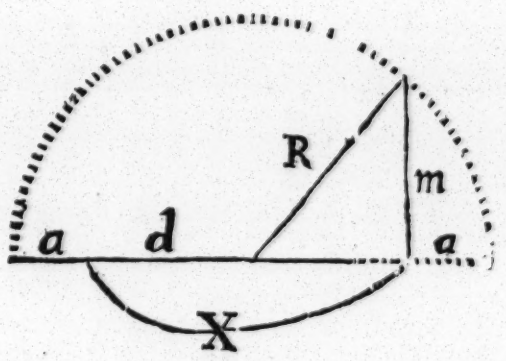
To find Two Right Lines, whoſe Sum and Difference is given, reciprocally proportional to Two given Lines.

Let the two given Lines be b and c, and let the Sum of the two Lines ſought, be Z: 'Tis required to find a Point where Z may be ſo divided, as that $b. a :: e. c$.

Firſt find m a mean proportional between b and c, which erect perpendicularly at either End of Z: Draw d parallel to Z, and where it cuts the Circle let fall m, and draw R: Then, I ſay, a and e are the Segments required: For $a e = m m = b c$. *Q. E. D.*







CASE II.

Where the Difference = X is given, find m as before, which erect perpendicularly at either End of X: Then draw R from the middle Point of X, and with it, as a Radius, deſcribe a Semi-circle on the Center d: So ſhall $a + X$ be the greater Line, and a the leſſer ſought: For $a + X$, multiplied by $a = m m = b c$, *Q. E. D.*

That is, in other Words, if you have the Extreams, and the Sum and Difference of 4 Proportionals, you may find the Terms ſeverally.

PROBLEM II.

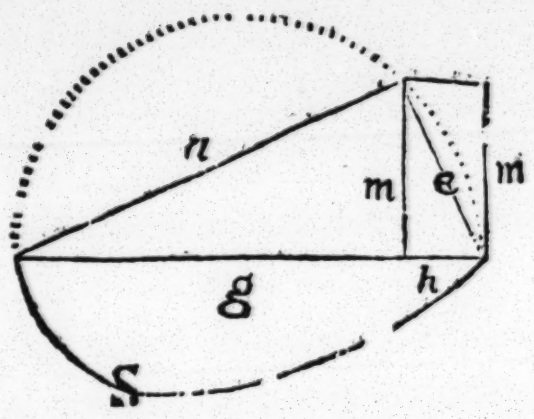
To find Two Squares, whoſe Sum or Difference is given reciprocally proportional to Two given Squares.

CASE

CASE I.

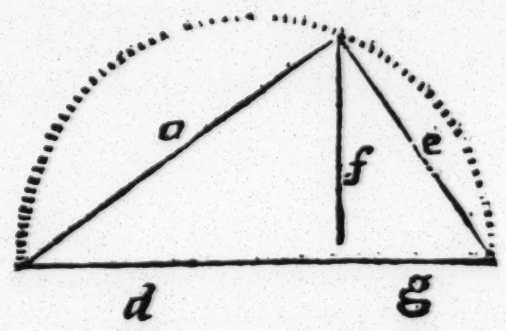
Let *b* and *c* be the Sides of the Squares given, and let S be equal to the Sum of the Squares required.

Find a fourth proportional to S *b* and *c*; which ſuppoſe to be *d*: Then, by the former Problem find 2 Lines reciprocally proportionable to *b* and *c*, whoſe Sum is S: As ſuppoſe the Segments *g* and *b*, and draw the Lines *a* and *e*, which ſhall be the Sides of the Squares ſought. For ſince S *b*:: *c d*. (or *m*): Therefore by Similar Triangles, S *a*:: *e*. *m*. Wherefore *ex æquo* reciprocally *b* . *a*:: *e*. *c*. Wherefore their Squares will be alſo in the ſame Ratio. *Q. E. F.*



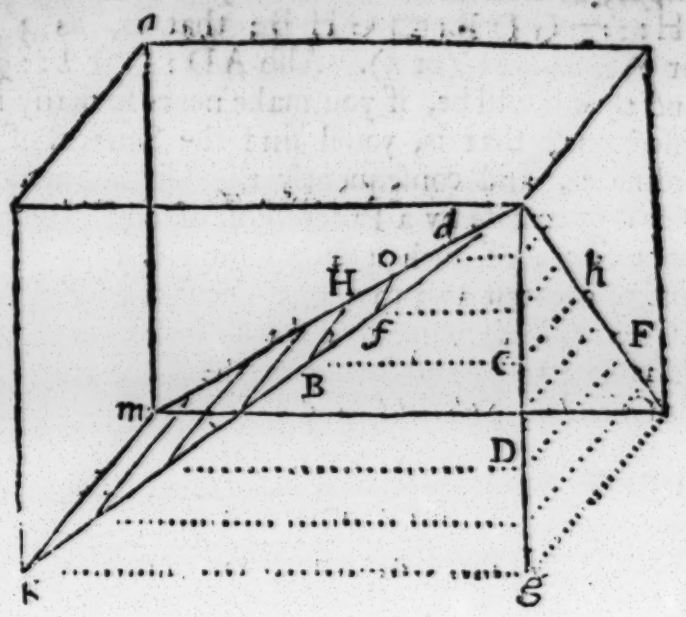
CASE II.

If *d*, the Side of a Square, which is the Difference of the Squares required, were given; make as *d*. *b*:: *c*. *f*. a fourth Proportional; and, by the former Problem, find 2 Lines reciprocally proportional to *b* and *c*; which ſuppoſe to be *g* and *d* + *g*, whoſe Difference is *d*: Then erect *f* at Right Angles, and on *d* + *g*, deſcribe a Semi-circle: After which drawing *a* and *e*, they ſhall be the Sides of the Squares required.



Of the Proportion of Solids.

Every Parallelopiped, as *a g*, is to a Pyramid, *g k m n b* of the ſame Baſe and Height, as 3 to 1.



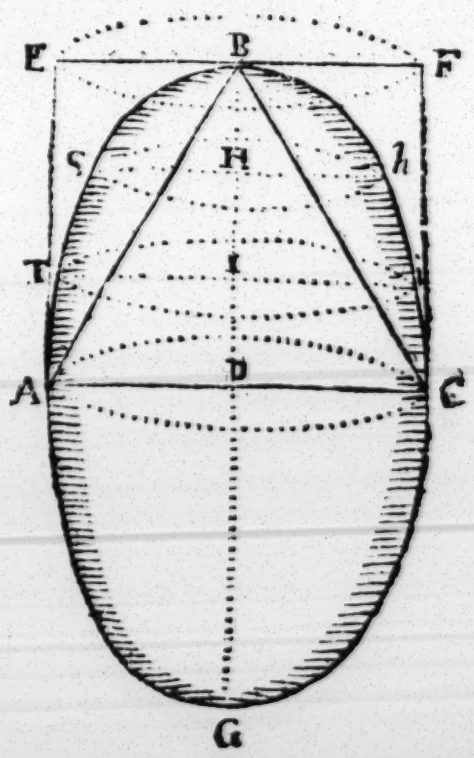
For if you ſuppoſe the Altitude *b g*, to be divided into any Number of equal Parts, by Plains parallel to the Baſe; then becauſe of the Pyramids *b n g k m b*, *b* F D B H *b*, &c. being ſimilar, the Baſes *m n g k* and H B D F, will be in a Duplicate Ratio of their Altitudes *b g*, D *b*. That is, Theſe Baſes diminiſh towards the Vertex in the Propoſition of the Squares of Numbers in Arithmetical Progreſſion.

But it was proved above in *Numb.* 7. of *Arithmetical Progreſſion*, That a Rank of ſuch Quantities are Subtriple to as many, equal to the greateſt; *i. e.* to ſuch as compoſe, or are the Elements of the Parallelopiped: Wherefore the Parallelopiped to the Pyramid, is as 3 to 1, or the former is triple of the latter.

And this muſt hold in all Priſms of what Figure ſoever, in reference to a Pyramid of the ſame Baſe with them.

And ſo alſo in the Proportion of Cones to Cylinders; for a Cone being compoſed of Circles whoſe Peripheries decreaſe Arithmetically, the Planes of thoſe Circles muſt be a Rank of *Secundans*, (for they are as the Squares of their Radius) and conſequently the whole Rank, or the Cone, will be Subtriple of the Cylinder, which is a Rank of as many Terms equal to the greateſt.

A *Cylinder*, *Spheroid*, and *Cone*, of the ſame Baſe and Height, are as 3, 2, and 1.



Let the Semiſpheroid A T S B h i c be divided into 3 equal Parts, as in the Figure. Then the

Ellipſis, as well as in the Circle) the □ AD : □ SH :: □ GDB : □ GHB; that is, as 3 × 3 (or 9) is to 5 × 1 (or 5). Alſo AD : □ TI :: 9 : 8. And thus it will be, if you make never ſo many new Biſſections; that is, you'll find the Squares of the Ordinates, and conſequently the Circles made on them do decreaſe by a Progreſſion of odd Numbers. But a Series of ſuch a Progreſſion is to as many equal to greateſt as 3 to 2 (by Corol 5. of *Progreſſion Geometrical*) wherefore the *Cylinder* to the *Spheroid* is as 3 to 2, and being to the Cone as 3 to 1. The *Cylinder*, *Spheroid*, and *Cone*, are as 3, 2, and 1. *Q. E. D.*

PROPORTIONAL *Spiral Lines*. See *Spiral Lines*.

PROPOSITION, (in General) is a Thing propoſed to be proved, made out, or demonſtrated: And in Mathematicks, is either a *Theorem*, or a *Problem*; which ſee.

PROPRIETATE *Probanda*, is a Writ that lies for him that would prove a *Property* before the Sheriff: For where a *Property* is alledged, a *Replegiare* lieth not.

PROPTOSIS, is the Falling-down of ſome Part; as of the Eye, the Cawle, &c.

PRO *Rata*. See *Oneranda pro rata portionis*.

PROROGUE, ſignifies to prolong, or put off to another Day. The Difference between a *Prorogation* and an *Adjournment*, or Continuance of the Parliament, is, That by the *Prorogation* in open Court, there is a Seſſion; and then ſuch Bills as paſſed in either Houſe, or both Houſes, and had not the Aſſent to them, muſt at the next Aſſembly begin again: For every Seſſion of Parliament is in Law a ſeveral Parliament; but if it be but Adjourned or Continued, then there is no Seſſion, and conſequently all Things continued in the ſame State they were in before the *Adjournment*.

PROSECUTOR, in Law, is he that follows a Cauſe in another's Name. See *Promoters*.

PROSODIA, is that Part of Grammar which teaches the Quantity of Syllables, diſtinguiſhing into Long and Short, &c.

PROSOPOPOEIA, is a violent Rhetorical Figure, wherein the Speaker addreſſes himſelf to inanimate Things as if they were living, and makes them ſpeak as if they had Souls.

PROSPHYSIS, is a Coalition, or growing together, as when two Fingers are connected to each other.

PROSTAPHERESIS, in Aſtronomy, is the ſame with the Equation of the Orbit, or ſimply the *Equation*; and is the Difference between the *True* and *Mean Motion* of a *Planet*. The Angle alſo made by the Lines of the Planets *Mean* and *True Motion*, is called the *Proſtapheresis*.

PROSTATÆ, *Adſtantes*, or *Corpora Glanduloſa*, are two Glandules placed near the Paſſage of the Seed; which (as may be gueſs'd) lubricate the common Paſſage of the Seed and Urine, and afford a kind of a Vehicle to the Seminal Matter, and are ſaid to provoke the Titillation in Coition: Their Moiſture being conveyed by certain little Tubes, which terminate in the Paſſage near where the Seed is ejected, and is emitted at the ſame time with it. The Learned *Bartholine* has obſerved ſome ſuch thing in Women.

PROSTASIS, a Part of Surgery, which fills up what is wanting; as we ſee in hollow and fiſtulous Ulcers filled up with Fleſh by Surgery. *Blanchard*.

PROSTHESIS, in Grammar, is in the General a Metaplaſm, and in particular an Addition of ſome Letter or Letters to the Beginning of a Word, as *Gnavus pro navus*. This is alſo called *Appoſition*.

PROSTOMIA, the Red-tinctured Part of the Lips. *Blanchard*.

PROTECTION, in Law, hath a general and a ſpecial Signification: In the general, it is uſed for that Benefit and Safety which every Subject, Deniſon or Alien, eſpecially ſecured, hath by the King's Laws. *Protection*, in the Special Signification, is uſed for an Exemption or Immunity given by the King to a Perſon againſt Suits in Law, or other Vexations, upon Reaſonable Cauſes moving him thereto. Of this *Fitz-Herbert* maketh two Kinds; the Firſt he calls a *Protection*, *cum clauſula volumus*, whereof he mentions Four Particulars: 1. A *Protection quia profecturus*, for him that is to paſs over Sea in the King's Service. 2. A *Protection quia moraturus*, for him that is Abroad in the King's Service upon the Sea, or in the Marches. 3. A *Protection* for the King's Debtor · that he be not ſued or attached till the King be paid his Debt: This the *Civilians* call *Moratoriam*. 4. A *Protection* in the King's Service beyond Sea, or in the Marches of *Scotland*.

The Second Form of *Protection* is *cum clauſula nolumus*, which is granted moſt commonly to a Spiritual Company for their Immunity, from taking their Cattle by the King's Miniſters: But it may be granted alſo to one Man Spiritual or Temporal.

PROTEST, in Law, hath two divers Applications; One is by way of Caution, to call witneſs, (as it were) or openly to affirm, That he doth either not at all, or but conditionally yield his Conſent to any Act, or unto the Proceeding of any Judge in a Court wherein his Juriſdiction is doubtful, or to anſwer upon his Oath further than by Law he is bound. The other is by way of Complaint, to *Proteſt* a Man's Bill. For Example: If I give Money to a Merchant in *France*, taking his Bill of Exchange to be repaid in *England* by one whom he aſſigneth; If at my coming, I find not my ſelf ſatisfied, but either delay'd or deny'd, then I go the *Exchange*, or other open Concourſe of *Merchants*, and *Proteſt*, That I am not paid: And thereupon, if he hath any Goods remaining in any Man's Hands within the Realm, the *Law of Merchants* is, That I be paid out of them to my full Satisfaction.

PROTESTATION, in Law, is a Defence of Safeguard to the Party which maketh it, from being concluded by the Act he is about to do, that Iſſue cannot be joined by it.

PROTOPATHIA, is a Primary Diſeaſe, not cauſed by another.

PROTRACTING-*Pin*, is a fine Needle faſtned in a Piece of Wood, Ivory, &c. uſed to prick off any Degrees and Minutes from the *Protractor*.

PROTRACTOR, is an Inſtrument uſed in *Surveying*: It is commonly made of a well poliſh'd thin Piece of Braſs, and conſiſteth of a *Semi circle* divided into Degrees, and a *Parallelogram* with Scales upon it, and may be of any Bigneſs deſir'd. But this Inſtrument is ſo well known, that there needs no further Deſcription.

Its Uſe is chiefly, To lay down an Angle of any aſſigned Quantity of Degrees: Or, an Angle being *Protracted*, to find the Quantity of Degrees it contains

contains readily, which is of great Use in Plotting, and making of Draughts, *&c.*

PROVISO, is a Condition inserted into any Deed, upon the Observance whereof the Validity of the Deed depends; but sometimes it is only a Covenant. It hath also another Signification in Matters Judicial, as if the Plaintiff or Demandant desist in prosecuting an Action, by bringing it to a Trial; the Defendant or Tenant may take out a *Venire facias* to the Sheriff, which hath in it these Words, *Proviso quod*, &c. to this End, That if the Plaintiff take out any Writ to that Purpose, the Sheriff shall summon but one Jury upon them both: In which Case, we call it going to Trial by *Proviso*.

PROW of a Ship, is that Part of her *Fore-castle* which is *Aloft*, and not in the *Hold*; and is properly that which is between the *Chase* and the *Loof*.

PRUNELLÆ *Sal.* See *Sal Prunellæ*.

PRUNIFEROUS-*Trees* or *Shrubs*, are such whose Fruit is pretty large and soft, with a Stone in the middle; in this kind the Flower adheres to the Bottom of the Base of the Fruit.

PSAMMISMUS, a Bath of dry and warm Sand, wherewith the Feet of Men in the Dropsy are dried. *Blanchard.*

PSEUDODIPTERON, is an Ancient Form of a Temple, compassed about with but one Row of Pillars, and which Row from the Wall, is at the Distance usually of two Rows of Pillars.

PSEUDOSTELLA, in Astronomy, signifies any kind of Comet or Phænomenon newly appearing in the Heavens like a Star.

PSOAS *Magnus*, or *Lumbalis*, is a Muscle of the Loins, which proceeds from all the Vertebres of the Loins and their transverse Processes internally and laterally, within the Cavity of the *Abdomen*; from thence descending over the superior Part of the *Os Sacrum* and Spine of the *Ilium*, where it's joined with the fleshy Fibres of the *Iliacus Internus*, with which it's inseparably united to their partly Fleshy and partly Tendinous Insertions in the inferior Part of the lesser *Trochanter* of the Thigh-Bone: It's Use is, together with the *Iliacus Internus*, to move the Thigh forwards.

PSOAS *Parvus*, is a Muscle of the Thigh, which arises fleshy from the superior Part of the first *Vertebra* of the Loins, internally and laterally within the *Abdomen*, immediately below the Cavity of the *Diaphragm*, whence descending obliquely inwards towards the *Pelvis Abdominis* (where it ceases to be Fleshy) in a manner embracing the *Psoas Magnus*, and is inserted with a thin, broad, strong Tendon, to that Part of the *Os Pubis*, where it is join'd to the *Os Ilium*: This Muscle, with its Partner Acting, assists the *Recti Abdominis* in drawing the *Ossa Pubis* upwards, as in raising our selves from a decumbent Posture. Thus Rope-Dancers hang by their Hands, and raise the inferior Parts of their Bodies, to take hold of a Rope with their Feet. Tho' their proper Action is to bend the Loins, yet their Tendons embracing the *Psoas Magnus* and *Iliacus Internus*, (which we have frequently observed to extend over the inferior Parts) not unlike the *Fascia Tendinosa Cubiti* and *Lata* of the Thigh, do also Corroborate them in their Action. *Cowper.*

PSOROPHTHALMY, an *Ophthalmy*, or Inflammation of the Eyes with itching. *Blanchard.*

PSYCTICA, are cooling Medicines against the Scab. *Blanchard.*

PTARMICA, or *Sternutatoria*, are those things which being endowed with a more piercing Acrimony than the Errhinaceous Medicines, do so extremely irritate and shrivel up the Membranes of the Brain, that it sends forth the pituitous Humour at the Nostrils, in an extraordinary Measure, and so cause Sneezing. *Blanchard.*

PTERIGOPALATINUS, or *Sphænopterigopalatinus*, is a Muscle of the *Gargareon*, whose former Appellation intimates its Progress and Insertion; the latter its Origin also. This arises from the Process of the *Os Spænoides*, and descends according to the Length of the Interstice made by the internal *Ala* of the *Os Sphænoides* and *Musculus Pterigoidæus Internus* of the lower Jaw; and becoming Tendinous, marches over the *Processus Pterigoides*, and is inserted to the Fore-part of the *Gargareon*. The Tendon of this passes over the Pterigoidal Process, which, like a Pulley, gives it a different Power from that of the *Sphænopalatinus*, tho' they have both their Origin from the same Place. Wherefore contrary to that, This draws the *Gargareon* downwards; which Contrivance in Nature is no less remarkable, than any of those where the like Artifice of a *Trochlea* is made use of.

PTERIGOPHARYNGÆUS, is a Muscle which arises thin and fleshy from both the Pterigoidal Processes of the *Os Cuneiforme*; also from the Root of the Tongue, and Extremities of the *Os Hyoides*; from these Places its fleshy Fibres run in a Semi-circular manner, embracing the superior and back Part of the glandulous Membrane of the *Fauces*, where they meet in a middle Line. When this Muscle acts, it brings the middle or back Part of the *Fauces* towards a Plain, by which means the *Tonsillæ*, together with the rest of the Glandules, are compress'd in the Evacuation of their *Mucus*, to join with the Aliment in its Descent into the *Stomach* in *Deglutition*; and at other times to promote *Screation*, in which this Muscle is the chief Instrument: That the *Tonsillæ* approach towards each other, is observable, when we inspect these Parts in living Persons.

PTERIGOSTAPHYLINUS *Externus*, is a Muscle which moves the *Uvula*, arising from a small Protuberance upon the under Side of the Body of the *Os Sphænoides*, and goes directly to be inserted into the hinder Part of the *Uvula*.

PTERIGOSTAPHYLINUS *Internus*, is a Muscle which moves the *Uvula*, arising from a small Protuberance of the *Os Sphænoides*, and growing into a small round Tendon, which passes over a small Process like a Hook, of the *Processus Pterigoidæus*; from thence reverting, it's inserted into the Fore-part of the *Uvula*.

PTERYGIUM, is the Wing or round rising of the Nose or Eye, or the Process of the Bone *Sphænoides*. which is like a Wing. Also a membranous Excrescence above the horney Tunic of the Eye, call'd *Unguis* and *Ungula*, growing for the most part from the inner Corner, towards the Apple of the Eye, and often obscuring it. *Blanchard.*

PTERYGOIDÆUS *Internus* and *Externus*, are two Muscles arising from the *Processus Pterygoides*, or *Aliformis* of the *Os Sphænoides*. Their Use is to move the Jaw from Side to Side.

PTERYSTAPHYLINI, are Muscles of the *Uvula* or *Gargareon*, and were so named by *Riolanus*; but the Accurate Dr. *Croon* changed their Names into *Sphænopalatinus* and *Pterigopalatinus*, or *Sphænopterigopalatinus*. (See those Words.) Their Use is to give various Motions to the *Uvula*.

PTISANA, *Ptisan*, is a Decoction of Pearl-Barley, Liquorish, Raisins, &c. being a cooling pleasant Drink for one in a Fever, and much used by the *French*.

PTYLOSIS, is a Disease when the Brims of the Eye-lids being grown thick, the Hairs of the Eye-brows fall off. *Blanchard*.

PUBIS OS. See *Pectinis Os*.

PUDDINGS, in a Ship, are Ropes nailed to the Arms of the Main and Fore-Yards, near the Ends, and then at 3 or 4 due distances inwards one from another, in order to keep the Robbins from galling or wearing asunder upon the Yards, when the Top-sail-Sheets are haled home.

They call also those Ropes which are wound about the Rings of Anchors to save the Clinch of the Cable from being galled with the Iron, by this Name. So that when the Ring is so served, 'tis called the Pudding of the Anchor.

PUDICÆ *Plantæ*, the same with sensitive Plants; which see.

PUGILLUS, is an handful of any Herbs. Others interpret it, as much as may be taken up with the Thumb and two Fingers.

PUISNE, or *Puny*; the Lawyers term for Younger.

PULMONARIA *Arteria*, or *Vena Arteriosa*, is a Vessel in the Breast, arising immediately out of the Right Ventricle of the Heart; its Mouth is not so large as that of the *Cava*: It has three Valves, called *Segmoidales* or *Semilunares*. Its Use is to carry the Blood from the right Ventricle of the Heart to the Lungs, and its Coat is double, like that of the Arteries.

PULMONARIA *Vena*, or *Arteria Venosa*, is a Vessel of the Heart, which discharges it self thro' the left Auricle into the Ventricle of the same side; for after it has accompanied the Wind-pipe and *Arteria Pulmonaris* in all their Branchings in the Lungs; and by its small Twigs has received the Blood out of the Artery, all these Twigs are united first into two Trunks (*viz.* the Right and Left) afterwards into one, which opens into the Left Ventricle of the Heart. This *Vein* hath no Valve in it, except that at its opening into the Left Ventricle, where at its Orifice are placed two Membranous Valves, called *Mitrales* from their Form resembling; when joined, something of a Mitre. These are very strong and firm, to sustain the violent Motion of the Blood, and to hinder it from returning back again into this Vein, and to direct its Course to the *Aorta*, whose Orifice opens in the *Systole* of the Ventricle.

PULMONARY *Vessels*, are those which carry the Blood from the Heart to the Lungs, and back again, being two in Number, *viz.* the *Pulmonary Vein*, and the *Pulmonary Artery*; which see.

PULPA, is the fleshy Part of Fruits, Roots, or other Bodies, which is extracted by Infusion or Boiling, and passing through a Sieve; as the Pulp of *Tamarinds*, *Althea*, *Dates*, &c.

PULSE, by the Mathematical Naturalists, is the Term used for that Stroak with which any Medium is affected by the Motion of *Light*, *Sound*, &c. through it.

And the Admirable Sir *Isaac Newton* demonstrates, *lib.* 2. *prop.* 48. *Princip.* That the Velocities of the Pulses, in an Elastick Fluid Medium (whose Elasticity is proportionable to its Density) are in a Ratio, compounded of half the Ratio of the Elastick Force directly, and half the Ratio of the Density inversly. So that in a Medium, whose Elasticity is equal to its Density, all Pulses will be equally swift.

PULSUS, the Pulse, is the immediate Index of the Heart, by the Mediation whereof the Blood is diffused through the whole Body, and is differently affected thereby, according to the different Influx of the Animal Spirits; the Motion whereof is chiefly to be attributed to the circular and direct Fibres. Others affirm it to be the Dilatation and Contraction of the Heart and Blood. A Pulse is either natural or preternatural: of the former we have spoken already; the latter is such as is different, according to the different Circumstances of the Fibres and Animal Spirits; to wit, *strong*, *weak*, *swift*, *slow*, *equal*, *unequal*, *intermittent*, &c.

PULSES, according to Dr. *Abercromby*, are either,

Pulse Unequal, is either in respect of Time or Strength; that is, either it strikes quicker and slower, or else stronger and weaker.

Pulse Interrupted, is when the Strokes are much smaller than usual, or their Intervals much greater.

Pulse Intense, is that whose Stroke is very hard, (the Parts as it were upon a bent) or else this Strength is made up with the Multiplicity and Frequency of less Mications, as in the Heights of Fevers.

Pulse Remiss, is that whose Strokes are less quick, or less strong, and in Sickness shews more Danger than the other.

Pulse Superficial, is that which shews an exact Temperament of Body, as also a free and merry Temper of Mind.

Pulse Deep, shews a Disposition to Melancholy, Asthma's, Lethargy, &c. and is more frequent in the Aged than the Young.

Pulse Leaping, is said to portend no great Danger.

Pulse Trembling, shews great Extremity.

Pulse Wandring, is that which is sometimes felt in one place, and sometimes in another, and sometimes no where, and is never but a few Minutes before Death.

PULSION, is the driving or impelling of any thing forward. See *Attraction*.

PULVERIZATION, is reducing any Body into a fine Powder, which is done by beating *Friable* Bodies in a Mortar; but to Pulverize *Malleable* ones, or such as will spread under the Hammer, some other Helps and Artifices must be made use of. To *Pulverize* Tin and Lead, proceed thus: Get a round wooden Box, which rub well with Chalk all over on the Inside; then melt the Metal, and pouring a little of it nimbly into the Box, shut the Lid, and shake the Box strongly and quick, and the Metal will be reduced by it into a Powder. And this is a very useful thing to know, tho' it be plain and easy; because by this means, these Metals are rendred fit for several Operations, and will easily be mixed with Salts or other Things.

PULVIS *Fulminans*. Mix well together three Parts of common Salt-petre, two Parts of Salt of Tartar, and one of common Brimstone, all finely powdered. Take half a Dram or a Dram of this Mixture, put it upon a Fire-shovel over a gentle Fire, so that it may heat, and appear to melt and change Colour gently, and in about half a quarter of an Hour it will go off with a terrible Noise, as great

great as that of a Musket, and yet without danger to any Perſon in the Room; for its Force is chiefly downwards. The Reaſon of this Effect appears to be, that the fix'd Salt of Tartar doth ſo lock up the Spirits of the Nitre and Sulphur, that they cannot get looſe without breaking their Priſons, which when the Fire hath aſſiſted and enabled them to do, they do it with very great Violence and Noiſe.

PUMP *Brake*, at Sea, is the Handle of the Pump, as,

PUMP *Can*, is the Bucket whereby they pour Water into the Pump to fetch it, and make it work when they intend to uſe it. And

PUMP *Vale*, is the Trough by which the Water runs from the Pump along the Ship-ſides, that it may go out at the *Scoper-holes*.

PUNCTUM *Lachrymale*. See *Lachrymale Punctum*.

PUNCTUM *Saliens*: In the Growth of an Egg, you ſee a little Speck or Cloud, as it were, in the innermoſt Tunic of it, called *Amnios*, which growing gradually thicker, acquires a kind of ſlimy Matter, in the middle whereof you ſee firſt this *Punctum Saliens*, (a little Speck that ſeems to leap) afterward the rude Body of an *Embryo*, which tends every day more and more to Perfection. *Blanchard.*

PUNY. See *Puiſne*.

PUPILLA, or *Pupula*, is the opening of the Tunic of the Eye, called *Uvea*, or *Choroides*; it is round in a Man, and is capable of being contracted or dilated like a Muſcle, according to the different Degree of Light the eye is Expoſed to.

PUPPIS *Vena*, is that Vein which ſpreads it ſelf about the hinder Part of the Head.

PURCHASE: This Word hath the ſame Senſe at Sea, as *Draw* has a-Shore; thus they ſay, *The Capſtan Purchaſes apace*; that is, draws in the Cable apace. And when they cannot draw or hale in any thing with the Tackle, they ſay, *The Tackle will not Purchaſe.*

PURFLEW; the Term in Heraldry to expreſs *Ermines*, *Pean*, or any of the Furrs when they compoſe a *Bordure* round a Coat of Arms. Thus they ſay, he Beareth *Gules*, a *Bordure Purflew*, *Verry*; meaning that the Bordure is Verry.

PURGATION, *Purging*, is an Excretory Motion quick and frequent, proceeding from a quick and orderly Contraction of the Carneous Fibres of the Stomach and Inteſtines, whereby the Chyle and Excrements, and corrupted Humours, either bred or ſent there from other Parts, are protruded from Part to Part, till they be quite excluded the Body. *Blanchard.*

PURGATION, in Law, is the clearing of a Man's ſelf of a Crime whereof he is generally ſuſpected, and of the ſame accuſed before the Judge; and is either *Canonical* or *Vulgar*. The *Canonical*, is that which is preſcribed by *Canon-Law*, the Form thereof is uſually thus in the Spiritual Court: The Man ſuſpected takes his Oath, that he is clear of the Fault objected, and brings ſo many of his Honeſt Neighbours, being not above Twelve, as the Court ſhall aſſign him, to Swear upon their Conſcience and Credulity, that he Sweareth truly. *Vulgar Purgation* was by *Fire* or *Water*, or by *Combat*, uſed both by Infidels and Chriſtians, till by the *Canon Law* aboliſhed: But *Combat* may be ſtill practiſed by the Laws of the Realm in Cauſes doubtful, and where there is want of Evidence and other Proof, if the Defendant chuſe rather the Combat than other Tryal.

PURIFICATION *of a Metal*, in Chymiſtry, ſignifies its being purged or cleanſed from the Mixture of all other Metals.

'Tis chiefly uſed about Gold and Silver. The beſt

Purification of Gold, is by Antimony, in this manner: Put the Gold in a Crucible, make it red hot, and when it begins to melt, pour upon it by degrees four times its Weight of Antimony in Powder; the Gold will preſently melt; continue a very ſtrong Fire, till you perceive the Metal to ſparkle; then take the Crucible out of the Fire, and knock it, that the Gold may ſink to the Bottom; break it when 'tis cold, and ſeparate the fine Gold, which is called the *Regule*, from the droſſy Part.

After this, melt the *Regule* again over a ſtrong Fire in a Crucible; and when it begins to melt, throw into it, by little and little, three times its Weight of *Salt-Petre*; continue a very ſtrong Fire to keep the Matter in conſtant Fuſion; and when the Fumes are all gone, and the Metal appears bright and clear, caſt it into an Iron Mortar greaſed and warmed; or elſe if you don't value the Crucible, leave it in that to cool, and break the Crucible before 'tis quite cold, and then ſeparate the *Regule* from its Droſs remaining at the Top, the Gold will be very pure.

There are ſeveral other ways of Purifying Gold, as the *Depart* and *Cementation*, which ſee under thoſe Words: But this is the beſt of all.

Red Gold is leſs valuable, as containing moſt Copper; the Yellow is better, and it ſhould remain Yellow while 'tis in the Fire.

Purification of Silver, is made in the Coppel thus:

Heat the Coppel gently and by degrees, till it grow red hot; then caſt into it four or five times as much Lead as you deſign to purify Silver: The Lead will ſoon melt, and fill the Sides of the Coppel; then put the Silver into the midſt of the melting Lead, and it alſo will preſently melt; then lay Wood all about and over the Coppel, and blow the Flame ſo that it may reverberate on the Matter, the Impurities of which will by this means mix with the Lead, and the Silver will remain pure and unmixed in the middle of the Coppel; and the Lead, mixed with the droſſy Parts of the Silver, will lie on the Sides like a Scum: This Scum is to be taken off with a Spoon, or other Inſtrument, and is what is called *Litharge*; which, according to the degree of the Calcination it hath endured, is of divers Colours, and ſometimes is called Litharge of Gold, and ſometimes Litharge of Silver.

PURLUE, or *Purlieu*, from the *French* Pur, *i.e. Purus*, and *Lieu*, i. e. *Locus*, is all that Ground near any Foreſt, which being anciently made Foreſt, is afterwards, by Perambulations, ſevered again from the ſame, and exempted from that Servitude that was formerly laid upon it: And he that Walketh or Courſeth within that Circuit, is not liable to the Laws and Penalties incurred by them which hunt within the Precincts of the Foreſt.

PURPURE, the Heralds Term for a Colour conſiſting of much Red and a little Black: And this Term is uſed in the Coats of all Perſons below the degree of Noble; but in the Coats of Noblemen, 'tis called *Amethiſt*; and in thoſe of Sovereign Princes, 'tis called *Mercury*. 'Tis expreſſed in Engraving by Lines

Lines drawn athwart the Escutcheon, beginning at the *Dexter Point*.

PURSER, an Officer in the King's Ship, who receives her Victuals from the Victualler, and is to take care that it be in good Condition, and well laid up and stowed: His Office is also to keep a List of the Men and Boys belonging to the Ship, and to set down exactly the Days of each Man's Admittance into Pay, that so the Pay-Master, or Treasurer of the Navy, may issue out his Disbursements, and Pay Men off according to the *Purser*'s Books.

PURSUIVANT. See *Poursuivant*.

PURVEYANCE. See *Pourveyance*.

PURVEYOR. See *Pourveyor*.

PUTREFACTION, is a slow kind of Corruption in Bodies, wrought generally by the Moisture of the Air, or some other ambient Fluid, which penetrating unto the Pores of Bodies, and being agitated in them, doth fetch or force out some of the more subtil and agile Parts of Bodies, loosen and dislocate the Parts in general one from another, and thereby quite change the Texture, and sometimes the Figure of the *Mixt*, from what it was before.

PUTTOCKS, or *Puttock Shrowds*, are small Shrowds which go from the Shrowds of the Main-Mast, Fore-mast, and Missen-Mast, to the Top-Mast Shrowds. And if there be any Top Gallant-Masts on the Top-masts, there are *Puttocks* to go from the Top-Mast Shrowds into those. These *Puttocks* are at the Bottom seized to a Staff, or to some Rope which is seized to a Plate of Iron, or to a Dead-man's Eye, to which the Laniards of the Fore-Mast Shrowds do come.

PYCNOSTYLE, in Architecture, is a Building where the Pillars stand very close one to another, one Diameter and a half of the Column being only allowed for the *Intercolumniation*.

PYLORUS, or *Janitor*, is the lower Orifice of the Ventricle, which lets the Meat out of the Stomach into the Intestines; Dr. *Willis* calls the Beginning of the Pylorus, where its Coats are thickest, the *Antrum*.

PYRAMID, in Geometry, is a Solid Figure whose Base is a Polygon, and whose Sides are plain Triangles, their several Tops meeting together in one Point.

The Solid Content of

A *Pyramid*, is = to $\frac{1}{3}$ of the Perpendicular Altitude multiplied by the Base; because a Pyramid is $\frac{1}{3}$ of a Prism of the same Height and Base. 7 *è.* 12. *Eucl.* which see also proved under the Word *Parallelopiped* (the same with Prism.)

The superficial Area of a *Pyramid*, is found by adding the Area of all the Triangles, whereof the Sides of the *Pyramid* consist, into one Sum: For the whole external Surface (except the Base) of any *Pyramid*, is nothing but a System of as many Triangles as the *Pyramid* has Sides.

If a *Pyramid* be cut with a Plane Parallel to the Base, the Surface of that Truncated *Pyramid* comprehended between the Parallel Lines, is found by Substracting the Surface of the *Pyramid* cut off from the Surface of the whole *Pyramid*.

Also the external Surface of a right *Pyramid*, that stands on a regular Polygon Base, is equal to a Triangle, whose Altitude is equal to the Altitude of one of the Triangles which compose it, and its Base to the whole Circumference of the Base of the *Pyramid*.

Whence therefore the Surface of a right *Cone*, (for a Cone is but a *Pyramid* of infinite Sides) is equal to a Triangle, whose Height is the Side of the *Cone*, and the Base equal to the Circumference of the Base of the *Cone*.

PYRAMIDALIA, are Vessels which prepare the Seed; of which in their proper place. Also Muscles of the Nostrils, and of the *Abdomen*, called *Pyramidales*, or of a Pyramidical Figure. Also two Strings of Marrow about the Basis of the oblongated Marrow.

PYRAMIDALIA *Corpora*. See *Corpora Pyramidalia*.

PYRAMIDALIS, *sive Succenturiatus Musculus*, one of the Muscles of the Abdomen, lying on the Rectus, helping in Conjunction with the rest, to compress the Abdomen, and to exclude its Contents: Mr. *Cowper* thinks it to have also a peculiar Use in compressing the Bladder.

PYRAMIDOID. See *Parabolick Pyramidoid*.

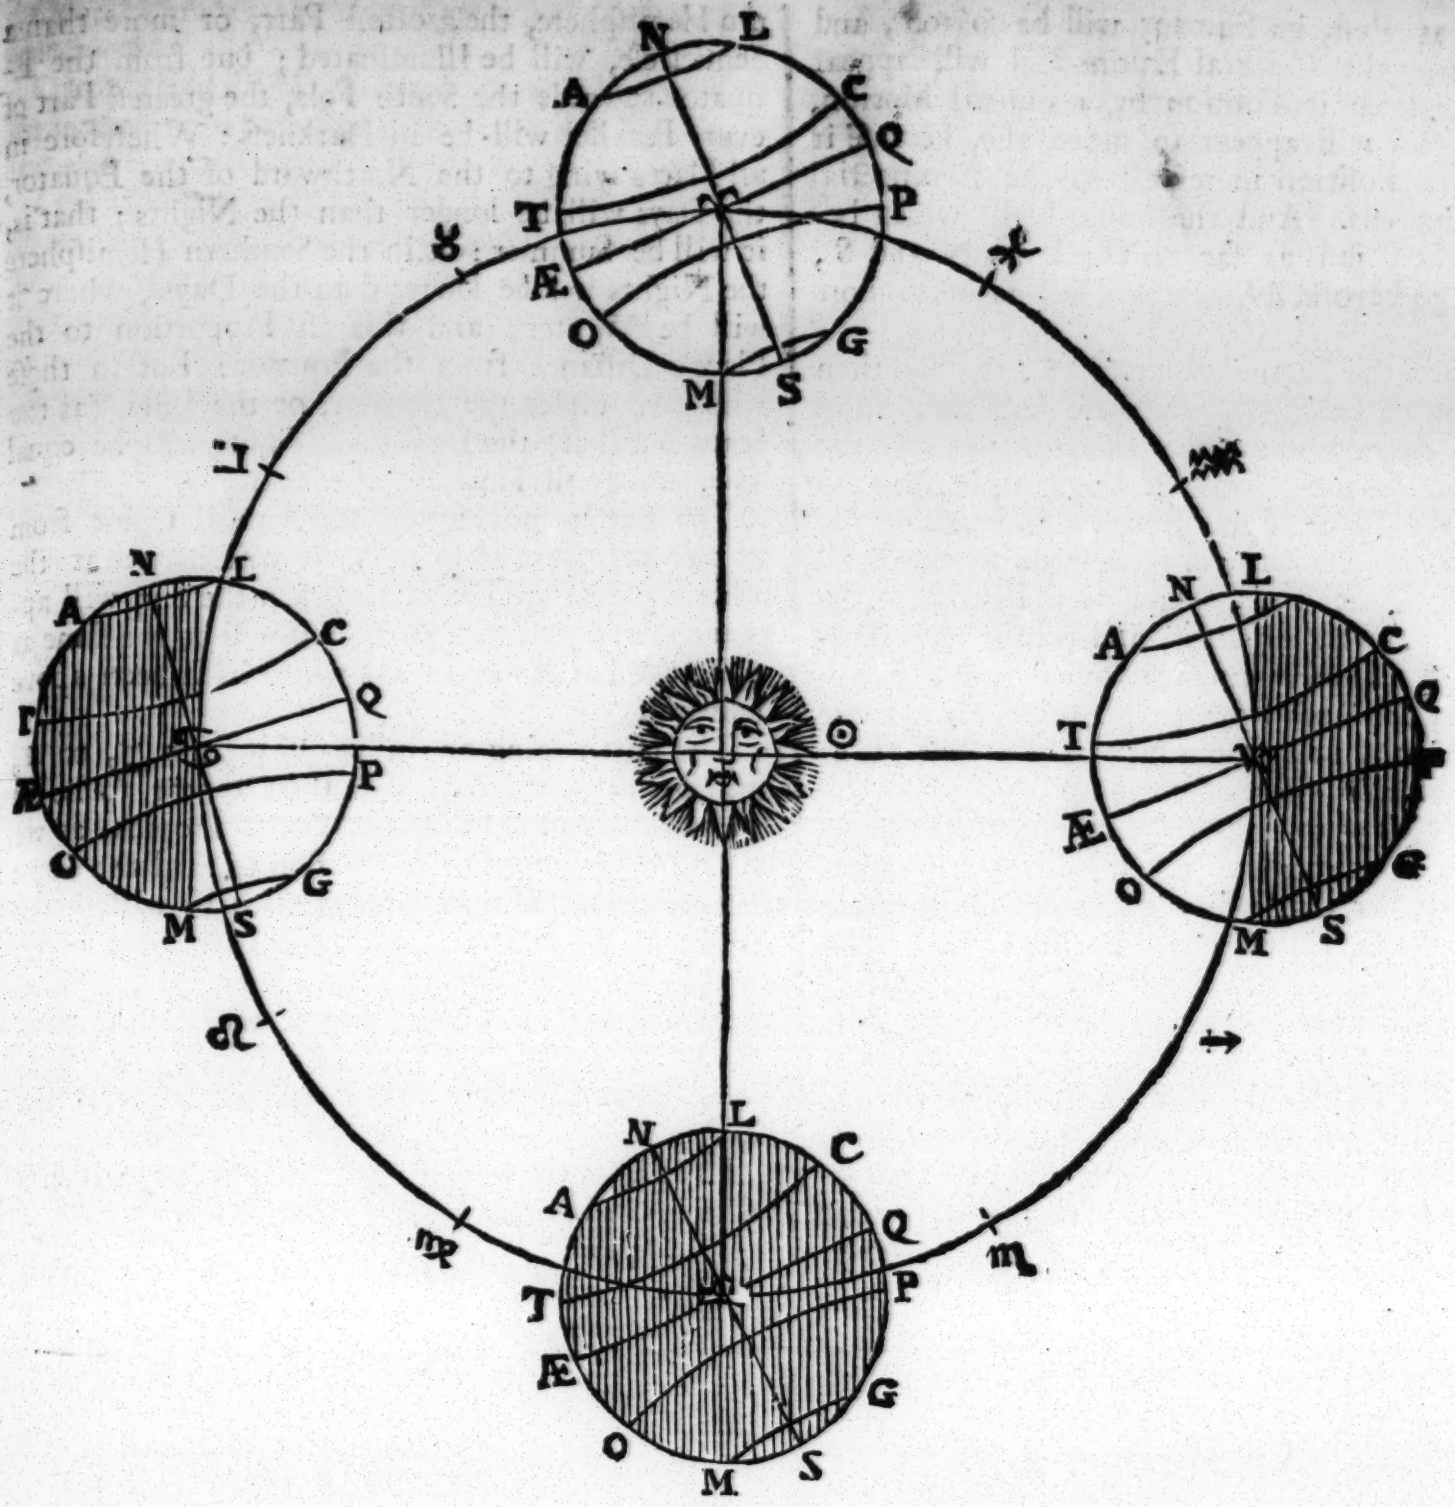
PYRIFOMIS, *seu Iliacus externus*, is a Muscle of the Thigh, which receives its first Name from its Figure, the second from its Situation; Its Beginning is round and fleshy from the inferior and internal Part of the *Os Sacrum*, where it respects the *Pelvis* of the *Abdomen*, and descending obliquely in the great *Sinus* of the *Os Ilium*, above the acute Process of the *Ischium*, and joining with the *Gluteus Medius*, it's inserted by a round Tendon to the superiot Part of the Root of the *Great Trochanter*. This moves the *Os Femoris* somewhat upwards, and turns it outwards.

PYROTECHNICK-ART, is the Art of Chymistry, so called from the *Greek* πῦρ *Fire*, and τέχνη *Art*; because Fire is the chief Instrument the Chymist makes use of in the separating and collecting the purer Substances of mixt Bodies.

PYROTECHNIA, the same with *Chymia*.

PYROTICA, or *Urentia*, are Medicines virtually Hot, which being applied to Human Bodies, grow extremely hot; because that having Particles and Pores so ordered, that Vapours and Humours insinuate into them, the subtil Matter finds such Passages, that it being moved extreme violently, forces certain earthy, hard, and acute Particles, which float in the Passages upon the Neighbouring Parts with great Impetuosity, and so excites an Heat which corrupts or changes differently, according to the Diversity of its Motion and the Particles that are moved. Such are things that cause Redness, that Blister, that Ripen or Rot, that close up, and bring Wounds to a Crust, and that pull Hairs out of the Body. *Blanchard*.

PYRRICHIUS, is the Foot of a *Latin* Verse consisting of two Syllables, and both short.



PYTHAGOREAN *Syſtem*, is the ſame with the *Copernican*, but is ſo called, as being maintained by *Pythagoras* and his Followers, and therefore is the moſt ancient of any. In this the Sun is ſuppoſed at Reſt in the Centre of our Syſtem of Planets, and the Earth to be carried round him annually in a Track or Path between *Venus* and *Mars*. I ſhall only add here an account how

The *Phænomena* of Day and Night, and the *viciſſitudes* of Seaſons are accounted for, according to the *Pythagorean* Syſtem, where the Earth moves round the Sun.

Let ♈ ♋ ♎ ♑ repreſent the Earth's Annual Orbit round the Sun at ☉. The Plane of which Orbit if infinitely produced among the Fix'd Stars, will deſcribe that Circle which we call the Ecliptick. In this Orbit, let the Earth be ſuppoſed to move from ♈ to ♉, next to ♊, &c. and let the Earth be repreſented by the Epicicles N A Æ S Q N, in which N and S are the North and South Poles, and the Line N S the Earth's Axis always keeping Parallel to it ſelf; and Æ Q, the Equator, whoſe Plane is inclined to the Ecliptick with an Angle of 23° 30′, which is the Complement of 66° 30′, the Angle that the Earth's Axis (perpendicular to the Plane of the Equator) makes with the Ecliptick.

Suppoſe then the Earth in ♎ (then will the Sun appear to be in ♈, the firſt Point of its Annual Orbit) and the Earth ſo turning it ſelf to the Sun, that the Axis of its Motion may be Perpendicular to a Line drawn from the Center of the Sun to that of the Earth, then will the Earth's Equator appear Coincident with the Celeſtial Equinoctial; and the Sun will appear to be juſt in the middle between the two Poles, and to ſend his Light equally towards both of them, and as far as both of them (for the Sun always illuminates one half of the Globe.) Wherefore as that Hemiſphere of it (*viz.* T N L C P) which is now turned towards him, is *Enlightned*, ſo the other (behind) is now ſuppoſed to be in Darkneſs. And becauſe the Earth revolves round its Axis N S in 24 Hours, which Axis is now at Right-Angles with the Line ♈ ☉ ♎ connecting the Centres of the Earth and Sun, every Point of the Equator Æ Q, and of the Tropicks T C and O P, and of all other Parallels to the Equator, will be as much in the Light as in the Dark, in every Diurnal Revolution; and conſequently the Days and Nights will be Equal, at that Time, all over the Earth.

But as the Earth moves further on in the Annual Orbit towards ♏ and ♐, the Plane of the Terreſtrial Equator will be then no more direct to the Sun, but will ſubſide towards the South, and therefore the Sun will appear to go as much toward the North Pole, and as it were from the Equator in the Heavens; for the Earth being ap-

parently at Reſt, its Equator will be ſo too, and conſequently the Celeſtial Equinoctial will appear to change from its Poſition by a diurnal Motion, and the Sun will appear to move alſo, becauſe it changes its Poſition in reſpect to the Equinoctial in the Heavens. And the Sun's Light which before reached juſt as far as the Poles N and S, will now go beyond N, and will fall as much ſhort of S.

But when the Earth is come to ♈, the Sun then will appear to be in ♋, where he will ſeem moſt of all to decline from the Equator towards the North, *viz.* as much as is the Angle of Inclination between the Plane of the Equator and that of the Ecliptick; and the Sun will then ſeem to move all Day in the Circle T C, which is a Parallel to the Equator at 23° 30′ diſtance, and is called the Tropick of ♋. The Earth being thus poſited, 'tis apparent that the Sun's Rays enlightening always one half of it, will now reach beyond the Pole N, as far as L, and fall ſhort of the Southern Pole S, by the Ark S M = to L N = to 23° 30′ the Inclination of the Ecliptick to the Equator; and therefore if 2 leſſer Circles are imagined to be there drawn on the Earth, they will be the Polar Circles as A L and M G: And 'tis plain that that Part of the Earth which lies between the Polar Circle A L and the Pole, will enjoy perpetual Day, notwithſtanding the Earth's diurnal Motion, as the oppoſite Part within the Antarctick Circle M G will be in continual Darkneſs. The Earth being thus in ♈, and the ☉ appearing in ♋, 'tis plain alſo that of every Circle parallel to the Equator in the Northern Hemiſphere, the greateſt Part, or more than a Semicircle, will be Illuminated; but from the Equator towards the South Pole, the greateſt Part of every Parallel will be in Darkneſs: Wherefore in all Places lying to the Northward of the Equator, the Days will be longer than the Nights; that is, it will be Summer; as in the Southern Hemiſphere the Nights will be longer than the Days, where it will be Winter; and this in Proportion to the Place's Diſtance from the Equator: But to thoſe who live under the Equator, or the Line, (as the Seamen call it) the Days and Nights will be equal now, and at all Times of the Year.

The Earth moving on its Annual Orbit from ♈ into ♒, ♓, and ſo to ♉ it will arrive at the other Equinoctial Point, and then the Sun will appear to be in ♎, and all Things will be the ſame as when the Earth was in ♎, which hath been above deliver'd.

The Earth going on in its Orbit from ♉, to ♊, and ſo to ♋, the Sun will then appear to be in ♈, and conſequently in the Winter Tropick, as we call it in reference to our Poſition toward the Sun: And now the State of Things with us will be the Reverſe of what it was when the Earth was in ♈, our Nights will be longer than our Days, *&c.* as appears from the Figure; and it will fare with us Inhabitants of the Northern Hemiſphere, in all reſpects, as it did then with the Inhabitants of the Southern.

PYXIS, is the Cavity of the Hip-Bone, which is called *Acetabulum*.

QUADRANGLE, or *Quadrangular Figure*, in Geometry, is that which hath no more than four *Angles*.

QUADRANT, is an Arch which is the fourth Part of a Circle, containing 90 degr. And oftentimes the ſpace contained between a Quadrantal Ark, and two Radius perpendicular one to another in the Centre of the Circle, is called a *Quadrant*; from the Figure of which the following Inſtrument takes it Name, which is called a

Quadrant, and is a very uſeful and ready Inſtrument, when well made, for many Operations. The Limb of it is divided into 60 Degrees, and as many Parts of a Degree as the Bigneſs of the Inſtrument will bear, and this by means of a String and Plummet, (or Label, if it be a ſcrewed Limb) gives you the Sun's Altitude, or that of any Star or other Object above the Horizon, reckoned from that Edge of the Quadrant where the Sights are not placed. In *Collin*'s Quadrant, this Limb is alſo divided into Time, and numbred accordingly, and then it ſerves very readily to find the Sun's right Aſcenſion either in Degrees or Time, and to ſhew the Hour of the Day there to a Minute, by his Altitude. Next to the Limb, in *Gunter*'s Quadrant, is the Calendar of the Months placed; but in *Collin*'s 'tis put in four little Quadrantal Arks next the Center of the Inſtrument, having an Ark alſo of the Sun's Declination fitted thereunto; ſo that the String laid to the Day of the Month, will ſhew the Declination; or laid to the Declination, will give the Day of the Month, in the Quadrantal Ark proper for that Seaſon of the Year. Next below this, in Mr. *Collin*'s Quadrant (which I judge to be the beſt) is the Projection, which is a 4th Part of *Stoffler's Aſtrolabe*, inverted and fitted to the Latitude of *London*; of which thoſe Lines which run from the Right Hand towards the Left are Parallels of Altitude, and thoſe which croſs them are Azimuths. In the Projection are drawn the two Eclipticks, with the Characters of the Signs upon them, and the two Horizons, all iſſuing from the ſame Point; and up and down in the Projection are placed ſuch eminent fixed Stars, as are between the Tropicks. Next below the Projection is the *Quadrat* and Line of Shadows, being only a Line of Natural Tangents to the Arks of the Limb; and by its help, the Heights of Towers, Steeples, *&c.* may be pretty exactly taken.

QUADRANT *of Altitude*, is part of the Furniture of an artificial Globe, being a thin Braſs Plate divided into 90 Degrees, and marked upwards with 10, 20, 30, *&c.* being rivetted to a Braſs Nut which is fitted to the Meridian, and hath a Screw in it, to ſcrew upon any Degree of the Meridian: when it is uſed, 'tis moſt commonly ſcrew'd to the Zenith. Its Uſe is for meaſuring *Altitudes*, to find *Amplitudes* and *Azimuths*, and deſcribing *Almicantars*.

QUADRANT *Aſtronomical*; ſee *Aſtronomical Quadrant*.

QUA-

QUADRANT *Triangular.* See *Triangular Quadrant.*

QUADRANTAL *Triangle*, is a Spherick Triangle, one of whoſe Sides (at leaſt) is a Quadrant, and one Angle Right.

QUADRAT, and Line of Shadows on a Quadrant, are only a Line of natural Tangents to the Arks of the Limb, and are placed there in order to meaſure Altitudes readily, for it will always be; as the Radius to the Tangent of the Angle of Altitude at the Place of Obſervation; (that is, to the Parts of the Quadrat or Shadows cut by the String) :: ſo is the Diſtance between the Station and Foot of the Object to its Height above the Eye.

Quadratick Equations.

QUADRATICK Equations, are ſuch as retain on the unknown Side, the Square of the Root or Number ſought; and are of two ſorts.

I. *Simple Quadraticks*, where the Square of the unknown Root is equal to the abſolute Number given, as $aa = 36$, $ee = 146$, $yy = 133225$. And for the Solution of thoſe, there needs only to Extract the Square Root out of the known Number, and that is the Value of the Root or Quantity ſought: Thus the Value of a in the Firſt Equation is equal to 6, in the Second $e = 12$ and a little more, it being a Surd Root. And in the Third Example $y = 365$.

II. *Adfected Quadraticks*, are ſuch as have between the higheſt Power of the unknown Number and the abſolute Number given, ſome intermediate Power of the unknown Number, as $aa + 2ba = 100$.

And this Equation is properly called *Adfected*; becauſe the unknown Root a is Multiplied into the Coefficient $2b$.

The Original of *Adfected Equations*, the Ingenious Mr. *Harriot* thus derives: Let a be $= +b$, or $a = -c$, then by Tranſpoſition will $a - b = 0$, and $a + c = 0$. And then multiplying one by another, the Product is $aa - ab + ca - bc = 0$.

And this he properly calls an *Original Equation.* From which, or others of the ſame Kind, Tranſpoſing bc over to the other Side with a contrary Sign, he gains ſuch an Equation as this, $aa - ab + ca = bc$, which he calls a Canonical Equation.

And from hence, by putting Examples in all Caſes, he ſhews, that every poſſible Quadratick Equation hath two real Roots, according to the Dimenſions of the higheſt Power; as being made up by the Multiplication of two ſimple Equations. And that theſe two Roots may be either both Affirmative, or both Negative; and that ſometimes they are equal to each other, and ſometimes not. And from hence he finds, that the abſolute Number bc is always the Rectangle of the two Roots b and c, (or of the two Values of a): And that if it have a poſitive Sign, the two Roots have like Signs, but if a Negative one, unlike.

And, That the Coefficient of the middle Term is always the *Aggregate of both the Roots with contrary Signs*; and conſequently their *Difference*, when without its Sign. See more in his *Second Section*, and in *Wallis's Algebra*, p. 132, &c.

And when in ſuch Kind of Quadraticks as theſe, the Index or Exponents of the Dimenſions of the unknown Root are in Arithmetical Proportion, that is, as in this Equation, $aa + 2ba = 100$, the Index of aa is 2, the Index of $2ba$ is 1, and the Index of 100 is 0; then may the Root be eaſily found out by the following Method.

All Equations of this Rank will be in one of theſe three Forms:

$aa + a = dR$
$aa - ad = R.$
$as - aa = R$

* *Some make four Forms, but at long run it comes to the ſame Thing.*

In all which Forms, R, the abſolute Number given, is a Rectangle or Product made out of the two Quantities or Roots ſought, a Greater and a Leſſer.

Of which in the *Firſt Form*, where all is Affirmative, the Coefficient d is the Difference between thoſe two Quantities or Roots; and a is the Leſſer of them, as is plain if you ſuppoſe the two Roots (as *Oughtred* doth) to be a the greater, and e the Leſſer. For then let $d = x$ be the Difference between them: So that $e + x = a$. If then you multiply each Part by e, it will be $ee + ex = ae$; from whence it appears alſo plainly, that ae is equal to R, the abſolute Number given, or equal to the Rectangle of the two unknown Roots a and e, of which in this Form, the Coefficient x or d is equal to the Difference between them, and e is the Leſſer of them.

In the *Second Form*, The Coefficient d is the Difference of the two Roots as before, but a *there* repreſents the Greater of them, as is plain by putting (becauſe the Sign is Negative) $a - x = e$, and multiplying each Part by a, it produces $aa - ax = ae$, the ſecond Form, where x or d the Coefficient is the Difference of the two unknown Roots; and a repreſents the greater of them.

In the *Third Form*, where the higheſt Power is Negative, the Coefficient s is the Sum of the two Quantities or Roots ſought; and a the Affirmative Root ſought, may be either the Bigger or the Leſſer of them. For let (becauſe the higheſt Power is Negative) $z - a = e$; then multiplying both by a it will $za - aa = ae = R.$ or if $z - e$ had been put equal to a, then it would have been $ze - ee = ae$, by multiplying all by e.

So that this Method ſhews you the Original Conſtitution of theſe Forms, and the Nature and Office of each Member of them.

From all which may be found this general Canon for the Solution of Quadratick Equations, according to this Method.

Multiply the abſolute Number by 4, and to the Product add the Square of the Coefficient, then Extract the Square Root of that Sum: Which Root ſhall be the Sum of the two Numbers ſought. Then to or from the half of that Root, add and ſubſtract half the Coefficient, and the Sum and Remainder are the two Roots required.

For the particular Solution of adfected Quadraticks there are three Ways.

1. *That of* Oughtred, *who proceeds in this Method.*

In all the three Forms, there is given either the Rectangle and Sum, or the Rectangle and Difference of the two unknown Quantities; whence 'tis very easy to find either the Difference in the former, or the Sum in the latter Case: And then having the Sum and Difference of any two unknown Quantities, the Quantities themselves will soon be known.

Thus in the first Form, let $a\,a + d\,a = \mathrm{R}$.

Here is given R the Rectangle of the Roots, d their Difference; and 'tis known that a represents the lesser of them. Let S stand for the Sum to be sought.

Let $a + e = \mathrm{S}$ and $a - e = d$, Then $aa + 2\,ae + ee = \mathrm{SS}$, and $aa - 2\,ae + ee = dd$, Substract the latter from the former, and there remains only $4\,ae = 4\,\mathrm{R}$. Wherefore $\mathrm{SS} - dd = 4\,\mathrm{R}$.

You may therefore by simple Algebra find that $4\,\mathrm{R} = \mathrm{SS} - d\,d$, and consequently that $4\,\mathrm{R} + d\,d = \mathrm{SS}$, and therefore S is known; and then having S and d, a the lesser Root will be known too, for $\frac{1}{2}\,\mathrm{S} - \frac{1}{2}\,d = a$.

Again, in the second Form. Let $a\,a - a\,d = \mathrm{R}$.

Here d and R (as before) the Difference and Rectangle of the two Roots are given; and a the greater of them; wherefore 'tis easy to find S the Sum, and then $\frac{1}{2}\,\mathrm{S} + \frac{1}{2}\,d = a$.

In the third Form, where $\mathrm{S}\,a - a\,a = \mathrm{R}$.

There is given the Coefficient S = Sum of the unknown Roots, A the Rectangle between them; and a may be either the bigger or lesser of them;

Here therefore to find d the Difference.

Because $\mathrm{SS} - dd = 4\,\mathrm{R}$, therefore $\mathrm{SS} + 4\,\mathrm{A} = d\,d$, and consequently d is known; and then $\frac{1}{2}\,\mathrm{S} + \frac{1}{2}\,d =$ greater, and $\frac{1}{2}\,\mathrm{S} - \frac{1}{2}\,d =$ lesser.

II. *The Solution of Adfected Quadratick Equations, by the Method of Compleating the Square.*

Which is by Mr. *Harriot*, thus: Since in every one of the three Forms of Quadraticks, one quarter of the Square of the Coefficient will make the unknown Side of the Equation a Compleat Square, whose true Root will be $a + \frac{1}{2}\,d$ (or whatever Letter else be the Coefficient.) 'Tis plain by this means, an Adfected Quadratick Equation, may be reduced to a *Simple* one.

Wherefore,

In the first Form, where all the Species are Affirmative.

Let $a\,a + d\,a = \mathrm{R}$

If $\frac{1}{4}\,d\,d$ be added to the unknown Side, it will be a perfect Square $aa + d\,a + \frac{1}{4}\,dd$, whose true Root is $a + \frac{1}{2}\,d$.

Add then, $\frac{1}{4}\,dd$ to R, and $\mathrm{R} + \frac{1}{4}\,d\,d$ will be a perfect Square Number and known: Whose Square Root extracted in Numbers, will be equal to $a + \frac{1}{2}\,d$; and consequently, a will be equal to that Root, when $\frac{1}{2}\,d$ is taken from it, and so a will be known.

The Practical Rule is this,

To the absolute Number, add $\frac{1}{4}$ of the Square of the Coefficient, (or the Square of half the Coefficient) and extract the Root of the Sum; then from that Root found in Numbers, subtract $\frac{1}{2}$ the Coefficient, and the Remainder is a, the lesser of the two Roots, or Values of a.

Example.

$$a\,a + d\,a = \mathrm{R}$$
$$\text{or } aa + 16\,a = 36$$
$$\text{to } 36 = \mathrm{R}$$
$$\text{add } 64 = \tfrac{1}{4}\,d\,d$$
$$\sqrt[2]{:100} = 10 = a - \tfrac{1}{2}\,d.$$
$$\text{but } \tfrac{1}{2}\,d = 8$$

therefore $2 = a$.

In the Second Form.

Let $a\,a - d\,a = \mathrm{R}$.

Proceed in all respects as in the first Form, only you must at last add $\frac{1}{2}$ the Coefficient to the Root Extracted out of the absolute Number instead of taking it from it, as before: because here a represents the greater Root; and thus, if $aa - 16\,a = 36$. a will be found = to 18.

In the Third Form.

Let $\mathrm{S}\,a - a\,a = \mathrm{R}$.

Here because the highest Power is Negative, 'tis impossible any such Root can be found that will produce $-aa$; wherefore you must imagine all the Signs changed, and then it will stand thus; $-\mathrm{S}\,a + a\,a = -\mathrm{R}$, or putting the highest Power first, $a\,a - \mathrm{S}\,a = -\mathrm{R}$.

In this Form, the Coefficient is the Sum of the two Roots, and a may be either of them.

And here the absolute Number is so determined as that it cannot be greater than the Square of half the Coefficient: For,

If the absolute Number be = to the Square of half the Coefficient, the Roots are equal.

The Practical Rule then is this:

From the Square of half the Coefficient, take the absolute Number given; and extract the Square Root of the Remainder; which Root either added to, or subtracted from half the Coefficient, will give accordingly the greater or lesser Value of a.

Thus: If $20\,a - aa = -36$
or $\mathrm{S}\,a - aa = -\mathrm{R}$
From $100 = \frac{1}{4}\,\mathrm{SS}$
take $36 = \mathrm{R}$
$\sqrt[2]{:64} = 8$
now $10 + 8 = 18$ the greater Root,
and $10 - 8 = 2$ the lesser Root.

III. *To*

III. *To Solve* Quadratick Adfected Equations, *by taking away the* Second Term.

In any of the Three Forms, if the Coefficient have a Negative Sign, put $e + \frac{1}{2}d$; but if it have an Affirmative Sign, put $e - \frac{1}{2}d$; inſtead of a, the Root of the higheſt unknown Power.

Then will $ee + ed + \frac{1}{4}dd = aa$
alſo $+ed + \frac{1}{4}dd = +da$.

And theſe two Quantities added together, muſt be equal to the Abſolute Number given, and the Equation will become a Simple one.

In the Firſt Form,

$aa + da = R$, or $aa + 16a = 36$.
Let $e - \frac{1}{2}d = a$,

Then will $ee - ed + \frac{1}{4}dd = aa$
and $ed - \frac{1}{2}dd = ad$
which added together make $ee - \frac{1}{4}dd = R$
Therefore $ee = R + \frac{1}{4}dd$
And conſequently $e = \sqrt{R + \frac{1}{4}dd}$

But $e - \frac{1}{2}d = a$,
Therefore $e = a + \frac{1}{2}d$
Conſequently $a + \frac{1}{2}d = \sqrt{R + \frac{1}{4}dd}$
Wherefore $a = \sqrt{R + \frac{1}{4}dd} - \frac{1}{2}d$. Q.E.D.

And ſince $a + \frac{1}{2}d = \sqrt{R + \frac{1}{4}dd}$: If each part of the Equation be Squared, there will ariſe,

$$aa + ad + \tfrac{1}{4}dd = R + \tfrac{1}{4}dd.$$

Which is the other common Canon for Solving Quadraticks, by adding to each Part the Square of half the Coefficient, in order to compleat the Square.

In the Second Form,

$$aa - ad - R.$$
Let $e + \frac{1}{2}d = a$.

Then is $ee + ed + \frac{1}{4}dd = aa$
and $-ed - \frac{1}{2}dd = ad$

Theſe added make $ee - \frac{1}{4}dd = R$
Therefore $ee = R + \frac{1}{4}dd$.

and $e = \sqrt{R + \frac{1}{4}dd}$.
but $e + \frac{1}{2}d = a$
Therefore $e = a - \frac{1}{2}d$.

And conſequently $a - \frac{1}{2}d = \sqrt{R + \frac{1}{4}dd}$.

Wherefore $a = \sqrt{R + \frac{1}{4}dd} + \frac{1}{2}d$.
Q. E. D.

And ſince $a - \frac{1}{2}d = \sqrt{R + \frac{1}{4}dd}$; if each Side of the Equation be Squared, you will have,

$$aa - ad + \tfrac{1}{4}dd = R + \tfrac{1}{4}dd.$$

Which is the common Canon for Solving Equations by compleating the Square.

In the Third Form,

$$da - aa = R.$$

Which Form muſt be thus changed,

$$aa - da = -R.$$

Then make as before, $e + \frac{1}{2}d = a$
and then $ee + ed + \frac{1}{4}dd = aa$
and $-ed - \frac{1}{2}dd = -ad$.

Whoſe Sum is $ee - \frac{1}{4}dd = -R$
Then is $ee = \frac{1}{4}dd - R$.

And $e = \sqrt{\frac{1}{4}dd - R}$.

And ſince, $e + \frac{1}{2}d = a$
$e = a - \frac{1}{2}d - (\sqrt{\frac{1}{4}dd - R})$

Wherefore (becauſe there are two Poſitive Roots in this Form)

$$a = \sqrt{\tfrac{1}{4}dd - R} + \tfrac{1}{2}d.$$

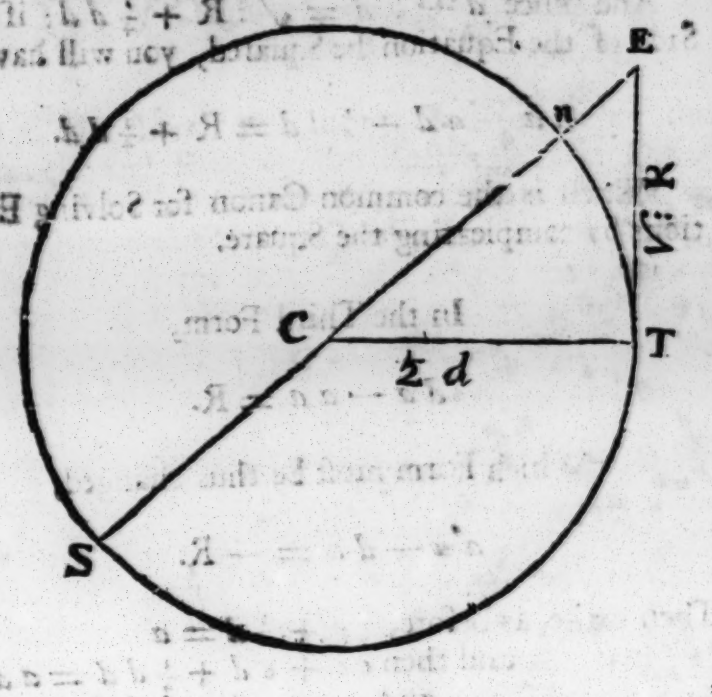
But the Value of a is Ambiguous, and you muſt generally try both Roots before you can find which will Solve the Queſtion: Whereas in the other two Forms, the firſt a found, will be that required.

N. B. In this way of Solving *Quadraticks*, the known Quantity added to, or Subſtracted from e, muſt be always half the Coefficient.

Conſtruction of Adfected Quadraticks.

The Conſtruction of *Simple Quadraticks*, you have before under *Simple Equations*: That of *Adfected* ones, is eaſily done many ways.

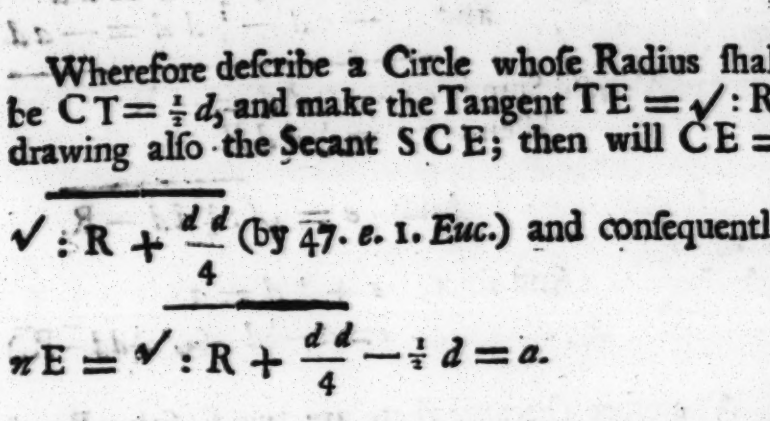
I. In the Firſt Form of Quadraticks, let $aa + da = R$. Then by the common Method of Solution, $a = \sqrt{R + \frac{dd}{4}} - \frac{d}{2}$.



Wherefore describe a Circle whose Radius shall be $CT = \frac{1}{2}d$, and make the Tangent $TE = \sqrt{:R}$, drawing also the Secant SCE; then will $CE = \sqrt{:R + \frac{dd}{4}}$ (by 47. *e.* 1. *Euc.*) and consequently $nE = \sqrt{:R + \frac{dd}{4}} - \frac{1}{2}d = a$.

II. In the Second Form, where $aa - dd = R$, a will be equal to $\sqrt{:R + \frac{dd}{4}} + \frac{d}{2}$. And consequently, The same Construction and Diagram will serve here, which was used in the first Form: And the Root will be represented by $SE = \sqrt{:\frac{1}{2}dd + R} \frac{1}{2}d$.

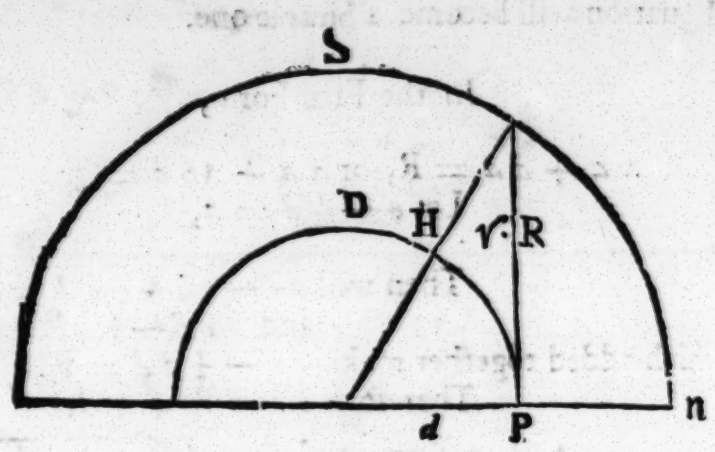
III. In the Third Form, where $Sa - aa = R$, a will be equal to $\frac{S}{2} + \sqrt{:\frac{SS}{4} - R}$, and here the Root a hath two real Values; make CT $(= \frac{1}{2}S)$ the Radius of a Circle, and erect the



Perpendicular $ET = \sqrt{:R}$; then draw EQ Parallel to CT, and NO Parallel to ET, draw also the Radius CN. Then will (by 47. *e.* 1 *Euclid.*) $CO = \sqrt{:\frac{SS}{4} - R}$, and consequently, $BO = \frac{S}{2} + \sqrt{:\frac{SS}{4} - R} =$ the greater Root a. Or the two Roots will be QN, and NE; equal to the two former.

Dr. *Wallis*'s way of Constructing the Three Forms of all Quadratick Equations, according to Mr. *Oughtred*'s Method of Solution.

Draw two Concentrick Circles, and let the Diameter of the greater be called S, and the Diameter of the lesser D, the Sum and Difference of the Roots found. Wherefore H and d will represent the half Sum and half Difference of the Roots.



Since therefore *Oughtred*'s Theorem, as is shewed above, is, That $SS - DD = 4R$. Wherefore, : divide all by 4 : $\frac{SS - DD}{4} = R$; Let $\sqrt{:R}$ be made a Tangent to the lesser, or a Right-Sine to the greater Circle, as you see in the Figure according as D, or S, is given: And draw also the Hypothenuse H. Then will the Base of the Triangle be d. And $HH - dd = R$ (by 47. *e.* 1.) That is, $\frac{SS}{4} - \frac{DD}{4} = R$. Wherefore by Transposition, $HH = R + dd$, and therefore $H = \sqrt{:R + dd}$. And consequently, if it had been in the first or second Forms, where d and R were given, H will also be found. Or if H had been given, and d required as in the third Form, since, $HH = R + dd$: Therefore, $HH - R = dd$; And $\sqrt{:HH - R} = d$: And having thus found A and d, the $\frac{1}{2}$ Sum and $\frac{1}{2}$ Difference of the two Roots: Then $H + d$ $(= op)$ will be the greater Root a. and $H - d$ $(= pn)$ will be the lesser, which will be Affirmative or Negative, according to the Form and Circumstances of the Equation.

A Question and Problems in Adfected Quadratick Equations.

QUESTION.

Two Men have each a certain number of Crowns, whose Sum Substracted from the Sum of their Squares, leaves $R = 78$: *But their Sum added to the Product of the two Numbers, makes* $39 = S$. How many Crowns had each?

For the unknown Sum of the Numbers put $2a$. And for their Difference $2e$.

For then the Numbers may be thus Noted, $a + e$ = the greater, and $a - e$ = the lesser.

Then

Then,

$1 - \overline{2a}$	1	$2aa + 2ee =$ Sum of their Sq.
	2	$2aa + 2ee - 2a =$ R. by the State of the Queſtion.
$2 \div \overline{2}$	3	$aa + ee - a = \frac{R}{2}$. $39. = S.$
by Tranſp.	4	$39 - aa + a = ee$ which Step will at laſt help to find e.
$\square + 2a$	5	$aa - ee + 2a = S.$ Their Product added to their Sum.
by Tranſp.	6	$aa + 2a - S = ee.$
4, 6,	7	$39 - aa + aa = aa + 2a - 39\ (S) = ee.$
by Tranſp.	8	$78 = 2aa + a.$
	9	$aa + \frac{1}{2}a = 39 = S$, which is a Quadratick of the firſt Form.
Comp. $\square$ ww	10	$aa + \frac{1}{2}a + \frac{1}{16} = 39 + \frac{1}{16}$
	11	$a + \frac{1}{4} = \sqrt{:}\ 39 + \frac{1}{16}$
	12	$a = \sqrt{:}\ 39 + \frac{1}{16} - \frac{1}{4} = 6.$
	13	Therefore $2a = 12.$

And (a) being known, the value of (e) will be found from the fourth Step. Where $e = 3$.

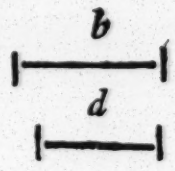
Now by our Suppoſition at firſt, the greater Number was $a + e$, that is 9; and the leſſer was $a - e$; that is 3: Which numbers 3 and 9, will Anſwer the Queſtion.

For 12, their Sum, taken from 90, the Sum of their Squares, leaves 78; and added to 27, their Rectangle, makes 39.

N. B. By this Method of putting $a + e$ and $a - e$ for the two Numbers ſought, inſtead of a and e as in the Common way; many Queſtions producing Adfected Quadratick Equations, when that way manag'd, may be ſolved as eaſily, and in the manner of Simple Equations. Eſpecially when the Sum and Difference, or Sum or Difference of the Squares of the Quantities ſought, are among the *Data*.

PROBLEM I.

The Difference of both the Legs of a Right angled Triangle being given from the Hypothenuſe; to find the Sides ſeverally, and to Form the Triangle.



Let the Difference of the leſſer Side from the Hypothenuſe be (b) and that of the greater (d.)

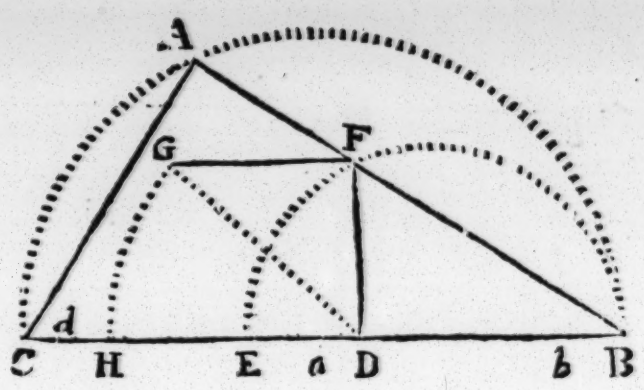
For the greater Side ſought put (a)

Then will,

$1 - \overline{b}$	1	$a + d =$ Hypothenuſe, and
	2	$a + d - b =$ to the leſſer Side.
47. *e.* 1.	3	$aa + 2ad + dd. = 2aa + 2ad - 2ab - 2bd + dd + bb.$
	4	$aa - 2ab - 2bd + bb = 0.$ by Compariſon and Tranſpoſition of the laſt Step.
Tranſp.	5	$aa - 2ab = 2bd - bb.$ which is a Quadratick Equation of the Second Form.
Compl. $\square$ ww	6	$aa - 2ab + bb = 2bd.$
	7	$a - b + \sqrt{:}\ 2bd$
		$a = \sqrt{:}\ 2bd + b.$

Geometrical Conſtruction.

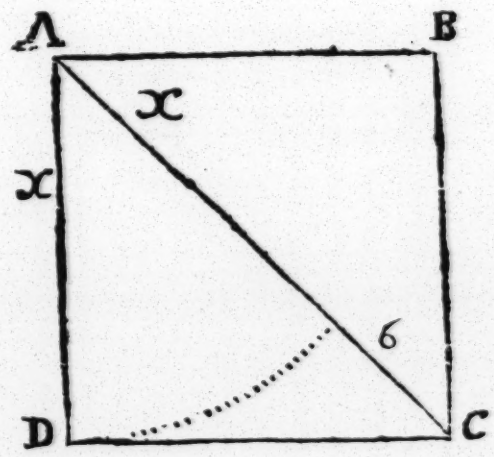
Find a mean Proportional between d and b, which let be D F: to which, place at Right-angles F G = to D F, Draw G D, and cut off H D = G D. Then will B H, be the greater Side ſought. And this being



produced to C (ſo that C H = E D) will give C D (= A C) the leſſer Side of the Triangle required, for $a + d - b =$ leſſer Side; Draw a Semi-circle on C B and apply A B = H B. Then draw A C, and the Triangle is found, which is A C B.

PROBLEM II.

Having in the Square A B C D, *the Difference between the Sides and Diagonal* = 6, *or* a, *to find the Side of the Square.*



Let the Side ſought be called x, and $6 = a$.

Then $x + a =$ A C the Diagonal.

But (by 47. *e.* 1 *Eucl.*) A C q; = 2 A D q; or to $2xx$,

That is $xx + 2xa + aa\ 2xx.$

Expunge then xx on both Sides, and it will be $2xa + aa = xx$, and then by Tranſpoſition, $xx + 2ax - aa.$ Compleat the Square, and it will be $xx - 2ax + aa = 2aa.$

Wherefore $x - a = \sqrt{:}\ 2aa$,

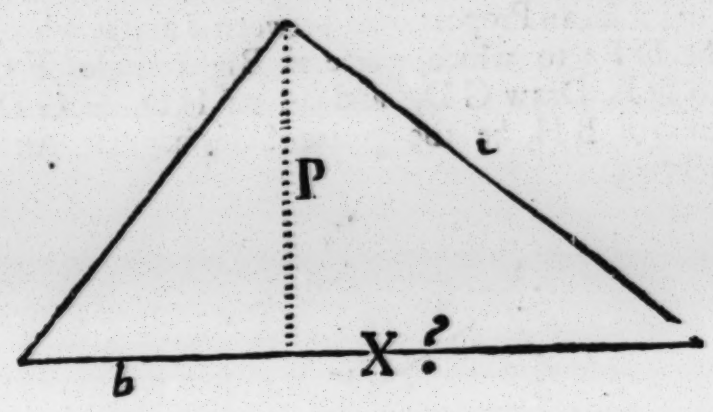
And conſequently $x = \sqrt{:}\ 2aa + a = 14.48.$

PROBLEM III.

Given one Segment of the Baſe of a Right-angled Triangle, as alſo the Side of the Triangle Adjacent to the other Segment of the Baſe; 'tis required to find the reſt, and to form the Triangle.

Suppoſe

Suppoſe it done; and let the Segment *b*, and the Side *c*, be both known or given. Let *x*, the other



Segment of the Baſe, be ſought; which is all that is neceſſary to ſolve the Problem.

Here therefore, ſince P is ſuppoſed to be a true Perpendicular;

1 | $cc + xx = pp$. 47 *è* 1 *Euclid.*

2 | And becauſe the Angle at the Top is a Right one, therefore $pp = bx$, which gives another way of expreſſing pp. So that,

3 | $cc - xx = bx$, and conſequently by Tranſpoſition,

4 | $cc = xx + bx$. which is an Adfected Quadratick of the firſt Form. Wherefore,

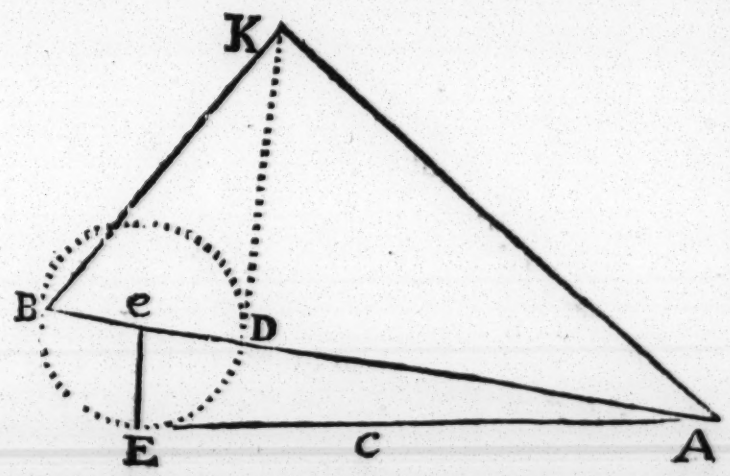
5 | $cc + \frac{bb}{4} = xx + bx + \frac{bb}{4}$ by compleating the Square. And,

6 | $\sqrt{cc + \frac{bb}{4}} = x + \frac{b}{2}$, by Evolution.

7 | Laſtly, $\sqrt{cc + \frac{bb}{4}} - \frac{b}{2} = x$.

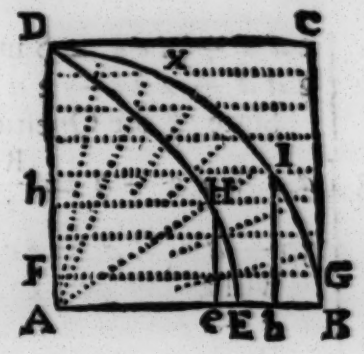
Geometrical Conſtruction.

Join together at Right-angles eE $= \frac{1}{2}b$ and EA $=$ C, Then with the Radius *e* E Deſcribe the Circle BED, and thro' the Centre *e* Draw the Line A D B. Erect then at D the Perpendicular D K,



which Limit, by Deſcribing a Semi-circle on BA that Semi-circle ſhall cut the Perpendicular in th Point K, the Vertex of the Triangle required, whence draw the two Legs BK and KA. So is BKA the Triangle ſought.

QUADRATRIX (in Geometry) is a Curve Line thus generated.



Let there be a Radius of a Circle, as AD, which imagine to move on the Centre A down the Circumference of the Quadrant D B, and at the ſame time let the Side of the Square C D move equally downwards, ſo that the Radius A D and the Side of the Square C D, may come to the Line A B together. Or let the Right Line D A, and the Quadrantal Ark D B, be both divided into a like Number of equal Parts, as in this Caſe they are each into 8. And to the Diviſions of the Quadrant let as many Radii be drawn from the Centre A, and through the Diviſions in A D as many Parallels to C D; for then if a Curve Line be drawn neatly connecting the Points of Interſection of theſe Radii and Parallels, it will be that Line which is called the *Quadratrix* (as D E). From this Geneſis of the Quadratrix ariſe theſe Corollaries.

1. That if through any Point, as H in this Quadratrix, you draw a Radius A H I, and the two Perpendiculars *Hb* and *He*, it will be, as the whole Quadrantal Ark D B, is to the Part I B :: ſo will the whole right Line D A be to the Part of it cut off *b* A, or its equal *He*, as is plain from conſidering the equal motion of the Radius A D, and the ſide of the Square D C, which interſect each other in H.

2. Wherefore any Ark of the Quadrant as I B, or any Angle as I A B, may by this Quadratrix be eaſily divided into 3 equal Parts, or any other Number at Pleaſure, or according to any given *Ratio*, by only drawing the Radius A I, and then from the Point of the Quadratrix H letting fall the Perpendicular *He*: for if *He* be divided into 3 or any given Number of equal Parts, Lines drawn from A the Center through thoſe Diviſions, ſhall divide the Ark or Angle after the ſame manner. For as the parts of *He*, are to the whole Line :: ſo will the parts of the Ark I B be to the whole Ark: By the former Corollary,

3. I ſay, *That the Baſe of the Quadratrix* A E *is a Third Proportional to the Radius* A D, *and the Quadrant* B D.

For D B. D A :: I B. H*e*, as follows (alternately) from *Cor.* 1.

And I*b*. H*e* :: *b* A : *e* A, by the Triangles being Similar.

Now if you conceive the Ark I B to grow infinitely ſmall, it muſt at laſt come to the ſame as its right Sine I*b*, and both will coincide in the Point B; and at the ſame time as H E and H*e* coincide in the Point E, (by the Geneſis of the Curve;) ſo that at laſt A*e* and A E, A*b* and A B will be coincident: And therefore at laſt D B . D A :: I B (*i. e.* I*b*)

(*i. e.* I *b*) H *e*. That is, as A *b* : A *e*. or which is the ſame at laſt, as A B (or A D) to A E.

Wherefore D B . D A :: D A . A E. *Q. E. D.*

4. Wherefore if on the Baſe of the Quadratrix A E, a Quadrantal Ark be deſcribed, it will be equal in length to D A the Side of the Square: And conſequently the Semicircle will be double, and the Periphery Quadruple, of D A.

5. Hence may a Right Line be found equal to D B or any other Quadrant of a Circle, by only making as A E . A D :: A D to a Third Proportional, which will be equal to the Quadrantal Ark, by *Cor.* 3.

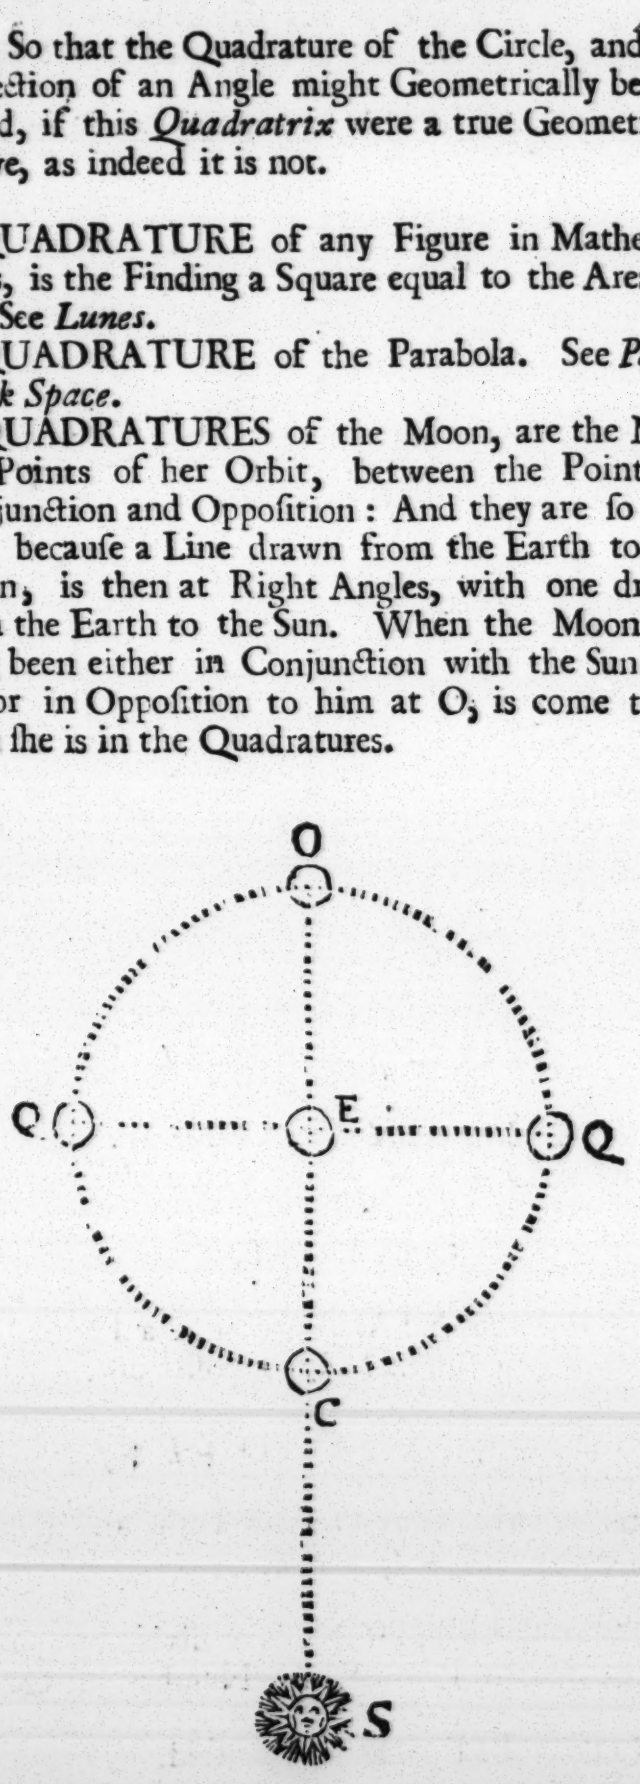
6. After the ſame manner may a Right Line be found equal to I B, or any other Ark of a Circle leſs than a Quadrant, if it be made as D A . H *e* :: D B . D B to a fourth Proportional by *Cor.* 1.

7. So that the Quadrature of the Circle, and the Triſection of an Angle might Geometrically be effected, if this *Quadratrix* were a true Geometrical Curve, as indeed it is not.

QUADRATURE of any Figure in Mathematicks, is the Finding a Square equal to the Area of it. See *Lunes*.

QUADRATURE of the Parabola. See *Parabolick Space*.

QUADRATURES of the Moon, are the Middle Points of her Orbit, between the Points of Conjunction and Oppoſition: And they are ſo called, becauſe a Line drawn from the Earth to the Moon, is then at Right Angles, with one drawn from the Earth to the Sun. When the Moon having been either in Conjunction with the Sun, at C, or in Oppoſition to him at O, is come to Q. then ſhe is in the Quadratures.



QUADRATUS *Femoris*, a Muſcle of the Thigh, ſo called from its Figure; it ariſeth broad and fleſhy, from the *Apophyſis* of the *Os Iſchium*, and paſſes tranſverſly with an equal breadth and thickneſs to its partly fleſhy, and partly Tendinous Inſertion at the Poſterior part of the *Os Femoris*, partly below the great *Trochanter*. This aſſiſts the *Marſupialis*, in turning the Thigh-bone outwards.

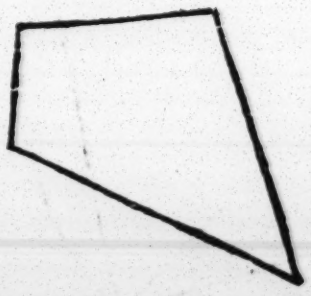
QUADRATUS *Genæ, Seu Tetragonus*, is a great Square Muſcle lying under the Skin of the Neck, and is ſpread over the whole inferior Region of the Face. It ariſes thin and membranous, from the Spines of the *Vertebræ*, the Skin on the Superior Part of the *Cucullaris*, and Pectoral Muſcle, from hence aſcending under the Skin of the Neck, becomes fleſhy, and one part adhering to the *Os Hyoides*, is ſoon inſerted to the Middle of the lower Jaw; the other broader portion proceeding farther to its Implantation in the Cheeks below the Angle of the Lips: It ſerves to draw down each Angle of the Mouth, together with the Cheeks, which Poſture of the Face is the proper expreſſion of Sorrow. But if the inferior Parts of theſe Muſcles (which lie on the Neck) Act alone, they diſtend the Superincumbent Skin, by making it approach to a direct Line with the *Clavicula* and lower Jaw-bone, which otherwiſe is Indented according to the Formation of the Part, whereby a double Skin (as they call it) is repreſented.

QUADRATUS *Lumborum*, is a ſhort thick, fleſhy Muſcle, ſituated in the Region of the Loins, or between the laſt Rib and Spine of the *Os Ilium*; it ariſeth from the Poſterior part of the Spine of the *Os Ilium*, and is inſerted to all the Tranſverſe Proceſſes of the *Vertebræ* of the Loins internally, under the *Pſoas* Muſcle. This like the *Muſculus Rectus Abdominis*, either moves the *Vertebræ* of the Loins nearer the *Os Ilium* laterally, when we are ſtanding on both Legs firm, or elſe moves the *Os Ilium* nearer the ſaid *Vertebræ* on the contrary ſide, when we ſtand upon one Leg only.

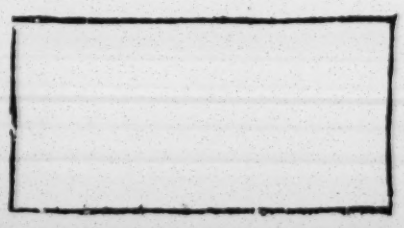
QUADRIGEMINI, according to ſome Anatomiſts, are four ſmall Muſcles that turn the Thigh toward the outſide, and are placed upon the Articulation, or jointing of the Thigh one by another.

QUADRILATERAL *Figures*, are thoſe whoſe Sides are four right Lines, and thoſe making four Angles; and they are either *Parallelogram, Trapezium, Rectangle, Square, Rhombus, Rhomboides*.

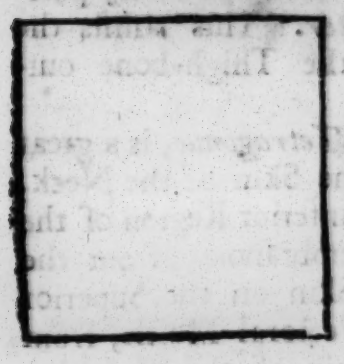
Parallelogram, is a *Quadrilateral* Figure, whoſe oppoſite Sides are Parallel and Equal.



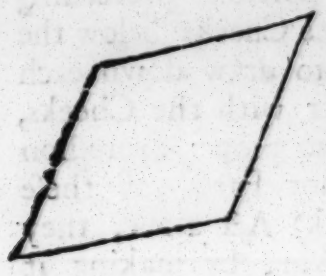
Trapezium, is a *Quadrilateral* Figure, whoſe Sides are unequal, as in this Figure.



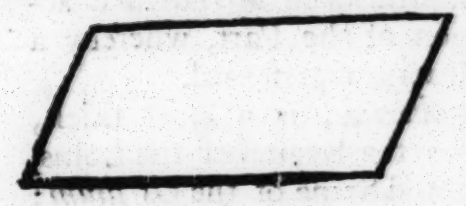
Rectangle, is a *Parallelogram* whoſe four Angles are Right, and is alſo called a *Rectangled Parallelogram*.



Square, is a *Quadrilateral* Figure having its Angles Right, and the Sides all Parallel and Equal, as in the Figure.



Rhombus, is a *Parallelogram*, having its oppoſite Angles and all its Sides equal, as in this Figure.



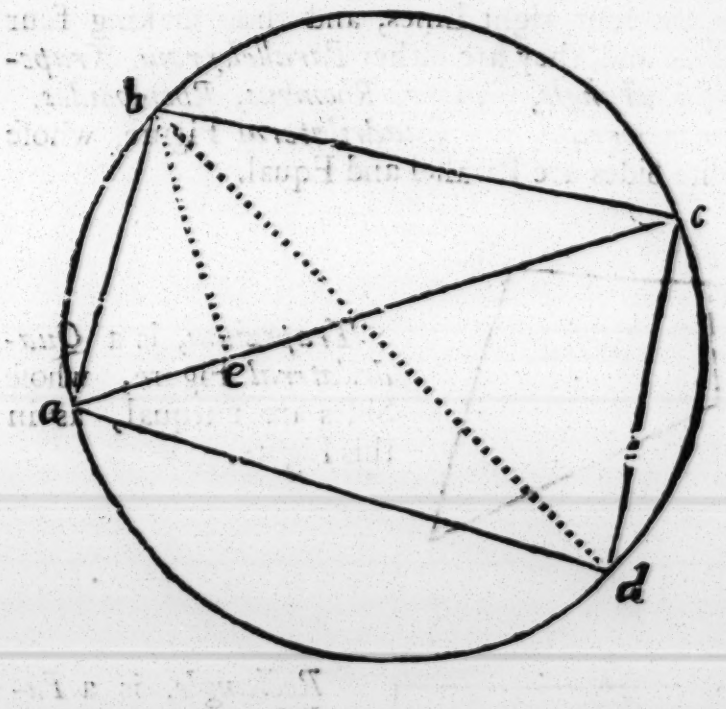
Rhomboides, is a *Parallelogram*, having neither its Angles nor Sides all equal.

PROPOSITION.

In a *Quadrilateral Figure* inſcribed in a Circle (as *a b c d*) the Rectangle under the two Diagonals (*a c* and *b d*) is equal to both the Rectangles made by the oppoſite Sides of the Figures *a b* × *c d*, and *b c* × *a d*.

That is, $\overline{a c \times b d} = \overline{b c \times a d} + \overline{b a \times c d}$. Make the Angle *a b e* = ∠ *c b d*.

DEMONSTRATION.



1. The Triangles *a b d* and *b c e* will be ſimilar; for ∠ *b d a* is equal to the ∠ *b c a*, (being in the ſame Segment) and the ∠ *a b d* = ∠ *e b c*, by the Addition of the common Angle *e b d*, to the two equal ones *a b e* and *d b c*.

Then will *b c* : *c e* :: *b d* : *d a*. and conſequently $\overline{b c \times d a} = \overline{c e \times b d}$. That is, the Rectangle under the oppoſite Sides *a d* and *b c*, is equal to the Segment *e c* multiplied by the Diagonal *b d*.

2. The Triangles *a b e* and *c b d* are Similar, becauſe the ∠ *a b e* = ∠ *c b d* (by conſtruction) and the ∠ *b a e* = ∠ *b d c*, being in the ſame Segment.

Therefore *a e* : *a b* :: *c d* : *b d*.

Conſequently $\overline{a e \times b d} = \overline{a b \times c d}$. That is, the ▭ under the remaining Segment *a e*, and the former Diagonal *b d* = ▭ under the oppoſite ſides *a b* and *c d*.

But *a c* = *a e* + *c e*.

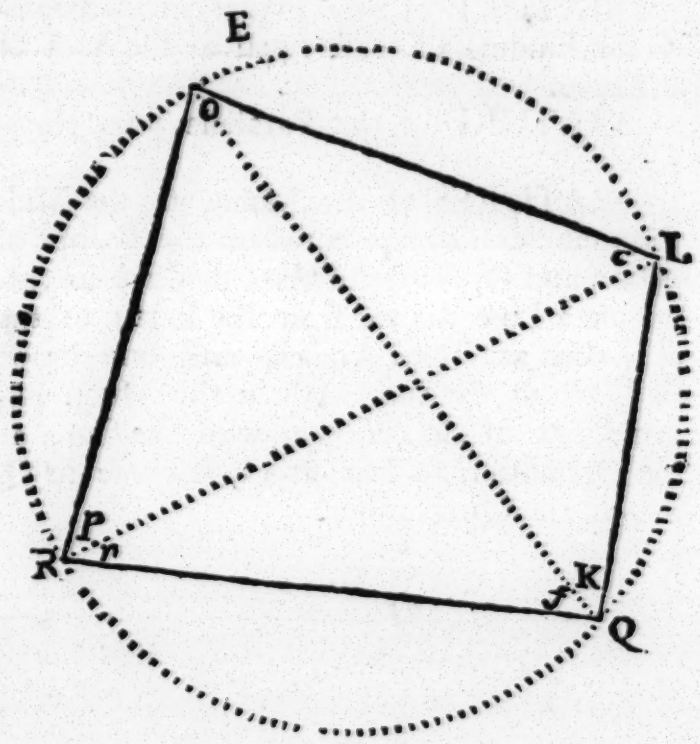
Wherefore $\overline{a c \times b d} = \overline{b c \times a d} + \overline{d c \times a b}$.

Q. E. D.

PROPOSITION.

The oppoſite Angles of any *Quadrilateral Figure* Inſcribed in a Circle, are always equal to two right ones.

I ſay O + *k* + *f* = 2 ∠. Draw the Lines R I. and E Q.



The Angles O + *p* + *c* = 2 ∠, by the 32 *q.* 1.

But ∠ *p* = ∠ *k*, and ∠ *c* = ∠ *f per* 21. *e.* 3.

Therefore O + K + *f* = 2 ∠. *q. e. d.*

COROL.

Hence the external Angle of ſuch a Figure, as E = *k* + *f*, the Internal and Oppoſite one.

For O + *e* = 2 ∠ = O + *k* + *f*.

Therefore take away O from both, and E will remain equal to *k* + *f*, *q. e. d.*

QUADRIPARTITION, is to divide by 4, or to take the fourth Part of any Number or Quantity.

QUADRUPLE, that is, Fourfold.

QUÆ *Plura*, was a Writ that lay where an Inquiſition had been made by an Eſcheator in any County, of ſuch Lands or Tenements as any Man died ſeized of, and all that was in his Poſſeſſion, was imagined not to be found by the Office: It differs

differs from the Writ called *Melius Inquirendum*, becauſe this is granted, where the Eſcheator formerly proceeded by Virtue of his Office; and the other, where he found the firſt Office by virtue of the Writ named *Diem clauſit extremum*.

QUÆ *Servitia*; ſee *Per quæ Servitia*.

QUALE *jus*, is a Writ judicial, that lies where a Man of Religion hath Judgment to recover Land, before Execution be made of the Judgment; for this Writ muſt go forth to the Eſcheator, between Judgment and Execution, to enquire whether the Religious Perſon hath any Right to recover, or whether the Judgment be obtained by Colluſion between the Demandant and the Tenant, to the intent that the true Lord be not defrauded.

QUALITY, ſignifies in the general the Properties or Affections of any Being, whereby it affects our Senſes ſo and ſo, and acquires ſuch and ſuch a Denomination.

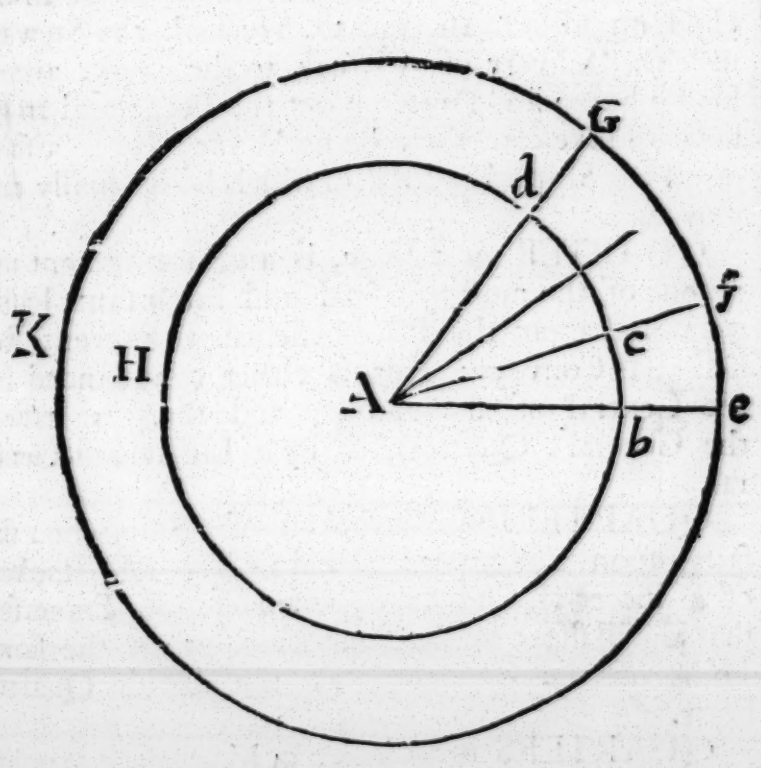
The Four *Firſt Qualities*, as they are accounted by ſome, are *Heat*, *Cold*, *Moiſture*, and *Dryneſs*.

The Four *Second Qualities*, or as they may be called, Chymical Qualities, are Volatility and Fixity, Corroſiveneſs and Corroſibility.

Senſible Qualities, are ſuch as are the more Immediate Objects of our Senſes.

Occult Qualities, were by the Ancients named ſuch, of which no rational Solution in their way or according to their Principles could be given.

Mr. *John Keill*, in his *Introductio ad Phyſicam*, thus proves that all Qualities are *Remitted*, or have their Power or Efficacy abated, in a *Duplicate Ratio* of the diſtance from the Centre of the *Radiation*, or Exertion of the Quality.



Let A be a Centre from whence any Quality exerts it ſelf round about, according to the right Lines A *e*, A *f*, A G, &c. The Efficacy of the Quality, be it Heat, Cold, Odour, &c. will be (at equal Diſtances from A) as the *Spiſſitude* or Thickneſs of the Rays A *b*, A *e*, A *f*. But the Rays within the Inner Circle, or rather Spherical Superficies *b c d* H, when they come to be extended to the outer Spherical Surface, *e f* G K, will be much leſs thick than before; and that in proportion *reciprocally*, as the Spaces they take up: That is, if the outer Surface be double of the inner, the Rays there will be but half as thick: But ſince Spherical Superficies are as the Squares of their Radij, therefore the Efficacy of the Quality in the inner Surface will be to that of the outer, as A *e* Square to A *b* Square. *q. e. d.*

QUAM *diu ſe bene geſſerint*, is a Clauſe often uſed in Letters-Patent of the Grant of Offices, as in thoſe of the *Barons* of the *Exchequer*, which muſt be intended only as to Matters concerning their Office; and is nothing but what the Law would have implied, if the Office had been granted for Life.

QUANTITY, ſignifies whatſoever is capable of any ſort of Eſtimation or Menſuration, and which being compared with another Thing of the ſame Nature, may be ſaid to be *greater* or *leſs* than, *equa* or *unequal to it*.

Quantity may have theſe Four Diviſions.

1. *Natural Quantity*, is what Nature furniſhes us with in Matter and its Extenſions, and in the Powers and Forces of natural Bodies; ſuch as Gravity, Motion, Light, Heat, Cold, Rarity and Denſity, &c.

2. *Moral Quantity*, which depends on the Manners of Men, and the free Determination of their Wills; as the Prizes and Values of Things, Dignity and Power, Good and Evil, Merit and Demerit, Rewards and Puniſhments, &c.

3. *Notional Quantity*, ariſing from the Operation of the Underſtanding only; ſuch as the Largeneſs or Narrowneſs of the Mind's Capacity, and of its Conceptions: In Logick, *Univerſals*, *Prædicaments*, and all ſuch Terms: In Grammar, the *Quantity* and *Meaſure* of *Syllables*, *Accents*, *Tones*, &c.

4. *Tranſcendental Quantity*, as Duration, the Continuation of any Being's Exiſtence, Time, &c. Quantity is divided alſo into *Continued* and *Diſcrete*, which ſee.

The QUANTITY of Matter in any Body, is its Meaſure ariſing from the joint Conſideration of its Magnitude and Denſity: As if a Body be twice as Denſe, and take up twice as much Space as another, it will be four Times as great. And this Quantity of Matter is beſt diſcoverable by the Weight of Bodies, which Sir *Iſ. Newton* found by his Nice Experiments on Pendulums, ſo exactly proportional to the Matter of Bodies. *Newton. Princip.*

The QUANTITY *of Motion* in any Body, is its Meaſure ariſing from the joint Conſideration of Quantity of Matter in, and the Velocity of the Motion of that Body. For the Motion of any Whole is the Sum or Aggregate of the Motion in all the ſeveral Parts: And tho' in a Body twice as great as another, moved with an equal Velocity, it will be double; yet if the Velocity be double alſo, the Quantity of the Motion will be Quadruple. *Newton. Princip.*

In *Philoſophical Tranſactions*, Numb. 195. is an Account by the Learned Captain *Halley*, of the ſeveral Species, or Kinds of *Infinite Quantity*.

Where he proves, That beſides *Infinite Length*, and *Infinite Area*, in which there are great Varieties;

There are alſo no leſs than three ſorts of *Infinite Solidity*. See *Infinite Quantities*.

QUANTUM *Meruit*, is an Action of the Caſe ſo called, grounded upon a Promiſe to pay a Man for doing any Thing, ſo much as he ſhould Deſerve, or *Merit*.

QUARE *ejecit infra terminum*; is a Writ that lieth for a Leſſee, where he is caſt out of his Farm, before his Term be expired, againſt the Feoffee or Leſſor that ejecteth him: And it differs from *Ejectione firmæ*, becauſe this lieth where the Leſſor, after the Leaſe made, infeoffeth another, which ejecteth the Leſſee: And the *Ejectione firmæ*, lieth againſt any other Stranger that ejects him. But the Effect of Both is all one; that is, to recover the reſidue of the Term.

QUARE *Impedit*, is a Writ that lies for him that hath purchaſed a Manor with an Advowſon thereto belonging, againſt him that diſturbs him in the Right of his Advowſon, by preſenting a Clerk thereto, when the Church is void: And it differs from the Writ called, a *Darreine preſentment*, *Aſſiſa ultimæ præſentationis*, becauſe that lies where a Man, or his Anceſtors formerly preſented: and this for him that is the Purchaſer himſelf: Note, That where a Man may have an *Aſſiſe Darreine Preſentment*, he may have a *Quare impedit*, but not contrariwiſe.

QUARE *Incumbravit*, is a Writ that lieth againſt the Biſhop who within ſix Months, after the Vacation of a Benefice, conferreth it upon his Clerk, while two others are contending in Law for the Right of Preſenting. This Writ always lies depending the Plea.

QUARE *intruſit Matrimonio non ſatisfacto*, is a Writ that lies where the Lord proffers convenable Marriage to his Ward, and he refuſes, and enters into the Land, and Marries himſelf to another; then the Lord ſhall have this Writ againſt him. But all Wardſhips being taken away by the Statute 12 *Car.* 2. *cap.* 24. this Writ is become uſeleſs.

QUARE *non admiſit*, is a Writ that lies againſt a Biſhop, refuſing to admit his Clerk that hath recovered in a Plea of *Advowſon*.

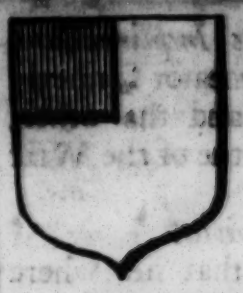
QUARE *non permittit*, is a Writ that lies for one that has Right to preſent for a Turn, againſt the Proprietary.

QUARE *obſtruxit*, is a Writ that lies for him who having Liberty to paſs through his Neighbours Ground, cannot enjoy his Right, for that the Owner has ſo Strengthened it.

QUARENTINA *habenda*, is a Writ that lies for a Widow to enjoy her *Quarentine*.

QUARENTINE, is a Benefit allowed by the Law of *England*, to the Widow of a Man Dying Seized of Land; whereby ſhe may challenge to continue in his Capital Meſſuage or chief Manſion-houſe (ſo it be not a Caſtle) by the Space of Forty Days after his Deceaſe; and if the Heir, or any other attempt to eject her, ſhe may have the Writ *de quarentina habenda*.

QUARTATION, is a way of Purifying of Gold, uſed by Refiners who melt three Parts of Silver with one of Gold (whence the Name) and then caſt the Mixture into *Aqua fortis*, which will diſſolve the Silver, and leave the Gold in a blak Powder at the Bottom.



QUARTER in Heraldry, ſignifies a Partition made of juſt a fourth Part of the Field, by Two Right Lines, thus;

He beareth *Argent*, a *Quarter Gules*.

QUARTER of a Ship, is that Part of the Ship's Hull which lieth from the Steerage Room to the Tranſom.

QUARTER-*deck*. See Deck.

QUARTER, in a Military Senſe, ſometimes is uſed to ſignify the good Treatment given to a vanquiſh'd Enemy: Thus ſay they, *The Enemy aſked Quarter*; *We gave no Quarter*, &c.

QUARTER ſignifies the Ground a Body of Men is Encamp'd upon; as when they ſay, Such a Quarter is well fortify'd; and oftentimes the Troops themſelves that are there Quartered; for they ſay alſo, *We beat up the Enemies Quarters*.

QUARTERS (*Winter*.) Winter Quarters ſometimes is uſed for the Interval between two Campaigns, but more generally for the Place or Places where Troops are lodged during the Winter.

QUARTERS *of Refreſhment*, are ſuch Places as Troops which have been much fatigued and haraſſed, are put into, to recover their Strength or Health, during ſome time of the Summer or Seaſon of the Campaign.

QUARTER-*Maſter*, in the Land Forces, is either the Quarter-Maſter General of an Army, who is to ſee out for good Quarters for the whole; or of any Regiment of Foot, or Troop of Horſe; whoſe Office it is to do the ſame for thoſe Bodies.

QUARTER-*Maſter*, is an Officer Aboard a Ship (of which there are more or fewer according to her Burthen) whoſe Buſineſs is to rummage in the Hold on all Occaſions, to overlook the Steward in this Delivery of Victuals to the Cook, and in his Pumping and Drawing out the Beer; and in general to take care there be no Waſte: He is alſo to mind the Ship's Loading, in which he is uſually employed.

QUARTER *at a Siege*, is an Encampment upon one of the moſt principal and important Paſſages round about the Place beſieged, to prevent Relief and Convoys: This is either commanded by the General of the Army, and then is called, the General's Quarters, or by a Lieutenant-General.

QUARTERING, is ſpoken of a Ship when ſhe ſails upon a Quarter Wind: 'Tis alſo ſpoken of a Piece of Ordnance, when 'tis ſo Traverſed that it will ſhoot on the ſame Line, or on the ſame Point of the Compaſs, as the Ship's Quarter bears.

QUARTERS in a Clock, or Movement, are little Bells which ſound the *Quarters*, or other Parts of an Hour. The Way of making any Clock ſtrike them, ſee in *Watch-Work*.

QUARTILE, is an Aſpect of the Planets, when they are 3 Signs, or 90 Degrees diſtant from each other, and is marked thus □.

QUAVER, a Note in Muſick ſo called: See the Words *Notes* and *Time*.

QUE *Eſtate*, in common Law, ſignifies a Plea, whereby a Man Entit'ling another to Land, &c. ſaith,

ſaith, That the ſame Eſtate he had, he hath from him.

For Example: In a *Quare Impedit*, the Plaintiff alledges, That ſuch four Perſons were ſeized of Lands whereunto the Advowſor in queſtion was appendant in Fee, and did preſent to the Church, and afterwards the Church became void, *Que eſtate del*, &c. that is, *Which Eſtate* of the four Perſons he has now during the Vacation, by Vertue whereof he preſented, *&c.*

QUE *eſt Meſme*, a Law Term uſed in an Action of Treſpaſs, or ſuch like, for a poſitive Juſtification of the very Act complained of by the Plaintiff, as a Wrong.

For Example: In an Action upon the Caſe, the Plaintiff ſays, That the Lord threatned his Tenants at Will, in ſuch ſort, that he forced them to give up their Tenures. The Lord, for his Defence pleadeth, That he ſaid unto them, That if they would not depart, he would ſue them at Law: This being the ſame Threatning that he uſed, or to ſpeak Artificially, *Que eſt le Meſme*, The Defence is good.

Queüe a'yronde, a Term in Fortification, being what we call Swallows Tail; and ſignifies a Detached or Out-work, whoſe Sides open towards the Head, or Campaign, or draw narrower or cloſer towards the Gorge. Of this kind are either ſingle or double Tenailles, and ſome Horn-works, whoſe Sides are not parallel, but are narrow at the Gorge and open towards the Head; like the Figure of a Swallow's Tail.

When theſe Works are caſt up before the Front of a Place, they are defective in this Point, that they do not ſufficiently cover the Flanks of the oppoſite Baſtions, but then they are very well Flanked by the Place, which covers all the length of their Sides the better.

QUEM *redditum reddat*, is a Writ Judicial, that lies for him to whom a Rent-ſeek, or Rent-charge is granted, by Fine levied in the King's Court againſt the Tenant of the Land that refuſeth to Attorn to him, thereby to cauſe to Attorn.

QUENE, as the Heralds write it, (but it ſhould be *Queüe*) the Word in Blazon for a Tail of a Beaſt, thus: If a Lyon have a forked or double Tail, they ſay he is *Double Quened*.

QUERELA, an Action preferred in any Court of Juſtice, in which the Plaintiff was *Querent*, or Complainant, and his Brief, Complaint, or Declaration, was *Querela*.

QUERELA *freſiæ fortice*, is a Writ of *Freſh-force*; which ſee.

QUERELA *coram Rege & concilio diſcutienda & terminanda*, is a Writ whereby one is called to Juſtify a Complaint of a Treſpaſs, made to the King himſelf, before him and his Council.

QUERENS *non invenit per legium*, is a Return made by the Sheriff upon a Writ directed to him, with this Condition inſerted, *Si* A. *fecerit* B. *ſecurum de clamore ſuo proſequendo*.

QUEST, or *Inqueſt*, an Inquiſition or Enquiry made upon Oath of an Impanell'd Jury.

QUEST-*Men*. See *Sidemen*.

QUESTUS, or *Quæſtus*, in Law, is taken for that Land which does not deſcend to us by Hereditary Right, but is gain'd by our own Labour and Induſtry: this is called *Purchaſed Lands*.

QUESTUS *eſt nobis*, is the Form of a Writ of *Nuſance* which lies againſt him to whom the Houſe, or other thing, that breeds the *Nuſance*, is alienated.

QUIA *improvide*, is taken to be a *Super ſedeas* granted in the behalf of a Clerk of the Chancery, ſued againſt the Privilege of that Court in the Common-Pleas, and purſued to the *Exigent*, or in many other Caſes, where a Writ is erroneouſly ſued out.

QUID *juris clamat*, is a Writ Judicial, iſſuing out of the Record of the Fine, which remaineth with the *Cuſtos brevium* of the Common-Pleas, before it be engroſſed; and it lies for the Grantee of a Reverſion or Remainder, when the particular Tenant will not Attorn.

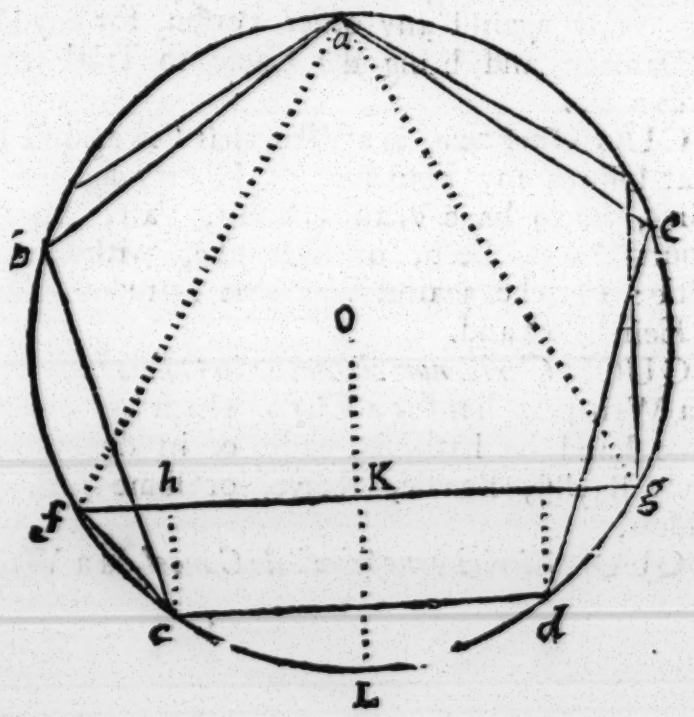
QUID *pro quo*, in Law is uſed for the Reciprocal Performance of both Parties to a Contract, and thereupon the giving of one thing of a Value for another thing of like Value, as 10*l.* for a Horſe, *&c.*

QUIETUS, is a Word uſed by the Clerk of the Pipe, and Auditors in the Exchequer, in their Acquittances or Diſcharges given to Accomptants, uſually concluding with an *abinde receſſit quietus*, which is called a *Quietus eſt*, and mentioned in the Act of *General Pardon*, 12 *Car.* 2. 11. and 14 *Car.* 2. *Cap.* 21. A *Quietus eſt*, granted to the Sheriff, ſhall diſcharge him of all Accounts due to the King.

QUINCUNX, that Poſition, or Aſpect, that the Planets are ſaid to be in, when diſtant from each other 150 Degrees, or 5 Signs, and is mark'd thus, *Vc.* or *Q*.

QUINDECAGON, is a plain Figure of 15 Sides and Angles, which if they are all equal to one another, is called a Regular Quindecagon; which how to deſcribe in a Circle, *Euclid* ſhews Prop. 16. *e.* 4.

The Side of a Regular Quindecagon, ſo deſcribed, is equal in Power to the half Difference between the Side of the Equilateral Triangle, and the Side of the Pentagon, and alſo to the Difference of the Perpendiculars let fall on both Sides, taken together.



Make the Pentagon *a b c d e*, and parallel to any one Side of it, ſet the Baſe of the Equilateral Triangle *f g a*. Then (by 16. *e.* 4 *Eucl.*) will *f c* be the Side of the *Quindecagon*, *f h*, $= \frac{1}{2}$ the Difference between the Side of the Triangle and Pentagon; and *h c* = to the Difference of the Perpendicular

pendiculars let fall from the Centre *o*, to both the Sides of the Figures.

But □ *f c* = □ *f b* + □ *b c*, by 47 *e. Euelid.*

Wherefore the Propoſition is true, &c.

QUINQUEANGLED, in Geometry, is a Figure conſiſting of five Angles.

QUINSIE, or rather *Squinancy*, a Diſeaſe ſo called. See *Angina*.

QUINTESSENCE, is a Medicine made of the Energetical and Active Particles of its Ingredients, ſeparated from all Fæces or Dregs.

QUINT *Exact*, in Law, is the laſt Call of a Defendant, who is ſued to the Outlawry, where, if he appear not, he is by the Judgment of the Coroners returned *Outlawed*; if a Woman, *Waved*. See *Exigent*.

QUINTILE, an Aſpect of the Planets when they are 72 Degrees diſtant from one another, and noted thus, *C* or *O*.

QUINTUPLE, Five-fold or five times as much as another thing.

QUITE *Claim*, is a Releaſe or Acquitting of a Man from any Action he hath, or might, or may have againſt him.

QUIT-*Rent*, is a certain ſmall Rent, payable yearly, by the Tenants of moſt Mannors; upon the payment whereof they are to quit, till it becomes due again.

QUO *Jure*, is a Writ that lies for him that has Land, wherein another challengeth *Common of Paſture*, Time out of Mind: And it is to compel him to ſhew *by what Title* he Challenges it.

QUO *Minus*, is a Writ that lies for him that hath a Grant of Houſe-bote and Hey-bote in another Man's Woods, againſt the Grantor, making ſuch Waſte as the Grantee cannot enjoy his Grant. This Writ lies alſo for the King's Farmer in the Exchequer, againſt him to whom he ſelleth any thing by way of Bargain touching his Farm, or againſt whom he hath any Cauſe of Perſonal Action: For he ſuppoſeth by the Vendees detaining any Due from him, he is made *leſs able* to pay the King's Rent; and under this pretence; any one who pays the King a Fee-Farm Rent, may have this Writ againſt any other Perſon, for any Debt or Damage, and bring the Cauſe to Trial in the *Exchequer*.

QUO *Warranto*, is a Writ that lies againſt him that Uſurps any Franchiſe or Liberty againſt the King, as to have Waife, Stray, Fair, Market, Court-Baron, Leet, or ſuch like, without good Title: Or elſe againſt him that intrudeth himſelf as Heir into Land.

QUOD *Clerici non eligantur in Officio Ballivi*, &c. is a Writ that lies for a Clerk, which by reaſon of ſome Land he hath, is made, or in doubt to be made Bayliff, Beadle, Reeve, or ſome ſuch like Officer.

QUOD *Clerici beneficiati de Cancel*, is a Writ to exempt a Clerk of the Chancery from Contribution towards the Proctors of the Clergy in Parliament.

QUOD *ei deforeat*, is a Writ that lies for the Tenant in Tail, Tenant in Dower, or Tenant for Term of Life, having loſt by Default againſt him that Recovered, or againſt his Heir.

QUOD *permittat*, is a Writ that lies for the Heir of him that is diſſeiſed of his Common of Paſture, againſt the Heir of the Diſſeiſor being Dead.

QUOD *Perſona nec Prebendarii*, &c. is a Writ that lies for Spiritual Perſons that are diſtrained in their Spiritual Poſſeſſions, for the Payment of a Fifteenth with the reſt of the Pariſh.

QUOILE, or *Coile*, at Sea; is ſpoken of Cables or Ropes, when they are placed in a round or Oval Ring one *Fake* (or Turn) upon another: that ſo they may the more eaſily be ſtowed out of the way, and alſo run out free and ſmooth, without *Knecks* or *Keuks* as they call them; *i. e.* without Twiſtings or Doublings: Then the Cable is ſaid to be *Quoiled* up.

QUOIN, a Sea Word, the ſame with *Coin*; which ſee.

QUORUM, a Word often uſed in our Statutes, as alſo in Commiſſions, both of Juſtices of the Peace, and others. As for Example, where a Commiſſion is directed to ſeven Perſons, or to any three of them, *whereof* A. B. and C. D. to be two, there A B C D. are ſaid to be of the *Quorum*, becauſe the reſt cannot proceed without them: So a *Juſtice of the Peace, and Quorun*, is one, without whom the reſt of the Juſtices, in ſome Caſes cannot proceed.

QUOTIDIAN *Ague*, is that, whoſe Fits return every Day.

QUOTIENT, is that Number in Diviſion which ariſes by dividing the Dividend by the Diviſor: And is called Quotient, becauſe it anſwers to the Queſtions *Quoties?* Or how often one Number is contained by another?

Thus:

If 360 be to be divided by 24, the Quotient will be 15, and the Numbers will ſtand thus:

24) 360 (15.

Where 15 is the Quotient.

QUOYLE, a Sea Word: They ſay a Cable is *Quoyled*, when 'tis laid round in a Ring on the Deck, or Floor of a Ship; in the middle of which Ring, or *Quoyle*, is a good Place to lay Shot in; which is more ſafe there than in Lockers along the Side; for there the Enemies Shot may fall into it, and beat it about among the Men.

RABANET. See *Rabinet.*

RABBETTING in a Ship, is the letting in of her Planks to the *Keel* which in the *Rake* and *Run* of the Ship, is hollowed away, that the Planks may join the better and closer, and this hallowing away, is called the Rabbet of the Keel.

RABDOIDES, the same that *Sutura sagittalis.*

RABINET, a sort of Ordnance, whose Diameter at the Bore is 1 ½ Inches, Weight 300 Pound, Length 5 Foot, Load ¾ of a Pound, Shot something more than an Inch and a quarter Diameter, and ½ a Pound Weight.

RACHITÆ, and *Rachiæi*, are Muscles belonging to the Back; so called by some Foreign Anatomists, and seem to be the same with what we call *Semispinati.*

RACHITIS. See *Rhachitis.*

RADIALES *Internus & Externus*, are Muscles of the Wrist, the one serves to bend it, and the other to extend it. *Blanchard.*

RADIATION, signifies the casting forth of Beams, or Rays of Light; and in Opticks it is considered as threefold, *viz. Direct*, *Reflected*, and *Refracted.* See *Ray.*

RADICAL *Moisture*, is a Term used by some, for the Fundamental Juice of the Body, which they will have to nourish and preserve the natural Heat, as the Oil in a Lamp preserves and feeds the Flame. *Blanchard.*

RADICLE, a Word used by Botanists, to denote that Part of the Seed of a Plant, which upon its Vegetation becomes its Root: This in Corn is that which Malsters upon its shooting forth, call the *Come.* 'Tis not easily to be discerned in many Seeds, by the naked Eye: but in that of Fenugreek, 'tis as big as one of the Lobes: And in the Garden-bean it appears visible on the Separation of the Coats, it is of a White Colour, more Glossy than the Main Body, and stands at the greater End without the Lobes: Therefore this End in setting Seeds, should always be placed lowermost.

RADIUS, in Geometry, is the Semi-diameter or half the Diameter of a *Circle:* See under the Word *Circle.*

RADIUS, is the left Bone of the Cubit, called *Focile minus*; it is more oblique than the great Bone, called *Ulna*, and is distant a little from it in the middle, where there occurs a small Ligament above the *Ulna*, which receives the *Radius*, and below the *Radius* receives it. The upper Part of the *Radius* is jointed with the outward Process of the Arm by *Diarthrosis* (which see); the lower by way of Appendix with the Wrist Bone, at the Middle Finger. It's upper end is small, and the lower thick. The greater Bone of the Leg also is called *Radius. Blanchard.*

RAGGULED, the Heralds Term for any Ordinary, *Ex. gr.* a Cross whose out Lines are of this Form.

He beareth *Sable, a Cross Ragguled Or*, by the Name of *Stoway.*

This differs from Indented, because that is regular, and this is not so, but rather ragged.

RAINBOW or *Iris*: the very Learned and Ingenious Mathematician, Mr. *Edward Halley*, in a Discourse *de Iride* in *Phil. Transact.* No. 267, gives the best Account that we have ever had, of the Cause of the various Colours of the Rainbow, and the Solution of their several Phænomena. He tells us there, that the Ingenious *Des Cartes* was the first, that by applying Mathematicks towards the Investigation of this surprizing Appearance, ever gave a Theory of the *Iris:* And he found the Laws of Refraction, which the Lucid Rays suffer in passing thro' any Diaphanous Bodies: And clearly demonstrated the *Primary Iris to be only the Sun's Image, reflected from the Concave Surfaces of an Innumerable Quantity of small spherical Drops of falling Rain: With this necessary Circumstance, that those Rays, which fell on the Objects, Parallel to each other, should not after one Reflection, and two Refractions,* (viz. *At going into the Drop, and coming out again*) *be dispersed, or made to Diverge, but come back again also to the Eye, parallel to each other.*

He shewed also, that the Colours, in the Rays of Light were produced by those Refractions as they are by passing through a Triangular Glass Prism. The *Seconddry Iris*, he supposes produced by those Rays of the Sun, which fall more Obliquely, but after the same Manner as before, only in these there are two Reflections, before the Sun's Rays refracted a second time, and tending towards the Eye, in a parallel Position, can get out from the Aqueous Globules. The Magnitude of the *Iris*, he makes to depend on the Degrees of Refraction; which is different, in different Liquors, or Transparent Solids: But supposing the Ratio of the Sines of Incidence, to those of the refracted Angles, to be in Water as :: 250. to 187, he determined thence the Semi-diameter of the *Iris*, near enough to Observation, *viz.* The Primary one to be 41 Degrees 30 Minutes, and the secondary one to be 51 Degrees 54 Minutes. See the 8 *Chap.* of his Meteors.

Mr. *Halley* observes, that *Des Cartes* using only a Tentative and Indirect Method, in determining his Angles, seems not to understand the Easiness of solving his own Problem.

Wherefore because hardly any one hath written well on this Subject since *Des Cartes*, he shews you there how to determine the Angle by which the *Iris* is distant from the opposite Point of the Sun, and the Ratio of the Refraction being given Geometrically, or *vice versa* the Iris being given, to determine the Refractive Power of the Liquor.

And first he saith, It is plain from *Des Cartes*'s Demonstrations, That the Primary Iris is made by the Sun's Rays, where the Excess of the two Refracted Angles above the one of Incidence, is the *greatest* possible.

And the Secondary Iris is formed by those Rays, where the Excess of three Refracted Angles above one of Incidence, is also the *greatest* possible.

And thus you may go on to 3, 4, 5, or 6 Iris's, which will all be formed where the Rays Emerge out of the Watery Cloud after 3, 4, 5, or 6 Reflections; but none but the Second will be ordinarily visible in the Heavens, because the Rays of the Sun

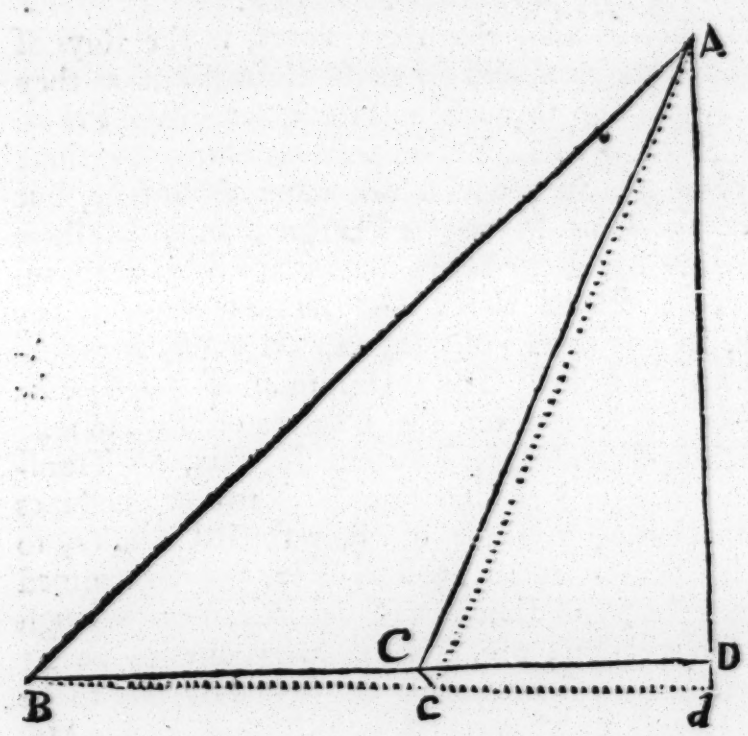
Sun grow at laſt very much attenuated and weakened.

Now if you double this greateſt poſſible Exceſs of the refracted Angles above that of Incidence, (if the Number of Reflections be odd) it will give the Diſtance of the Iris from the Point oppoſite to the Sun.

But if the Number of Reflections be even, then the double of the greateſt refracted Angle, will be the Diſtance of the Iris from the Sun himſelf.

Now to gain theſe Greateſt Exceſſes, having the Refraction of any Liquor, or the Ratio of the Sine of the Angle of Incidence to the Sine of the refracted Angle, you muſt obſerve, that the Exceſs of two refracted Angles, above one of Incidence, will be Greateſt where the Momentaneous Augment or Fluxion of the Angle of Incidence, is preciſely double to the Momentaneous Augment of the the refracted Angle. And if there be three refracted Angles, the Greateſt Exceſs will be where the Momentaneous Augment of the Angle of Incidence is Triple of the Moment of the refracted Angle, and ſo on, which is ſufficiently evident.

But in order to find the Angles themſelves, Mr. *Halley* premiſes the following Lemma.



Let there be a Triangle ABC, whoſe Vertex is at A; its Legs BA and CA, and the Baſe BC; on which produced, let fall the Perpendicular AD. Then let the Vertical Angle BAC be ſuppoſed to be increaſed by a Quantity infinitely ſmall, as ſuppoſe by the Moment CA *c*: Then drawing the Lines BC *d*, and *c* D, they will be only imaginarily different from BCD and CD.

This done, I ſay, That if the Legs of the Plane Triangle BAC, (or any other) continuing the ſame, the Vertical Angle be imagined to be encreaſed by any infinitely ſmall Moment or Fluxion, then will *the Moments of the Angles at the Baſe, be reciprocally as the Segments of the Baſe:* That is, CB*c*, is to the Moment of the Angle ACB, or ACD :: as CD is to BD.

For ſince the external Angle ACD = to ABC + Angle BAC, its Moment muſt alſo be equal to the Sum of their Moments, or to CB*c* + CA*c*: but now becauſe the Triangle ACD is right-angled at D, AC may be the Diameter of a Circle, whoſe Periphery will paſs through A, D, C, and *c*, and conſequently the Angles CA*c*, CD*c* being in the ſame Segment are equal. So that the Sum of the two Fluxionary Angles CB*c*, and *c*DC' (*i. e.* the external Angle D*c d*) will be the Moment of the Angle ACD; or ACB. But thoſe CB*c*, and D*c d*, being infinitely ſmall, will be to each other, as the Sides oppoſite to them, or as *c* D or CD is to BD: That is, reciprocally as the Segments of the Baſe. *Q. E. D.*

If B and C had been both Acute, the way of Proof is the ſame, all Things conſidered.

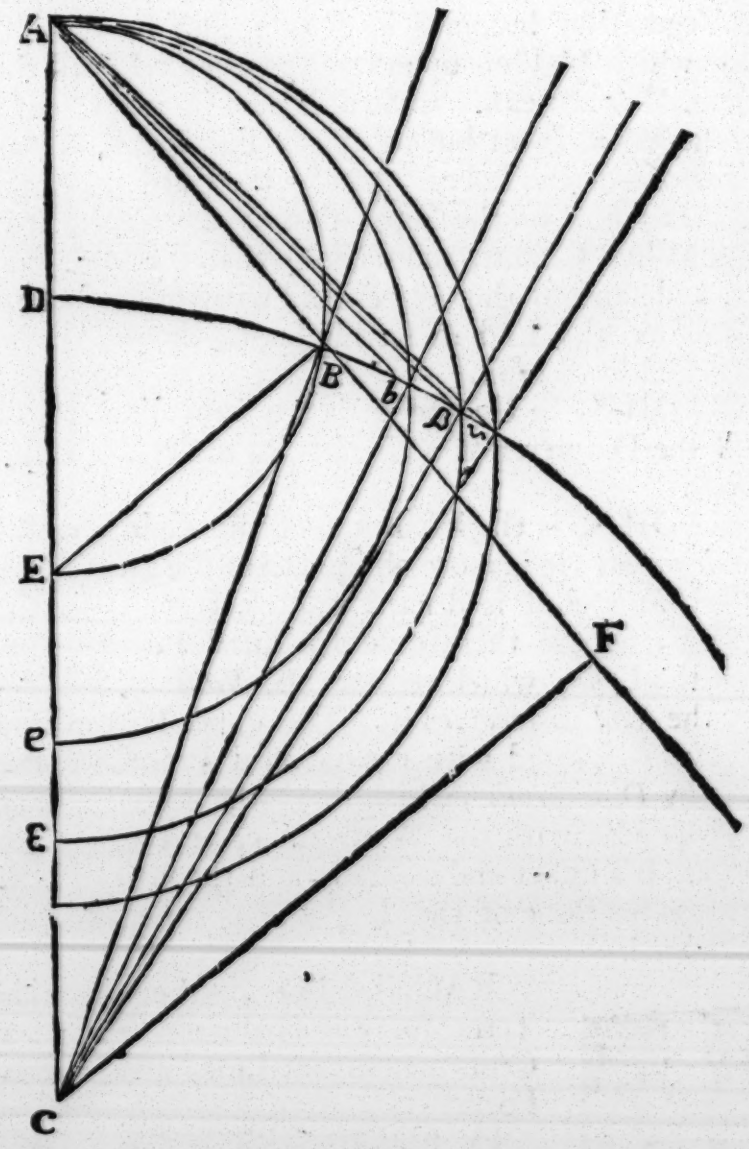
COROLLARY.

Hence it follows, That the Moments of the Angles at the Baſe, are to one another directly as the Tangents of theſe Angles.

By the help of this Lemma he ſhews how to obtain the Diameter of any Iris, either Geometrically, or by Calculation.

Let there be any Right Line as AC, and let it be ſo divided in D, that CA may be to CD:: according to the Ratio of Refraction; that is, in Water :: as 250 is to 187, or more nicely :: 529 is to 396. Then let it be divided again in E, ſo that CE ſhall be to AE :: as Unity is to the Number of Reflections which the Solar Rays muſt undergo in producing the Iris propoſed: This done; on the Diameter AE let the Semicircle ABE be deſcribed; and on the Centre with the Radius CD, draw the Ark BD, cutting the Semi-circle ABE in the Point B. Then drawing the Right Lines CB, AB, let the Perpendicular CF, be let fall on AB produced to F; and to that Perpendicular draw the Parallel EB.

I ſay the Angle CBF is the Angle of Incidence, CAB is the refracted Angle, both required for the producing the propoſed Iris.



DEMONSTRATION.

Since the Triangles ACF, AEB are Similar, AF will be to BF :: as AC to EC :: that is, as the

the Number of Reflections augmented by Unity, is to Unity; by the Construction.

Wherefore the Moment of the Angle CBF, is to the Moment of the Angle CAF in the same Ratio, by the Lemma.

But the Sine of the Angle CBF, is to the Sine of the Angle CAF:: in the Ratio of their Sides CA, CB: That is, in the Ratio of the Refraction given.

By the Construction also, the Angle of Incidence RBF, hath its corresponding Refracted Angle RAF: Wherefore since their Moments are in the Ratio proposed, those are the Angles sought or required. *Q.E.D.*

Now therefore multiplying the Refracted Angle by the Number of Reflexions augmented by Unity, and from the Product Substracting the Angle of Incidence, you will have half the distance of the *Iris* from the Sun, if the Number of Reflexions were even; but if they were odd, from the opposite Point of the Sun, as was said before.

And from hence, by a very easy, short, and elegant Construction, he shews how to exhibit to the Eye, the Incidences of all manner of *Iris*'s, as they will appear in any Liquor whose Refraction is given. For, if the Line A C in the last Figure, bisected in E, have a Third part cut off from it in *e*, a Fourth part in E, a Fifth part in *n*, &c. And then there be Semicircles described on the Diameters AE, A*e*, AE, A*n*, &c. all which shall be cut by the Circular Ark D B *b*, and *v*, described on the Centre C with the Radius C D, (which Radius CD is to AC in the Ratio of the given Refraction) in the Points B *b*, B *v*, &c. I say, the Lines AB, A*b*, AB, A*v*. shall make with the Line AC, Angles equal to the refracted Angles, and with the Radii CB, C*b*, CB, C*v*, respectively Angles equal to those of Incidence required; that is, ABC (or rather its Complement to a Semicircle) for the *Primary Iris* A*b*C for the Secondary one, ABC for the Third, and A*v*C for the Fourth, &c. and so on as far as you please.

He shews also, that the Reader, if skill'd in Algebra, may easily find these Angles by Accurate Calculation, derived from the same Fountain: Thus, Let the Radius be = 1. and the Ratio of Refraction, as *r* to *s*; then will the Sine of Incidence be $\sqrt{\frac{4}{3} - \frac{1}{2}\frac{r\,r}{S\,S}}$ but the Sine of the Refracted Angle will be $\sqrt{\frac{4}{3}\frac{S\,S}{r\,r} - \frac{1}{3}}$; from which Angles the Primary Iris will be found.

For the Second Iris $\sqrt{\frac{9}{8} - \frac{1}{8}\frac{r\,r}{S\,S}}$ will be the Sine of Incidence; and $\sqrt{\frac{9}{8}\frac{S\,S}{r\,r} - \frac{1}{8}}$ will be the Sine of the refracted Angle. And so on, as he further shews.

And if you proceed to Calculate according to *D. Cartes* his Proportion, the Primary Iris will be Distant *ab Oppositо Solis* 41° 30′, the Secondary one 51° 55′. But the Third and Fourth will be distant 40° 20′, and 45° 33′ from the Sun himself; but probably no one can ever see either of these, for the reasons above given.

As to the Colours with which this wonderful Bow is adorned, he observes, That our most Sagacious Sir *Is. Newton* was the first who shewed by most plain Experiments, that the Rays of Light do not come uniform and simple out of the Luminous Body; but that the pure white Light which we see, is compounded of the Corpuscles of all manner of Colours, blended one with another, by the most rapid Motion; and, That the Colours of all Bodies arise from their different Disposition to refract or reflect some peculiar Species of Light. This is principally proved from *Refractions*, by which these *distinct Species* are separated one from another; for Blue or Purple Light is, for Instance, more refracted in passing through a Diaphanous Body, than Yellow or Red. See the Words *Light* and *Colours*, where I have given you a large Account of Sir *Is. Newton*'s Experiments, as mentioned in his Letter in the *Phil. Trans.* N. 80, &c.

It being therefore certain that all kind or degrees of blue Light, are a little more refracted than any reddish Light whatsoever, 'Tis plain, saith Mr. *Halley*, that from this difference the breadth of the Iris must arise; but which, is hardly to be determined by Observation, by reason of the uncertain Limits of the Colours in the Clouds. But the greater the Ratio of Inequality between CA and CD, or the greater the Refraction is, by so much the greater will the Distance be of any *Iris* from the Sun; so that those which are more remote from the Sun, are always more adorned with a Purple Colour, but the more near ones with a Red one, as is apparent in the *Primary Iris*, which vanishes or disappears in *Oppositо Solis*, if the Sine of Incidence to that of the refracted Angle be as CA to CE:: or as 2. to 1. And if the Ratio be greater than this, the Primary Iris will not be at all visible, or no Primary Iris at all can be seen.

It is to be observed also, That the *Secondary Iris* will go off in a Point, in *Oppositо Solis*, whenever the Ratio of Refraction is as 1. to $\sqrt{\frac{1}{3}} + \sqrt{:\frac{4}{7}}$ or as 1 to 0. 847487. And from thence will run back towards the Sun himself, and there disappear, if the aforesaid Ratio be as 3 to 1, or as CA to C*e*.

But in the Intermediate Proportions, (which are found in all known Fluids, except Air) the greater the Ratio of Refraction, the further is the Iris distant *ab Oppositо Solis*, or rather from the Sun himself, the Ark being numbered beyond the Semicircle, and therefore the Colours will appear to be found in an Order diverse from that in the *Primary Iris*, unless you thus reckon the distance of the Secondary one from the Sun himself, which must also be taken notice of in the other *Iris*.

The Third *Iris* in *Oppositо Solis* is quite confused; the Ratio of the Refraction being as 1 to 91855, and from thence it runs back in the Ratio of 1 to 68250; from whence again, the order of the Colours being restored, in the Ratio of 4 to 1, or of CA to C*e*, it ends in *Oppositо Solis*.

But the Fourth *Iris* beginning from the Sun in the Ratio of Equality, passes off in the Points opposite to him in the Ratio of 1 to 94895, and thence returns to the Sun again, if the Ratio be as 1 to 4; and from thence is again dispersed or scattered towards the Parts opposite to the Sun, in the Ratio of 1 to 56337, within which Bounds are the Refractions of all known Fluids contained.

Lastly, if the Ratio were as 5 to 1, or as CA to C*n*, the Iris will vanish into the Sun himself; and the Colours to appearance will be inverted at

its Regreſs to the Sun, as they were right or direct at their Egreſs.

And from hence it is that the Primary and Fourth Iris in Watry Clouds obverts a reddiſh Colour towards the Sun, but the Secondary and Third, a Purple one.

After this, Mr. *Halley* ſhews how, having the Diſtance of the Iris from the Sun, to find the Ratio of the Refraction; and this by a very eaſy, but moſt accurate Obſervation.

Take a ſmall Glaſs Tube, and erecting it perpendicular to the Horizon, ſuſpend in its lower Orifice a ſmall drop of Water, or ſome ſuch clear Fluid; and then at ſome time when the Sun is near the Horizon, and ſhines very bright, let it be obſerved under what Angle *cum Oppoſito Solis*, the Colours of the Iris are ſeen in the pendulous drop; for then the Ratio of the Refraction may be had by an eaſy Calculation. And its Inveſtigation forms a Cubick Equation, having only one Root, by which the Primary Iris being given, the Ratio may be found. The Equation is this, $T^3 - \frac{3}{4} T^2 t - 4rrr = 0$. In which, T is the Tangent of the Angle of Incidence ſought, and t is the Tangent of half the Diſtance of the Iris *ab Oppoſito Solis*, to the Radius $r = 1$. Whence, according to *Cardan*'s Rules, there ariſes this Theorem, *viz.*

From the Cube t, let there be taken the Product of $2tr$ into the Exceſs of the Secant of the ſame Ark above the Radius, the remainder of difference ſhall be the leſſer Cube: But the Sum of them, adding $4trr$ ſhall be the greater Cube. The Sum of the Sides of both Cubes added to t, will be equal to the Tangent of the Angle of Incidence; and the half of that Sum, the Tangent of the refracted Angle. Whence the *Ratio* of the Refraction is known.

Of this he gives the following Example.

In a drop of Oil of Turpentine, the diſtance of the Primary Iris *ab Oppoſito Solis*, was obſerved to be 25° 40′.

The Ratio of the Refraction was required.

t = Tangent 12° 50′	= 0. 2278063

t =	0. 2278063
	1. 2586322 = Side of the Cube of leſſer. = T The natural Tangent of the Angle of Incidence 51° 32′ and its Half,

viz. 0. 6293161 is the natural Tangent of the Refracted Angle, *viz.* 32° 11′.

Laſtly, as $\sqrt{} : T^2 + 4. \sqrt{} : T^2 + 1 :: r.s.$ or ſo, is 1 to 68026. Which Ratio comes very near to that which by Experiment is found to be in Glaſs and moſt diaphanous Solids.

Only, indeed, a Diamond exceeds the reſt of Pellucid Stones, in this Power of Refraction; for its Ratio is nearly as 5 to 2, or more accurately, as 100 to 41. See Vol. 2.

RAKE *of a Ship*, is ſo much of her Hull as over-hangs at both ends of her Keel. That part of it which is before, is called her *Rake forward on*; and that part which is at the ſetting on of the Stern-Poſt, is called her *Rake aft-ward on*: When a Ship hath but a ſmall *Rake forward on*, but is built with her Stern too ſtrait up, ſhe is called *Bluffe-headed*.

The common Proportion for a Ship's *Rake forward on*, is more than a Third, but leſs than $\frac{1}{3}$ the length of her *Keel*: and the *Rake aft* is about a 4th or 5th of her *Rake before*. Tho' in this Proportion, there is no certainty, ſome *Nations*, and ſome *Carpenters* building with longer *Rakes* than others. A *Long Rake forward on*, if a Ship have alſo a *good fat Bow*, gives her a good Way, and helps her to keep a good Wind; but then this makes her apt to pitch under Water in a Head-Sea, and beſides is a great Streſs and Charge to a Ship, becauſe ſhe over-hangs ſo a Head. Therefore the middle Proportion is beſt, conſidering all things.

RAKE *of the Rudder*. See *Rudder*.

RAKED *Table*, a Term in Architecture. See *Table*.

RAM *Head*, is the Name of a great Block (aboard a Ship) belonging to the Fore and Main-Halliards; it hath in it 3 Shivers, into which the Halliards are put, and at its Head the *Tyes* are reeved into an Hole made there for that Purpoſe.

RAMIFICATION, is a Collection of ſmall Branches iſſuing out from one large one. Thus in *Anatomy*, the ſeveral Branches of the *Aorta* or *Great Artery*, by which the Arterial Blood is convey'd to all the extream Parts of the Body, are called the *Ramifications* of the Artery: and when they are exceeding ſmall, they are called *Capillary Arteries*; which ſee.

RAMMER, is a Staff with a round piece of Wood at one end, in order to drive home the Powder to the Breech of the Great Gun, as alſo the Shot and the Wad, which keeps the Shot from rowling out. At the other end of theſe *Rammers*, are uſually rolled in a certain Piece of Ships-skin fitted to the Bore of the Piece, in order to clear her after ſhe has been diſcharged: And this is called Spunging the Piece.

RAMPANT: The Term in Heraldry for a Lion, or any Beaſt of Prey, in a Poſture of Climbing, or Standing upright on his hinder Legs, and rearing up his Fore-feet. 'Tis different from *Salient*, which is a Poſture not ſo erect. See *Salient*.

RAMPART, in Fortification, is the Maſs of Earth which is raiſed about the Body of any Place, to covert it from Great Shot, and conſiſts of ſeveral *Baſtions* and *Curtains*; having its *Parapet*, *Platform*, *interior* and *exterior Talus*, and *Berme*, as alſo ſometimes a Stone Wall, and then they ſay it is Lined. The Soldiers continually keep Guard here, and Pieces of Artillery are Planted for the Defence of the Place.

The Height of the *Rampart* muſt not exceed three Fathom, as being ſufficient to cover the Houſes from the Batteries of the Cannon: Neither ought its Thickneſs to be above ten or twelve, unleſs more Earth be taken out of the Ditch, than can be otherways beſtowed.

The *Ramparts* of Half-Moons are the better for being low, that the ſmall Fire of the Defendants may the better reach the Bottom of the Ditch; but yet

yet it muſt be ſo high, as not to be commanded by the Covert-way.

RAMUS *Anterior*, *Sc. Vena Subcutanea*, is a Branch of the *Subcutaneous* Vein, (which takes its Name from its ſhallow running juſt under the Skin) and is it ſelf a Branch of the *Baſilica*; it goes under the Muſcles of the *Ulna* to the little Finger, where it joins a Branch of the *Cephalica*.

RAMUS *Poſterior*, another Branch of the *Subcutaneous* Vein of the Arm, running near the Elbow; it ſends out a Branch which goes to the Wriſt, then it unites with the *Cephalica Interior*, and forms the *Mediana*.

RANDOM-*Shot*, is a Shot made when the Muzzle of a Gun is raiſed above the Horizontal Line, and is not deſigned to ſhoot directly or Point-blank. The utmoſt *Random* of any Piece, is about ten times as far as the Bullet will go Point-blank; and the Bullet will go fartheſt when the Piece is mounted to about 45 Degrees above the Level-Range. The Diſtance of the *Random* is reckoned from the Platform to the Place where the Ball firſt Grazes.

RANGE, a Term in Gunnery, ſignifying the Line a Shot goes in from the Mouth of the Piece. If the Bullet go in a Line parallel to the Horizon, that is called the *Right* or *Level-Range*; if the Gun be mounted to 45 Degr. then will the Ball have the higheſt or utmoſt Range, and ſo proportionably all others between 00 Degr. and 45°, are called the *Intermediate Ranges*.

RANGES, in a Ship, are two Pieces of Timber going a-croſs from Side to Side; one aloft on the *Fore-Caſtle* a little abaft the *Foremaſt*; and the other in the *Beak-Head* before the *Wouldings* of the *Bow-Sprit*.

That in the Fore-Caſtle, is faſtened into the Timbers of the Ship's-Sides, and hath two Knees about the Middle, on either Side the Fore-Maſt, faſtened to the Deck and the Timber, in which the Top-Sail-Sheets run in a Shiver: In it alſo are ſeveral Wooden Pins to belay the *Fore-bowling*, the *Fore-Tack*, and the *Fore-looſ Hook*.

That in the Beak-Head lies in the Form of the other, and hath the Sprit-Sail, and Sprit-Sail-Top-Sail-Sheets and Ropes belayed about its Pins.

RANGER, is a Sworn Officer of the Foreſt, whereof there are Twelve: His Buſineſs chiefly conſiſts in three Points; To walk daily through his Charge, to ſee, hear, and enquire, as well of Treſpaſſes, as Treſpaſſers in his Bailywick; To drive the Beaſts of the Foreſts, both of Venery and Chaſe, out of the Diſforeſted into the Foreſted Lands; And, To preſent all Treſpaſſes of the Foreſt. This *Ranger* is made by the King's Letters-Patent, and hath yearly Penſion out of the *Exchequer*.

RANULA. See *Hypogloſſum*.

RANULARES, are thoſe Branches of the external Jugular Veins which run to the Tongue, and are very apparent under it.

RAPHE. See *Satura*.

RAPINE, in Law; to take a Thing in private againſt the Owner's Will, is properly Theft; but to take it openly, or by Violence, is *Rapine*.

RAPSODY, originally ſignifies a Connection together, or a Repetition of a vaſt Number of Heroick Verſes, ſuch as thoſe of *Homer*, &c. But now we uſually underſtand by it, a long, tedious, impertinent ſpinning out of a Diſcourſe to little or no Purpoſe, or Benefit to the Reader.

RAPTU *Hæredis*; is a Writ lying for the taking away of an Heir holding in Socage; of which there are two Sorts; one when the Heir is Married, the other when he is not. Of both theſe, ſee the *Reg. Orig. Fol.* 163.

RARE Bodies, are ſuch as have more Space, or take up more Room in Proportion to their Matter, than other Bodies do.

RAREFACIENTIA, rarifying Remedies, are ſuch as by diſſipating a little the Vapours and Humours, make the Pores of Bodies larger. *Blanchard.*

RAREFACTION, of any natural Body, is when it takes up more Dimenſions, or a larger Space than it had before.

There are three Ways of Explicating of Rarefaction.

1. That of the *Ariſtotelians*, which is called the Rigorous Way, who ſuppoſe the ſame Body doth not only obtain a greater Space in Rarefaction, but alſo adequately fill it; and acquires larger Dimenſions, without either having any Pores or Vacuities between its Corpuſcles, or admitting any other Body or ſubtle Matter to be joined with them.

2. That of the *Carteſians*, which was alſo the Opinion of many of the Old Philoſophers, who aſſert, That in Rarefaction the Pores of the rarefied Body are dilated, and repleniſhed with ſome fine ſubtle and ethereal Subſtance, which inſinuates it ſelf freely into the Interſtices between its disjoined Particles.

3. That of the *Atomiſts* or *Vacuiſts*, who ſuppoſe the Parts of the rarefied Body to be disjoined and removed farther from each other, and yet no other Body (neceſſarily) comes in between them. See this explained under *Air*.

RASANT *Line of Defence*, in Fortification, is a Line drawn from the Point of the Baſtion along the Face, and prolonged till it come to the Curtain, and therefore ſhews how much of the Curtain will clear or ſcour the Face. This is called alſo the Second Flank, the Hanking, or Stringent Line.

RASETTA, the ſame with *Carpus*.

RASH. See *Ratch*.

RASPATORIUM, or *Scalprum Raſorium*, is a Chirurgeon's Inſtrument to ſcrape or ſhave filthy or ſcabby bones with.

RATCH, is a ſort of a Wheel of 12 large Fangs, that runneth Concentrical to the Dial Wheel, and ſerveth to lift up the *Dentes* every Hour, and make the Clock ſtrike: and are by ſome called *Raſh*.

RATCHET, in a Watch, are the ſmall Teeth at the Bottom of the Fuſy or Barrel, that ſtop it in winding up.

RATE-Tythe, is when Sheep or other Cattle are kept in a Pariſh for a leſs Time than a Year, the Owner muſt pay *Tythe* for them *pro rata*, according to the Cuſtom of the Place.

RATIFICATION, a Law-Term, uſed for the Confirmation of a Clerk in a Prebend, &c. formerly given him by the Biſhop, &c. where the Right of Patronage is doubted to be in the King.

RATIO. When two Quantities are compared one with another in reſpect of their Greatneſs or Smallneſs. That *Compariſon* is called *Ratio*, and ſignifies the *Rate*, *Reaſon* or *Proportion* in Quantity, that one hath to the other. Though ſome, indeed, confine Ratio or Reaſon only to two Numbers, and call it *Proportion*, when it is between 3, 4, or more Numbers or Quantities. But the Word Proportion is often uſed inſtead of Ratio or Reaſon, to expreſs the Compariſon of one ſingle Quantity to another, by very good Authors.

RATIOCINATION, a Rational way of Arguing.

RATIONABILI *parte bonorum*, is a Writ that lies for the Wife againſt the Executors of her Huſband, denying her the third Part of her Huſband's Goods.

RATIONABILIBUS *diviſis*, is a Writ that lies where two Lords, in divers Towns, have Seigniories joining together, for him that findeth his Waſte by little and little to have been encroached upon, againſt the other that hath Encroached, thereby to rectify their Bounds. And this is a King of *Juſticies*, and may be removed by a *Pone*, out of the County to the Common Bench. By the *Civilians* it is called *Judicium finium Regundorum*.

RATIONAL *Horizon*. See *Horizon*.

RATIONAL *Quantities*. Any Quantity being propoſed, (for which we may always put 1.) and which *Euclid* (Book 10.) calls *Rational*, there may be infinite others which are Commenſurable, or Incommenſurable to it; and that either Simple, or in Power. Now, all ſuch as are Commenſurable any how to the given Quantity, he calls Rational Quantities, and all the others Irrational.

RATLINES, (or as the Seamen call them, *Ratlings*) are thoſe Lines which make the Ladder Steps, to get up the Shrouds and Puttocks; therefore they are called the Ratlings of the Shrouds.

RAVELIN, in Fortification, is a ſmall Triangular Work compoſed only of two Faces, which make a Saliant Angle, without any Flanks. It is generally raiſed before the Curtains or Counterſcarp, and commonly called a Half-Moon by the Soldiers.

A *Ravelin* is like the Point of a Baſtion with Flanks cut off. The reaſon of its being placed before a Curtain, is to cover the oppoſite Flanks of the two next Baſtions. 'Tis uſed alſo to cover a Bridge or a Gate; and 'tis always placed without the Moat.

What the Engineers call a Ravelin, the Soldiers generally call a Half-Moon, which ſee.

RAY Common, is a right Line drawn from the Point of the Concourſe of the two Optical Axes, through the Middle of the right Line which paſſeth by the Centre of the Pupil of the Eye.

RAY Direct, is that which is carried from a Point of the viſible Object directly to the Eye, through one and the ſame Medium.

RAY of Incidence, or Incident Ray, in Catoptricks, is a right Line which falls from ſome Point of an Object upon the Surface of the Looking-Glaſs or poliſhed Metal.

RAY of Incidence, or Incident Ray, in Dioptricks, is the Ray of Light which goes in a right Line from a certain Point of the viſible Objects in one Medium, until it meet with a Second Medium.

RAY in Opticks, is a Line imagined to paſs from the Eye toward the Object, or from the Object toward the Eye, and is called a Viſual Ray. But there is alſo a Pyramid of Rays, which ſtrike the *Tunica Retina* of the Eye, and are broken or refracted in the Cryſtalline.

RAY Principal, in Perſpective, is the perpendicular Diſtance between the Eye and the Vertical Plane, or Table, as the *French* call it.

RAY of Reflection is the right Line whereby the Reflection is made.

RAY of Refraction, or broken Ray, is a right Line whereby the Ray of Incidence changeth its rectitude; or is broken in traverſing the Second Medium, whether it be thicker or thinner.

RAYS, or Beams of the Sun, or Rays of Light, are either according to the Atomical Hypotheſis, thoſe very minute Particles or Corpuſcles of Matter, which continually iſſuing out of the Sun, do thruſt on one another all around in Phyſically ſhort Lines; (and that this is the right Opinion, many Experiments do evince, particularly the Incomparable Sir *Iſ. Newton* about Light and Colours) or elſe as the *Carteſians* aſſert, they are made by the Action of the Luminary on the Contiguous Æther and Air, and ſo are propagated every way in ſtrait Lines, through the Pores of the Medium.

RAYS Convergent, are thoſe which going from divers Points of the Object, incline towards one and the ſame Point tending to the Eye.

RAYS Divergent, are thoſe which going from a Point of the viſible Object, are diſperſed, and continually depart one from another, according as they are removed from the Object.

RAYS Parallel, are thoſe that keep an equal Diſtance from the viſible Object to the Eye, which is ſuppoſed to be infinitely remote from the Object.

RAZANT *Line of Defence*. See *Raſant Line of Defence*.

REACH, is the Diſtance between any two Points of Land, that lie in a right Line one from another.

REALGAL, or *Sandaracha*, is red Arſenick.

REAL Horizon. See *Horizon*.

REAR-Guard, is that Part of an Army which follows the main Body, to hinder and ſtop Deſerters.

REASON, in Mathematicks, the ſame with Proportion; 'tis better called by the *Latin* Name *Ratio* (which ſee) to avoid confounding it with the common Signification of the word *Reaſon*.

REATTACHMENT, is a Second *Attachment* of him that was formerly attached and diſmiſſed the Court without Day, as by the not coming of the Juſtices, or ſome ſuch Caſualty. And is ſaid to be either General or Special. General-Reattachment, is where a Man is reattached for his Appearance upon all Writs of Aſſize lying againſt him: Special-Reattachment, muſt be for one or more certain.

REBUSSES, are in Heraldry ſuch Coats of Arms as bear an Alluſion to the Surname of the Perſon, as 3 Coneys for *Coniſby*, 3 Cups for *Butler*, 3 Caſtles for *Caſtleton:* And ſuch Bearings are very ancient.

REBUTTER, in Common-Law, when a Man grants Land to the uſe of himſelf, and the Iſſue of his Body, to another in Fee with Warranty: And the Donee leaſeth out his Lands to a Third for Years; the Heir of the Donor impleadeth, the Tenant alledging, That the Land was in Tail to him: The Donee comes in, and by virtue of the Warranty made by the Donor, repelleth the Heir, becauſe tho' the Land was Entailed to him, yet he is Heir to the Warrantor likewiſe; and this is called a *Rebutter*. And if I grant to my Tenant, to hold *Sine impetitione vaſti*, and afterwards implead him for Waſte made; he may debar me of this Action, by ſhewing my Grant; and this is alſo a *Rebutter*.

RECAPTION, is a Second Diſtreſs of one formerly diſtrained for the ſame Cauſe, and alſo during the Plea grounded on the former Diſtreſs: It likewiſe

likewiſe ſignifies a Writ lying for the Party thus Diſtrained.

RECEIVER. See *Recipient.*

RECEPTACULUM *Chyli*, was firſt found out by *Pecquet*, *A. D.* 1651, 'tis a Cavity into which all the Lacteal Veins empty themſelves: it is of a Veſicular Subſtance, which is thicker in Men than in Beaſts, but the Cavity is larger in Beaſts than Men: Out of it goes the *Ductus Thoracicus*; which ſee.

RECESSION *of the Equinoxes*, is the going back of the Equinoctial Points every Year about 50 Seconds. The Reaſon of which is, That the Axis of the Earth, after many Annular Revolutions round the Sun, really deviates from that Parallelism, which it ſeems to keep with it ſelf all the time of one Annular Revolution: By this Aberration it deſcribes a Conical Superficies; and the Earth's Equator moving round the Sun, together with the Earth's Axis, the Interſections of the Celeſtial Equator with the Ecliptick, will *run back*, or move *in Antecedentia*, as will all other Points of the Ecliptick, (as well as thoſe Equinoctial ones.) And therefore the Signs or Fix'd Stars that make the 12 Zodiacal Conſtellations, will appear to move forward, or *in Conſequentia*; as they now ſeem to have done by the Quantity of a whole Sign; for which Reaſon, you find the Picture of the *Ram* painted on our Globes at the beginning of the Sign *Taurus*, &c.

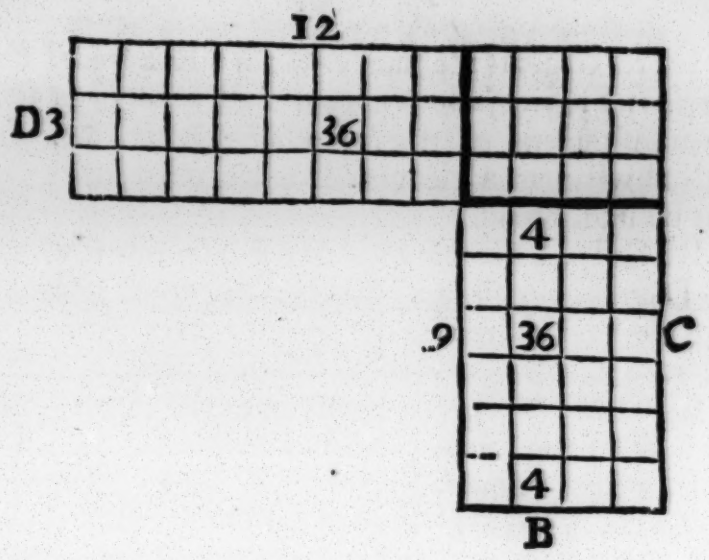
Dr. *Gregory* in his Excellent *Aſtronomia Phyſica & Geometrica*, Prop. LXIV. Lib. 1. makes the Prolate Spheroidical Figure of the Earth, to be the Primary Occaſion of this Receſſion of the Equinoctial Points; and withal ſhews that the Earth's Axis in every Annual Revolution round the Sun, twice changes its Inclination to the Ecliptick, and as often returns again to its former Poſition.

RECIDIVUS *Morbus*, a Relapſe, is when the Morbifick Matter, that was left in the firſt Diſtemper, begins to work and ferment again.

RECIPIENTS, or *Receivers*, are thoſe Veſſels, which in Diſtillation, are Luted to the Beak, or Noſe of Alembick, Retort, &c. to receive the Matter which is raiſed or forced over the Helm by the Fire. That Glaſs alſo which is exhauſted of Air by Mr. *Boyle*'s Air-Pum, and within which any Animal or other Bodies, are included to make Experiments upon, is by him uſually called the *Receiver*.

RECIPROCAL *Figures* in Geometry, are ſuch as have the Antecedents and Conſequents of the Ratio in both Figures.

Here A : B :: C : D,
i. e. 12 : 4 :: 9 : 3.



That is, as much longer as the Side A in the firſt Rectangle is than B : : ſo much deeper is the Side C in the ſecond Rectangle, than the Side D in the firſt; and conſequently the Length of one is compenſated by the Depth of the other; and alſo as the Side A is $\frac{1}{4}$ longer than the Side C, ſo the Side B is one 4th longer than D. Wherefore the Rectangles muſt needs be equal.

And this is the Foundation of the *Catholick Theorem*; That *the Rectangle of the Extreams muſt always be equal to that of the Means:* And conſequently the Reaſon of the *Rule of Three*, or *Golden Rule*; for ſuppoſe there was given any three Numbers or Quantities Geometrically proportional, as A, B, and C, and that it were required to find a fourth D proportional to them.

Since it is that A : B : : C : D therefore A D = B C, and conſequently $D = \frac{B C}{A}$; that is, the Fourth Term is equal to the Quotient of the Second, multiplied by the Third Term, divided by the Firſt:

Or thus in Numbers.

Suppoſe given 12, 4, and 9; required a fourth Proportional.

Now as 12 : 4 : : 9 : Q.

But 12 Q = 4 × 9 = 36.

Therefore $Q = \frac{4 \times 9}{12}$ (: 3. by dividing both Sides by 12.

COROLLARY.

And from hence 'tis plain, That if any two Triangles, Parallelograms, Priſms, Parallelopipeds, Pyramids, Cones, or Cylinders, have their Baſes and Altitudes *Reciprocally proportional*, thoſe two Figures or Solids are equal to one another; and *vice verſa*, if they are equal, their Baſes and Altitudes are Reciprocally proportionable.

RECIPROCAL *Proportion*, is when in four Numbers, the Fourth is leſſer than the Second, by ſo much as the Third is greater than the Firſt, and

vice

vice verſa; on which is founded the Inverſe or Indirect *Rule of Three*, thus.

4 : 10 : : 8 : 5.

See the *Corollary* after Reciprocal Figures.

There is great uſe made of this *Reciprocal Proportion*, by Sir *Iſaac Newton*, and others, in their Demonſtrations of the *Laws of Motion*, &c. and indeed without a clear knowledge of it, they cannot be underſtood.

RECLINATION *of a Plain*, is the Quantity of Degrees which any Plain, on which a Dyal is ſuppoſed to be drawn, lies or falls backwards from the truly upright or vertical Plain.

RECLINING, in Dyalling, the Plane that leans from you when you ſtand before it, is ſaid to be a *Reclining Plane*.

RECLINING *Declining Dyals*. See *Declining Reclining Dyals*.

RECOGNIZANCE, in Law, is a Bond or Obligation of Record, teſtifying the *Recogniſor* to owe to the *Recogniſee* a certain Sum of Money, and is acknowledged in ſome *Court of Record*, or before ſome Judge, Maſter of the Chancery, or Juſtice of Peace; and thoſe that be meer *Recogniſances*, are not Sealed but Enrolled, and Execution by force thereof, is of all the *Recogniſor*'s Goods or Chattels, (except Draught Beaſts and Implements of Husbandry) and the Moiety of his Lands.

RECOGNISEE, is he to whom one is bound in a *Recogniſance*.

RECOGNITIONE *adnullanda per vim & duritiem facta*, is a Writ to the Juſtices of the Common Bench, for the ſending of a Record touching a *Recogniſance* which the *Recogniſor* ſuggeſts to have been acknowledged by force and dureſſe, that if it be ſo, it may be annulled.

RECOGNITORS, is a Word often uſed for the Jury Impannelled upon an Aſſize: The reaſon why they are ſo called, is, becauſe they acknowledge a Diſſeiſin by their Verdict.

RECOLLECTION, is a Mode of Thinking, whereby thoſe Ideas ſought after by the Mind, are with Pain and endeavour found, and brought again to view.

RECORD, in Law, ſignifies an Authentick and Uncontroulable Teſtimony in Writing, contained in Rolls of Parchment, and preſerved in Courts of Record; and they are ſaid to be *vetuſtatis & veritatis veſtigia*. An Act committed to Writing in any of the King's Courts, during the Term wherein it is Written, is alterable, being no *Record*; but that Term once ended, and the Act Enrolled, it is a *Record*, and of that Credit, that admits no alteration or proof to the contrary. Lawyers Reckon three ſorts of Records, *viz. Record Judicial*, as Attainder, &c. *Record Miniſterial* upon Oath, as an Office or Inquiſition found. And a *Record* made by Conveyance and Conſent, as a Fine or Deed Enrolled, or the like.

RECORDARE *facias*, or *Recordari facias*, is a Writ directed to the Sheriff, to remove a Cauſe depending in an Inferior Court, as Court of ancient Demeſne, Hundred or County, to the King's-Bench, or Common-Pleas; it ſeems to be called *Recordare*, becauſe it commands the Sheriff to make a Record of the Proceedings by himſelf and others, and then to ſend up the Cauſe.

RECORDER, is he whom the Mayor, or other Magiſtrate of any City, or Town Corporate having Juriſdiction, or a Court of Record within their Precincts, by the King's Grants, doth aſſociate unto him for his better Direction in Matters of Juſtice and Proceedings according to Law; and is therefore for the moſt part a Man verſed and experienced in the Law.

RECORDO *& proceſſu Mittendis*, is a Writ to call a Record together, with the whole Proceeding in the Cauſe, out of an Inferior Court into the King's-Bench Court.

RECORDO *utlagariæ Mittendo*, is a Judicial Writ; which ſee in *Reg. Judic. fol.* 32.

RECOVERY, in a Legal Senſe, ſignifies an obtaining any thing by Judgment or Tryal at Law, as *Evictio* doth among the *Civilians*.

And there is a *True* and a *Feigned Recovery*: A *True Recovery* is an actual or real Recovery of any thing, or the Value thereof by Judgment; as if a Man ſue for any Land, or other thing moveable or immoveable, and have a Verdict and Judgment for him.

A *Feigned Recovery*, is, (as the Civilians call it) *Quædam fictio Juris*, a Certain Form or Courſe ſet down by Law, to be obſerved, for the better aſſuring of Lands and Tenements unto us; and the end and effect thereof is to diſcontinue and deſtroy Eſtates Tail, Remainders and Reverſions, and to bar the Intails thereof.

And in this Formality are required three Perſons, *viz.* The *Demandant*, *Tenant*, and *Vouchee*.

The *Demandant*, is he that brings the Writ of Entry, and may be termed the *Recoverer*.

The *Tenant*, is he againſt whom the Writ is brought, and may be termed the *Recoveree*.

The *Vouchee*, is he whom the Tenant voucheth, and calls to Warranty for the Land in demand.

A Recovery with double Voucher, is, where the Tenant voucheth one, who voucheth another, or the common Vouchee.

And a *Recovery with treble Vouchers*, is where three are vouched: As when a Man that is deſirous to cut off an Eſtate Tail in Lands or Tenements, to the end, to ſell, give, or bequeath it, cauſes a Feigned Writ of Entry, *Sur diſſeiſin en le poſt*, to be brought for the Lands of which he intends to cut off the Entail, and in a Feigned Count, or Declaration thereupon made, pretends he was diſſeiſed by him, who by a Feigned Fine or Deed of Bargain and Sale, is named and ſuppoſed to be the Tenant of the Land. This Feigned Tenant, if it be a *Single Recovery*, is made to appear and Vouch the *Bag-bearer of Writs* for the *Cuſtos brevium*, in the *Common Pleas*, (for there only can ſuch *Recoveries* be ſuffered) who makes Default. Whereupon the Land is recovered by him that brought the Writ, and a Judgment is by ſuch fiction of Law entred, that the Demandant ſhall recover the Value of the Lands againſt the Lands of the *Vouchee*.

Bag-bearer is a Poor Unlanded and Illiterate Perſon, which is feigned to be a Satisfaction to the Heir in Tail, tho' he is never to have or expect it.

This *Feigned Recovery*, is alſo called a *Common Recovery*, becauſe it is a beaten and common Path to that end for which it is appointed, *viz.* to cut off the Eſtates above ſpecified. But a *True Recovery* is as well of the Value as of the Thing: As if a Man buy Land of another with Warranty, which Land a third

a third Perſon afterwards by Suit of Law recovereth againſt me, I have my Remedy againſt him that ſold it me, to recover in Value; that is, to recover ſo much in Money, as the Land is Worth; or ſo much other Land by way of Exchange.

RECOUPE, in Law, is a quick and ſharp Reply to a peremptory Demand, and uſed by Lawyers to defalk or diſcount; as if a Man hath Ten Pounds iſſuing out of certain Lands; and he diſſeiſes the Tenant of the Land in an Aſſiſe brought by the Diſſeiſee, the Diſſeiſor ſhall *Recoupe* the Rent in the Damages.

RECREMENT, any Superfluous Matter in the Blood or Body, or any of its Parts.

RECREMENTS, a Word uſed by the Phyſicians and Anatomiſts, for ſuch Juices as are ſeparated in the ſeveral Glands of the Body for proper and peculiar Uſes; as the Spirits, the Lympha, the Gall, the Pancreatick Juice, the proper Ferments of the Stomach, Guts, *&c.* and theſe are diſtinguiſh'd from Excrements, which are expelled out of the Body, as being of no further Uſe to it.

RECTANGLE, in Arithmetick, is the ſame with Product; which ſee.

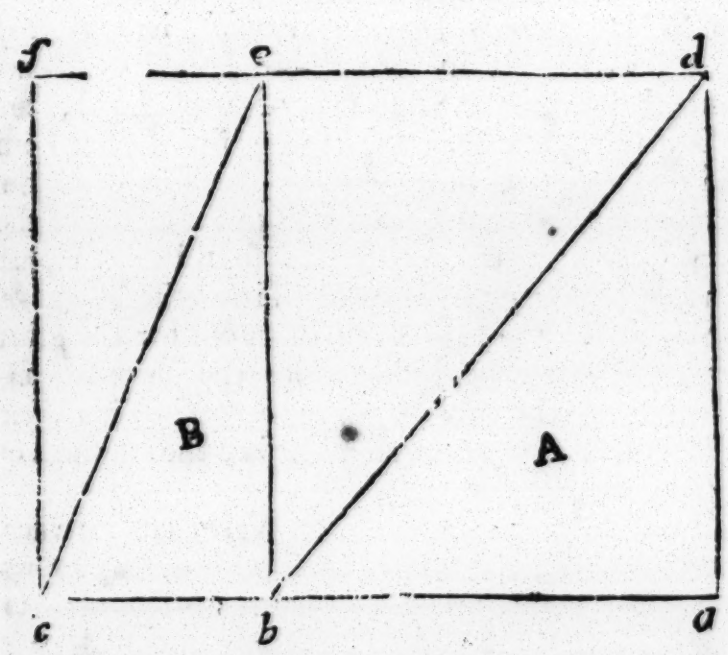
RECTANGLES in Geometry, are Parallelograms, whoſe Sides are unequal, but Angles right. Their Area is found by multiplying the two unequal Sides one into another, for then the Product is the Superficial Content or Area.

RECANGLED Triangle, the ſame with Right-angled Triangle.

All Rectangles, (as A and B) which have the ſame Height, are to one another as their Baſes.

That is,

□ A : □ B :: *ab* : *bc*.



For A is made by the Multiplication of *b a* its Baſe by the Line *b e*; and B is alſo made by multiplying *c b* its Baſe by the ſame Line *b e* (or its equal *c f*.)

But the Product of any two Numbers Multiplied by the ſame Third Number, are as thoſe Numbers were to each other before Multiplication. Therefore,

A : B :: *ab* : *bc*. Q. E. D.

Hence all Rectangles, or Parellelograms, between the ſame Parallel Lines, or which have the ſame Height, muſt be to one another as their Baſes are.

For they are all equal to Rectangles; on the ſame or equal Baſes with themſelves, and conſequently muſt have the ſame Proportion to each other, as ſuch Rectangles; that is, be to each other as their Baſes. *Q. E. D.*

And the ſame Thing muſt be true of all Triangles that are between the ſame Parallels, or which have the ſame Height, becauſe they are the halves of thoſe Parallelograms. See the Figure.

RECTANGULAR, or Right-angled, is ſpoken of a Plain Figure in Geometry, when one or more of its Angles are right. Of Solids, 'tis ſpoken in reſpect of their Situation: For if their Axes be perpendicular to the Plane of the Horizon, they are therefore Rectangular, or Right Cones, Cylinders, *&c.*

RECTANGULAR Section of a Cone; by this the Ancient Geometers always meant a *Parabola*, which Conick Section, before *Apollonius*, was only conſidered in a Cone, whoſe Section by the Axe would be a Triangle, Right-angled at the Vertex. And hence it was that *Archimedes* entituled his Book of the *Quadrature of the Parabola*, (as 'tis now called) by the Name of *Rectanguli Coni Sectio*.

RECTIFIE, or Rectification, in Chymiſtry, is the Diſtilling over again of any Spirit, in order to a more fine and pure State; and to ſeparate from it any Heterogeneous Parts, that might riſe with it before.

RECTIFIE, is a Word uſed in the Deſcription and Uſe of Globe, or Sphere. For the firſt Thing to be done before any Problems can be wrought on the Globe, is to *Rectify it*. That is, to bring the Sun's Place in the Ecliptick on the Globe, to the graduated Side of the Braſs Meridian, to elevate the Pole above the Horizon, as much as is the Latitude of the Place, and to fit the Hour Index exactly to Twelve at Noon, ſcrewing alſo the Quadrant of Altitude, (if there be Occaſion) to the Zenith. All this is comprehended under the Word *rectify the Globe*: And when this is done, the (Celeſtial) Globe repreſents the true Poſture of the Heavens, for the Noon of that Day it is Rectified for.

RECTIFIER (in Navigation) is an Inſtrument conſiſting of two Parts, which are two Circles either laid one upon, or let into the other, and ſo faſtened together in their Centers, that they repreſent two Compaſſes, one fixed, the other moveable; each of them divided into the 32 Points of the Compaſs, and 360 Degrees, and numbred both Ways, both from the North and the South, ending at the Eaſt and Weſt, in 90 Degrees.

The Fixed Compaſs, repreſents the Horizon, in which the North, and all the other Points of the Compaſs are fixed and immoveable.

The Moveable Compaſs repreſents the Mariners Compaſs, in which the North, and all the other Points are liable to Variation.

In the Centre of the Moveable Compaſs is faſtned a Silk Thread, long enough to reach the out-ſide of the Fixed Compaſs. But if the Inſtrument be made of Wood, there is an Index inſtead of the Thread.

Its Uſe is to find the Variation of the Compaſs, to rectify the Courſe at Sea; having the Amplitude or Azimuth given.

RECTIFYING of Curves, (in Mathematicks) is to find a ſtrait Line, equal to a Curved one; or a Plane equal to a curved Surface.

Of

Of this Dr. *Wallis* gave the firſt Hint to the World, in his Arithmetick of Infinites, *Prop.* 38. *& Scholium.*

Soon after which, Mr. *William Neil* applied thoſe Conſiderations to the *Semi-cubical Paraboloid*, where the Cubes of the Ordinates are as the Squares of the Diameters: And ſhewed that there the ſmall Segments of the Curve, cut by the Ordinates at equal Diſtances, are as the Ordinates in a Parabola, and therefore their Squares increaſed by Equals, in Arithmetical Progreſſion: Wherefore that Curve muſt be to a Right Line :: as the Trunk of a Parabola, to the Parabola: Which, the Quadrature of the Parabola being known, is a known Proportion; and this was the firſt Attempt of this Nature. But it was afterwards ſoon demonſtrated alſo by Sir *Chriſtopher Wren*, my Lord *Brouncker*, and by Dr. *Wallis*. And the Year following, *viz.* 1658. Sir *Chriſtopher Wren* ſhewed the Curve of the Cycloid, to be Quadruple of its Axis: Which was the ſecond Demonſtration of a Straight Line equal to a crooked one. Of which ſee Dr. *Wallis*'s *Engliſh Algebra*, p. 292, *&c.* See more alſo in his Excellent Book *de Cycloide*.

RECTILINEAL, or Right-lined, in Geometry, is ſpoken of ſuch Figures as have their Extremities all Right Lines.

RECTI *Minores*, are two ſmall Muſcles of the Head, appearing both in Sight at once: They ariſe fleſhy from the Poſterior Part of the firſt *Vertebræ* of the Neck; and are ſo inſerted to the middle Part of the *Os Occipitis* in two ſhallow Depreſſures of the ſaid Bone. Theſe from their Uſe, may be called *Renuentes* or Nodders backwards, and are Antagoniſts to thoſe we call *Annuentes*.

RECTO, is a Writ of Right, and is of ſo high a Nature, that whereas other Writs in real Actions are only to recover the Poſſeſſion of Lands or Tenements in Quſtion, which have been loſt by our Anceſtors or our ſelves; this aimeth to recover both the Seiſin, which ſome of our Anceſtors or we had, and alſo the Property of the Thing whereof the Anceſtor died not Seized, as of Fee, and whereby are Pleaded and Tried both their Rights together, *viz.* as well of Poſſeſſion as Property: So that if a Man once loſe his Cauſe upon this Writ, either by Judgment, Aſſize, or Battle, he is without all Remedy, and ſhall be excluded *per exceptionem rei Judicatæ*.

It is divided into two Kinds, *Rectum Patens*, a Writ of right Patent; and *Rectum Clauſum*, a Writ of right Cloſe. This the *Civilians* call *Judicium Petitorum*. The *Writ of right Patent* is ſo called, be auſe it is ſent upon, and is in Nature the higheſt Writ of all others, lying always for him that hath Fee-ſimple in the Lands or Tenements ſued for, and not for any other. And when it lieth for him that Challengeth, Fee-ſimple, and in what Caſes, ſee F. N. B. *Fol.* 1. 6. This Writ is alſo called *Breve magnum de recto*. *A Writ of right Cloſe*, is a Writ directed to a Lord of *Ancient Demeſne*, and lieth for thoſe which hold their Lands and Tenements by Charter in Fee-ſimple, or in Fee-Tail, or for Term of Life, or in Dower, if they be ejected out of ſuch Lands, *&c.* or diſſeiſed. In this Caſe, a Man or his Heirs may ſue out this *Writ of right Cloſe*, directed to the Lord of the *Ancient Demeſne*, commanding him to do him right, *&c.* in his Court. And this is called, *Breve parvum de recto*.

RECTO *de Advocatione Eccleſiæ*, is a *Writ of Right* lying where a Man hath right of Advowſon, and the Parſon of the Church dying, a Stranger preſents his Clerk to the Church, and he not having brought his Action of *Quare Impedit* nor *Darrein Preſentment* within Six Months, but ſuffered the Stranger to Uſurp upon him. And this Writ he only may have, that claimeth the *Advowſon* to himſelf, and to his Heirs in Fee; and as it lies for the whole *Advowſon*, ſo it lies alſo for the half, third or fourth Part.

RECTO *de Cuſtodia terræ & hæredis*, was a Writ that lay for him whoſe Tenant holding of him in Chivalry, died in Nonage, againſt a Stranger that entred upon the Land, and took the Body of the Heir; and is now become uſeleſs as to Lands holden *in Capite*, or by *Knights Service*, but not when there is Guardian in *Socage*, or appointed by the laſt Will and Teſtament of the Anceſtor.

RECTO *de Dote*, is a Writ of Right of Dower, which lieth for a Woman that hath received Part of her Dower, and purpoſes to demand the Remainder in the ſame Town, againſt the Heir, or his Guardian, if he be a Ward.

RECTO *de dote unde nihil habet*, is a *Writ of Right*, which lies in caſe where the Huſband having divers Lands or Tenements, hath aſſured no Dower to his Wife; and ſhe thereby is driven to ſue for her Thirds, againſt the Heir or his Guardian.

RECTO *de rationabili parte*, is a Writ that lies always between Privies of Blood; as Brothers in *Gavelkind*, or Siſters, or other Coparceners, as Nephews or Nieces, and for Land in Fee-ſimple; as if a Man leaſe his Land for Term of Life, and afterwards dies, leaves iſſue two Daughters, and after that the Tenant for Term of Life dieth alſo, the one Siſter entreth upon all the Land, and ſo deforcing the other, the Siſter ſo deforced ſhall have this Writ to recover part.

RECTO *quando Dominus remiſit*, is a *Writ of Right*, which lies in caſe where Lands or Tenements being in the Seigniory of any Lord, are in Demand by a *Writ of Right*; for if the Lord hold no Court, or otherwiſe, at the Prayer of the Demandant, or Tenant, ſhall ſend to the Court of the King his Writ, to put the Cauſe thither for that Time, (ſaving to him at other Times the Right of his Seigniory) then the Writ iſſues out for the other Party, and hath the Name from the Words contained, being the true Occaſion thereof. This Writ is *Cloſe*, and muſt be returned before the Juſtices of the *Common-Bench*.

RECTO *ſur Diſclaymer*, is a Writ that lies when a Lord in the King's *Court of Common-Pleas* avows upon his Tenant, and the Tenant *diſclaimeth* to hold of him; upon which *diſclaimer* he ſhall have this Writ; and if the Lord averr and prove, That the Land is held of him, he ſhall recover the Land for ever.

RECTUM *Inteſtinum*, is the ſtrait Gut which begins at the firſt *Vertebra* of the *Os Sacrum*, and paſſeth ſtrait downward to the Extremity of the *Rump*, or utmoſt End of the Back-bone. It is about a Foot in length, and not ſo wide as the *Colon*, but its Membranes are thicker.

RECTUS *Femoris*, is a Muſcle of the Leg, ſo named from its ſtreight Progreſs and Situation; it ariſeth fleſhy from the Tubercle of the *Os Ilium*, that is in the Mid-way between the fore-part of its Spine and the *Acetabulum*, from thence deſcending directly between the *Vaſtus Externus* and *Internus*, and over the *Crureus*. Its Fibres externally deſcend from a middle Line obliquely Laterally: Internally

nally they run according to the Length, and become entirely Tendinous four Fingers breadth above the *Patella*, where it is united with the Tendons of the *Vaſtus Externus* and *Internus*, and *Cruræus*, and inſerted together with 'em at the Upper part of the *Tibia*. It ſerves to help to extend the *Tibia*.

RECTUS *in Curia*, ſignifies one that ſtands at the Bar, and no Man objects any thing againſt him. Alſo, when a Man hath reverſed the Outlawry, and can participate of the benefit of the Law, he is *Rectus in Curia*.

RECTUS *Internus Major*, is a Muſcle of the Head which ariſes Tendinous, but chiefly Fleſhy, from the fore-part of all the Tranſverſe Proceſſes of the *Vertebræ* of the Neck, except the firſt and ſecond, and in its Aſcent becoming Fleſhy, paſſes over thoſe two ſuperior *Vertebræ*, and is inſerted to the Anterior *Appendix* of the *Os Occipitis*, near the great *Foramen*, that tranſmits the *Medulla Oblongata*. This manifeſtly bends the Head forwards, and therefore may be called *Flexor Capitis*, from its Uſe.

RECTUS *Internus Minor*, is a Muſcle of the Head, which with its Partner appears on the Fore-part of the 1ſt *Vertebræ*, like the *Recti Minores* on the Back-part, and ariſe near its Tranſverſe Proceſſes, and aſcending directly, are inſerted to the Anterior *Appendix* of the *Os Occipitis* immediately under the former. Theſe nod the Head forward, and are Antagoniſts to the *Recti Minores*. Wherefore they may be called *Annuentes*.

RECTUS *Lateralis*, is a ſhort, thick, fleſhy, Muſcle of the Head, ariſing from the ſuperior part of the Extremity of the Tranſverſe Proceſs of the firſt *Vertebræ* of the Neck, between the former and *obliquus Superior*, thence aſcends directly to its Inſertion to the *Os Occipitis* in the Interſtice made by the *Proceſſus Mammillaris* and *Styloides*. This nods the Head to one ſide.

RECTUS *Major*, is a Muſcle of the Head, which ariſeth partly Tendinous, but chiefly Fleſhy, from the ſuperior Part of the double Spines of the ſecond *Vertebræ* of the Neck, and in its aſcent becomes broader and Fleſhy, and is ſo inſerted to the poſterior Part of the *Os Occipitis*: This Muſcle with its Partner acting, pulls the Head directly back on the firſt *Vertebræ*.

RECTUS *Muſculus*, one of the Muſcles of the *Abdomen*, ſo called from the Uprightneſs of its poſition. Its Uſe in common with the other Muſcles of this Part, is to help to exclude the *Fæces* and Urine, by the compreſſion of the *Abdomen*.

RECTUS *Palpebræ Superioris*, is a Muſcle which lifts up the upper Eye-lid.

RECURRENT *Nerves*, by ſome called *Vocal*, becauſe they are ſpent upon the Inſtruments of Speech, and which *Galen* ſaith he tried to cut, and by that means rendred the Animal *Mute*. This Dr. *Willis* takes to be a diſtinct Pair by it ſelf, but 'tis uſually reckoned a Branch of the *Par-vagum* or 8th Pair, ſpringing out of their Trunks, and ſo called, becauſe firſt they deſcend, and then aſcend again to ſupply the Muſcles of the *Larynx*.

REDDENDUM, a Word uſed ſubſtantively for the Clauſe in a Leaſe, *&c.* whereby the Rent is reſerved to the Leſſor.

REDDITION, is a Judicial Confeſſion and Acknowledgment, that the Land or thing in Demand, belongs to the Demandant, or at leaſt not to the Perſon ſo ſurrendring.

REDENT, in Fortification, is a Work made in Form of the Teeth of a Saw, with *Saliant* and *Reentring-Angles*, to the end that one part may defend another. Theſe ſort of Works are uſually erected on that ſide of a Place which looks towards a Marſh or River.

REDINTEGRATION, a reſtoring any Mixt Body or Matter whoſe Form is deſtroyed, to the ſame Nature and Conſtitution, and that it ſhall have the ſame Properties it had before.

The Honourable Mr. *Boyle*, hath a particular Tract about the *Redintegration* of Salt-petre; in which he proves, that after Nitre had been fluxed in a Crucible over a ſtrong Heat, and after all its volatile Parts had been forced away by the injection of lighted Coals ſo often into the Crucible, that no farther Detonation would happen; by which means the Salt-petre was turned into that Body which is called *Fixt Nitre*, and which is very nearly akin, in all its Properties, to fixt Salt of Tartar; yet he could very ſpeedily, by pouring to this fixt Salt-petre, either diluted with a due proportion of Water, or let run *per ſe* into a Deliquium, a ſufficient quantity of Spirit of Nitre, (which by the by amounted nearly to the quantity of that volatile Part which was burnt off) he could, I ſay, ſuddenly reproduce true Cryſtals of Salt-petre of the common Form and Virtue.

REDISSEISIN, is a *Diſſeiſin* made by him that once before was made and adjudged to have *Diſſeiſed* the ſame Man of his Lands or Tenements; for which there lies a ſpecial Writ, called a Writ of *Rediſſeiſin*.

RED-*Lead*, how made. See *Minium*.

REDOUBT, in Fortification, is a ſmall Fort of a ſquare Figure, having no Defence but in the Front, its uſe being to maintain the *Lines of Circumvallation*, *Contravallation*, and *Approach*. In Marſhy Grounds, theſe *Redoubts* are often made of Maſon's Work for the Security of the Neighbourhood. Their *Face* conſiſts of from ten to fifteen Fathom; the Ditch round about being from eight to nine Foot broad and deep, and their *Parapets* having the ſame thickneſs.

REDUBBORS, are thoſe which buy ſtollen Cloath, knowing it ſuch, and change it into ſome other Form or Colour that it may not be known.

REDUCING *Scale*, is a thin broad piece of Box with ſeveral different *Scales* of equal Parts, and Lines to turn Chains and Links into Acres and Rods, by Inſpection; and is uſed by Surveyors to reduce any Map or Draught. It is ſometimes called, the *Surveying-Scale*.

REDUCT, a Military term, ſignifying an advantageous piece of Ground, entrenched and ſeparated from the reſt of the Place, to retire to in caſe of ſurprize.

REDUCTION, in Aſtronomy, is the difference between the Argument of Inclination and the Eccentrical Longitude; that is to ſay, the Difference of the two Arches of the Orbit, and the Ecliptick, intercepted between the Node and the Circle of Inclination.

REDUCTION *of Decimals*. See *Decimals*.

REDUCTION *of Equations*, in Algebra, is the clearing of them from all ſuperfluous Quantities, and the ſeparating of the known Quantities from the unknown, to the end that at length every reſpective Equation may remain in the feweſt and ſimpleſt *Terms*, and ſo diſpoſed, that the known Quantity or Quantities may poſſeſs one

part thereof, and the unknown the other. See *Equation.*

REDUCTION *of Fractions.* See *Fractions.*

REDUCTION of Money, Weights, Meaſure, *&c.* is of two kinds. 1. When a Quantity is to be brought from any higher Denomination into a lower, and this is done, by conſidering how many of the next leſſer Denomination are contained in the next greater before, and by that number multiplying the greater; as *Pounds* are brought into *Shillings* by Multiplying by 20, *Shillings* into *Pence* by 12, and *Pence* into *Farthings* by 4. Alſo, *Troy-Weight* may be reduced into Grains, by Multiplying by 12, 20, and 24. And *Averdupois Great Weight* into Ounces, by 4, 28, and 16.

2. If it be to bring the lower to a higher, then divide the leaſt by ſo many of its Denominations as are contained in the next greater. Thus 24720 Pence is 103 Pounds: But if there remains any thing after Diviſion, they are the odd Pence and Shillings; as 6713 Pence *Reduced*, gives 27 *l.* 19 *s.* 5 *d.*

Note, That the way to *reduce* Shillings into Pounds, is to cut off the laſt Figure, and take half of the reſt, as in the laſt Inſtance.

13) 6713 (551 | 9 (27 *l.* 19 *s.* 5 *d.*

71

113

5 *d.*

After the ſame manner may *Troy* Weight, *Averdupois* Weight, or any other Weight or Meaſure be reduced.

Likewiſe *Foreign* Coin may be reduced into *Engliſh*, by turning the Value into *Engliſh* Coin of any Part: As, what is the value of 223 *Scotch Marks*, each equal to 13 *d.* $\frac{1}{2}$ *Engliſh?* which is 54 Farthings, and 223 by 54 = 12042 Farthings, which reduced backwards to Pounds, Shillings, and Pence, makes 12 *l.* 18 *s.* 10 $\frac{1}{2}$ *d.*

REDUPLICATIVE *Propoſitions*, are ſuch wherein the *Subject* is repeated: Thus, Men, as Men, are Rational; Kings, as Kings, are ſubject to none but God.

RE-ENTRING *Angle*, a Term in Fortification. See *Angle.*

RE-ENTRY, in Law, ſignifies the reſuming and retaking that Poſſeſſion which we had lately forgone: As if I make a Leaſe of Land or Tenement, I do therefore forego the Poſſeſſion; and if I do condition with the Leſſee, That for Non-payment of the Rent at the Day, it ſhall be lawful for me to *Re-enter*; this is as much as if I condition'd to take again the Lands, *&c.* into my own Hands, and to recover the Poſſeſſion by my own Fact, without the aſſiſtance of Judge, or other Proceſs.

REEF, a Term in Navigation: When there is a great Gale of Wind, they commonly roll up part of the Sail below, that by that means it may become the narrower, and ſo not draw ſo much Wind. And this contracting or taking up the Sail, they call a *Reef* or *Reefing* the Sail; and when it is done, they ſay the Sail is *Reefed.*

Alſo, when a Top-Maſt is *Sprung*, as they call it, *i. e.* crackt or almoſt broken in the Cap, they cut off the lower piece that was near broken off, and ſetting the other part, now much ſhorter, in the Step again, they call it a *Reeſt* Top-Maſt.

REEVE, is to put a Rope through a Block; and to pull a Rope out of a Block is called Unreeving.

REFLECTION, in general, is the regreſs or return that happens to a moving Body, becauſe of the meeting of another Body, which it cannot penetrate. Thus the material Rays of Light are reflected variouſly from ſuch Bodies as they cannot paſs through.

REFLECTION, in *Metaphyſicks*, Mr. *Lock* defines to be, That Notice which the Mind takes of its own Operations, and the Manner of them; by reaſon whereof there come to be Ideas of thoſe Operations in the Underſtanding.

REFLECTION *of the Rays of Light.* Sir *Iſaac Newton*, finding by Experiment that Light was an Heterogeneous Body, conſiſting of a Mixture of differently refrangible Rays; and conſequently concluding no farther Improvement could well be made in Optical Inſtruments in the Dioptrick way, he took *Reflections* into Conſideration, and tells us, that by their help, Optick Inſtruments might be brought to *any degree of Perfection*, if we could but find a reflecting Subſtance which would Polliſh as finely as Glaſs, reflect as much Light as Glaſs tranſmits, and be formed into a Parabolical Figure.

An Experiment of which he made in the kind of a Catoptrick Teleſcope, (which I have ſeen at *Greſham* College) and by which, tho' not above two Foot long, he could (he ſaith) diſcern the Jovial Satellites, and the Phaſes of *Venus*. *Phil. Tranſ.* N. 18. See Vol. 2.

REFLECTED *Ray*, or *Ray of Reflection*, is that whereby the *Reflection* is made upon the Surface of a reflecting Body.

REFLECTING, or *Reflexive Dyals*, are made by a little piece of Looking-Glaſs-Plate, duly placed, which reflects the Sun's Rays to the top of a Ceiling *&c.* where the Dial is drawn. This Glaſs ſhould be as thin as can well be ground. For the making of theſe Dials, there are many Methods: Of the two following, the 1ſt is Mr. *Collins*'s, the 2d Dr. *Clark*'s.

Firſt, Determine the moſt convenient Point in the Window, where to place the *Reflecting Glaſs*, as near the Ceiling as you can conveniently, provided it be not ſo near as that the Corniſh of the Window will ſhade the Glaſs when the Sun is high in Summer; ſuppoſe within about 10 or 11 Inches of the Ceiling, at leaſt of that Ceiling which belongs to the Window it ſelf; then from that Point draw a true Meridian upon a plane Horizontally placed againſt the determined Point in the Window, and to that Meridian fit an Horizontal Dial; but invert it ſo, that the Axis or Stile may point downward, and be under the Horizontal Plane, according to the Elevation of the Pole, which Stile muſt be placed truly alſo in the Plane of the Meridian; then by the help of a Thread running from the Centre along the Stile, find where that Stile would cut the Floor, or any other Place, if it were produced, and drive a Nail into that Point, and faſten alſo a Thread there long enough to be extended to any part of the Ceiling.

Faſten

Faſten alſo another long Thread to the Centre of the Horizontal Dial, which let it be extended Horizontally, as the Plane will direct, and exactly over every Hour-Line in order, whilſt in the mean time you extend the Thread which was faſtened to the Nail in the Stile, to the Ceiling, but ſo as it may touch the other Horizontal Thread: Then mark that Point in the Ceiling which the extended Thread toucheth, and make more ſuch Marks, whereby to draw the Hour-Lines upon the Ceiling; and do this in like manner for the reſt of the Hours, Half-Hours, and Quarters.

Then take all away, and place your Glaſs Horizontally; and becauſe your Glaſs hath ſome Thickneſs, place it a little under the determined Point, that the Centre of the Glaſs may be juſt in the imaginary Axis, which goes to the Nail; for whereſoever you place it, in that it will go true.

But becauſe it may be troubleſome to place an Horizontal Dial faſt enough and exactly, as alſo to find the Point where the Nail is to be driven, I will ſhew you another Method, which may be more eaſily practiſed.

Firſt, Draw an Horizontal Dial upon the back of ſome Table or Floor, and draw a Meridian upon the Bay-board of the Window, by a Thread or perpendicular black Line, paſſing through the Point where you intend your Reflecting Glaſs ſhall be, and by a Plumb-Line tranſlate it from the Bay-board to the Ceiling. Take the neareſt Diſtance between the Glaſs and the Ceiling; with this Diſtance come to the Horizontal Dial, and ſet one end of it on that Part of the Axis where the other will juſt touch the Meridian; that Point in the Axis may be called the Glaſs Point; from which erect a Perpendicular; and where it cuts the Meridian, make a Point, which will be the Equinoctial Point, from which alſo erect a Perpendicular, which will be a Tangent; then at ſome Diſtance on which Side of the Equinoctial Point you find moſt convenient, erect another Tangent there, two Tangets will cut the Hour-Lines in Points, which may be called the Hour-Points.

Then take the Diſtance betwixt the Glaſs-Points and the Equinoctial-Point, and extend it from the Glaſs toward the Meridian, and where it toucheth, that is the Equinoctial-Point upon the Ceiling.

Laſtly, Set off correſpondent Tangent-Lines upon the Ceiling, and make like Hour-Points, draw the Hour-Lines, you need not blot out the Equinoctial Tangent, it being pleaſant to ſee how the Sun will go in that Line all Day, when it is in the Equinoctial. Beſides, the Equinoctial-Point will tell you on that Day whether your Glaſs lie Horizontally, which is ſomewhat difficult otherwiſe to determine. Or upon any Day you may Calculate the Sun's Meridian Altitude, and ſee whether it falls juſt upon that Point in the Meridian at 12 a Clock.

This Dial is nothing but an Horizontal Inverted, the Center whereof is in the Air without, except you make a North Dial, and then it will be upon the Ceiling, which you muſt find by its Diſtance from the Equinoctial Point, and let that Centre govern your Tangents. The Ground of this Dial is, that the Angles of Reflection are equal to the Angles of Incidence.

Sometimes, inſtead of two Tangents, you may uſe two Circles, eſpecially when the Centre of the Dial is upon the Ceiling, or when your Glaſs is near the Window-Ceiling, then the Equinoctial Point will be upon that Ceiling, and you may project the Hour-Lines upon the Chamber Ceiling, or the Walls, by one Thread extended over the Hour-Lines, and another Thread touching that, and extended from the Equinoctial-Point, or any Point in the imaginary Axis to the Ceiling or Wall.

REFLECTING Teleſcope. See *Teleſcope*.

REFLEXION of the Moon, is (according to *Bullialdus*) her 3d Inequality of Motion; This *Tycho* calls by the Name of her *Variation*, which ſee.

REFLUX of the Sea, is the *Ebbing* of the Water off from the Shore; as its coming on upon it, or Tide of Flood, is called the Flux of the Sea. See *Tide*.

REFRACTED Angle, in Opticks, is the Angle contained between the refracted Ray and the Perpendicular.

REFRACTED Dials, may be made thus: Stick up a Pin, or aſſign any Point in any Concave Bowl, and make that the Center of the Horizontal Dial, aſſigning the Meridian-Line on the Edges of the Bowl, and taking away the Horizontal Dial, elevate a String or Thread from the end of the ſaid Pin faſtened thereto, over the Meridian-Line, equal to the Elevation of the Pole or Latitude of the Place; then with a Candle, or if you bring the Thread to the Shade upon any Hour-Point formerly marked out on the Edges of the Bowl, at the ſame time the Shade in the Bowl is the Hour-Line.

And if the Bowl be full of Water, or any other Liquor, you may draw the Hour-Lines, which will never ſhew the true Hour, unleſs filled with the ſaid Liquor again.

REFRACTION, in general, is the Incurvation or change of Determination in the Body moved, which happens to it, whilſt it enters or penetrates any *Medium*.

In Dioptricks, it is the Variation of a Ray of Light, from that right Line which it would have paſſed on in, had not the Denſity of the Medium turned it aſide.

Dr. *Hook* diſcovered by Experiment, That the *Sines* of the Angles of Incidence of the Rays of Light, are proportionable to the *Sines* of Refraction. See the Preface to *Micrographia*, where his Inſtrument is deſcribed, by which he made the Diſcovery.

Sir *Iſaac Newton* found that the Rays of Light are Incurvated or Refracted in their Motion, whenever they come near the Edges of any Body, tho' it be not Diaphanous. See *Light*.

And he thinks that the Errors of Refraction in Optick Glaſſes might be corrected, if two Spherical Glaſſes were combined together with Water included between them. And ſuch Glaſſes he judges preferable to Elliptical or Hyperbolical ones, becauſe (beſides that they can be more eaſily ground) they do more accurately refract the Pencils of Rays poſited without the Axis of the Glaſs.

Dr. *Wallis* in *Philoſ. Tranſ.* N. 187, ſaith, That tho' Refraction by Vapours near the Horizon, may make a thing appear higher, yet it cannot make it appear broader; whereas in Refraction by Glaſſes, the thing is apparently enlarged every way.

From whence it is, that the diverſe Power of Refraction in Fluids ariſes, is not eaſy to determine, tho' it would be of great Advantage if it could be diſcovered: Pure clear Water, of all Flu-

ids, refracts the Rays of Light the leaſt; and if it be impregnated with Salts, it increaſes the Refraction in Proportion to the Quantity and Weight of the Salts diſſolved in it.

The *Aquæ Stygiæ*, or corroſive Menſtruums, ſuch as *Aqua fortis*, &c. which are Salt diſſolved and rendred Corroſive by the Violence of the Fire, do yet much more refract the Sun's Rays; which need not be wondred at, becauſe theſe are much denſer and heavier Fluids than the former. But then why in ſuch light fine Fluids as Spirit of Wine and other Ardent Spirit; in Oil of Turpentine, which is ſo light and fine a Fluid, as to be generally called, an *Ethereal Oil*; why theſe, I ſay, ſhould produce ſo great a Degree of Refraction, as 'tis known they do, is a thing of great Difficulty to account for, and well deſerves a farther Enquiry into.

Dr. *Gregory* in his Aſtronomy, very well accounts for the Oval Figures which the Sun near the Horizon (eſpecially in high Latitudes) is ſometimes ſeen to put on from Refraction. For having before demonſtrated, That becauſe of the Earth's Atmoſphere all Bodies near the Horizon, will appear ſomething higher in the vertical Circle than they really are, and this the more, the nearer they are to the Horizon: He ſhews that the upper Margin of the Sun's Diſk being raiſed a little more than it ought to be, and the lower one a great deal more, the Sun's Vertical Diameter will ſeem to be contracted, but the Horizontal one will not, and therefore he will appear Oval. And for the ſame Reaſon, the obſerved Diſtance of two Fix'd Stars, is ſenſibly leſs (when meaſured by an Inſtrument) if they are in the ſame Vertical Circle, and one of them near the Horizon, than when they both have a conſiderable Altitude.

After this he ſhews how to determine the Quantity of the Refraction in any given Degree of Altitude, and to make a Table of it; thus.

Let ſome Fix'd Star having no ſenſible Parallax, and much elevated above the Horizon, be choſen, whoſe Place he ſhews how to determine at *P.* 164, *Prop.* 26, by Obſervations made when the Star is ſo high as to have no ſenſible Refraction. Then let the Time be noted when this Star hath any known Altitude, (as taken by an Inſtrument) and Calculation made for the true Altitude, (according to the Star's known Place) the Exceſs of the obſerved Altitude above this is the Refraction.

REFRACTION Aſtronomical, is that which the Atmoſphere produceth, whereby a Star appears more elevated above the Horizon than really it is.

REFRACTION Horizontal, is that which cauſeth the Sun or Moon to appear on the Edge of the Horizon, when they are as yet ſomewhat below it.

REFRACTION from the Perpendicular, is when a Ray falling, inclined from a thicker Medium into a thinner, as from Glaſs into Air, in breaking, departs farther from that Perpendicular.

REFRACTION to the Perpendicular, is when a Ray falling inclin'd from a thinner or more diaphanous Medium, upon a thicker or leſs tranſparent, as from Air upon Water, in breaking, comes nearer the Perpendicular, drawn from the Point of Incidence at Right Angles, on the Surface of the Water wherein the Refraction is made.

REFRANGIBLE, is whatever is capable of being Refracted.

REFRIGERATORY, is that Part of an Alembick or Diſtilling Veſſel which is placed about the Head of the Still, and filled with Water to cool the Head of the Alembick, that the Spirituous Vapours may the ſooner and the more eaſily condenſe into Drops. Cold Water muſt continually be put into the Refrigeratory, as the Veſſel grows hot. Moſt Apothecaries, Diſtillers, &c. that have Occaſion for drawing off large Quantities of Spirits, do now-a-days uſe the *Veſica* or Copper Body with its *Moors-Head* of the ſame Metal: and without any Refrigerations about the Head of the Still: But there is below, a long Worm or Serpentine in a Tub of Water, where the Spirituous Vapours are very eaſily condenſed into a Liquor. And this may as well be called a Refrigeratory as the former.

REFUTATIO *Feodi*, a Term in Civil-Law ſignifying the Loſs of a *Feudal Tenure* by Forfeiture; which is of two Kinds, either by not performing the Service required, or by committing ſome villanous Act againſt the Lord or Sovereign.

REGALIA, the Royal Rights of a King, reckoned by the *Civilians* to be Six. 1. Power of Judicature. 2. Power of Life and Death. 3. Power of War and Peace. 4. Materleſs Goods. 5. Aſſeſſments. 6. Minting of Money. Alſo, the Crown, Scepter with the Croſs, Scepter with the Dove, St. *Edward*'s Staff, four ſeveral Swords, the Globe, the Orb with the Croſs, and ſuch other like Things uſed at the Coronation of our Kings, are called *Regalia*.

REGARDANT, the Heralds Term for a Lion or ſuch kind of Beaſt of Prey, born in a Poſture of looking back behind him.

REGEL, or *Rigel*, a fix'd Star of the firſt Magnitude in *Orion*'s left Foot; its Longitude is 72 deg. 19 min. Latitude 30° 10′.

REGIMENT, is a Body of Troops of Horſe, or Companies of Foot, commanded by a Colonel; but the Number is as undetermin'd as that of the Men in a Troop or a Company. There are Regiments of Horſe that are not above 300 Men; and there are ſome in *Germany* of 2000; and the Regiment of *Picardy* in *France* conſiſts of 6000 Men.

REGIO *Aſſenſu*, is a Writ whereby the King gives his Royal Aſſent to the Election of a Biſhop.

REGION: *Fernelius* with ſome Anatomiſts, diſtinguiſh the *Cavities* of an Animal Body into ſeveral Regions or Parts, which they ſpecify into *Publick* and *Private*. The Publick are Three. The firſt includes the *Vena Porta*, and all Parts to which its Branches reach. 2. The Second begins at the Roots of the *Vena Cava*, and ends in the ſmall Veins before they become Capillary. The Third they make to contain the Muſcles, Bones, and Bulk of the Body: But this is not much received. The *Abdomen* is uſually diſtinguiſhed alſo into thre Regions, the *Uppermoſt*, *Middle*, and *Lower*.

REGION, is alſo taken for our *Hemiſphere*, or the Space within the Four Cardinal Points of the Heavens, or of the Air, &c.

—— In Geography, it ſignifies a large Extent of Land inhabited by many People of the ſame Nation, and encloſed within certain Limits or Bounds.

REGION *Elementary*, according to the *Ariſtotelians*, is a Sphere terminated by the Concavity of the Moon's Orb, comprehending the Earth's Atmoſphere.

REGION *Æthereal*, in Coſmography, is the vaſt Extent of the Univerſe; wherein are comprized all the Heavens and Celeſtial Bodies.

REGIONS of the Air, are diſtinguiſhed into *Upper*, *Middle*, and *Lower*.

REGISTERS, in a Chymical Furnace, are Holes purpoſely left in the Sides of the Furnace with Stopples to them, to let in or keep out the Air, according as the Fire is required to be greater or leſs.

REGIUS *Morbus*. See *Icterus*.

REGRATOR, ſignifies him that Buys and Sells any Wares or Victuals in the ſame Market or Fair, or within five Miles thereof. In the *Civil Law*, ſuch an one is called *Dardanarius*.

REGULAR *Body*, is a Solid whoſe Surface is compoſed of *Regular* and Equal Figures; and whoſe Solid Angles are all equal. Such as the,

1. *Tetrahedron*, which is a Pyramid, comprehended under Four Equal and Equilateral *Triangles*.

2. *Hexahedron*, or Cube, whoſe Surface is compoſed of ſix equal *Squares*.

3. *Octahedron*, which is bounded by eight Equal and Equilateral *Triangles*.

4. *Dodecahedron*, which is contained under 12 Equal and Equilateral *Pentagons*.

5. *Icoſihedron*, conſiſting of 20 Equal and Equilateral *Triangles*.

That there can be no more *Regular Bodies* beſides theſe, may be thus proved.

1. Of Equilateral Triangles, there muſt be three at leaſt to make a Solid Angle; and three of them joined together will make the *Tetrahedron*; for thoſe three Triangles meeting in a Point, do form a Triangular Baſe ſimilar and equal to the Sides; as appears by the bare Compoſition of the Figure. Four ſuch Triangles joined together in a Point, make the Angle of the *Octahedron*.

By joining five ſuch Triangles together, the Angle of the *Icoſihedron* is formed.

But ſix ſuch Triangles joined in a Point, cannot make a Solid Angle; becauſe they make four right ones; (for every Angle of an Equilateral Triangle is $\frac{1}{3}$ of two; or $\frac{2}{3}$ of one right Angle; either of which Fractions multiplied by Six, gives four right Angles) whereas every Solid Angle is made up of four ſuch plane Angles as all together muſt be leſs than four right ones: So that with Triangles 'tis impoſſible to form any more *Regular Bodies* than theſe three.

If you take *Squares* and join three of them together, they will make the Angle of a *Cube*; and there can no other *Regular Body* but a *Cube* be made with *Squares*; for four *Squares* joined together, will not make a Solid Angle, but a Plane.

If you join the Angles of three *Pentagons* together, you will conſtitute the Angle of the *Dodecahedron*. But four ſuch Angles cannot make a Solid one.

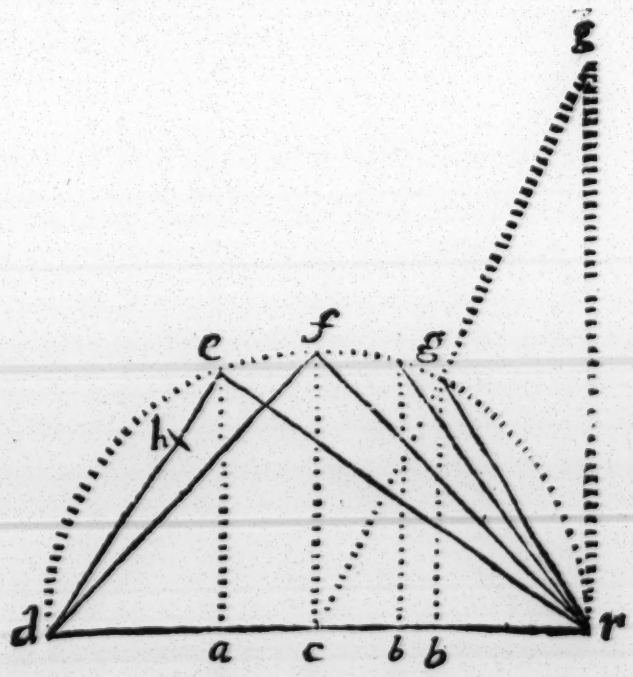
And three *Hexagons* joined together, do make juſt four right Angles, and therefore they cannot make a Solid Angle. And as for three *Heptagons*, or other Figures yet of more Sides, they can much leſs do it; becauſe their Angles being very obtuſe, three of them will exceed four right ones. So that upon the whole, 'tis plain, that of theſe Five *Regular Bodies*, three are made of *Triangles*, one of *Squares*, and one of *Pentagons*, and there can be no other.

The Proportion of the Sphere, and of the Five Regular Bodies *inſcribed in the ſame; from* Peter Horigon, Curſus Matth. *Vol.* 1. *P.* 779, *And* Barrow's *Euclid*, Lib. 13.

The Diameter of the Sphere being 2.

The Circumf. of the greateſt *Circle*	6. 28318
Superficies of the greateſt *Circles*.	3. 14159
Superficies of the *Sphere*	12. 56637
Solidity of the *Sphere*	4. 18859
Side of the *Tetrahedron*	1. 62299
Superficies of a *Tetrahedron*	4. 6188
Solidity of a *Tetrahedron*	0. 15132
Side of a *Cube* or *Hexahedron*	1. 1547
Superficies of the *Hexahedron*	8.
Solidity of the *Hexahedron*	1. 5396
Side of an *Octahedron*	1. 41421
Superficies of the *Octahedron*	6. 9282
Solidity of the *Octahedron*	1. 33333
Side of the *Dodecahedron*	0. 71364
Superficies of the *Dodecahedron*	10. 51462
Solidity of the *Dodecahedron*	2. 78516
Side of the *Icoſihedron*	1. 05146
Superficies of the *Icoſihedron*	9. 57454
Solidity of the *Icoſihedron*	2. 53615

If one of theſe *Five Regular Bodies* were requir'd to be cut out of the Sphere of any other Diameter, 'twill be as the Diameter of the Sphere 2 is to the Side of any one Solid inſcribed in the ſame, (ſuppoſe the Cube 1. 1547) ſo is the Diameter of any other Sphere (ſuppoſe 8.) to 9. 2376, the Side of the *Cube* inſcribed in this latter Sphere.



Let *dr* be the Diameter of any Sphere, and *da* $\frac{4}{3}$ of it. $= ab = br$. Erect the Perpendiculars *ae*, *ef*. and *bg*, and draw *de*, *df*, *er*, *fr*, and *gr*.

Then

Then will

1. *re* be as the Side of the Tetrahedron.
2. *df* is the Side of the Hexahedron.
3. *de* is the Side of the Octahedron.
4. Cut *de* in extream and mean Proportion in *h*, and *dh* will be the Side of the Dodecahedron.
5. Set the Diameter *dr* up perpendicularly at *r*, and from the Centre *c*, to its Top, draw the Line *cg* cutting the Circle in *g*. Let fall the Perpendicular *gb*. So is *br* the Side of the *Icosihedron*.

REGULAR *Figures*, in Geometry, are such whose Sides, and consequently their Angles, are all equal to one another.

Whence all *Regular* Multilateral Planes are call'd *Regular Polygons*.

The Area of such Figures is speedily found by multiplying a Perpendicular let fall from the Centre of the Inscribed Circle to any Side by half that Side, and then that Product by the Number of the Sides of the Polygon.

REGULAR *Fortification*. See *Fortification*.

REGULAR *Curves*, are such *Curves* as the Perimeters of the Conick Sections, which are always curved after the same Regular Geometrical manner

But *Irregular* Curves, are such as have a *Point of Inflexion*; and which being continued, do turn themselves a contrary way, as the *Conchoid*, and the Solid *Parabola* which hath a Square for its *Parameter*.

REGULATOR, a small Spring belonging to the *Balance* in the new Pocket-Watches.

REGULUS. See *Basilicus*.

REGULUS, or *Regule*. When any Metal or Mineral is separated in a Crucible, by Purification, from its more gross and terrene Parts, the finer and metalline Parts will sink to the Bottom of the Crucible. And this the Chymists call *Rex* or *Regulus*, the Royal or Noble Part of the Mixt.

REGULUS *of Antimony*, is thus made. Mix together 16 Ounces of Antimony, 12 of Crude Tartar, and 6 of Salt-petre, all well powdered; then heat a large Crucible red hot, and throw into it a Spoonful of the Mixture, presently Covering the Crucible with a Tile; repeat this Spoonful by Spoonful till all the Matter is thrown in. Then make a great Fire about the Crucible, and when the Matter hath been a while melted, pour it into an Iron Mortar greased a little with Suet, and warm'd; knock the Mortar on the Side with the Pestle, to make the Regulus precipitate to the Bottom. When 'tis cold separate it from the Dross, then Powder it, and melt it again in another Crucible, with a little Salt-petre thrown on it when 'tis in Fusion. Cast it out as before into a greased Morter, or mould it into Pills, Cups, &c.

For of this Regulus is made the *Antimonial Cup*, and the Regulus. If you powder four Ounces of it, and Calcine it in an Earthen Pan, unglazed, over a small Fire, stirring the Powder all the while with a Spatula, a Fume will arise, for about an Hour and half or two Hours, the Powder will turn grey, and at the End of that small Time, will Weigh near two Drams and an half, more than the Powder did at first, tho' it fumed all the time; which may satisfy us, that some Bodies have their Pores so adapted, that they can detain the very Particles of Fire themselves, and Incorporate with them. An Augmentation of Weight happens in making the Calx of Lead, and some others, but not in such a degree, nor so soon as this.

If an Ounce of the Dross of the Regule of Antimony, be boiled in a Pint of Water, and then set to stand and cool without stirring it, it will coagulate into a Substance very like to Blood, but not so red.

The Chymists make much ado about a Regulus of Antimony made with Steel, because of a kind of Star that appears in the Bottom of it: But it hath no other Virtues than this described above. You may see the way of making it in *Lemery*, *p.* 265. last Edit. and in many other Chymical Authors.

If Antimony be calcined in an Earthen Pot unglazed, and continually stirring till no more Fumes arise; and afterwards the Matter be put into a Crucible, and in a very violent Fire melted and kept an Hour in Fusion, it will be turned into a reddish Opake Glass, which they call Glass of Antimony, and is a most violent Emetick.

REJOYNDER, in Law, signifies an Answer or Exception to a Replication; for first the Defendant puts in an Answer to the Plaintiff's Bill, which is sometimes called, *An Exception*, the Plaintiff's Answer to that is called, a *Rejoynder*, especially in Chancery. 'Tis by the Civilians called *Duplicatio*.

RELAIS, a *French* Term in Fortification, the same with *Berme*.

RELATION *Inharmonical*, a Term in Musical Composition, signifying a harsh Reflection of Flat against Sharp, in a cross form, *viz.* When some harsh and displeasing Discord is produced, in comparing the Present Note of another Part.

RELATIVE *Gravity*, the same with *Specifick*; which see.

RELATIVE *Propositions*, are those that include some Comparison, and some Relation, thus: Where the Treasure is, there is the Heart: As much as thou hast, so much art thou worth.

RELAXANTIA. See *Chalastica*.

RELAXATION, is a Dilatation of parts or Vessels.

RELEASE, in Law, is an Instrument whereby Estates, Rights, Titles, Entries, Actions, and other things, be sometimes extinguished, sometimes transferred, sometimes abridged, and sometimes enlarged; and is either *in Fact* or *in Law*.

A *Release in Fact*, is that which the very Words expresly declare.

A Release in Law, is that which doth Acquit by way of Consequence or Intendment of Law.

RELEGATION, in Law, signifies a Banishment for a certain time.

RELEIFE, or *Relievo*, is the Protuberant jetting or standing out of any Figures or Images above the Plain on which they are formed. And whatever Figures or Representations are thus cut, stamped, or otherwise wrought, so that not the entire Body, but only part of it is raised above the Plain, is said to be done in *Releife*; and when the Work is low, flat, and but a little raised, 'tis called *Basse Releife*, or *Low Releife*. When a Coin or a Medal hath its Figure low and thin, and hardly distinguishable from the Plain, we say its *Releife* is low and weak; but when 'tis much raised, we say 'tis Bold, and its Releife is Strong.

RELEVISH, in Law, signifies to let one to Mainprise upon Surety.

RELICTA

RELICTA *Verificatione*, is when a Defendant hath Pleaded, and the Iſſue is entred of Record, and after that the Defendant *Relicta Verificatione*, (*que eſt ſon Plea*) acknowledges the Action, and thereupon Judgment is entred for the Plaintiff.

REMAINDER, in Law, is an Eſtate limited in Lands, Tenements, or Rents, to be enjoyed after the Expiration of another particular Eſtate. As a Man may let to one for Term of his Life, and the Remainder to another for the Term of his Life; and this Remainder may be either for a certain Term, or in Fee-ſimple, or Fee-taile; the Difference between a Remainder and Reverſion, is this, That by a Reverſion, after the appointed Term the Eſtate returns to the Donor, or his Heirs, as the proper Fountain; whereas by Remainder, it goes to ſome third Perſon, or a Stranger.

REMEMBRANCE, is when the Idea of ſomething formerly known, recurs again into the Mind, without the Operation of the like Object on the External Senſory.

REMEMBRANCERS *of the Exchequer*, are three Officers or Clerks there, viz. *The King's Remembrancer*, *the Lord Treaſurer's Remembrancer*, and *the Remembrancer of the firſt Fruits*.

The King's Remembrancer enters into his Office all Recognizances, taken before the Barons for any of the King's Debts, for Appearance, or for obſerving Orders; and maketh out Proceſs againſt the Collectors of Cuſtoms, Subſidies, and Fifteenths for their Accounts: All Informations upon Penal Statutes, are entred in this Office, and there all Matters upon *Engliſh* Bills in the Exchequer-Chamber remain: He makes the Bills of Compoſition upon Penal Laws, takes the Scalment of Debts, has Delivered into his Office all manner of Indentures, Fines and other Evidences whatſoever, that concern the aſſuring of any Lands to the Crown: He every Year *in craſtino animarum* reads in open Court, the Statute for Election of Sheriffs, and gives them their Oath: and he reads in open Court the Oath of all the Officers of the ſame, when they are admitted, beſides many other Things.

The Lord Treaſurer's Remembrancer, upon whoſe Charge it lies, to put the Lord Treaſurer, and the reſt of the Judges of that Court, in Remembrance of ſuch Things as are to be call'd on, and dealt in for the King's Behoof. He makes Proceſs againſt all Sheriffs, Eſchearors, Receivers and Bailiffs, for their Account: He makes Proceſs of *Fieri facias* & *Extent*, for any Debts due to the King either in the Pipe or with the Auditors; makes Proceſs for all ſuch Revenues as are due to the King, by reaſon of its Tenures: He makes Record, whereby it appears whether Sheriffs, and other Accountants, pay their *Profers* due at *Eaſter* and *Michaelmas*. He makes another Record, whether Sheriffs, and other Accountants, keep their Days of Preſixion. All Eſtreats of Fines, Iſſues, and Amerciaments, ſet in any Courts at *Weſtminſter*, or at the Aſſizes, or Seſſions, are certified into this Office, and are by him delivered to the Clerk of the Eſtreats, to write Proceſs upon them, &c.

The Remembrancer of the Firſt Fruits, takes all Compoſitions and Bonds, for Firſt Fruits, and Tenths, and makes Proceſs againſt ſuch as do not pay the ſame.

REMINISCENCE, is the Power which the Humane Mind hath of recollecting it ſelf, or calling again to its Remembrance ſuch Ideas or Notions which it had really forgot: In which it differs from *Memory*, which is a treaſuring up of things in the Mind, and keeping them there without forgetting them.

REMISSION, is a Word uſed by Phyſical Writers, to ſignify the Abatement of the Power or Efficacy of any Quality, as when it is increaſed, they ſay 'tis Intended; and all Qualities are thus capable of *Intenſion* or *Remiſſion*.

See in the Word Quality, a Demonſtration that the *Intenſion* of all Qualities decreaſes, as the Squares of the Diſtance from the Centre of Action reciprocally.

REMITTER, in a Legal Senſe, is to reſtore one that hath two Titles to Lands or Tenements, and is ſeized of them by a latter Title which is diſcovered to be defective, to the former and more ancient Title, that ſo he may continue in Quiet Poſſeſſion.

RENAL *Artery*, is ſaid by ſome, to come out of the *Aorta*, and to enter into the Kidneys, bringing to it the Seroſity of the Arterial Blood.

RENALIS. See *Adipoſa Vena*.

RENDER, in Law, is a Word uſed in levying of a Fine, which is either ſingle, whereby nothing is granted or rendred back again by the Cogniſee to the Cogniſor, or double, which containeth a Grant or render back again of ſome Rent, Common, or other Thing out of the Land it ſelf to the Cognizor, &c.

Alſo, there be ſome Things in a Mannor that lie in *Prender*: that is, which may be taken by the Lord or his Officer, when they change, without any Offer made by the Tenant, as Eſcheats, and the like: and ſome that lie in *Render*; that is, muſt be delivered or anſwered by the Tenants, as Rents, Reliefs, Heriots, and other Services. Alſo ſome Service conſiſts in Seiſance, ſome in *Render*.

RENDS in a Ship, are the ſame as the Seams between her Planks.

RENES, the *Reins* or *Kidneys*; there are always two of them, and placed in the *Abdomen* between the two Membranes of the *Peritonæum*, and adjoining to the Sides of the *Aorta* and *Vena Cava*, the Right Kidney lies lower in Men, and is ſomething leſs than the left: They are covered with a double Membrane; of which the outwardmoſt is common, proceeding from the *Peritonæum*: and is called the *Membrana Adipoſa*, from its being covered with Fat, in Fat and Corpulent People: into this the *Arteria Adipoſa* enters from the *Aorta*; and the *Vena Adipoſa* goes out from it, which the right Kidney uſually ſends into the *Emulgent Vein*, rarely into the *Cava*, but the left Kidney generally into the *Cava*. By means of this *Membrane*, both the Kidneys are joined to the *Loins* and *Diaphragma*: The right one to the *Cæcum Inteſtinum*, and ſometimes to the Liver, and the left is connected by it to the Spleen and Colon.

Its Interior Membrane or Tunick, and which is proper to it, is taken from the External Root of thoſe Veſſels which enter the Kidneys, (and which do enter it but with a ſingle Coat:) and this hath ſome ſmall Nerves from a Branch of the ſixth Pair, and from the *Stomachick Branch*, which give the Kidneys but a dull ſmall Senſe, but afterwards branched out into the *Ureters*, render them extreamly ſenſible; and thoſe Nerves (by Conſent of Parts) cauſe that Vomiting which uſually accompanies Nephritick Pains. The Kidneys have two Eminent Blood Veſſels, the *Emulgent Vein and Artery*; of which the later diſtributes the Blood from

the *Aorta* into the Body of the Kidneys, and the former brings it back again.

RENES *Succenturiati*, are a Pair of Glandulous Bodies placed above the Reins or Kidneys: Their Uſe (by ſome) is ſuppoſed to be, to receive the Lympha into their Cavities, thereby to attenuate and render more fluid and capable of Circulation, the Blood returning from the Kidneys, where it hath parted with its *Serum*. But we are yet, ſaith Dr. *Gibſon*, in the dark as to their true Uſe: They are called alſo *Glandulæ Renales*, and by *Bartholin Capſulæ Atrabilariæ*: By Dr. *Wharton*, *Glandulæ ad Plexum Nerveum ſitæ*. They are larger in Children than in Men; being in the former near as big as the Kidneys, but they do not increaſe proportionably as other Parts do.

RENITENCY, is that Reſiſtance which there is in Solid Bodies when they preſs upon, or are impelled one againſt another, or that Reſiſtance that any heavy Body makes on the Account of its Weight, to our Arm or Hand when we lift it up.

RENT, ſignifies a Sum of Money, or other Conſideration iſſuing Yearly out of Lands or Tenements; of which Lawyers reckon three Sorts, *viz. Rent-ſervice*, *Rent-charge*, and *Rent-ſeck*: *Rent-ſervice*, is where a Man holds his Lands of his Lord by Fealty, and certain Rent, or by Fealty Service, and certain Rent, or that which a Man making a Leaſe to another for Term of Years, reſerveth Yearly to be paid for them. *Rent-charge*, is where a Man makes over his Eſtate to another, by Deed indented, either in Fee, or Fee-taile, or for Term of Life, yet reſerves to himſelf, by the ſame Indenture, a Sum of Money Yearly to be paid to him, with Cauſe of Diſtreſs for Non-payment. *Rent-ſeck*, or Dry Rent, is that which a Man making over his Eſtate by Deed indented, reſerveth Yearly to be paid to him without Cauſe of Diſtreſs, mentioned in the Indenture.

REPARATIONE *facienda*, is a Writ which lies, in divers Caſes, whereof one is, where three are Tenants in Common, or Joint-tenants, *pro indiviſo*, of a Mill or Houſe which is fallen to decay, and the one being willing to repair it, the other two will not; in this Caſe the Party willing ſhall have this Writ againſt the other two.

REPELLENT *Medicines*, are ſuch Things as by ſtopping the Heat and Afflux of Humours, and by ſhutting up the Pores with their cold and binding Qualities, decreaſe the ſwelling of a Part, and drive the Humours another way.

REPETITION, (a Figure in Rhetorick) is when a Perſon thinking his firſt Expreſſion not well underſtood, and is impatient to make his Hearers know what he means, repeats or explains it, another way.

REPLEADER, in Law, is to plead againſt that which was once pleaded before.

REPLEGIARE, ſignifies properly to redeem a Thing detained or taken by another, by putting in legal Sureties. See *Replevin*.

REPLEGIARE *de averiis*, is a Writ brought by one whoſe Cattle are diſtrained, or put in the Pound, upon any Cauſe by another, upon Surety, given to the Sheriff to proſecute or Anſwer the Action in Law.

REPLEVIN, is a Writ that lies where a Man is Diſtrained for Rent or other Thing, then he ſhall have this Writ to the Sheriff, to deliver to him the Diſtreſs, and ſhall find Surety to purſue his Action againſt the Diſtrainer; and if he purſue it not, or if it be found or judged againſt him, then the Diſtrainer ſhall again have the Diſtreſs, and he ſhall have in ſuch Caſe a Writ called, *Returno habendo*. Goods may be replevied two Ways, *viz.* by Writ; and that is by the Common Law; or by Plaint, and that is by Statute Law for the more ſpeedy having again of their Cattle and Goods.

REPLICATION, is an Exception of the ſecond Degree, made by the Plaintiff, upon the firſt Anſwer of the Defendant: It is alſo, that which the Plaintiff replies to the Defendant's Anſwer in Chancery, which is either *General* or *Special*.

The Special is grounded upon Matter ariſing out of the Defendant's Anſwer, *&c.*

The General is ſo called from the general Words therein uſed.

REPORT, in Law, is a publick Relation of Caſes Judicially argued, debated, reſolved, or adjudged, in any of the King's Courts of Juſtice, with the Cauſe and Reaſons of the ſame delivered by the Judges. Alſo when the *Chancery*, or other Court, refer the ſtating of ſome Caſe, or comparing an Account, *&c.* to a Maſter of Chancery, or other Referree, his Certificate therein is called, a Report.

REPRISALIA, the ſame with *Clarigatio*.

REPRISES, is commonly (in Law) taken for Deductions and Duties which are Yearly paid out of a Mannor and Lands, as *Rent-charge*, *Rent-ſeck*, *Penſions*, *Corrodies*, *Annuities*, *Fees of Stewards or Bailiffs*, &c. Wherefore when we ſpeak of the clear Yearly Value of a Mannor, we ſay it is ſo much *per Annum ultra repriſas*, beſides all Repriſes.

REPRIEVE, in Law, is properly to take back, or ſuſpend a Priſoner from the Execution and Proceeding of the Law for that time.

REPTILS, are all thoſe *Creeping Animals* which reſt upon one Part of their Body while they advance the other forward; as *Adders*, *Aſps*, *Snakes*, *Earthworms*, &c.

RESCEIT, is an Admiſſion, or reciving a third Perſon to plead his Right in a Cauſe formerly commenced between other two; as if a Tenant for Life or Years bring an Action, he in the Reverſion comes in, and prays to be received to defend the Land, and to plead with the Demandant. The Civilians call this *Admiſſionem tertii pro ſuo intereſſe*.

Reſceit is alſo applied to an Admittance of Plea, tho' the Controverſy be only between two.

RESCOUS, or *Reſcue*, in Law, is a Reſiſtance againſt lawful Authority; as if a Bailiff, or other Officer, upon a Writ do Arreſt a Man, and others by Violence take him away, or procure his Eſcape, this is a *Reſcous in Fact*: So, if one diſtrain Beaſts for Damage feaſant in his Ground, and as he drives them in the High-way towards the Pound, they enter into the Owner's Houſe, and he withholds them there, and will not deliver them upon Demand, this Detainer is a *Reſcous in Law*. It is alſo uſed for a Writ which lies for this Fact, called *Breve de Reſcuſſu*. *Reſcous*, in Matters relating to Treaſon, is Treaſon; and in Matters concerning Felony, is Felony.

RESCUSSOR, is he that commits ſuch a *Reſcous*.

RESERVATION, in Law, ſignifies a Keeping or Providing; as when a Man lets his Land, he reſerves a Rent to be paid to himſelf for his Maintenance. Sometimes it ſignifies as much as an Exception; as when a Man lets a Houſe, and reſerves

ſerves to himſelf one Room, that Room is excepted out of the Demiſe.

RESIANCE, or *Reſidence*, ſignifies a Man's Abode or Continuance in one Place: And it is all one indeed with *Reſidence*; but that Cuſtom ties this only to Perſons Eccleſiaſtical.

RESIDENCE, is a Word peculiarly uſed both in the Common and Canon-Law, for the Continuance or Abode of a Parſon or Vicar upon his Benefice.

RESIDUAL *Figure*, in Geometry, ſignifies the remaining Figure after Subſtraction of a Leſſer from a greater.

RESIDUAL *Root*, in Mathematicks, is one compoſed of two Parts or Members only connected together with the Sign — : Thus $a - b$, or $5 - 3$, is a *Reſidual Root*; and is ſo called, becauſe its true Value is no more than its *reſidue* or difference between the Parts *a* and *b*.

RESIGNATION, is a Word uſed for the giving up of a Benefice into the Hands of the Ordinary, otherwiſe by the *Canoniſts* termed *Renunciation*: And though it ſignifies all one in Nature with the Word *Surrender*, yet it is by Cuſtom reſtrained to the yielding up a Spiritual Living, and *Surrender* to the giving up of Temporal Lands into the Hands of the Lord.

RESINA, in *Pharmacy* and *Botany*, is a fat and oleaginous Liquor flowing either Spontaneouſly, or elſe let out by Inciſion from any Tree or Plant. It will not diſſolve in Water, but in Oil only, and is eaſily Inflammable.

RESINE, or *Roſine*, of Jalap, Benjamin, Scammony, Turbith, &c. or of any Vegetable which abounds with Roſinous Particles, is thus made in Chymiſtry.

The Vegetable groſly Powdered, is put into a Matraſs, and then well rectified Spirit of Wine is poured on it to the Height of four Fingers above the Matter; then another Matraſs hath its Neck fitted and luted into the former to make a double Veſſel; and thus the Matter is digeſted for 3 or 4 Days in a Sand Heat, or till it hath given a good Tincture to the Spirit of Wine: Then the Diſſolution is filtrated; and two Thirds of the clear Liquor is evaporated off, the Remainder is poured into a large Veſſel of Water, and it will turn into a Milk, and the *Reſine* will in time precipitate to the Bottom in a white Powder. It muſt be waſh'd and dry'd in the Sun, and it will grow hard like common *Roſine*.

RESISTENCE *of the Medium*, is the Oppoſition againſt, or Hindrance of the Motion of any Body moving in a Fluid; as in the Air, the Water, the Æther, &c. And *this*, together with the Gravity of Bodies, is the Cauſe of the Ceſſation of the Motion of Projectiles, &c. This *Reſiſtence*, in Mediums which are very Denſe and Rigorous, ſo that Bodies can there move but very ſlowly, is nearly as the Velocity of the moving Body: But in a Medium free from all ſuch Rigor, as the Squares of the Velocities, *Newt. Princip.* P. 245. For by the Action of a ſwifter Body, there is communicated to the ſame Quantity of the Medium, a greater Motion, in Proportion to that greater Swiftneſs or Velocity; and therefore in an equal Time, (by reaſon of the greater Quantity of the Medium being moved) the Motion will be communicated in a duplicate Ratio: But the Reſiſtance muſt always be as the Motion communicated, becauſe Action and Re-action are equally contrary.

He found alſo the Thing to be true by Experiment, in a Pendulum of 10 Feet in Length; that the Reſiſtence againſt a Globe or Ball moving ſwiftly in our Air, is nearly in a duplicate Ratio of its Velocity: But if it move Slower, a little greater than in that Proportion, P. 339.

He found alſo by making a Leaden Bullet ſwing as a Pendulum in a Veſſel of Water, that the Reſiſtence of Water in Proportion to Air, is as 535 to $\frac{123}{110}$.

Dr. *Wallis* hath an entire Diſcourſe on this Subject in *Phil. Tranſ.* N°. 186, where he premiſes as a *Lemma*, That ſuppoſing all other Things equal, the Reſiſtence of Bodies is always proportionable to the Velocity; ſince in a double Degree of Velocity there is twice as much Air to be moved in the ſame time, &c.

As to the different Reſiſtences which Bodies of different Figures will find in paſſing through any Medium, Sir *Iſ. Newton* proves, *Prop.* 34. *Theor.* 28.

That if a Globe and Cylinder with equal Diameters be moved according to the Direction of the Axis of the Cylinder, that the Globe's Reſiſtence will be but half of the Cylinders.

And in the following Scholium, he ſhews what kind of Figure revolving round an Axis, will generate a Solid that ſhall move in any Medium, with the leaſt Reſiſtence; and gives a Hint of the Uſe that this may be of for *Building of Ships*.

After this, ſeveral Inveſtigations of the Figure of a roundiſh Solid, which ſhould move through a Medium with the leaſt Reſiſtence, were publiſh'd by the Marquis *Hoſpital*, *Bernoulli*, and very briefly and clearly by Mr. *John Craig* in the *Phil. Tranſact.* N. 268. Where he ſolves the Problem, to determine the Curve, by whoſe Rotation round an Axis, a round Solid ſhall be generated, which being moved according to the Direction of that Axis, ſhall have the leaſt Reſiſtence in any Medium.

RES *Naturales*: Natural Things are Three; Health, the Cauſes of Health, and its Effects. Others reckon Seven; as the Elements, Temperaments, Humours, Spirits, Parts, Faculties, Actions: but Elements and Temperaments belong to Natural Philoſophy; Humours, Spirits and Parts, are reckoned amongſt the Cauſes of Health, which conſiſt of a good Temperature, and a due Conformation; Faculties and Actions are comprehended under the Effects of Health. *Blanchard.*

RES *Non-naturales*: Things that are not Natural, are Six; Air, Meat and Drink, Motion and Reſt, Sleeping and Waking, the Affections of the Mind, Things that are let out of, and Things retained in the Body. They are ſo called, becauſe that if they exceed their due Bounds, they often occaſion Diſeaſes. *Blanchard.*

RESOLVEND, a Term in the Extraction of the Square and Cube Roots, &c. ſignifying that Number which ariſes from augmenting the Remainder after Subſtraction, by drawing down the next Square Cube, &c. and writing it after the ſaid Remainder.

RESOLUTION (in Mathematicks) is a Method of Invention, whereby the Truth or Falſhood of a Propoſition, or its Poſſibility or Impoſſibility is diſcover'd, in an Order contrary to that of *Syntheſis*, or Compoſition: For in this Analytical Method, the Propoſition is propoſed as already known, granted, or done; and then the Conſequences thence deducible are Examined, till at laſt you come to

ſome known Truth or Falſhood, or Impoſſibility, whereof that which was propoſed is a neceſſary Conſequence, and from thence juſtly conclude the Truth or Impoſſibility of the Propoſition: Which if true, may then be demonſtrated in a Synthetical Method. This Method of Reſolution conſiſts more in the Judgment, Penetration, and Readineſs of the Enquirer or Artiſt, than in any Particular Rules: Tho' thoſe of Algebra are of neceſſary Uſe, and a good Treaſure of Geometry in his Head will be of great Advantage to him in all Manner of Inveſtigations.

RESORT, or *Reſtort*, is a Law Word, properly uſed in a Writ of Tail of Couſenage, as *Deſcent* is in the Writ of Right.

RESPECTU *computi vice-comitis habendo*, is a Writ for the reſpiting of a Sheriff's Account, upon juſt Occaſion directed to the Treaſurer and Barons of the *Exchequer*.

RESPIRATION, Ἀναπνοή, includes both In-and Expiration, and is an alternate Dilatation and Contraction of the Cheſt, whereby the Air is taken in by the Wind-pipe for the Accenſion of the Blood, and by and by is driven out again with other Vaporous Effluviums. The Cauſe of Reſpiration does not ſeem to conſiſt in the Dilatation and Contraction of the *Thorax*, as is commonly thought, but in the Contraction of the Tunic, which covers the upper Part of the *Oeſophagus* and the Wind-pipe, as far as its cloſeſt Receſſes. *Blanchard.*

There are many Opinions about the Uſes of Reſpiration: Some think the chief, if not the ſole Deſign of it, is to cool and temper the Heat of the Blood, and the Heart.

Others will have the Subſtance of the Air to get by Reſpiration into the Veſſels of the Lungs to the left Ventricle of the Heart; not only thereby to cool the Blood, but alſo help to generate aerial Spirits. This was the Opinion of *Hippocrates*, *Ariſtotle* and *Galen*.

Others take, with more Probability, *Reſpiration* to ſerve for the *Ventilation* of the Blood in the Lungs, in its Paſſage through them, whereby 'tis diſburthened of many Excrementitious Steams and Superfluous Seroſities, which are carried off by the Breath in Expiration; ſo that the Blood may be advantageouſly depurated, by what is carried off by the Emunctory of the Lungs.

In the *Philoſ. Tranſ.* N° 65, there is a very pretty Account of the Cauſe and Manner of Reſpiration, by the Famous *Laur. Bellini*.

RESPITE, a Word uſed in Law, for Delay, Forbearance, or Continuance of Time.

RESPITE *of Homage*, is the Forbearing of *Homage*, which ought firſt of all to be performed by the Tenant that holdeth by *Homage*; and it had the moſt frequent Uſe in ſuch as held by Knight-Service in *Capite*, who did pay into the *Exchequer* every fifth Term, ſome ſmall Sum of Money, to be *reſpited* the doing of their *Homage*. See the *Stat.* 12. *Car.* 2. *cap.* 24. whereby this is taken away as a Charge incident or ariſing from *Knights-Service*.

RESPONSALIS, in Law, he who gives an Anſwer, is he that appears for another in Court at a Day aſſigned: As if *Eſſoigniator* came only to declare the Cauſe of the Parties Abſence, whether Demandant or Tenant; and *Reſponſalis* came for the Tenant, not only to excuſe his Abſence, but alſo ſignify, what Trial he meant to undergo.

REST, in Muſick. See *Pauſe*.

RESTITUTION, the returning of Elaſtical Bodies forcibly bent to their natural State, is called the *Motion of Reſtitution*.

RESTITUTION, in Law, ſignifies the yielding up again, or reſtoring of any Thing unlawfully taken from another: As alſo the ſetting him in Poſſeſſions of Lands or Tenements that hath been unlawfully diſſeiſed of them.

RESTITUTIONE *extracti ab Eccleſia*; is a Writ to reſtore a Man to the Church, which he had recovered for his Sanctuary, being ſuſpected of Felony.

RESTITUTIONE *Temporalium*, is a Writ that lies where a Man being Elected and Confirmed *Biſhop* of any Dioceſe, hath the King's Royal Aſſent thereto for the *Recovery of the Temporalities* or Barony of the ſaid Biſhoprick; and it is directed from the King to the Eſcheator of the County.

RESTRAINT, is when any Action is hindred or ſtopped contrary to Volition or Preference of the Mind.

RESUMMONS, in Law, ſignifies a *Second Summons*, and Calling of a Man to anſwer an Action, where the *Firſt Summons* is defeated upon any Occaſion, as the Death of the Party, or the like.

RESUMPTION, in a large Senſe, ſignifies the taking again into the King's Hands ſuch Lands or Tenements, as before, upon falſe Suggeſtion, or other Error, he had delivered to the Heir, or granted by Letters-Patent to any Man.

RETAINING *Fee*, is the firſt *Fee* given to any Serjeant or Counſellor at Law, whereby to make him ſure that he ſhall not be on the contrary Part.

RETE *Mirabile*. In thoſe Creatures, that have the *Glandula Pituitaria* large, (as in Calves for Inſtance) the two Carotid Arteries meeting about the *Sella* of the Wedge-like Bone, preſently divide themſelves into ſmall Twigs, which being interwoven with (tho' not ſo numerous) Twigs from the internal Jugular Veins, and alſo with nervous Fibres from the larger Trunk of the fifth Pair of Nerves, make on each Side a notable *Plexus*, called *Rete Mirabile*. There enter into this *Rete* ſome Twigs alſo from the Cervical Arteries; and there paſs out of it ſeveral Twigs into the *Glandula Pituitaria*. So that in theſe Creatures that Gland ſeems to be of the ſame Uſe to the *Rete Mirabile*, as the *Glandula Pinealis* is to the *Plexus Choroides*, *viz.* To ſeparate a ſerous Matter from the arterial Blood. But in Man (according to moſt Anatomiſts) this *Rete* is wholly wanting; ſo that there paſſing only ſometimes a Twig or two, and ſometimes none, from the Trunk it ſelf of the Carotid Artery, into the *Glandula Pituitaria*, that Gland is of leſs Uſe in him than in other Creatures that have the *Rete*. Yet Dr *Ridley* affirms, That he never found this *Rete* wanting, or with any Difficulty diſcoverable in Men, ſpringing from, and lying on the Inſide of each Carotid Artery: But confeſſes, that it is far ſmaller in them than in Brutes; for which Difference he thus accounts. Brutes by reaſon of their prone Poſition, would, but for this *Rete*, be in danger of having their Brains deluged as it were with an over-great Quantity of the influent Blood, and of a Rupture of the Veſſels by its violent Ingreſs, and this Danger is ſo much the more threatned, by how much the ſame Cauſe which brings it into the Brain with that Force, is equally as great and effectual to hinder its proportionable

tionable return. For the Relief of which Inconvenience, Nature hath contrived a Means for its more eaſy and ſafe Deſcent into the Brain, by turning that one largeſt Stream of Blood (which through its being pent in one Channel, becomes ſo rapid) into many more, (by which means the Carotid Trunk above the *Dura Mater* in thoſe Creatures, is very ſmall to what it is beneath; whereas that Artery in Men, &c. hath the ſame Bigneſs on both Sides the Membrane) and they not only reticulated and contorted for the more ſlow and laborious Deſcent of the Blood; (which Contrivance the Ancients thought was only for a more exact Preparation of the Blood for Animal Spirits) but alſo many of them by their Inſertion into the *Glandula Pituitaria*, attended with ſmall Veins iſſuing thence, to take off ſome Part of the Burthen too. And that to the aforeſaid Poſition of ſeveral Creatures ought chiefly to be aſcribed the Variety of Magnitude of this *Rete* in ſeveral of them, its Size in *Dogs* ſeems highly to evince; in whom, by reaſon of their Horizontal Poſition, being neither ſo prone as ſeveral Brutes who feed on Graſs, nor ſo erect as Man, this *Rete* is found ſmaller than in the firſt, and larger than in the laſt.

RETENTION, is a Faculty of the Mind, whereby it makes a farther Progreſs towards Knowledge.

RETICULARIS *plexus*, the ſame with *Choroides*

RETICULUM, the ſame with *Omentum*.

RETIFORMIS *plexus*. See *Plexus Retiformis*.

RETIFORMIS *tunica*, is the principal Organ of Sight, being a certain Expanſion of the inner Subſtance of the Optic Nerve in the Eye, which is to the Eye like a whited Wall in a dark Chamber, and receives and repreſents the viſible Species that are let in by a Hole as it were into a darkened Room.

RETINA *tunica*, the ſame with *Retiformis*.

RETIRADE, in Fortification, is a kind of Retrenchment made in the Body of a Baſtion or other Works, which is to be diſputed Inch by Inch, after the firſt Defences are Diſmantled. It uſually conſiſts of two Faces, which make a Re-entring Angle.

RETIRED *Flank*. See *Flank*.

RETORT, is an Inſtrument or Veſſel in Chymiſtry, commonly of this Figure, uſed for Diſtillations of Oils and Volatile Salts, and alſo of Acid Spirits. 'Tis ſometimes made of Glaſs, ſometimes of Earth', and ſometimes of Iron, according to the Nature of the Matter to be Diſtilled, and the Degree of Fire neceſſary to perform the Operation.

Earthen Retorts are beſt for the drawing of Acid Spirits, becauſe they will bear the utmoſt Heat, and not Melt, as Glaſs ones ſometimes do. Therefore when you are forced to uſe a Glaſs Retort in ſo ſtrong a Fire, it muſt be *coated* or covered over with *Lute*. See that Word.

There is alſo another kind of Earthen Retorts, which are flat at the Bottom, and whoſe Noſe or Beak turns upwards, which in great Furnaces are uſed for the Diſtillation of Acid Spirits; and they have Earthen Receivers Luted to them.

RETRACTORES *Alarum Naſi, & Elevatores Labii Superioris*: Theſe Muſcles ariſe broad and fleſhy from the fourth Bone of the Upper Jaw, whence deſcending obliquely, they are ſoon inſerted to the Upper Lip, and *Alæ Naſi*. Their Name ſhews their Uſe is to lift up the Noſe and Upper Lip.

RETRAHENS *Auriculam*, is a Muſcle by ſome called *Triceps Auris*, becauſe it has ſometimes 3 Beginnings. *M. du Verney* ſays it is compoſed of five or ſix fleſhy Fibres, which have their Origination from the Superior and Forepart of the *Apophyſis Maſtoides*, and deſcend obliquely to their Inſertion in the Middle of the *Concha Auriculæ*.

RETRENCHMENT, in Fortification, is a Ditch bordered with its Parapet, and ſecur'd with Gabions or Bavins laden with Earth. It is ſometimes taken for a ſimple *Retirade* in Part of the *Rampart*, when the Enemy is ſo far advanced, that he is no longer to be Reſiſted, or beaten from the firſt Poſt.

RETROCESSION of the Equinoxes, is the Annual going backward of the Equinoctial Points about 50 Seconds. See *Equinoxes*.

RETROGRADE, in Aſtronomy, is uſually appropriated to the Planets, when by their proper Motion in the Zodiack, they move backward or contrary to the Succeſſion of the Signs: As from the ſecond Degree of *Aries* to the firſt, &c. But this Retrogradation is only apparent, and occaſioned by the Obſerver's Eye being placed on the Earth: For to an Eye at the Sun, the Planet will appear always Direct, and never either Stationary or Retrograde.

RETURN, in Law, hath two ſeveral Applications: The one is the *Return* of Writs by Sheriffs and Bayliffs, which is only a Certificate made to the Court, of that which he hath done touching the Execution of their Writ directed to him. And this among the *Civilians* is termed *Certificatorium*: Of *Returns* in this Signification ſpeaks the Statute of *Weſtmin.* 2 *Cap.* 39. So is the *Return* of a Commiſſion, a Certificate or Anſwer to the Court, of that which is done by the Commiſſioners, Sheriffs, or other, to whom ſuch Writs, Commiſſions, Precepts or Mandates are directed. Alſo, certain Days in every Term are called *Return Days*, or Days in Bank; and ſo *Hilary* Term hath four *Returns*, viz. *Octabis Hilarii*, *Quindena Hilarii*, *Craſtino Purificationis & Octabis Purificationis*. *Eaſter* Term hath Five, *viz. Quindena Paſchæ*, *Tres Paſchæ*, *Menſe Paſchæ*, *Quinq. Paſchæ*, and *Craſtino Aſcenſionis Domini*. *Trinity* Term hath Four, *Craſtino Trinitatis*, *Octabis Trinitatis*, *Quindena Trinitatis*, *Tres Trinitatis*; and *Michaelmas* Term Six, *viz. Tres Michaelis*, *Menſe Michaelis*, *Craſtino Animarum*, *Craſtino Martini*, *Octabis Martini*, *Quindena Martini*. The other Application of this Word is in Caſe of *Replevin*; for if a Man Diſtrain Cattle for Rent, &c. and afterwards juſtify or avow his Act, ſo as it is found lawful, the Cattle before delivered unto him that was deſtrained, upon Security given to follow the Action, ſhall now be *returned* to him that diſtrained them.

RETURNO *habendo*, is a Writ that lies upon him that has avowed a Diſtreſs made of Cattle, and proved his Diſtreſs to be lawfully taken, for *returning* to him the Cattle diſtrained, which before were *replevied* by the Party diſtrained, upon Surety given to Proſecute the Action; or when the Plaint or Action is removed by *Recordari*, or *Accedas ad Curiam*, into the Court of *Common Pleas*, and he whoſe Cattle were diſtrained makes default, and doth not proſecute his Suit.

RETURNUM *averiorum*, is a Writ Judicial, granted to one Impleaded for the taking the Cattle of another, and unjuſt detaining them *contra Vadium & Plegios*, and appearing upon Summons, and is diſmiſſed without Day, becauſe the Plantiff makes Default; and it lies for the *return* of the Cattle to the Defendant, whereby he was Summoned, or which were taken for Security of his Appearance upon the Summons.

RETURNUM *irreplegiabile*, is a Writ Judicial, ſent out of the *Common-Pleas* to the Sheriff, for the final Reſtitution or *return* of Cattle to the Owner, unjuſtly taken by another, as *Damage-feaſant*, and ſo found by the Jury before Juſtices of Aſſize in the Countrey, or otherwiſe by Default of Proſecution.

REVENUE, ſignifies properly the Rent that accrues to every Man from his Lands and Poſſeſſions.

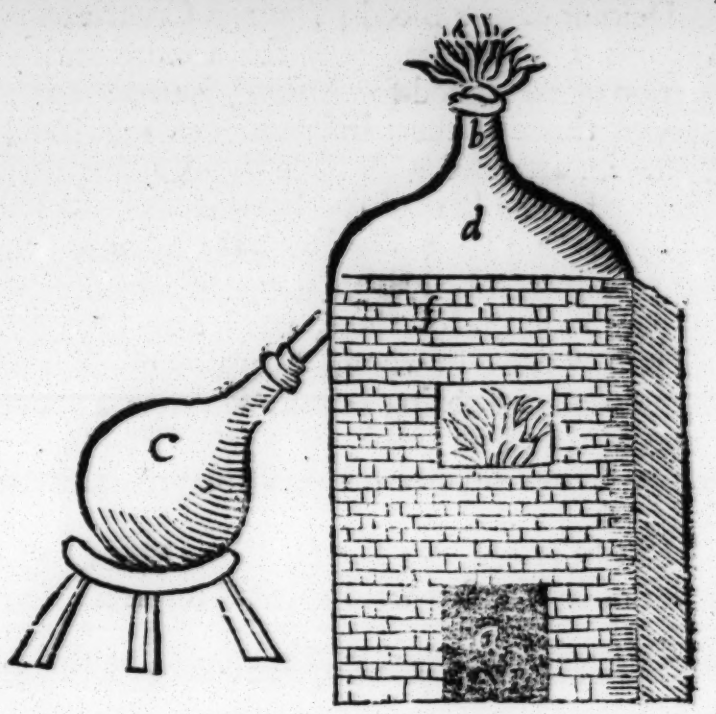
REVERBERATE: The Word ſignifies properly to ſtrike, reflect, or beat back again. The Chymiſts ſay, *Make the Flame* reverberate *on the Coppel.* That is, Let either the Flame of the Wood be ſo blown with the Bellows, as that it may be beaten back down on the Metal; or elſe make the Sides of the Furnace ſo cloſe all about, that the Flame ſtriking againſt its Sides, may be beat back again down on the Matter to be melted. For which latter Purpoſe they have a Particular Furnace called the

REVERBERATORY *Furnace*; which is a ſtrong fix'd Furnace of two Bricks thickneſs, and muſt be large enough to hold a Retort, or more than one, for the Diſtillation of Acid Spirits, and other Things. The Mortar or Lute for ſuch a Furnace is uſually one Part Potters Earth, as much Horſe-dung, and two Parts of common Sand kneaded in Water. The Aſh-hole muſt be about a Foot high, and the Door contrived, if poſſible, ſo as that the Air may come freely to it, to light the Fire the more eaſily, or to increaſe the Flame. The Fire-place need not be quite ſo high: At the top of it are two Iron Bars placed croſs-wiſe, to ſet the *Retort* on; and then the Furnace is rais'd about a Foot higher, to cover or cloſe the *Retort:* Then is there fitted to this a *Dome* or Cover with its Chimney, which is ſet on the top of the Dome on a little Hole, which when the Chimney is not uſed, hath a Stopple to it. This Dome may be made of the ſame Paſte that portable Furnaces are uſually made of; which ſee under *Furnaces.*

And one may make according to his Fancy, Room, or Convenience, a Furnace of this Kind; and there is no need of keeping exactly to this Form, eſpecially as to the Dome, which in a large Reverberatory may be made with Tiles or Bricks placed over the Retorts, and plaiſtered over with a Lute made of Aſhes, melted with common Water.

Here follows the Figure of Mr. *Lemery*'s Reverberatory, which will ſerve to give an Idea of the former Deſcription.

a The Aſh-hole.
e The Fire-Place.
d The Dome or Cover.
b The Chimney.
c The Receiver.
f The Retort.



Such a Furnace as this, will alſo ſerve for many Uſes, as well as Diſtilling *per Reverberium*: as to Diſtil with the *Refrigeratory*, in *Balneo*, &c. for the Copper Body may be placed on the Bars, and the Veſſel holding the Water, Sand, Aſhes, &c. as a little Practice will ſoon teach the Young Chymiſt.

REVERSED *Talon.* See *Talon.*

REVERSION, in Law, hath a double *Acceptation*, one is, *Jus revertendi cum ſtatus poſſeſſionis defecerit*, and this is but an Intereſt in the Land, when the Poſſeſſion ſhall fall.

Secondly, When the Poſſeſſion and Eſtate which was parted with for a Time, ceaſeth, and is determined in the Perſons of the Alienees, Aſſignees, Grantees, or their Heirs, or effectually returns to the Donor, his Heirs or Aſſigns whence it was derived.

The Difference between a *Reverſion*, and a *Remainder*, is, that a *Remainder* is general, and may remain to any Man, but to him that granteth or conveyeth the Land, &c. for Term of Life only, or otherwiſe. A *Reverſion* is to himſelf, from whom the Conveyance of the Land, &c. proceeded, and is commonly perpetual, as to his Heirs alſo. And yet ſometimes *Reverſion* is confounded with *Remainder.*

REVIEW, *A Bill of Review in Chancery*, is where a Cauſe hath been heard, and the Decree ſigned and enrolled; and ſome Error in Law appears upon the Decree made, which Bill cannot be exhibited, but by Licenſe of the Court.

REVIVE, when any mix'd Body is reſtored again to its Natural Form and Condition, from out of the Diſguiſes it was in, by being mixed with ſome other Body, they ſay it is *Revived.*

Thus when Mercury is diſtilled from Cinnabar, they call it Mercury revived from Cinnabar: becauſe the Mercury was made into Cinnabar only for ſafety and convenience of its being carried from Place to Place. See *Mercury.*

Bill of REVIVER, is where a Bill hath been exhibited in *Chancery*, againſt one who anſwers, and before the Cauſe is heard, or if heard, before the Decree enrolled, either Party dies: In this caſe a *Bill of Reviver* muſt be brought, that the former Proceedings may ſtand revived, and the Cauſe be finally determined.

REVIVING, in Law, ſignifies a renewing of Rents and Actions after they be extinguiſhed.

REVOLUTION, in Aſtronomy, is the Circulation of any Celeſtial Body, till it return to the ſame Point in which it was when it firſt began to move. But,

REVOLUTION, or as ſome call it, The *Reſtitution* of the *Anomaly*, is the Return of a Planet to any one Point of its Eccentricks, after it hath parted from it.

REVULSORIA, *V. S.* is whereby the Blood that guſhes upon one part, is diverted a contrary way, by opening of a Vein in a remote and convenient place. This our Surgeons call frequently Bleeding for a *Revulſion*.

RHABDOLOGY, is the Art of computing or numbering by thoſe Rods, commonly called *Neper's Bones*; which ſee.

RHACHITIS, is according to ſome, the Spinal Marrow; (which ſee in its proper place:) Alſo a Diſeaſe common amongſt the *Engliſh*, which is an unequal Nouriſhment of the Body, accompanied with Looſeneſs of Parts, Softneſs, Weakneſs, Faintneſs, Drowſineſs, a great ſwelling Head, with Leanneſs below the Head; with Protuberances about the Joints, crookedneſs of Bones, ſtraitneſs of the Breaſt, ſwelling of the *Abdomen*, ſtretching of the *Hypochondres*, a Cough, &c. The *Engliſh* call it the Rickets: But becauſe the occaſion of it often lies in the Spinal Marrow, the Famous *Glyſſon* calls it appoſitely enough *Rhachitis*. *Blanchard.*

RHAGADES, the *Latins* ſay *Sciſſuræ*, *Fiſſuræ*, *Rimæ*, Chinks, Clefts, which as they happen in other parts of the Body, Hands, Feet, Lips, the entrance of the Womb; ſo they may happen in the Fundament, in the Extremity of the Gut *Rectum*, and in the Sphincter, or Muſcle which cloſes the Fundament. *Rhagades* in the Fundament are certain oblong little Ulcers, without ſwelling, like thoſe which are ſometimes occaſioned in the Hands by great Cold. Some are ſuperficial, others deep: Some are not hard nor callous, others are: Some are moiſt, and ſend forth Matter, others dry and cancrous. *Blanchard.*

RHEGMA, is a breaking forth or burſting of any part, as of a Bone, the inner Rind of the Belly, the Eye, &c.

RHEUMATISM, is a wandring Pain in the Body, often accompanied with a ſmall Fever, Swelling, Inflammation, &c. *Blanchard.*

RHEXIS, the ſame with *Rhegma*.

RHINENCHYTES, is a little Syringe to inject Medicines into the Noſtrils.

RHOMBE *Solid*, is two equal and right Cones joined together at their Baſes.

RHOMBOIDES, ſo called from its Figure, is a pair of Muſcles of the Scapula, proceeding from the two lowermoſt Vertebres of the Neck, and from the four upper Spinal Proceſſes of the Vertebres of the Back: By and by they deſcend obliquely, and being fleſhy at the beginning and end, go as far as the Baſis of the Shoulder-blade, which they move backward and obliquely upward: It adheres ſtrongly to its Subjacent Muſcle the *Serratus Superior Poſticus*.

RHOMBOIDES, a Figure in Geometry. See *Quadrilateral* Figures.

RHOMBUS. See *Quadrilateral Figures*.

RHUMBS. See *Rumbs*.

RHYOS, a Diſeaſe of the Eyes, cauſed by a conſuming or diminiſhing of the Caruncle, or ſmall piece of Fleſh in the great corner of the Eye, ſo that it can no longer contain its Liquor. *Blanchard.*

RHYPTICA are Scouring Medicines which cleanſe away Filth. *Blanchard.*

RHYTHMUS, is a certain Proportion of Pulſes, Time, Life, Age, &c. *Blanchard.*

RIBBON, a Term in Heraldry, ſignifying the eighth part of a Bend; it is born a little cut off from the out-lines of the Eſcutcheon, thus.

He beareth *Or*, a *Ribbon Gules*.

RIBBS of a Ship, are the Timbers of the Puttocks when the Planks are off; ſo called, becauſe they are bending like the Ribs of a Carcaſe.

Thoſe little long wooden Pieces alſo which belong to the Parrels of the Yards, and have holes in them like the Comb under the Beak-head, are called the Ribbs of the Parrels.

Ride, a Ship is ſaid to Ride, when her Anchors hold her faſt, ſo that ſhe drives not away by the force of the Wind or Tide; and a Ship is ſaid to Ride well, when ſhe is built ſo that ſhe doth not over beat her ſelf into a Head Sea, as that the Waves over-rake her, (that is over-waſh her) from Stern to Stern. They ſay alſo a Ship

RIDES a-croſs, when ſhe Rides with her Main-yards and Fore-yards hoiſted up to the Hounds; and both Yards and Arms topped alike. She is ſaid to

Ride a *Peek*, when one end of the Yard is peeked up, and the other hangs down: And this is alſo ſaid of a Ship, when in Weighing ſhe is brought directly over her Anchor. She is ſaid to

RIDE *Athwart*, when her Side is to the Tide. And to

RIDE *betwixt Wind and Tide*, when the Wind hath equal force over her one way, and the Tide another; but if the Wind hath more Power over her than the Tide, ſhe is ſaid to *Ride Wind Rode*. She is ſaid to

RIDE *Hawſeful*, when in a Streſs of Weather ſhe falls ſo deep into the Sea with her Head, that Water runs in at her *Hawſes*. She is ſaid to

RIDE *Portiſe*, when her Yards are ſtruck upon the Deck, or when they are down *Aportlaſt*.

RIDEAU, in Fortification, is a Ditch, the Earth whereof is raiſed on its Side, or a ſmall elevation of Earth, extending it ſelf in length on a Plain, which ſerves to cover a Poſt, being alſo very convenient for thoſe that would beſiege a Place at a near diſtance; and to ſecure the Workmen in their Approaches to the Fort of a Fortreſs.

RIDERS in a Ship, are great Timbers both in the Hold and alſo Aloft, which are bolted on to other Timbers to ſtrengthen them, when 'tis diſcovered a Ship is too weakly built.

RIENS *Arreare*, is a kind of Plea uſed to an Action of Debt upon *Arrearages* of Account, whereby the Defendant does alledge, There is *nothing in Arrear*.

RIENS *paſſe par le fait*, is the Form of an Exception taken in ſome Caſes to an Action.

RIENS *per deſcent*, is a Form of Pleading when an Heir is ſued for a Debt of his Anceſtor, and he hath no Aſſetts in his Hand, nor any Lands liable to be extended.

RIGGING of a Ship, is all her Ropes whatſoever belonging to her Maſts or Yards, or any Part about her.

A Ship is well Rigged, when all her Ropes are of their fit ſize in proportion to her Burden. She is ſaid to be over-rigged when her Ropes are too big for her; which wrongs her much in her Sailing, and is apt to make her *Heel*.

RIGHT, in Law, ſignifies not only a Right for which a *Writ of Right* lies; but alſo any Title or Claim, either by vertue of a Condition, Mortgage, or the like, for which no Action is given by Law, but only an Entry.

Thus is *Jus Proprietatis*, a Right of Propriety: *Jus Poſſeſſionis*, a Right of Poſſeſſion: And *Jus Proprietatis & Poſſeſſionis*, a Right both of Property and Poſſeſſion, and this was formerly called, *Jus duplicatum:* As if a Man be diſſeiſed of an Acre of Land, the Diſſeiſee hath *Jus Proprietatis*; the Diſſeiſor hath *Jus Poſſeſſionis*, and if the Diſſeiſee releaſe to the Diſſeiſor, he hath *Jus Proprietatis & Poſſeſſionis.*

Right-*angled*, a Figure is ſaid to be Right-angled, when its Sides are at Right-angles, or ſtand Perpendicularly one upon another: And this is ſometimes in all Angles of the Figures, as in Squares and Rect-angles: Sometimes only in part, as in Right-angled Tri-angles.

Right-*angled Tri-angle.* See *Tri-angle.*

Right-*Angles.* See *Angles.*

RIGHT-*aſcenſion*, of the Sun or Star, is that Degree of the *Equinoctial*, accounted from the beginning of *Aries*, which riſeth with it in a *Right Sphere.*

Or, it's that Degree and Minute of the Equinoctial (counted as before) which cometh to the Meridian, with the Sun or Stars, or with any Point of the Heavens. The reaſon of which referring it to the Meridian, is becauſe that is always at Right Angles to the Equinoctial; when the Horizon only is in a Right or Direct Sphere.

To find the Sun's or Star's *Right Aſcenſion*, by the *Globe.*

Bring the Sun's or Star's Place to the Meridian, and the Number of Degrees intercepted between the beginning of *Aries*, and that Degree of the Equinoctial which comes to the Meridian, is the *Right Aſcenſion*, if required in Time: Account every 15 Degrees to be an Hour, and every Degree to be 4 Minutes.

To find the Sun's Right Aſcenſion *Trigonometrically; having his* greateſt Declination *and* Diſtance *from the next* Equinoctial Point *given; ſay,*

As Radius is to the Co-ſine of the Sun's *greateſt Declination* :: So is the Tangent of his Diſtance *from the next* Equinoctial Point to the Tangent of the *Right Aſcenſion.*

Example.

Let the Sun's Diſtance from the next Equinoctial Point be 30 Degrees 00 Minutes; his greateſt Declination be 23 Degrees 30 Minutes.

Then to the Co-ſine of 23° 30′	9. 962398
Add the Tangent of 30° 00′	9. 761439
Sum leſs Radius is the Tan. of 27° 53′	19. 723837

Which is the *Right Aſcenſion* required.

The ſame may be alſo found, by having the preſent Declination, (ſuppoſe 11 Degrees 30 Minutes) and the greateſt Declination 23 Degrees 30 Minutes given.

For, *As the Tangent of the Sun's greateſt Declination, is to the Tangent of his preſent Declination :: So is the Radius to the Sine of his Right Aſcenſion.*

The Operation ſtands thus:

To the Ar. co. of the Tan. of 23° 30′	0. 361698
Add the Tangent of 11° 30′	9. 308463
Sum adding the Radius = S. 27° 53′	19. 670161

RIGHT or *Direct Sphere*, is that which has the Poles of the World in its Horizon, and the Equator in the Zenith: The Conſequences of living under ſuch a Poſition, (as thoſe who live directly under the Line are in) is that they have no Latitude, nor Elevation of the Pole. They can ſee nearly both Poles of the World; all the Stars do Riſe, Culminate, and ſet with them. And the Sun always riſes and deſcends at Right Angles to their Horizon, and makes their Days and Nights even; becauſe the Horizon biſſects the Circle of his Diurnal Revolution.

To find the Right Aſcenſion of a Planet, or Star that hath Latitude, uſe this Proportion.

As Co-ſine of the Stars Declination is to the Co-ſine of its Diſtance from the next Equinoctial Point :: So is the Co-ſine of its Latitude, to the Co-ſine of its Right Aſcenſion.

RIGHT *the Helm*, a Sea Phraſe, uſed by him that *Conds* to the Man at Helm, ordering him to keep the Helm even with the Middle of the Ship.

RIGHT *Line*, is the neareſt Diſtance between any two Points. See *Line.*

RIGHT *Muſcles* of the Head. See *Rectus Internus Major & Minor.*

RIGHT *Sailing*, is when a Voyage is perform'd on ſome one of the four *Cardinal Points.*

If a Ship ſail under the Meridian; that is, on the North or South Points, ſhe varieth not in Longitude at all; but only changeth the Latitude, and that juſt ſo much as the Number of Degrees ſhe hath run.

If a Ship ſail under the Equinoctial, upon the very Eaſt or Weſt Points, ſhe altereth not her Latitude at all, but only changeth the Longitude, and that juſt ſo much as the number of Degrees ſhe hath run. If the Ship ſail directly Eaſt or Weſt under any Parallel, ſhe there alſo altereth not her Latitude, but only the Longitude; yet not according to the Number of Degrees of a great Circle ſhe hath ſailed, as under the Equinoctial; but more

more than ſo many, according as the Parallel is remoter from the Equinoctial towards the Pole: For the leſs any Parallel is, the greater is the Difference of Longitude.

RIGHT *Sine*, the ſame with *Sine*; which ſee.

RIGOR, is a Vibration and Concuſſion of the Skin, and Muſcles of the whole Body, accompanied with Chilneſs.

RIGOROUS way of explicating Rarefaction is, as it is called by the Moderns, that which is made uſe of in the Peripatetick School; which ſee under *Rarefaction*.

RIM, in a Watch or Clock, is the Circular part of the Balance thereof.

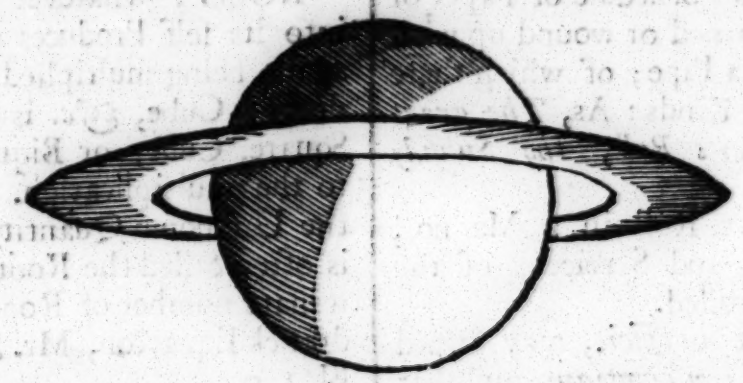
RING *Dial.* See *Univerſal Equinoctial Dial.*

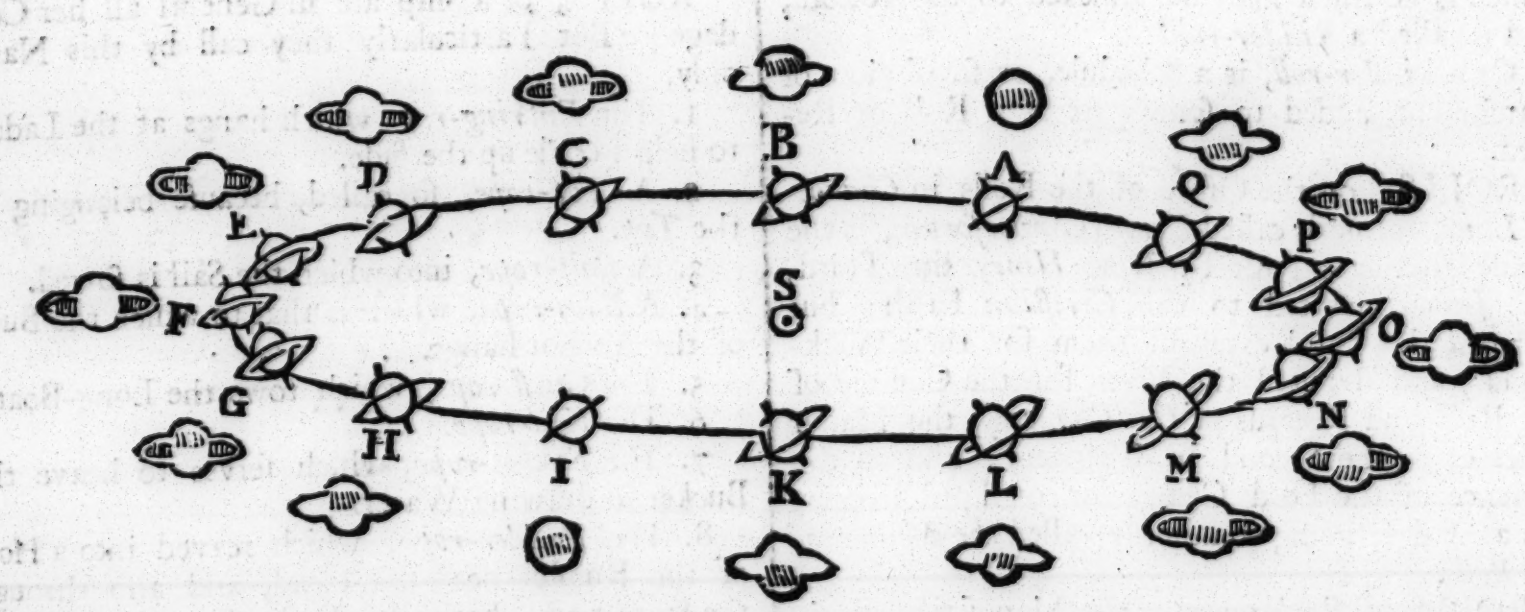
RING of *Saturn* is an Opacous Solid, Circular Arch and Plane, like the Horizon of a Globe, of Matter entirely encompaſſing round the Planet, and no where touching it; its Plane is at this Time nearly parallel to the Plane of our Earth's Equator: The Diameter of this Ring is 2 $\frac{1}{4}$ of *Saturn*'s Diameters, and the Diſtance of the Ring from the Planet, is about the breadth of the Ring it ſelf.

Galileus firſt diſcovered the Figure of *Saturn* not to be round; but that the Inequality was thus in the Form of a Ring, Mr. *Hugens* firſt found out and publiſhed in his *Syſtema Saturniana*, 1659. 'Tis this Ring, and its various Poſitions in reſpect of the Sun, (whoſe Light it reflects like the Body of *Saturn* it ſelf) and of the Eye of the Spectator, which occaſions all the various Appearances of *Saturn* with his *Anſæ* (as they call them) or with none, with broad, or narrow ones, &c.

The following Figures which I borrowed from Dr. *Gregory*'s Aſtronomy, will very well illuſtrate this Matter.

The firſt is a ſingle Figure of the Planet, when his Ring is moſt viſible: And the ſecond explains the ſeveral Phænomena of the Ring in all its Poſitions, in reſpect of the Sun at S. during the Planet's entire Revolution round the Sun. When the Planet is at A or I, the Ring is ſcarce viſible, becauſe the Sun's Rays running almoſt parallel to it, can illuminate it but very ſparingly. But when *Saturn* is at E. or N. then the Sun's Rays falling almoſt directly upon the Ring, do render it moſt of all conſpicuous.





RIOT, in Law, ſignifies the forcible doing of an unlawful thing, by three or more Perſons aſſembled together for that purpoſe.

RISING of the Sun or Star, is their appearing above the Horizon.

The *Riſing of the Sun* may be found by the Globe; thus.

Firſt rectify the Globe (which Word ſee;) then bring the Sun's Place to the Eaſt part of the Horizon; and the Hour Index will ſhew the Time either before or after Six.

The Time of the Sun's Riſing doubled, gives the Length of the Day.

The *Riſing of any Star*, may be thus found by the Globe.

Rectify your Globe and Hour Index; bring the Star to the Eaſt, and the Index will ſhew the Time of the Star's Riſing.

Riſing *Timbers* in a Ship, are the Hooks placed on her Keel; and are ſo called, becauſe as theſe riſe in Proportion, ſo her Rake and her Run riſe on her flat Floor by degrees.

The

The RISINGS in a Ship, are thoſe thick Planks which go fore and aft, on both Sides under the End of the Beams and Timbers of the Second Deck unto the third Deck, half Deck, and quarter Deck; and on them the Beams and Timbers of the Deck do bear at both ends by the Ship's ſide.

RISUS *Sardonius*, is a Contraction of each Jaw, or a Convulſive kind of Grinning, cauſed by a Contraction of the Muſcles on both ſides of the Mouth. *Blanchard.*

RIVERS and *Springs*; whence they ariſe, ſee under the Word *Vapour*.

A Road, is in any place near the Land where the Ships may Ride at Anchor, and a Ship riding there is called a Roader.

ROB. See *Apochyliſma*.

ROBBINS in a Ship, are thoſe ſmall Lines which make the Sail faſt to the Yards, being reeved into Evlet-holes in the Sail under the Head-rope, for that purpoſe. The Word is, *Make faſt the Robbins*: For at Sea they don't ſay *tie*, but *make faſt*.

ROD, a Meaſure of Length containing by Statute juſt 16 ½ Feet *Engliſh*. See *Pole*. This muſt carefully be diſtinguiſhed from *Rood*, which is a Square Meaſure containing the fourth part of an Acre.

ROLL, in Law, ſignifies a Schedule of Paper or Parchment, which may be turned or wound up with the Hand to the Faſhion of a Pipe; of which there are in the Exchequer ſeveral Kinds: As, *The great Wardrobe Roll*, *the Cofferer's Roll*, *the Subſidy Roll*, &c.

Roll *of Court*, the Court Roll in a Mannor, wherein the Names, Rents, and Services, of the Tenants were copied and enrolled.

RIDDER-*roll*; the Court *ex officio*, may award a *Certiorari ad informandam conſcientiam*; and that which is certified ſhall be annexed to the Record, and is called a *Ridder-roll*.

Or a *Ridder-roll*, is a Schedule, or ſmall piece of Parchment, added to ſome part of a Roll or Record.

ROLLS, or the Office of the Rolls in *Chancery-Lane*, formerly called *Domus Converſorum*, is the Houſe that was built by King *Henry* the Third, for *Jews* converted to the *Chriſtian* Faith; but *Edward* the Third expulſed them for their Wickedneſs, and deputed the Place for the Cuſtody of the Rolls and Records of the *Chancery*, the Maſter whereof is the Second in Chancery, and in the Abſence of the Lord Chancellor or Lord Keeper, ſits as Judge, being commonly called *the Maſter of the Rolls*.

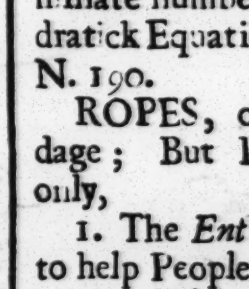
ROLLS *of Parliament*, the Manuſcript Regiſters or Rolls of the Proceedings of our old Parliaments. For before the uſe of Printing, and till the Reign of *Henry* the Seventh, our Statutes were all engroſs'd in Parchment, and (by vertue of the King's Writ to that purpoſe) proclaimed openly in every County.

In theſe Rolls we have a great many deciſions of difficult Points in Law, which were frequently in former times referred to the Determination of this Supreme Court, by the Inferior ones of both Benches, &c.

ROMAN *Indiction*. See *Indiction*.

ROMAN *Order of Architecture*, is the ſame with the *Compoſite*. 'Twas invented by the *Romans* in the Time of *Auguſtus*, and ſet above all the others, to ſhew (ſay ſome) that the *Romans* were Lords over all other Nations: 'Tis made made up of the *Ionick*, and *Corinthian Orders*, and is more Ornamental than either.

ROMPEE, in Heraldry, they call a Chevron ſo, when it is born of this Figure.



He beareth *a Chevron Rompee, between three Mullets, Or, by the Name of Sault.*

RONDEL, in Fortification, is a Round Tower ſometimes erected at the Foot of the Baſtions.

ROOD, a Square Meaſure containing juſt a Quarter of an Acre of Land: Some confound this Meaſure with a *Rod*, which is the Length of 16 ½ Feet; and others with a Yard Land, or the *Quartona Terræ*, but both very erroneouſly.

A *Rood* is ſometimes called a *Farthendele*.

ROOF-*trees*, or *Ruff-trees*, are the Timbers in a Ship, which go from the *Half-Deck* to the *Fore-Caſtle*: They ſerve to bear up the Gratings, and are ſupported by *Stanchions*. Alſo that Piece of Timber which on Occaſion is laid over the *Half-Deck* to bear up Nettings, Sails, or Pieces of Canvaſs, is called a *Roof-tree*.

ROOT, whatever Quantity being multiplied into its ſelf Produces a Square, and that Square again being multiplied by that firſt Quantity Produces a Cube, &c. is called a *Root*, as either the Square, Cube, or Biquadrate *Root*, &c. according to the multiplication. See *Square*, *Cube*, &c. Alſo the Unknown Quantity in an Algebraick Equation is often called the Root. And what are the Determinate number of Roots in any Cubick, or Biquadratick Equation, Mr. *Halley* ſhews in *Philoſ. Tranſ.* N. 190.

ROPES, of a Ship are in General all her Cordage; But Particularly they call by this Name only,

1. The *Entring-rope* which hangs at the Ladder to help People up the Side.

2. A *Top-rope*, ſo called, becauſe belonging to the *Top*.

3. A *Bolt-rope*, into which the Sail is ſowed.

4. A *Buoy-rope*, which is that to which the Buoy of the Anchor hangs.

5. The *Gueſt rope*, which tows the Long-Boat.

6. The *Keel-rope*.

7. The *Bucket-rope*, which ſerves to heave the Bucket in drawing Water.

8. The *Rudder-rope*, which reaved into a Hole of the Rudder near the Head, and alſo through the Stern-poſt, both the Ends thereof are ſpliced together, ſerving to ſave the Rudder, if by any Accident it ſhould be beaten off.

Alſo the *Preventer-rope*, which is a ſmall Rope, ſeized croſs over the Ties, cloſe at the Ram-head; ſo that if any one part of the Tie ſhould be broke, yet the Remainder ſhould not run through the Ram-head, to endanger the Yard.

There is alſo a Rope called a *Breaſt-rope*, which Laſhes the Parrels to the Maſts.

And another called the *Guy-rope*, which is reeved through a Block, faſtned by a Strop, to the Head of the Fore-maſt, and having its end faſtened to the Strop of the Winding Tackle, to bowſe it forwards, that it may plumb directly over the Hatch Way.

And there is also a *Boat-rope*, by which the Boat hangs, or is fastened a Stern of the Ship.

ROPE *yarn*, is the Yarn of any Rope untwisted: 'Tis commonly made of Cable Ends which are Worn out, which are called Junks of the Cables: The Use of it is to serve small Ropes, to make Sinnet Matts, *&c.* also to make Knettles, which are 2 of these Rope Yarns, untwisted, together: Also it helps to make Caburns, *i. e.* Lines to bind Cables withal; and to fasten the Sails to the Yard Arms, *&c.*

RORIFERUS *Ductus*, the same that *Ductus Chyliferus*.

ROS, in the Account of the Ancients, was the First Moisture that falls from the Extremities of the Vessels, and is dispersed upon the Substance of the Members. *Ros*, says *Galen*, is a Third sort of Moisture whereby the Parts of our Body are nourished, and is contained in all the Parts of an Animal, like a certain Dew sprinkled upon them. *Blanchard.*

ROS *Vitrioli*, according to *Ang. Sala*, is the first Phlegm or Water that is distilled from Vitriol in *Balneo Mariæ*.

ROSA, the same that *Erysipelas*.

ROSIMES, of Vegetables how made. See *Resine*.

ROSTRIFORMIS *Processus*. See *Coracoides*.

ROSTRUM, in Chymistry, is the Nose of an Alembick.

ROTA *Aristotelica*, is the Consideration of a Wheel moving along a Plain, till it hath made one entire revolution: For then will its Centre have described a Line equal to that of the Circumference of the Wheel, and so will all lesser Concentrical Circles. See *an Explication of this* in *Boyle* against *Linus*.

ROTATOR *Femoris Extrorsum*. See *Obturator Externus*.

ROTATOR *Major & Minor*, are two *Apophyses* in the upper Part of the Thigh-Bone, called *Trichanteres*, in which the Tendons of many Muscles are terminated.

ROTULA, the same that *Mola genu*.

ROTULÆ, See *Tabellæ*.

ROTUNDUS, *(Sc. Musculus)* is a Muscle of the Radius, serving to turn the Palm of the Hand downwards.

ROUND, is a Military Term, signifying a Walk or Turn, which an Officer attended with a Few Soldiers, takes in a Garrison or Fortifi'd Place during the Night, to observe whether the Centries do their Duty, or not.

ROUND-*house*, is the uppermost Room or Cabbin on the Stern of the Ship where the Master lies.

ROUND-*in*, or *Round-aft*, a Term at Sea belonging to the Main and Fore-sail: When the Wind largeth, they say, *Let rise the Main-tacks, or the Fore-tacks! Hale aft the Fore-sheet to the Cat-head; and the Main-sheet to the Cubbridge-head!* And when these Sheets are thus haled down they keep them from flying up with the *Passarado-rope*. This Work is called, *rounding in, or rounding aft* the Sail.

ROWLE in a Ship, is a round piece of Wood or Iron, wherein the Whip goes, being made to turn about, that it may carry over the Whip the easier from side to side.

ROWSE *in the Cable, or Rowse in the Hawser*, is a Word of Command at Sea, when a Cable or Hawser lies too slack in the Water, and they would have it be made more *taught*; lest on the turning of the Tide, the Cable should happen to be foul of the Anchor.

ROYAL *Assent*, is that *Assent* which the King gives to a thing formerly done by others, to the Election of a Bishop by Dean and Chapter; which given, then he sends a Special Writ for the taking of *Fealty*.

And also to a Bill passed in both Houses of Parliament; which *Assent*, in Parliament, being once given, the Bill is endorsed with these Words, *Le Roy le veult*, i. e. *It pleases the King*: But if he refuses to agree to it, then thus; *Le Roy S' aviser a*, i. e. *The King will Advise*.

ROYAL *Fort*. See *Fort*.

ROYAL *Parapet*, or, *Parapet of the Rampire*, in Fortification, is a Bank about three Fathoms broad, and six Foot high, placed upon the Brink of the *Rampire*, towards the Country, to cover those who defend the *Rampire*.

RUBIGO, or *Mildew*, is a Disease happening to *Plants*, caused by a *Dewy Moisture* which falling upon them, and continuing there for want of sufficient Heat of the Sun to draw it up, doth by it's Sharpness, or Acrimony, scorch and corrupt the Inmost Substance of the *Plant*.

RUBRICA. See *Impetigo*.

RUCTATION, or Belching, is a depraved Motion of the Stomach, occasioned by an Effervescence there, whereby Vapours and Flatulent Matter are sent out at the Mouth *Blanchard*.

RUDDER of a Ship, is a Piece of Timber hung on the Stern-posts by 4 or 5 Iron Hooks (called *Pintles*) and is as it were the Bridle of a Ship; because by it she is turned about at the Pleasure of him that stands at the Helm. A Narrow Rudder is best for a Ship's sailing, provided she can feel it; that is, be guided and turned by such a Rudder. For a Broad Rudder will hold much Water, when the Helm is put over to any side: But yet if a Ship have a *Fat Quarter*, so that the Water cannot come quick and strong to her Rudder, she will require a Broad Rudder. The aftermost Part of the Rudder is called, the *Rake of the Rudder*.

RUDDER-*irons*, are the Cheeks of that Iron, whereof the Pintle is part, which is fastnened and nailed down about the Rake of the Rudder.

RUDDER-*rope*. *Vide Rope*.

RUGITUS, is an Effervescence of Chyle and Excrements in the Blood, whereby Wind and several other Motions are excited in the Guts, and rowl up and down the Excrements, when there's no easie Vent upwards or downwards. *Blanchard*.

RULE *of Falshood*. See *Position*.

RULE *of Three*, or the *Rule of Proportion*; or as it is called, from its excellent Use, *The Golden Rule*, is that which teaches to find a Fourth Number, which shall have the same Proportion to one of the three Numbers given, as the others have to one another.

This *Rule of Three* is, 1. *Direct*. 2. *Indirect*. 3. *Double-Rule Direct*. 4. *Double-Rule Indirect*.

Rule of Three Direct finds a fourth Number in such Proportion to the Third, as the second is to the first; or, as the first is to the second, so is the third to the fourth: Thus.

1 : 2 :: 3 : 6

This Rule requires (and is to be known thus: That if the ſecond Term be greater or leſs than the firſt, the fourth Term ſhall be likewiſe greater or leſſer than the third.

Or in the Queſtion, if more require more, or leſs require leſs, then uſe this *Rule Direct*, and Multiply the ſecond and third Terms together, and divide the Product by the firſt Term, the Quotient gives the fourth Term required.

Note, That the firſt and third Terms, and the ſecond and fourth, are of the ſame Denomination: As if the firſt be of Money, Weights, or Meaſures, &c. ſo ſhall the third; and ſo as the ſecond, the fourth.

Example.

If 4 *Yards coſt* 8 s. *What will* 6 *Yards coſt?*

Anſwer, 12.

y. s. y. s.
For 4 : 8 :: 6 : 12.

Here (according to the Rule $8 \times 6 = 48$, which divided by 4, gives 12 required.

Obſerve, That the Term which makes the Queſtion, is to be ſet in the third place, and that which is of like Name with it, ſet in the firſt place, and the Numbers remaining ſet in the ſecond, of whoſe Nature the Number ſought muſt always be.

In this Rule, if you Multiply the ſecond and third Terms together, the Product ſhall be equal to the Product of the firſt Term multiplied by the fourth; which may very well ſerve for a Proof, if required.

RULE *of Three Indirect*, or the *Backward Rule*, is known by being contrary to the *Direct*; for whereas the former required, that more ſhall have more, and leſs leſs; as if 4 Yards coſt 2 *s.* 8 Yards will coſt more than 2 *s.* becauſe it is double to 4 Yards, and ſo muſt the Anſwer be double to 2 *s.* that is 4 *s.*

But in this Rule, more will require leſs, and leſs more; as, if 4 Horſes in 6 Days eat 10 Buſhels of Oats, 8 Horſes will eat 10 Buſhels in a fewer quantity of Days, *viz.* in 3. Here 10 Buſhels being common is omitted, and the Queſtion ſtands thus:

4 : 6 :: 8 : 3

Here the third Term contains the firſt, as often as the ſecond doth the fourth: Therefore the Product of the firſt and ſecond divided by the third, gives the fourth,

As $\frac{4 \times 6}{8} = 3$, that $\frac{24}{8} = 3$ the fourth Term required.

The *Double Rule of Three*, both *Direct* and *Indirect*, may be compriſed in one Rule, with two Operations only.

1. Obſerving, That the given Terms are always five, whereof three are Conditional and Antecedent, or Suppoſitious, the other two demand the Queſtion, and are Conſequents anſwering ſome of the former Antecedents; inſomuch, that with the Anſwer there will be as many Conſequents as Antecedents, which muſt match one another in the ſame Denomination exactly.

2. For the right placing of the Queſtion and Terms, the three Terms of the Conditional part are duly to be regarded: Let that which is the Principal Cauſe of Loſs or Gain, Increaſe or Decreaſe, Action or Paſſion be put in the firſt place; and that which betokeneth the ſpace of Time, Diſtance of Place, &c. be put in a ſecond Place; and the remaining part in the third. The Conditional part thus ſtated, the other two Terms wherein the Demand lies, muſt be placed ſo under the former Terms, that they may correſpond one with another.

RULE I.

Then, If the *Blank* or Place ſought, fall under the third Term, Multiply the three laſt Terms for a Dividend, and the two firſt for a Diviſor, and the Quotient gives the ſixth Term required.

RULE II.

But, If the *Blank* fall under the firſt or ſecond Terms, Multiply the firſt, ſecond, and fifth Terms for a Dividend, and the third and fourth for a Diviſor, the Quotient gives the Anſwer.

Example 1.

If 12 *Rods of Ditching be done by* 2 *Men in* 6 *Days, how many Rods ſhall be wrought by* 8 *Men in* 24 *Days?*

Anſwer, 194.

State your Numbers according to the former Direction, they'll ſtand thus; the Blank under the third place.

Men.	Days.	Rods.
2	6	12
8	24	

Therefore (by the firſt Rule) $12 \times 8 \times 24 = 2304$ for the Dividend, and $2 \times 6 = 12$ for the Diviſor; the Quotient 194 gives the Anſwer.

Example 2.

If 2 *Men work* 12 *Rods in* 6 *Days, how many Men will work* 192 *Rods in* 24 *Days?*

Anſwer, 8.

Your Terms being rightly placed, the Blank will fall under the firſt Term thus.

Men:	Days.	Rods.
2	6	12
	24	192

Here

Here 2 x 6 x 192 = 2304 is the Dividend, and 12 x 24 = 288 is the Divisor, and the Quotient 8 is the Answer.

RUMB, or *Course of a Ship*, is the Angle which she makes in her Sailing with the Meridian of the Place where she is.

Complement of the Rhumb, is the Angle made with any Parallel to the Equator by the Line of the Ship's run.

RUMB, in Navigation, is one Point of the Compass, or 11 ¼ *Degrees*, viz. the $\frac{1}{32}$ part of the Circumference of the *Horizon* or *Compass Card*, which is the Representative of the *Horizon*.

RUMB-*Line*, is a Line described by the Ship's Motion on the Surface of the Sea, Steered by the Compass, making the same or equal Angles with every *Meridian*.

There *Rumbs* are *Helispherical* or *Spiral* Lines, proceeding from the Point where we stand, winding about the Globe of the Earth till they come to the Pole, where at last they lose themselves.

But in the *Plain* and *Mercator's* Charts, they are represented by strait Lines. Their Use is to shew the bearing of any two Places one from another; that is, upon what Point of the Compass any Shore or Land lies from another.

RUMINANT *Animals*, are such as chew the Cud.

RUMINATION, is the Action of chewing the Cud in some Adimals. *J. Con. Peyerus* hath Written a Tract, *De Ruminantibus & de Ruminatione*, Printed at *Basil*, in 4*to*. In which he takes Notice, That some Animals do really and truly chew the Cud; such as Oxen, Sheep, Deer, Goats of all Kinds, Camels, Hares, and Squirrels; which therefore generally have 3 Stomachs, the *Paunch*, the *Feck*, and the *Read*. But those which seem only to imitate that Motion, he calls *Ruminantia Spuria*; such as the Mole, Cricket, Bee, Beetle, Crab, Lobster, Mullet, and several Birds. And these he affirms to have all of them their Stomachs composed of Muscular Fibres, by means of which, they do as it were grind and work their Meat up and down something like *Ruminating Creatures*. He defines.

Rumination to be a Natural Motion of the Stomach, Mouth, and other Parts, which relieve one another in this Action; by which means, the Meat eaten hastily at first, is conveyed back to the Mouth again, there Chewed, and then Swallowed down a second time, to the great Advantage of the Animal.

RUN of a Ship, is so much of her Hull as is always under Water, growing thinner and lanker by degrees from the *Floor Timbers* to the Stern Post. This is also called her *Way afterward on*; and they say a Ship hath a *good Run* when 'tis long, and that the Water passes cleverly to her Rudder, her *Tuck* not lying too low, which is of great Importance to her Sailing; for if the Water don't come strongly to her Rudder, by reason of her being Built too broad below, she can never *Steer well*; and a Ship that can't *Steer well*, can't keep a good Wind, and will have no fresh way through the Sea, but will be still falling to Lee-ward, and therefore can never be a good Sailor. Nevertheless a Ship with a large and *good Run*, will lose much Stowage, because she is narrow below.

RUNDLES, or *Roundels*, the same as Balls or Bullets, which see. 'Tis a Word used in Heraldry.

RUNG-*Heads*, which are made a little bending, to direct the *Sweep* or *Mold* of the *Futtocks* and Naval Timbers; for here the Lines which make the Compass and Bearing of a Ship, do begin.

RUNGS, the same with the Floor or Ground-Timbers, being the Timbers in a Ship which constitute her Floor, and are bolted to the Keel, whose ends are *Rung-heads*.

RUNNER, is a Rope belonging to the *Garnet*, and to the two Bolt-tackles, *viz.* That before which comes in the aftermost Shrouds of the Fore-Mast, and that abast which comes in the foremost Shrouds of the Main-Mast.

This *Runner* is reeved in a single Block which is seized to the end of a Pendant, and has at the one end a Hook to hitch into any thing, and at the other end a double Block, into which is reeved the fall of the *Tackle* or the *Garnet*, by which means it doth Purchase more than the *Tackle* or *Garnet* can do alone. The Word is *Overhale the Runner*; that is, bring down that end which has the Hook to it, that it may be hitched into the Sling, &c.

RAYS, is a too plentiful and preternatural faling of Tears.

SABLE; the Heralds Word for a Black Colour in the Arms of Gentlemen; but in those of the Nobility, they call it *Diamond*, and in the Coats of Soveraign Princes, 'tis called *Saturn*.

'Tis expressed in engraving by strokes drawn perpendicularly a-cross each other.

SACCHARUM *Saturni*. See Salt of *Saturn*.

SACULI *Medicinales*, are when several Simples, according to the Nature of the Disease, are compounded and beaten together, and tied up in a little Bag, to be applied to the Part affected. This Bag is to be sewed or quilted down in several places, that the Ingredients run not altogether in a Lump. *Blanchard*.

SACCULUS *Chyliferus* or *Roriferus*, is what we usually call the *Receptaculum Chyli*, or the common Receptacle of the Chyle; and sometimes *Receptaculum Pecquettianum*, from *Pecquet*, who first found out both it and the *Ductus Thoracicus* (whose beginning it is) in the Year, 1651. I mean he was the first that assigned the true use unto them, but both were observed in Horses by *Bartholomæus Eustacius*, above 130 Years ago, as appears in a Book he writ, 1564. *pag.* 301. of the *Vena sine pari*, wherein he has these Words. (as cited by Dr. *Wharton*)

From this notable left Trunk of the Throat, (viz. *the* Subclavian Vein) *there springs a great Branch, which besides that it has a Semi-circular Door,* (or Valve) *in its Origin, is moreover white, and full of watry Humour; and not far from its rise it is divided into two, that after a little space, unite again into one, which sending forth no Branches, descends by the left side of the* Vertebræ; *and having passed thro the Midriff, runs down the middle of the Loins: Where becoming larger, and folding about the great Artery, it has an obscure ending, which I have not as yet well discovered.*

Here we have a clear *Description of them*, only that it is the beginning which he takes for the end: And contrarily, it is called the *common* Receptacle, because it receives both the *Chyle* and *Lympha* promiscuously, tho' some call it the Receptacle of the *Chyle*, in particular, but without reason; for it might as well be called, *Receptaculum Lymphæ*, as *Chyli*; for that the *Lympha* passes not only with the *Chyle*, but after this is all distributed, the *Lympha* still continues to glide into it, and to ascend by the *Ductus Chyliferus Thoracicus*, which might as well be called *Lymphaticus* for the same reason.

It is seated under the Celiack Artery, and Emulgent Veins, about the middle Distance between the Kidneys and *Capsulæ atrabilariæ*, upon the *Vertebræ* of the Loins, but for the most part, rather toward the left side.

Pecquet and *Casp. Bartholin* say, 'Tis seated betwixt the Tendon (or Appendices) of the *Diaphragma*; by the Motion whereof, it is pressed and milked, as it were, and its Contents propelled. It is of a Membranous, but thicker Substance in Men than in Brutes, but not so capacious, seldom being so large as to admit one's Fingers end. Out of it there springs a Duct that presently ascends up into the *Thorax* (behind the descending Trunk of the *Arteria magna*) where it begins to be called, *Ductus Thoracicus*; but according to *Sylvius* it might more fitly be called *Spinalis*, seeing it runs along the inside of the *Spina Dorsi*.

This Duct having past the *Abdomen* and the *Midriff*, marches farther upward under the great Artery, till about the fifth or sixth *Vertebra* of the *Thorax*, where it turns a little aside from under it to the left Hand; and so underneath the Intercostal Arteries and Veins, and the Gland *Thymus*, it ascends to the left Subclavian Vein, into whose lower side it opens, just there where the left Jugular Veins enters into it on the upper side, so that their Mouths face one another. But it opens not into this Vein with any large Orifice, but by six or seven little ones, which are all cover'd in the Cavity of the *Subclavia* with one broad Valve, looking towards the Cava from the Shoulder, whereby there is granted to the *Chyle* and *Lympha* a free Passage out of the *Ductus Chyliferus* into the *Subclavia*, but their return (or of Blood with them) out of the Vein into the Duct, is prevented.

This Duct ending thus in the Subclavian Vein, the *Chyle* that it conveys into it, passes with the Blood (returning by the Cava) into the right Ventricle of the Heart, where we will leave it to supply the Defect of the depauperated Blood; having only observed, that this Duct has many Semilunar Valves that hinder the ascending *Chyle* and *Lympha* from gliding back again; which Valves are manifest by this, that the *Chyle* contained in the Duct may easily by the Finger be pressed upwards, but by no means downwards; or if one make a hole in it, the Liquor tending from beneath upwards, will flow out at it; but that which is above it, is so stopt by the Valves, that it cannot be made to descend by it.

SACCULUS *Cordis*. See *Pericardium*.

SACCUS, is with some Writers the Gut called *Rectum*.

SACER *Ignis*. See *Herpes Exedens*.

SACER *Morbus*. See *Epilepsia*.

SACER (*Musculus*) which may be also called *Transversalis Lumborum*. It lies under the Tendinous part of the *Longissimus Dorsi*; it ariseth fleshy not only from the *Os Sacrum*, but also from all the transverse Processes of all the *Vertebræ* of the Loins, and is inserted to their Superior Spines. We have sometimes observed, (saith Mr. *Cowper*) a *Spinalis Lumborum*, like the *Spinalis Colli*, which arising from the Superior Spines of the *Os Sacrum*, and marching with direct fleshy Fibres, is so inserted to the Superior Spines of the *Vertebræ* of the Loins: The *Transversalis Lumborum* lying under it, helps to move the whole Spine, or *Vertebræ* of the Neck, Back and Loins, obliquely backwards, as in looking behind us, &c.

SACCER. See *Saker*.

SACKS *of Earth*, used in Fortification, are made of course Cloath, the largest of them being about a Cubick-foot wide, and the lesser some-

what

what more than half a Foot. They are ſerviceable upon ſeveral occaſions, more eſpecially for making Retrenchments in haſte, to place on Parapets, or the Head of the Breaches, &c. or to repair them when beaten down. They are of good uſe alſo when the Ground is rocky, and affords not Earth to carry on Approaches, becauſe they can be eaſily brought on and carried off: The ſame Bags on occaſion, are uſed to carry Powder in; of which they hold out about 50 Pound a piece.

SACRAMENTO *recipiendo, quod vidua Regis ſe, non maritabit ſine licentia Regis*, is a Writ or Commiſſion to one, for taking of an Oath of the King's Widow, that ſhe may not Marry without the King's Licence.

SACRE. See *Saker*.

SACRILEGIUM, Sacrilege, or an Alienation to Lay-men, and to profane or common purpoſes, of what was given to Religious Perſons, and to Pious Uſes. Our honeſt Fore-fathers were very tender of incurring the Guilt and Scandal of this Crime. And therefore when the Order of the Knights-Templers was diſſolved, their Lands, &c. were all given to the Knights Hoſpitallers of *Jeruſalem*, for this ſacred Reaſon: *Ne in plus uſus erogata contra donatorum voluntatem in alios uſus diſtraherentur.*

SACROLUMBALIS, is a Muſcle of the *Thorax*, which with the *Dorſi Longiſſimus*, have their Origination in Common: Externally they are Tendinous as they ſpring from the Poſterior part of the Spine of the *Os Illium*, and Superior Spine of the *Sacrum*, and all the Spines of the *Vertebræ* of the Loins: Internally it ariſes fleſhy, not only from thoſe parts, but from the Tranſverſe Proceſſes of the laſt named *Vertebræ*; whence with direct Fibres aſcending before it marches over the laſt Rib, it's divided into 2 fleſhy Bodies; the outermoſt of which is called *Sacrolumbus*, whoſe Fibres aſcend directly, and make ſo many thin Tendons as there are Ribs to whom they are inſerted, which are joined with ſo many Acceſſory Muſcles, ariſing from each Rib, and united with them, before their Inſertions, as they paſs over the Superior: And this Order or multiformed Diſpoſition of it, is continued the whole length of the *Thorax*, to the third, fourth, fifth and ſixth *Vertebra* of the Neck; which ſuperior part is by *Diemerbroeck* made a diſtinct Muſcle, and called, *Cervicalis deſcendens.*

SACRUM *Os*: The *Os Sacrum* is the broadeſt of all the Bones of the Back, and doth ſuſtain all the other *Vertebræ*: On the inſide it is ſmooth and hollow, on the outſide convex and uneven, being of ſomething a triangular ſhape. In its upper part on each ſide it is knit firmly to the *Oſſa Ilia*, by an inverting Cartilage. It conſiſts of five or ſix Bones, plainly diſtinguiſhable in Infants, but more obſcurely in grown Perſons. Theſe Bones have the Reſemblance of (and are uſually called) *Vertebræ*; for each of them have a Body and Proceſſes, and a large hole to receive the *Spinalis Medulla*. The Bodies of theſe differ from thoſe of the other *Vertebræ* in this reſpect; that whereas in thoſe the lower part is always bigger, in theſe it is the leſs; by which means the uppermoſt is the biggeſt, and the loweſt the leaſt. Their ſmaller holes which ſerve for the ingreſs and egreſs of the Veſſels, differ alſo from thoſe of the other, in that they are not in their ſides, but before and behind; of which thoſe before are much the larger. As for their Proceſſes, the Oblique can hardly be diſcerned, except in the firſt. The Tranſverſe are pretty long, but ſo united, that all ſeem but one. The hinder, or Spines, are like thoſe of the Loins, but leſs, and ſtill the lower the leſſer; inſomuch that the loweſt hath no Proceſs, but only a round Protuberance.

SAFFRON *of Gold*. See *Aurum Fulminans*.

SAFFRON *of Steel*, or *Mars*, See *Crocus Martis*.

SAGITTA, a *Conſtellation* in the Northern Hemiſphere, conſiſting of 8 Stars.

SAGITTA, in Botany, ſignifies the upper part of any ſmall Twig, Cyon, or Graft of a Tree.

SAGITTA, in Mathematicks, is the ſame as the *Verſed Sine* of any Ark, and is ſo called by ſome Writers, becauſe 'tis like a Dart or Arrow ſtanding on the Chord of the Ark. See *Verſed Sine*.

SAGITTALIS *Sutura*, or *Veruculata*, is that Suture of the Scull, which begins at the *Coronal* Suture, and ends in the *Lambdoidal* Suture.

SAGITTARIUS, is the Ninth, in the Order of the 12 Signs of the *Zodiack*.

To SAIGNER *a Moat*, is to drain the Water by Subterraneous Conveyances, to the end that Hurdles laden with Earth, or a Bridge of Bulruſhes, may be afterward laid upon the Mud that remains, and the Paſſage thereby conſolidated.

SAIL: Every Yard in a Ship hath its proper Sail to it, and it takes its Name from the Yard: As the *Main-ſail*, is that which belongs to the *Main-yard*: The *Fore-top Sail*, is that which belongs to the *Fore-top-maſt Yard*, &c. *Head Sails*, are ſuch as belong to the *Fore-maſt* and *Boltſprit*: Theſe are uſed to keep a Ship from the Wind, and to flat her. *After Sails*, as the *Main-maſt* and *Miſſen Sails* do keep a Ship to the Wind.

Few Ships can ſteer on a quarter Wind with one Sail, but require a *Head Sail* and an *After Sail* both, one to countermand the other: Tho' ſome Ships can Steer with their *Main-top Sail* only.

The *Miſſen Sail* is cut by the Leech twice as deep as the Maſt is long, from the Hounds to the Deck: And the *Sprit-Sail* is $\frac{3}{4}$ of the Depth of the *Fore-Sail*.

SAILING. See *Plain*, and *Mercator's Sailing*.

SAKER, a ſort of Cannon, is either *Extraordinary*, *Ordinary*, or *leaſt Size*.

SAKER *Extraordinary*, is 4 Inches Diameter at the Bore, 1800 Pound Weight, 10 Foot long, its Load 5 Pounds, Shot 3 Inches $\frac{1}{4}$ Diameter, and ſomething more than 7 Pound $\frac{1}{4}$ Weight; its level Range is 163 Paces.

SAKER *Ordinary*, is a ſize leſſer, 3 Inches and $\frac{3}{4}$ Bore, 9 Foot long, 1500 weight, its Charge 4 Pounds of Powder, Bullets Diameter 3 Inches $\frac{1}{2}$, Weight 6 Pounds; level Range 160 Paces.

SAKER *the leaſt Size*, is 3 Inches $\frac{1}{2}$ Diameter at the Bore 1400 Pound weight, 8 Foot long, its Load near 3 Pound $\frac{1}{2}$, Shot 4 Pound $\frac{3}{4}$ weight, and 3 Inches $\frac{1}{4}$ Diameter.

SALAMANDERS *Blood*, is a fooliſh Term that the Chymiſts give to the red Vapours, which in Diſtillation of Spirit of *Nitre*, towards the latter end, do fill the Receiver with red Clouds; they are the moſt fix'd and ſtrongeſt part of the Spirit; and nothing but *Nitre* yields a red Vapour in Diſtillation.

SAL *Armoniack*, is either *Natural*, which is found in ſome Parts of *Africa*, near the Line; or *Artificial*, which is made thus.

Five parts of Urine, one of Sea Salt, or *Sal Gemmæ*, and half an one of Chimney Soot are boiled toge-

together into a Mass, which Mass, being after this put into a subliming Pots, over a gradual Fire, it sublimes into the Form of that Salt, which is the common *Sal Armoniack*. It is purified by Dissolution in Water, Evaporation, &c. As other Salts.

Equal Parts of this Salt, and common Salt decrepitated, are mingled, and then the Armoniack is sublimed from the Mass, which is called, *Flowers of Sal Armoniack*. If instead of Sea Salt, you should use Filings of Steel, the Flowers would be yellow, and they are a little more penetrating than the former.

SAL *Circulatus Paracelsi*, the same with the Alkahest.

SAL *Polychrestum*, is a Preparation of Salt-petre made by burning equal Parts of it with Sulphur in a Crucible, whereby 'tis deprived of its Volatile Parts.

They give it this Name from the *Greek* πολύχρηστος, as being good for many Uses. Tho' 'tis indeed no very good Medicine, and unless it be very white, ought not to be used.

They give it as a Purge, from half a Dram to six Drams; but there are so many other good Purgative Medicines, that there is no need of using this.

SAL *Prunellæ*, is only purified Salt-petre, having some of its most Volatile Parts separated from it, by burning upon it when melted in a Crucible over the Fire, about a 30th part of its weight of Flour of Brimstone. 'Tis given to cool and provoke Urine in Fevers and Quinsies; but Salt-petre purified three or four Times, is certainly a much better Medicine; for this burning of Sulphur upon it, carries off a good part of the fine and volatile Parts, and instead of opening it, renders it more fix'd.

They often adulterate *Sal Prunellæ* with Alum, but you may distinguish it by its over whiteness, and glittering too much. This is sometimes called, *Lapis Prunellæ* and *Chrystal Mineral*.

SAL *Volatile Oleosum*, or an *Aromatick Volatile Salt* is made, by putting to every Ounce of Volatile Salt of *Sal Armoniack* distilled with Salt of Tartar, and dulcified with Spirit of Wine, about a Dram and an half of some *Aromatick Oil or Essence*, drawn from one or more noble odoriferous Vegetables; as Cinnamon, Cloves, Rosemary, Balm, &c. and after the Spirit and Oil are well stirred and incorporated together, the Volatile Salt and Spirit is drawn off in a Cucurbit.

Some mingle all together, *viz.* the *Sal Armoniack*, *Sal Tartari*, Spirit of Wine, and the Powder of Cinnamon, Cloves, &c. at first, and then distill off the Volatile Salt and Spirit all at once; but the former is the best way.

The *Sal Volatile Oleseum*, is a well known and noble Medicine; 'twas first invented by *Silvius de la Boe*: 'Tis a great Cephalick and Cordial, and is much beyond any of the Volatil Parts that are not Aromatized.

SALIANT *Angle*, a Term in Fortification. See *Angle*.

SALIENT, the Term in Heraldry for a Lion in a leaping Posture, and standing so that his right Fore-foot is in the Dexter chief Point, and his hinder left Foot in the Sinister base Point of the Escutcheon, by which 'tis distinguished from *Rampant*.

SALIQUE *Law*, *De terra* Salica *nulla portio Hæreditatis mulieri veniat, sed ad virilem Sexum tota terræ hæreditas perveniat*, &c. was an ancient Law made by *Pharamond* King of the *Franks*; part of which seems to have been borrowed by our *Henry* the First, in compiling his Laws, as *cap.* 89. *Qui hoc fecerit secundum Legem* Salicam *moriatur*.

SALIVA, or Spittle, is a Liquor separated by proper Ducts (which they call the *Ductus Salivales*) from the Glands of the Mouth, as the *Parotides*, the *Glandulæ Nuckianæ*, the *Maxillares*, the *Sublinguales*.

'Tis probable that the Origin of the *Saliva*, is from the Arterious Blood; for as the Arteries pour Nutritious Blood into all other parts, so they do into the Glands also; part of which they convert into the own Nourishment, part is returned by the Veins in the circulation, and part (*viz.* of what is serous) they separate, and bestowing a subacid quality thereupon, make *Saliva* (or Spittle) of it.

To the Composition whereof (if not for the Separation of it) some think a Nervous Juice is contributed, the rather because larger and more numerous Twigs of Nerves are communicated to the Glands, than to more other parts, which yet have a more exquisite sense than these.

But in refutation of this Opinion, the abovementioned Dr. *Nuck* alledges this Experiment.

That if the Nerve that runs to any Gland, be either hard tied or cut in sunder, yet the Secretion of the *Saliva* will not thereupon cease, but will only proceed more slowly; which slowness may be attributed not to the want of any constitutive Principle of the *Saliva*, so much as to the want of that Motion in the Gland (that to be sure depends as well upon the Nerves as upon the Pulsation of the Artery) which is necessary for the quicker dispatch of the *Saliva*, through or out of the Gland.

The manner of the Secretion of the *Saliva*, is like that of the Liquor of all other Glands, and proceeds from the Conformity of the Particles of the Liquor to the Pores in the Gland, or the Mouths of the Excretory Vessel.

After its Separation, its Motion into and along the Salival Ducts is much farthered by the Muscular Motion of each part respectively.

Now the *Saliva* is not to be reputed a meer Excrement, for it is believed by all Modern Anatomists, that it serves for the farthering of the Fermentation of Meats in the Stomach, if it be not the main Ferment of it.

That it has a fermentative Quality *Diemerbroeck* proves by this Experiment: That if a piece of white Bread be chewed and moisten'd with much Spittle, and then be mixed with Wheat-paste kneeded with warm Water, it will make it ferment.

Dr. *Nuck* thinks it an Universal Ferment for Meats and Drinks, partaking of Divers Qualities (or Particles) but of none in any excessive Degree. That it is Acid he demonstrates by this familiar Observation.

"That if when Milk is a boiling, one take a "Spoonful to taste of, and then presently whilst it "is moist with the *Saliva*, put it into the Milk a-"gain (still a boiling) the Milk will break as if "some Acid Liquor were mixed with it.

That it is endued with a Volatile Salt, he thinks is evident from its curing the Itch, Tetters, &c. That Oleous Particles are mixed with the acid, he supposes must be concluded from its killing Quicksilver: And whereas it usually becomes frothy in the Mouth, upon its being agitated by the Motion of

of the Muſcles of the Tongue, and thoſe which move the lower Jaw, and that he thinks proceeds from its being endued with a Lixivial Salt and Spiritous Oleous and acid Particles, (while the Volatile Spirit vaniſhes.)

SALIVATION, is an Evacuation of Spittle by Salivating Medicines, of which ſort principally are Mercurial Preparations.

SALLY, in the Art of War, is the Term for the iſſuing out of the Beſieged from their Works, and falling upon the Beſiegers to cut them off, and to deſtroy their Works.

SALT, the firſt of the three Hypoſtatical, but the third of the five Chymical Principles: Its two Eſſential Properties ſeem to be, *Diſſolubility in Water*, and *a pretty Pungent Sapor*, being an active incombuſtible Subſtance; they ſay it gives all Bodies their Conſiſtence, and preſerves them from Corruption, and occaſions all the Variety of Taſts.

There are three Kinds of Salts: *Fix'd Volatile*, and *Eſſential*.

The *Fix'd Salt* is thus drawn: The Matter is firſt calcined, and then the Aſhes are boiled in a good deal of Water, that the Salt may be the better diſſolved: After this the Solution is filtrated, and all the Moiſture evaporated, and then the Salt remains in a dry form at the bottom of the Veſſel. This *Fix'd Salt* ſo drawn, is called a *Lixivious Salt*, becauſe a kind of *Lixivium*, or Lye, was made of the Aſhes of the Body calcined.

Volatile Salt, is that which is drawn from the Bodies or Parts (chiefly) of Animals, and from ſome fermented, or rather purrified parts of Vegetables: It riſes quick and eaſily, and is the moſt Volatile of any Bodies ſo called.

The *Eſſential Salt* is drawn from the Juice of Plants by Chryſtallization: How, ſee *Eſſential Salt*.

Mr. *Boyle* reckons three other Kinds of Salts, viz. *Acid*, *Urinous*, and *Lixiviate*: See thoſe Words. And he diſcovers whether any Liquor contains an Acid Salt, or no, by dropping ſome of it on Syrup of Violets, for then it will turn it *red*; but if it turn it *green*, it is either of an *Urinous* or *Lixiviate* Nature: To diſtinguiſh which, he drops ſome of it into a Solution of Sublimate made in common Water; then if a white or milky colour be produced, he concludes it to belong to the Tribe of *Urinous Salts*; but if it produce a yellow or orange colour, he judges it to be of a Lixiviate Nature.

SALT *Common*, its Spirit how drawn, ſee *Spirit of Salt*.

Mr. *Boyle* proves this Principle producible by Art, as well as other. See *Sceptical Chymiſt, Part ult. p.* 1.

SALT *of* Saturn, *Saccharum Saturni*, or Sugar of Lead, is the Body of that Metal opened and reduced to the Form of a Salt by diſtilled Vinegar.

Thus any of the Calxes of Lead, as ſuppoſe *Ceruſe*, is powdered, and diſtilled Vinegar is poured upon it to four Fingers height above the Matter, an Ebullition will follow, but without ſenſible heat it muſt be digeſted in a Sand-heat, two or three Days, and ſtirred often: Then pour off the Liquor by Inclination, and digeſt more diſtilled Vinegar with the *Ceruſe*, and more after that till you have diſſolved about half the Matter, mix all the Impregnations together in an Earthen or Glaſs Veſſel; evaporate the Matter in a Sand-heat, till a ſmall Skin or *Pellicle*, begin to ariſe upon the Surface, after which, place the Veſſel in a cool place, there will appear white Chryſtals: Take them out, and evaporate again as before, and ſet the Veſſel to cool to gain the reſt of the Salt: Continue this till you have gotten all; then dry the Chryſtals in the Sun, and keep them in a Glaſs. 'Tis chiefly uſed outwardly for Diſeaſes of the Skin; but ſometimes 'tis given inwardly, from two to four Grains at a Doſe in Quinſies, *&c.*

SALT *of Steel*. See *Vitriol of Mars*.

SALT *of Sulphur*, a Preparation in Chymiſtry, improperly ſo called, ſince it is only a *Sal Polychreſtum* impregnated with Spirit of Sulphur, and then reduced to an Acid Salt by Evaporation of all the Moiſture. Some ſay this is a great Febrifuge.

SALT *of Tartar*, is made either by powdering what remains in the Retort after the Diſtillation of Tartar; or elſe by calcining bruiſed Tartar wraped up in a Paper, till it turn white. Either of theſe muſt have a great deal of hot Water poured upon them to make a *Lixivium*, then the Liquor is filtrated and evaporated in a Sand-heat, till the Fix'd Salt remain at the bottom of the Veſſel. This is the Alkali, or Fix'd Salt of Tartar. If it be expoſed to the Air a few Days in an open Veſſel in a Cellar, or ſome ſuch moiſt place, it will melt or run into a Liquor; and this the Chymiſts call Oyl of Tartar *per Deliquum*.

SALTIER, the Name of one of the Ordinaries in Heraldry, of the Form of St. *Andrew*'s Croſs.

They tell you, that anciently 'twas the Figure of an Engine, which being ſtuck full of Pins, was uſed in the Scaling of the Walls of a Beſieged Place.

Pearl a *Saltier Ruby*, the Coat of my Lord *Macklesfield*.

The *Saltier* is often counterchanged with the Field, and ſometimes quarterly quartered, *&c.*

SALVA *guardia*, is a Security given by the King to a Stranger, fearing the Violence of ſome of his Subjects, for ſeeking his Right by Courſe of Law.

SALVATELLA, is that Vein which from the Veins of the Arm is terminated in the little Finger.

SANATIVE *Waters*, are the Mineral Waters of any kind, ſuch as the *Chalibiate* ones of *Tunbridge*, the *Vitriolick* ones of *Epſom*, &c.

SANDARACHA, is by ſome Chymiſts the Term for red Arſenick; 'tis called alſo *Realgal*.

SANGUIFICATION, is the turning of the Chyle into Blood; which is performed in all the parts of the Body, and not as the Ancients imagined in ſome particular parts, as the Heart, Liver, *&c.*

SANGUINE, the Heralds term for the Colour uſually called *Murry*, being made of Lake, with a little *Spaniſh* Brown; 'tis repreſented in Engraving by Hatches like *Purpure*: 'Tis moſtly uſed in the Coats of Knights of the Bath. When 'tis born by Nobles, 'tis call'd *Sardonyx*; and in the Coats of Soveraign Princes they call it *Dragon's Tail*.

SANIES, is a thick and bloody *Pus* or Matter, iſſuing out of a Wound or Sore.

SAPHÆNA, is the Vein of the Leg, or Crural Vein. it goes down under the Skin of the Thigh and Leg, accompanied with a Nerve which loſes it ſelf at the inner Ankle; it turns towards the upper part of the Foot, where it gives ſeveral Branches, of which ſome go to the great Toe.

SAPHA

SAPHATUM, is a dry Scurf in the Head. See *Achor. Blanchard.*

SAPONEA, is a Lambative made of Almonds. *Blanchard.*

SAPORIFICK *Particles*, are ſuch as by their Action on the Tongue occaſion that Senſation which we call Taſte or Sapor. The manner of which, ſee in *Taſte*.

SAPOROUS, are ſuch Bodies as are capable of yielding ſome kind of Taſte when touch'd with our Tongue; but thoſe that afford no Taſte, are called *Inſipid.*

SAPPE, in Fortification, formerly ſignified the undermining, or deep digging with Pick-axe and Shovel at the Foot of a Work to overthrow it without Gun-powder: Now it is uſed to ſignifie a deep Trench carried far into the Ground, and deſcending by Steps from top to bottom; ſo that it covers the Men ſideways; and to ſave them from danger on the top, they uſe to lay a-croſs it Madriers, that is, thick Planks; or Clugs, that is, Branches of Trees cloſe bound together, and then they throw Earth over all, to ſecure them from Fire. When a Covert-way is well defended by Musketiers, the Beſiegers muſt make their way down into it by *Sappe*.

SARCOCELE, is a kind of Rupture, which conſiſts in a fleſhy Excreſcence of the Teſticles. *Blanchard.*

SARCOLPIPLOCELE, a fleſhly Rupture, or Protuberancy of the *Omentum*, either about the Navel, or in the Cods.

SARCOMA, is a fleſhy Excreſcence in the Noſtrils, and chiefly in the loweſt part of the Noſe, where it is fleſhy, without any ſhape, but like the proud Fleſh of an Ulcer. *Blanchard.*

SARCOMPHALUM, is a fleſhy Excreſcence of the Navel. *Blanchard.*

SARCOTICKS, are thoſe Medicines which fill up Wounds with Fleſh, ſuch as by their moderate Heats, and cleanſing Qualities keep Wounds and Ulcers free from Filth, and preſerve the Natural Temper of the Parts, ſo that the Aliment eaſily ſupplies the Solution of the Parts. *Blanchard.*

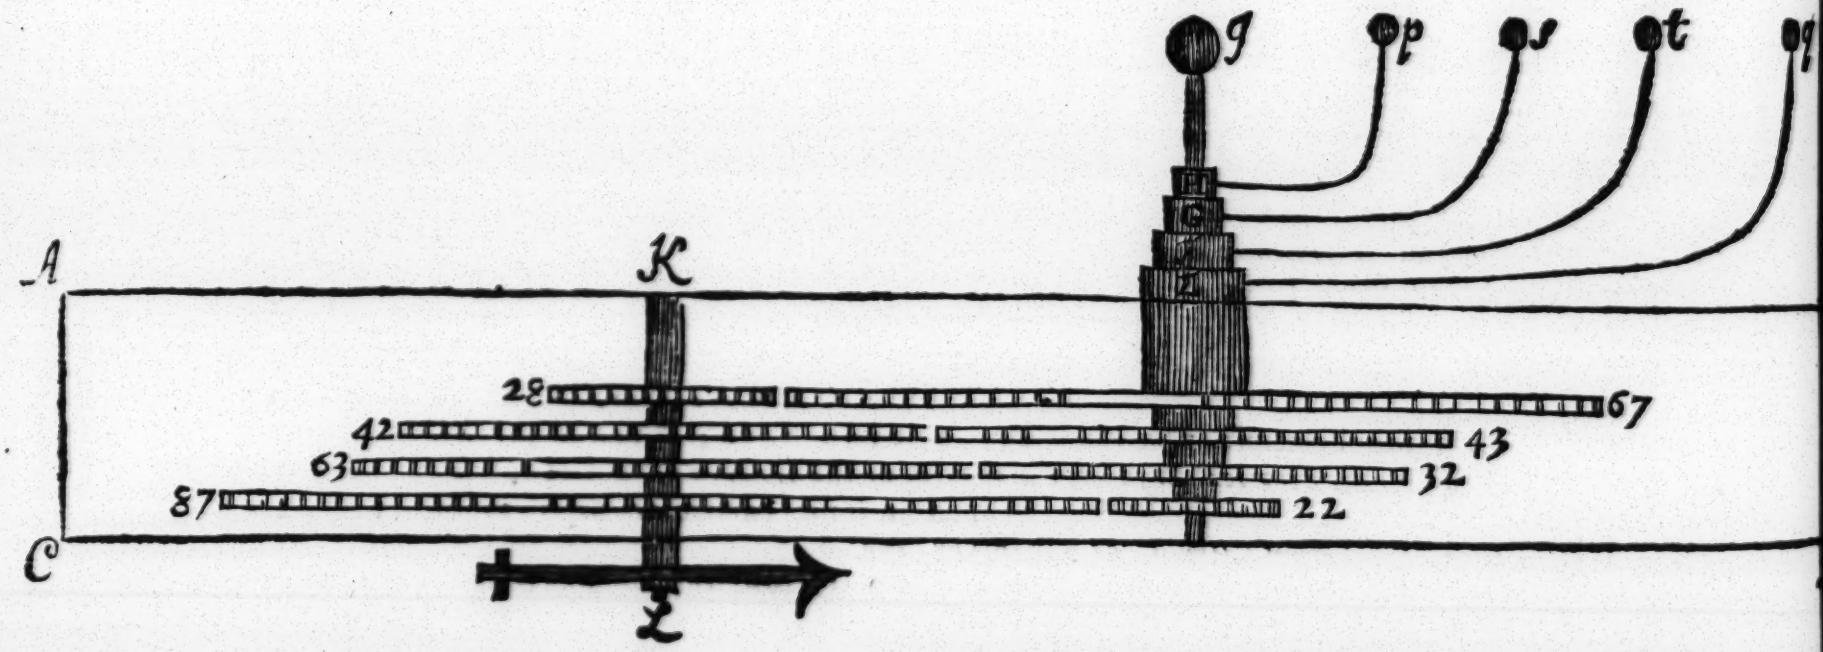
SARDONIAN, or *Sardonick Laughter*, is an Involuntary Laughter, or rather a Convulſive Diſtortion of the Muſcles of the Mouth, in which the Patient appears to Laugh.

SARPEDO. See *Lichen.*

SARRASIN, in Fortification, is a kind of Portcullice, otherwiſe called a *Herſe*, which is hung with a Cord over the Gate of a Town, or Fortreſs, and let fall in caſe of a Surprize.

SARTORIUS, a Muſcle of the Leg, which receives this Denomination from the Uſe Taylors make of it, in bringing one Leg and Thigh over the other, to ſit croſs-leg'd. It is alſo called *Longiſſimus Femoris*, it exceeding the reſt of the Muſcles of that Part in length; and *Faſcialis* from its paſſing over the Muſcles of the Thigh and Leg like a Swathe. It ariſeth ſharp and fleſhy from the forepart of the Spine of the *Os Ilium*, cloſe by the *Membranoſus*, and deſcending obliquely inwards above the *Muſculus Rectus*, and *Vaſtus Internus*, and over part of the *Tibiceps*, of an equal breadth or Thickneſs, meets with the *Gracialis* below the middle of the Thigh internally, and deſcending with it becomes Tendinous in its Paſſage over the Internal and Inferior Head of the Thigh-bone, (under a ſtrict Incloſure of the *Faſcia Lata*) and is inſerted four Fingers breadth below the ſuperior part of the *Tibia* internally: Its Uſe is declared above.

SATELLITE *Inſtrument* of Mr. *Romer*, Mathematician to the *French* King, as its Deſcription was ſent in a Letter to Mr. *Flamſtead*, *A. D.* 1679. and ſince publiſhed in the *Artificial Clock-maker*, in the Figure annexed.



A B and *C D*, repreſent the Upper and Lower Plates of the Inſtrument.

K L, is an Axis or Spindle on which 4 Wheels are fixed, and which turn round with it, and with the Hand *L*: once in 7 Days.

E F G H, are Sockets or hollow Arbors of 4 Wheels running concentrically, or one within another.

The hollow Arbor H, carrieth round the *Firſt Satellite p*, and belongeth to the Wheel or Pinion 22, which is driven by the fixed Wheel 87.

The hollow Arbor G, carrieth round the *Second Satellite s*, and belongeth to the Wheel 32, which is driven by the Wheel 63.

And the like of the Arbors F and E.

Within all theſe hollow Arbors is another fixed one included; on the top of which, is a Ball.

(♃) repreſenting the Planet *Jupiter*; round which the *Satellites* move, repreſented by the little Balls *p s t q*.

This

This *Satellite Inſtrument* may be added to a Watch, by cauſing the great Wheel, or Dial-Wheel, to drive round the Arbor *KL*, once in 7 Days.

And this Inſtrument may be of good uſe both at Sea and Land, to aſſiſt in finding the Longitude by *Jupiter*'s *Satellities*; partly by giving notice when an approaching Eclipſe is, that we may be ready with a Teleſcope to obſerve it; and partly when any Eclipſe happeneth, to ſhew which *Satellite* it is that is Eclipſed, which is difficult to be ſeen in the Heavens; and partly to ſupply the place of Tables, or Calculations of the *Satellite Eclipſes*, which it may do for a little while, tho' it muſt not be long truſted to.

SATELLITES, by Aſtronomers, are taken for thoſe Planets who are continually, as it were, waiting upon, or revolving about other Planets; as the *Moon* may be called the *Satellite* of the *Earth*; and the reſt of the Planets, *Satellites* of the *Sun*. But the Word is chiefly uſed for the new Diſcovered ſmall *Planets*, which make their Revolution about *Saturn* and *Jupiter*.

SATELLITES *of Jupiter*, are four ſmaller Moons or Planets moving round about the Body of *Jupiter*, as the Moon doth round our Earth. They were firſt diſcovered by *Gallilæus*, by the help of the Teleſcope.

The Diſtances of theſe Satellites, *from the Body of* Jupiter, *are as follows; from the Obſervations of*

	1	2	3	4	
Caſſini	5.	8.	13.	23.	Semi-diameters of *Jupiter*.

	Days.	Hours.	Min.	
Firſt	1	18	28	$\frac{3}{5}$
Second	3	13	17	$\frac{2}{10}$
Third	7	3	59	$\frac{3}{5}$
Fourth	16	18	5	$\frac{1}{5}$

Vid. Newton's *Princip.* pag. 403.

Mr. *Flamſtead* in *Philoſoph. Tranſact.* N. 154. ſays, That when *Jupiter* is in a Quartile of the Sun, the Diſtance of the firſt *Satellite* from his next Limb when it falls into his Shadow, and is Eclipſed, is one *Semi-diameter*, of *Jupiter*; of the ſecond, two, or a *whole Diameter* nearly; of the third, three; of the fourth, five of his *Semi-diameters*, or ſomething better, when the Parrallax of the Orb is greateſt. But theſe Quantities diminiſh gradually as he approaches the Conjunction or Oppoſition of the Sun ſomewhat nearly, but not exactly in the Proportion of Sines.

SATELLITES of *Saturn*. *Anno.* 1684, in the Month of *March*, Mr. *Caſſini*, by the help of excellent *Object Glaſſes*, of 70, 90, 100, 136, 155, and of 220 Feet, diſcovered the two innermoſt; (that is, the firſt and ſecond) *Satellites* of *Saturn*.

The *Firſt Satellite* he obſerved to be never diſtant from *Saturn*'s *Ring*, above $\frac{2}{3}$ of the apparent length of the ſame Ring: And it was found to make one Revolution about *Saturn*, in 1 Day, 21 Hours, and 19 Minutes; making two Conjunctions with *Saturn*, in leſs than two Days; one in the upper part of his Orb, and the other in the lower part. It is diſtant from the Centre of *Saturn* 4 $\frac{3}{5}$ of *Saturn*'s Semi-diameters.

The *Second Satellite* of *Saturn*, was obſerved but $\frac{1}{4}$ of the length of his Ring diſtant therefrom, making his Revolution about him in two Days, 17 Hours, and 43 Minutes. This is diſtant from the Centre of *Saturn*, 5 $\frac{3}{5}$ *Semi-diameters* of that Planet.

From a great number of choice Obſervations be concluded, That the Proportion of the Digreſſion of the *Second* to that of the *Firſt*, counting both from the Centre of *Saturn*, is as 22 to 17.

And the time wherein the *Second Satellite* makes its Revolution, is to the time wherein the firſt makes its, as 24 $\frac{3}{4}$ to 17.

The *Third* is diſtant from *Saturn*, 8 of his *Semi-diameters*, and revolves round him in almoſt 4 $\frac{3}{5}$ Days.

The *Fourth*, or *Hugenian Satellite*, as 'tis called, becauſe diſcovered firſt by Mr. *Hugens*, revolves round *Saturn*, in about 16 Days, and is diſtant from his Centre about 18 *Semi-diameters* of *Saturn*.

The *Fifth Satellite* of *Saturn*, is diſtant from his Centre 54 *Semi-diameters* of *Saturn*; and revolves round him in 79 $\frac{1}{3}$ Days. The greateſt diſtance between this *Satellite*, and the precedent, made Mr. *Hugens* ſuſpect there may be a Sixth between theſe two; or elſe that this Fifth may have other *Satellites* moving round him.

Mr. *Halley*, in *Philoſoph. Tranſact.* N. 145. gives a Correction of the Theory of the Motion of the *Hugenian*, or *Fourth Satellite* of *Saturn*, and makes the *True Time of its Period* to be 15 Days, 22 Hours, 41 Minutes, 6 Seconds; its *Diurnal Motion*, to be 22 Degrees, 34 Minutes, 38 Seconds, 18 Thirds. And the Diſtance of this *Satellite* from the Centre of *Saturn*, to be about 4 *Diameters* of the *Ring*, or 9 of the *Globe*; and the place where it moves, to differ little or nothing from that of the *Ring*; that is to ſay, interſecting the Orb of *Saturn* with an Angle 23 ½ Degrees, ſo as to be nearly Parallel to the *Earths Equator*.

The Periodical Times of the Satellites *of* Saturn, *according to Mr.* Caſſini, *are of the*

	Days.	Hours.	Minutes.
Firſt	1	21	19
Second	2	17	43
Third	4	12	27
Fourth	15	23	15
Fifth	79	22	00

SATURN: The Proportion of the Body of *Saturn* to our Earth is about 30 to 1.

The Periodical Time of *Saturn*'s Revolution about the Sun, is in the ſpace of 30 Years or 10950 Days.

The Semi-diameter of *Saturn*'s Orbit, is almoſt ten times as big as that of the *Magnus Orbis*, and therefore is of Engliſh Miles 946969690.

According to Mr. *Caſſini*, *Saturn*'s greateſt Diſtance from the Earth is 244330, his mean Diſtance 210000, and his leaſt Diſtance 175670 Semi-diameters of the Earth.

Mr. *Hugens* found the Inclination of the Ring of *Saturn* to the Ecliptick, to be an Angle of 31 Degrees.

Mr. *Azout* aſſerts, That the remote Diſtance of *Saturn* from the *Sun* doth not hinder, but that there is Light enough to ſee clear there, and more than in our *Earth* in Cloudy Weather.

In an Obſervation which *Caſſini* made *June* 19 1692, of a preciſe Conjuction between a Fixt Star, and one of *Saturn*'s Satellities, he ſaith, That with his 39 Foot Glaſs, he could plainly ſee the Shadow of *Saturn*'s Globe to be in part oval upon the hinder part of his Ring. The Diameter of *Saturn* at the time of this Obſervation, appeared to be 45 Seconds.

The Diameter of *Saturn* to that of his Ring is as 4 to 9.

And the Diameter of the Ring ſeen from the Sun, would be but 50″. and therefore the Diameter of *Saturn* ſeen from thence would be but 11″. as Mr. *Flamſtead* found by meaſuring it. But Mr. *Newton* thinks it ought rather to be accounted but as 10″. or 9″. becauſe he ſuppoſes the Globe of *Saturn* to be a little dilated by the unequal Refrangibility of Light.

Capt. *Halley*, in his Preface to the Catalogue of the Southern Stars, ſays, He found *Saturn* to move ſlower than the Aſtronomical Tables repreſent him.

The Diſtance of *Saturn* from the Sun, is about 10 times as great as that of our Earth from him; and therefore that Planet will not have above the 100th part of the Influence of the Sun which we have; and conſequently cannot be Habitable by ſuch Creatures as live on our Globe, unleſs there be ſome unknown way of communicating Heat to him.

Dr. *Gregory*, in his Aſtronomy, makes the Semi-diameter of the Ring of *Saturn* to that of the Planet, as 2 ¼ to 1. and the Interſtice between the Planet and the Ring, is the Breadth of the Ring.

How the Ring of *Saturn* will appear in all parts of the Orbit of the Planet, to an Eye placed at the Sun, or at the Earth, the ſame Learned Aſtronomer ſhews in his *Aſtron. Phy. & Geometr.* Lib. IV. Prop. 69, 70.

If an Eye were placed in *Saturn*, the Diameter of the Sun would appear 10 times leſs than it doth to us almoſt; and conſequently, his Disk, Light and Heat will be there 90 times leſs. *Saturn*'s Year is almoſt 30 of ours, but the length of his Day is yet uncertain, becauſe the time of his Revolution round his Axis is not yet known: But Mr. *Hugens* judges they are not longer than the Days in *Jupiter*. That great Aſtronomer ſuppoſeth the Axis of *Saturn* to be perpendicular to the Plane of his Ring, and of the Orbites of the Satellites: If ſo, then there will be the ſame Poſition of the Equator and Poles, (as to the Fixt Stars) as there is in our Earth: The ſame Pole Star and the Fixt Stars will appear to Riſe and Set after the ſame manner, in the ſame Latitudes. There is a vaſt Inequality in the Length of the Day in ſeveral parts of this Planet; and as great a diverſity of Summer and Winter; which depends on the Quantity of the Inclination of the Plane of the Equator, to the Plane of the Orbit of *Saturn* round the Sun; which *Hugens* makes to be 31 Degr. which is almoſt ⅓ more than in our Earth; where yet the differences and variety of Seaſons and Weather are very ſenſible. For in *Saturn*, in the Latitude of 50 Degr. the longeſt Day will have no Night at all, and the longeſt Night will have no Day. And the two Frigid Zones will be each of them 62 gr. broad, at leaſt 10 times as large as the whole Surface of our Earth. The Eye thus placed, will be able to diſcern none of the Planets but *Jupiter*, which will appear always to accompany the Sun, and never to be from him above 37 gr. The Parallax of the Sun in *Saturn*, is but 9″, and therefore Inſenſible; but the Parallaxes of all his Moons or Satellites, are very conſiderable, and therefore their Diſtances from him will be eaſily computable.

But what an Eye placed in *Saturn* would moſt admire, is the Ring of that Planet; the only thing of that nature that is diſcovered in any of the Planets. *Tho. Kepler* in his *Epitome Aſtron. Copernic.* Lib. 4. p. 586, and after him Capt. *Halley* in his Enquiry into the Cauſes of Variation of the Needles Variation, *Phil. Tranſ.* N. 195, do ſuppoſe our Earth may be compoſed of ſeveral Cruſts or Shells one within another, and concentrical to each other. And if ſo, then 'tis poſſible the Ring of *Saturn* may be the Fragment or remaining Ruins of his formerly exterior Shell, the reſt of which is broken and fallen down upon the Body of the Planet. And if *Saturn* ever had ſuch a Shell round it, its Diameter would then have appeared as big to an Eye at the Sun, as that of *Jupiter* doth now, when ſeen from thence.

Since the outward Margin of the Ring is diſtant from *Saturn* 2 ¼ of *Saturn*'s Semi-diameter, this cannot be ſeen at the diſtance of 64 Degr. from *Saturn*'s Equator (in whoſe Plane the Ring is placed.) Therefore a Spectator placed in a Latitude higher than that, can never ſee the Ring at all; ſo that there

there is a Zone of almoſt 53° broad towards either Pole, to whom this famous Ring can never appear. And as the Spectator ſhall move nearer the Pole, firſt one, then the ſecond Satellite, next the third and fourth; and when he is come within one Degree of the Pole, even the fifth Satellite cannot be ſeen, unleſs by Refraction; and in the Winter-time, neither Sun, Moon, nor any Planet, will be there viſible, unleſs perhaps a Comet.

If the Eye be ſuppoſed to be placed in the Equator of *Saturn*, or in the Zone nearly adjoining, it can never ſee thoſe Stars that are in or very near the Equator, nor any one of the Satellites; becauſe the Ring will always hide them; and then at the Equinoxes it cannot ſee the Sun; and if it were any where elſe placed, it could not then ſee the Ring; becauſe neither of its Faces will then appear illuminated by the Sun.

The breadth of this Ring 'tis hard to determine from our Earth, becauſe its Thickneſs is ſo ſmall: But Mr. *Hugens* makes it to be *about ſix hundred German Miles.*

For one half of *Saturn*'s Year, (*viz.* 15 Years of ours) only one Face of the Ring will be enlightned by the Sun: Whence the Inhabitants which may be ſuppoſed to live in that Hemiſphere, to which this Face of the Ring is turned, or to whom it is Summer, will ſee that part of the Ring which is above their Horizon, ſhining faintly by Day, (as our Moon doth when the Sun is above our Horizon) but brighter and ſtronger by Night, as our Moon doth in the Sun's abſence: And after Sun-ſet, the Eaſtern part of this enlightened Arch will fall within the Shadow of *Saturn*; which Shade will aſcend as Night comes on, and at Midnight will be at the higheſt; and then will deſcend again towards the Weſtern part of the Ring, according as the Sun comes more and more to the Eaſtward.

This enlightened Ark will always ſhew how to deſcribe a Meridian Line; for a Plane perpendicular to the Horizon, and paſſing thorough the Vertex of the Ark, will be in the true Meridian.

To an Eye placed any where without, and at leſs than 52° diſtance from the Equator, this enlightened Ark of the Ring will appear Concave as well as Convex, like a kind of Furnace or Vault, riſing above the Horizon: But to an Eye or more than 52′, and leſs than 64 Degrees diſtant from the Equator, the hollow or concave Part will not be viſible; but there will appear a britiſh Body ariſing as it were out of the Ground, and contiguous to the Horizon.

For the other half of *Saturn*'s Year, while the Sun declines towards the depreſſed Pole, or during the 15 Years Winter, the Ring will not be viſible, as having not that Face Illuminated which is obverted to the Spectator's Eye; but however will render it ſelf ſenſible, by covering from the Sight, ſuch Stars and Parts of the Heavens as are oppoſite to it, or apparently behind it. The ſhade of the Ring alſo will be extended more and more towards the nearer Pole; ſo that to an Eye placed any where within the aforeſaid ſpace, the Sun, when he attains ſuch a certain Declination, will appear to be covered or eclipſed juſt at Noon, and then ſtrait to emerge out of the Shadow. The next Day, the like Phænomenon will happen, but the Eclipſe will begin ſooner, and will be over later: And theſe Meridian Eclipſes will daily encreaſe in their duration, until the middle of Winter; and then they will decreaſe again gradually, till at laſt they will come to nothing again; *viz.* When the Sun returning from the Tropick, hath the ſame Declination as he had when theſe Meridional Eclipſes began.

And this will happen, if any Eye be placed in any Latitude greater than 25 or 26 Degrees; but if in a Latitude leſs than this, when the Meridian Darkneſs is of the greateſt duration, the Sun will ſuddenly appear juſt in the Meridian, and then ſtraitway will be Eclipſed again. The next Day, there will appear the like ſort of Light, but it will laſt longer; and this Meridian Light will grow ſtill longer and longer in duration, till Midwinter, and then (like the Darkneſs above-mentioned) it will be continually decreaſing, until it quite diſappear.

And from hence 'tis plain, that there is the greateſt difference between Summer and Winter in the Globe of *Saturn*, of all the other Planets; and this both on the account of the long duration of each, and the great declination of the Sun from the Equator; and alſo, by reaſon of theſe Meridional Darkneſſes in the Winter, ariſing from the Rings Eclipſing the Sun. *Gregor. Aſtr. Phy. & Geom. Lib.* 6. *Prop.* 6. *p.* 480.

SAUSAGE, is a long piece of Cloth, the ſides whereof are ſewed in form of a Gut, as large as to contain a Tennis Ball. It is dipt in Pitch or Tar, and filled with Powder, on purpoſe to ſerve as a Train to ſet Fire to Mines, Fougades, or Bomb-Cheſts. Two of theſe *Sauſages* are commonly applied to every Mine, to the end that if one ſhould fail, the other may take effect.

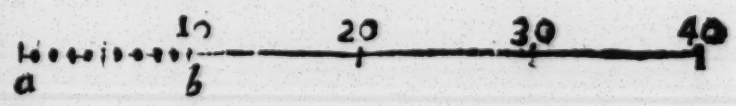
SAUCISSONS, are a ſort of Faggots made of great Boughs of Trees bound together in the middle and at both ends. Their uſe is much the ſame with the Bavings or ſmall Faggots, *viz.* to conſolidate the Way for Carriages, to make Traverſes or Parapets in Ditches full of Water, *&c.*

SAVER *default*, in Law, is Word for Word to excuſe a *Default* in Court, comes afterwards and alledges a good Cauſe why he did it, as Impriſonment at the ſame time, or ſuch like.

SCALADOE, is the mounting of the Wall of a Fortify'd Town or Caſtle, with Scaling Ladders.

SCALE, in Mathematicks, ſignifies any Meaſures or Numbers which are commonly uſed; or the degrees of any Ark of a Circle, or of ſuch Right Lines as are divided from thence; ſuch as *Sines, Tangents, Chords, Secants,* &c. drawn or plotted down upon a Ruler, for ready Uſe and Practice in Geometrical or other Mathematical Operations. The ſeveral kinds of which follow, as

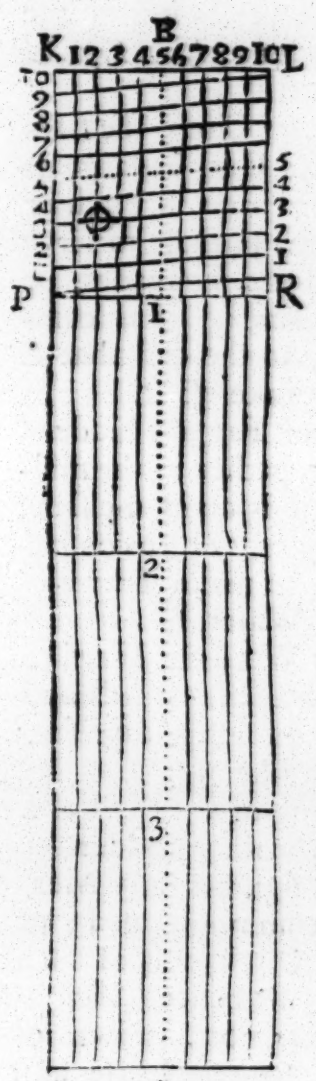
1. *Scales of Equal Parts*; of which that commonly called, *a Plane Scale*, is made by drawing any Right Line, as *a z* on *Paper, Paſtboard,* &c. Then with a Pair of Dividing Compaſſes run along 10 ſmall Diviſions from *a* to *b*; and then ſetting off the whole Diviſion *a b*, as often as you pleaſe, toward the Right-hand, as you ſee



For then may each of theſe great Diviſions repreſent 10 Miles, as in a Scale of Miles in a Map; and conſequently each of the ſmaller Diviſions one Mile: Or the diſtance *a b* may be an Inch, and

the leſſer Diviſions will be 10th parts of Inches: Or the larger Diviſions may be Leagues at Sea, *&c.* Or, in a word, this Scale may well enough repreſent any Meaſures or Numbers whatſoever, whoſe Parts are equal one to another. But this is more accurately indeed done by a

Diagonal Scale, which the larger Diviſions of are commonly of an *Inch*, or of *half an Inch*; and are made upon eleven Lines, ſo as to include ten equal Spaces (as in the Figure B) which are all cut at right Angles to the Tranſverſe Lines P R. Then P K being divided into 20 equal Parts, as alſo R L; and from the Points of Diviſion upon the Line P K, to thoſe on the Line R L, are 10 Diagonals drawn; the 1ſt beginning at P, and ending at the 1ſt Diviſion above R. The ſecond beginning at the 1ſt Diviſion above P, and ending at the 2d above R, *&c.* In ſhort, they are all drawn from one Diviſion leſs from P, to one Diviſion more from R.

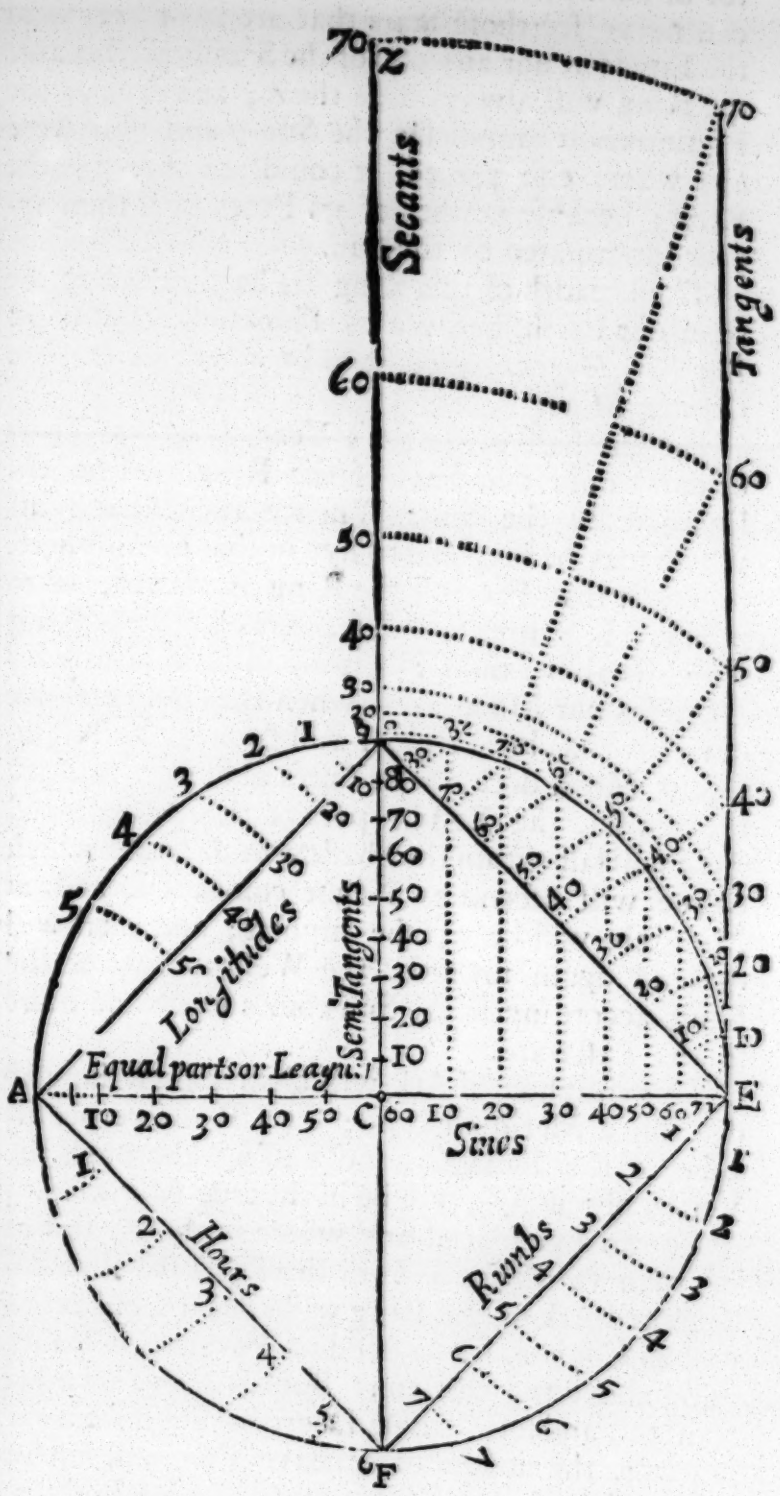


So that every *Diagonal*, by that time it hath paſſed from the firſt Line to the eleventh, is a whole 10th part of an Inch farther diſtant from the Line P R, than at the Point upon the firſt Line whence it was drawn. And every one of theſe *Diagonals* is divided into 10 equal Parts by the Parallel-line drawn along the Scale, and numbred on the Top from 1 to 9. Whereby 'tis evident, that the Interſection of any of theſe Parallel Lines numbred at the Top, with any *Diagonal*, is farther diſtant from the Line P R than the Interſection of the Line next before it, with the ſame *Diagonal*, by $\frac{1}{10}$ of $\frac{1}{10}$, that is, by $\frac{1}{100}$. Therefore you may by the *Diagonal Scale*, take the 100 part of an Inch, or of half an Inch, very exactly.

The Uſe of theſe *Scales*, viz. of *Equal Parts*, or the *Diagonal*, is chiefly, *To lay down any Meaſure taken; or a Line being laid down, to find how much of the Meaſure that Line containeth.*

The way to do both which, is to reckon the Unities from P towards R; the Tens, from P towards K; and the Hundreds, from 1, to 2, 3, 4, *&c.* of the great Diviſions. Thus, for 432, count two of the Parallel Lines downward, and then run your Eye forward to the Right-hand, till you come to the 3d *Diagonal*, as at *o*; then the Compaſſes on the Line, extended from *o* to 4, will repreſent 432.

The Plain SCALE, (for Sea Uſes) has alſo ſet thereon, the *Scale of Chords, Natural Signs, Tangents, Semi-tangents, Seconds, Rhumbs, Hours, Leagues*, and *Longitudes*; with the *Diagonal Scale* on the back-ſide, and ſome others, according as there is room. The way of deducing or graduating all which from the equal Diviſions, or Degrees of the Circumference of a Circle, is, as in the following Scheme.



Having deſcribed the Circle A F E 90, and quartered it with two Diameters A E, F 90 at Right Angles.

1. Divide the Ark E 90 into 9 equal Parts, and tranſfer the Diviſions to the Right Line E 90, and that will be a *Line of Chords*.

2. Then Perpendicular to the Radius C E, erect the Tangent E 70; then a Ruler laid over C, and the equal Diviſions of the Ark E 90, gives E 70, the *Tangent Line* truly divided.

3. If thro' the Diviſions, 10, 20, 30, *&c.* on the Ark E 90, then you draw Parallels to C 90, it will divide CE, ſo as to make it a *Line of Sines*.

4. Setting

4. Setting one Foot of the Compaſs in C, extend the other to the ſeveral Diviſions on the Tangent Line E 70, and deſcribe the Arches 10, 10; 20, 20; 30, 30; &c. and the Line Z 90, will be a true *Line of Secants.*

5. A Ruler from A, to the ſeveral Diviſions of the Ark E 90, divides the Line C 90, into a *Line of Semi-tangents.*

6. Divide the Ark E F, into eight equal Parts, and ſetting one Foot in E, transfer the Diviſions of the Ark 1, 2, 3, &c. to the Right Line E F, and it ſhall be the *Line of Rhumbs.*

7. Divide F A, into ſix equal Parts, and ſetting one Foot in A, transfer them to the Strait Line FA, and that will be a *Line of Hours.*

8. Divide the Radius AC, into ſix equal Parts, and thro' each Diviſion draw Lines Parallel to C 90; thoſe Lines will Divide the Quadrant A 90, into ſix unequal Parts, and thoſe transfer'd into the *Chord* A 90, makes the *Line of Longitudes.*

9. And the equal Diviſions on the Radius A C, being ſubdivided, is the *Line of Leagues*, or *Line of equal Parts.*

SCALE *of the Gamut*, or *Muſical Scale*, is a kind of *Diagram*, conſiſting of certain Lines and Spaces drawn to ſhew the ſeveral Degrees, whereby a Natural or Artificial Voice or ſound may either aſcend or deſcend.

The Name thereof is taken from the *Greek* Letter *Gamma*, which *Guido Aretinus*, who reduced the *Greek* Scale into this Form, plac'd at the bottom, to ſignifie from whence it was derived; ſo that ever ſince, this Scale or *Gamut*, hath been taken for the Ground-work or firſt Foundation of all Muſick, both Vocal and Inſtrumental.

But there were three different Scales in uſe among the Ancients, which had their Denominations from the three ſeveral ſorts of Muſick, *viz.* The *Diatonical*, *Chromatical*, and *Enharmonical.* Which ſee.

SCALENI, are three Muſcles of the Thorax, ſo called from their Figure, having three unequal Sides.

1. *Scalenus Primus*, which ariſes fleſhly from the Fore-part of the ſecond, third, and fourth Tranſverſe Proceſſes of the *Vertebræ* of the Neck; and deſcending obliquely forwards, becomes Tendinous at its Inſertion to the firſt Rib: The Axillary Nerves paſs between this and the following Muſcles. Its Uſe is to draw the Superior Rib, together with the reſt, upwards in Inſpiration.

2. *Scalenus Secundus*, this ſprings fleſhly from the ſecond, third, fourth, and fifth Tranſverſe Proceſſes of the *Vertebræ* of the Neck, laterally, (like the former) in its deſcent, it becomes thin and tendinous, marching over the firſt Rib to its Inſertion in the ſecond, and ſometimes to the third.

3. *Scalenus Tertius*, this has its beginning near the former, from the ſame Tranſverſe Proceſſes of the *Vertebræ* of the Neck; as alſo from the fifth and ſixth of thoſe Proceſſes, and is ſoon Inſerted to the firſt Rib.

SCALENOUS *Triangles.* See *Triangles.*

SCALPRUM; a Surgeon's Raſping and Scraping Iron, with which he ſcrapes rotten Bones.

SCAMILLI *Impares*, in Architecture, are certain Blocks or *Zocco*'s which ſerve to elevate the reſt of the Members of any Column or Statue, which was placed before the Horizon, (*i. e.*) beneath the Projectures of the *Stylobata Cornices*, and, other *Saillies*; and will eaſily be conceived by conſidering the Pedeſtals of Statutes, which do well repreſent them.

SCAMNUM *Hippocratis*, *Hippocrates*'s Bench, is an Inſtrument of ſix Ells long: 'Tis uſed in ſetting of Bones.

SCANDALUM *Magnatum*, in Law, is the ſpecial Name of a Wrong done to any high Perſonage of the Land, as Prelates, Dukes, Earls, Barons, and other Nobles; as alſo of the Chancellor, Treaſurer, Clerk of the Privy-Seal, Steward of the Houſe, Juſtice of the Bench or other, and other great Officers of the Realm, by falſe News or Meſſages, whereby Debates and Diſcords betwixt them and the Commons, or any Scandal to their Perſons might ariſe; and hath given Name to a Writ granted to recover Damage thereupon.

SCAPHA *ſeu Linter*, is the Inner Rim of the Ear.

SCAPHOIDES, is the third *Os Tarſi* in the Foot; 'tis joined to the Ancle-Bone, and the three hinder Bones. 'Tis called alſo *Os Naviculare*, from ſome reſemblance it has to a Boat.

SCAPULA, the Shoulder-blade, a broad triangular Bone, with 3 Proceſſes; 'tis very thin in the middle, but grows thicker about the Proceſſes.

SCAPULARIS, *Externa* and *Interna*, are two little Veins ſo called, of which the former ariſes from the Muſcles covering the *Scapulæ*; and the latter, from the Muſcles which poſſeſs the cavity of the *Scapulæ.*

SCAPUS, is the term in Botany for the ſtrait Stalk or *Shaft* of a Plant, ſtanding upright like a Pillar or Column.

SCARFED, in the Sea-Carpenters Language, is the ſame as *Pieced*, or faſtened or joined in: Thus they ſay the Stem of a Ship is *Scarfed* into her Keel; and they imploy by it, That the two Pieces are ſhaped away ſlanting, ſo as to join with one another cloſe and even; which they call *Wood and Wood.*

SCARIFICATION; 'tis an Inciſion of the Skin with a Pen-knife or Lancet. This is done either with or without Cupping-Glaſſes; without Cupping Glaſſes, if there be any Mortification or Gangrene, becauſe the ſeparation is by no means to be haſtened; with Cupping Glaſſes, if there be a neceſſity to take away Blood.

SCARP, in Fortification, is the Foot of the Rampart-Wall, or the ſloaping of the Wall from the bottom of the Work, to the Cordon on the ſide of the Moat.

SCARPE, a term in Heraldry, probably derived from the French *Eſcharpe*, ſignifying the Scarfe which Military Commanders wear for Ornament. It is born ſomething like a *Battoon Sinister*, but is broader than it, and is continued out to the Edges of the Field; whereas the Bottom is cut off at each end.

He beareth Argent a Scarpe Azure.

SCELOTYRBE, is a wandring Pain in the Legs, proceeding chiefly from the Scurvy. Hence the Water proper for this Diſtemper, is called *Aqua Scelotyrbitis*. *Blanchard.*

SCENOGRAPHY, in *Perſpectives*, the *Scenographick* appearance of any Figure, Body, or Building, is that Side that declines from, or makes Angles with that ſtrait Line imagined to paſs through the two outward convex Points of the Eyes, generally called by Workmen, the *Return* of a foreright Side; and differs from the *Orthographick* Appearance in this, That the latter repreſents the Side of a Body or Building as it is ſeen, when the Plain of the Glaſs ſtands parallel to that Side: But *Scenography* repreſents it as it ſeems through a Glaſs, not parallel to that Side.

In Architecture and Fortification, *Scenography* is the manner of delineating the ſeveral parts of a Building or Fortreſs, as they are repreſented in Perſpective.

SCEPTICK, is the term for a Perſon who maintains there is nothing Certain, and no real Knowledge at all to be had; but that a Man ought to Doubt of, and Disbelieve every thing.

SCHEME, is the Repreſentation of any Geometrical or Aſtronomical Figure or Problem, by Lines ſenſibly to the Eye; and theſe are otherwiſe called *Diagrams*.

SCETICA *febris*, is oppoſed to the Hectick Fever, becauſe it is ſeated moſtly in the Blood, and is eaſily cured; but the Hectick Fever is fixed in the very Habit of the Body, and not to be remov'd without great difficulty. *Blanchard.*

SCHIRRUS, and *Schirroma*, is a hard, livid Swelling, that reſiſts the touch, and is without Pain. *Blanchard.*

SCHOLIUM, is a remark made leiſurely, and as it were by the by, on that Propoſition, Subject or Diſcourſe before advanced, treated of, or delivered.

SCIATICA, the Gout in or about the Hip-Bone.

SCIENCE, is Knowledge founded upon, or acquir'd by clear, certain, and ſelf-evident Principles.

SCIOGRAPHY, is the Art of *Shadows* or *Dyaling*: Alſo in Architecture, this Word is ſometimes taken for the Draught of a Building cut in its Length or Breadth, to ſhew the Inſide of it; as alſo the Thickneſs of the Walls, Vaults, Floors, Timber-works, *&c.*

SCIOPTRICKS. See *Obſcura Camera.*

SCIOTHERICUM *Teleſcopium*, is an Horizontal Dyal, with a Teleſcope adapted for obſerving the true Time both by Day and Night, to regulate and adjuſt Pendulum Clocks, Watches, and other Time-keepers; Invented by the Ingenious Mr. *Molyneux*, who hath publiſhed a Book with this Title, which contains an Accurate Deſcription of this Inſtrument, and all its Uſes and Applications.

SCIRE *facias*, is a Writ Judicial, moſt commonly to call a Man to ſhew cauſe to the Court whence it Iſſues, why Execution of a Judgment paſſed, ſhould not be made out. This Writ is not granted until a Year and a Day be elapſed after a Judgment given. *Scire facias*, upon a Fine, lies not but within the ſame time after the Fine levied, otherwiſe it is the ſame with the Writ of *Habere facias ſeiſinam*.

SCLEROPHTHALMY, it is hard bleareduneſs of the Eyes, accompanied with Pain; a ſlow motion of the Eyes, with redneſs and dryneſs. *Blanchard.*

SCLEROTICA, or hardening Medicines, are ſuch as unite the Parts more firmly amongſt themſelves; and that either by diſſipating the thin and ſoft Parts, or elſe ſometimes by retaining them; the firſt by hardning the Matter into a *Schirrus* by too hot Medicines; the latter is done when the Part affected acquires a Hardneſs, by cooling and aſtringent Medicines, ſuch are *Sengreen*, *Nightſhade*, *Purſlane*, and *Water-Lentils*. Therefore theſe *Sclerotick* Medicines are either Healing, or elſe Cooling and Aſtringent. *Blanchard.*

SCLEROTICA *Tunica*. See *Cornea.*

SCOLIASIS, is a diſtortion of the Back-Bone to one or t'other ſide.

SCLOOPOMACHÆRION, is a Chirurgeon's Knife, with which Wounds of the *Thorax* are widened; 'tis uſed alſo in opening larger Swellings; as alſo in opening the *Abdomen*.

SCONCES, are ſmall *Forts* built for Defence of ſome Paſs, River, or other Place.

Sometimes they are made regular of four, five, or ſix Baſtions; others of ſmaller Dimenſions fit for Paſſes, or Rivers, and likewiſe for the Field, which are.

1. *Triangles with half Baſtions*, which may be all of equal Sides, or they may be ſomething unequal. However it be, divide the Sides of the Triangle into two equal Parts, one of theſe three Parts will ſet off the *Capitals*, and the *Gorges*, and the *Flanks* being at Right-Angles with the Sides, make half of the *Gorge*.

2. *Square with half Baſtions*, whoſe Sides may be betwixt 100 and 200 Feet; and let one third of the Side ſet off the *Capital* and the Gorges; but the Flank (which raiſe at Right-Angles to the Side) muſt be but one half of the Gorge or *Capital*, that is on the ſixth part of the ſide of the Square.

3. *Square with half Baſtions and Tong*.

4. *Long Squares*.

5. *Star Redoubt of four Points*.

6. *Star Redoubt of five or ſix Points*.

7. *Plain Redoubts*, which are either ſmall or great: The ſmall are fit for Court of Guards in the Trenches, and may be a Square of 20 Foot to 30. The middle ſorts of *Redoubts* may have their Sides from 30 to 50 Feet; the Great ones from 60 to 80 Feet ſquare.

The Profile (that is, the Thickneſs and Height of the Breſt-works) to be ſet on theſe ſeveral Works, and the Ditches, are alterable and uncertain; for ſometimes they are uſed in Approaches, and then the Wideneſs of the Breſt-work at the Bottom may be 7 or 8 Foot, Inward Height 6, and Outward 5 Foot; the Ditch may be 8 or 10 Feet, and ſometimes 12; and for the Sloaps to be wrought according to the nature of the Earth; ſometimes they may be made 14 or 20 Feet Wide at the Bottom, and the Height of 7, 8, or 9 Feet, and

and to have two or three Aſcents to riſe to the *Parapet*; the Ditch may be 16 or 24 Feet Wide, and 5 or 6 Deep; and ſometimes they may come near the ſmalleſt ſort of Ramparts, and have a Breſt-work Cannon Proof, with a Ditch of 50 or 60 Feet Wide, and are thus made to ſet upon Paſſes or Rivers to endure.

SCOPER-*Holes*, in a Ship are Holes made through the Sides, cloſe to the Deck, to carry off the Water that comes from the Pump, or any other way. Theſe Holes in the loweſt Deck, and in the *Manniger*, have round Leathers nail'd over them, to keep the Sea-water from coming up into the Ship, which are called *Scoper Leathers*; and the ſhort Nails with broad Heads, which faſten theſe Leathers down, are called *Scoper-Nails*.

SCORBUTUS, the Scurvy, is a Diſeaſe that is Epidemical to the *Hollanders*. The ſymptoms of it are generally livid Spots on the Hands and Feet, weakneſs of the Legs, ſtinking Breath, looſeneſs of the Teeth, bleeding of the Gums, Convulſions, Pains, running Gout, Cholick, *&c. Blanchard*.

SCORE, in Muſick, is the Original Draught of the whole Compoſition, wherein the ſeveral Parts, *viz.* Treble, ſecond Treble, Baſe, *&c.* are diſtinctly ſcored or marked.

SCORPIO, is the 8th Sign of the *Zodiack*, being uſually marked thus (♏).

SCOT. a Part or Portion, according to *Raſtall*, is a certain Cuſtom, or common Tallage made to the Uſe of the Sheriff, or his Bailiffs; but now ſignifies a cuſtomary Contribution laid upon all Subjects, according to their Ability; for whoever are Aſſeſſed to any Contribution, are generally ſaid to pay *Scot* and *Lot*.

SCOTIA, a term in Architecture, the ſame with *Trochile*; which ſee.

SCOTIA, is Architecture, in a certain Member hollowed in form of a Demi-channel, which is placed berween the *Tours* and the *Aſtragal* in the Baſes of Pillars; as alſo ſometimes under the *Larmier* or *Drip*, in the Cornice of the *Dorick* Order.

SCOTOMY, Dizzineſs or Swimming of the Head, is when the Animal Spirits are ſo whirl'd about, that the external Objects ſeem to run round. *Blanchard*.

SCROBICULUS *Cordis*, or *Anticardium*, the *Heart Pit*, formerly called *Cardia*, the Pit of the Breaſt, or as 'tis uſually called the Stomach.

SCROPHULA, art preternatural hard Glandules, or preternatural Swellings of the Glandules of the Neck and Ears; they are contained in a proper Tunick. *Blanchard*.

SCROTUM, is that Rag which contains the Teſticles of the Male: It conſiſts of a Skin, a fleſhy Panniculus, and the two Tunics; of which, the outermoſt is called *Elytroids* or *Vaginalis*; the innermoſt Tunic is called *Albuginea*. In the middle of it is a Line extended in the length, which divides the right part from the left, which they call the *Septum*. For its more eaſie Diſtention or Contraction, 'tis generally ſuppoſed to be void of Fat. See more under the Word *Teſtes* and Teſticuli.

SCROTUM *Cordis*, ſo ſome are pleaſed to call the *Pericardium*; which ſee.

SCROWLES, or *Volutes*, a term in Architecture. See *Valuta*.

SCURVY. See *Scorbutus*.

SCUTIFORME *Os*. See *Mola Genu*.

SCUTIFORMIS *Cartilago*. See *Enſiformis*.

SCUTTLES in a Ship, are ſquare Holes, big enough to let in the Body of a Man cut in the Deck, to let People down on occaſion into any Room below. They are generally before the Main-Maſt, before the Knight in the Fore-Caſtle: In the Gun-Room to go down to the Stern Sheets: In the Round-Houſe to go down into the Captain's Cabbin, when forced by the Enemy in a Fight aloft. There are alſo ſome ſmaller Scuttles, which have Gratings over them; and all of them have covers to them, that Men may not tumble in at Night, when 'tis dark.

Alſo, thoſe little Windows and long Holes which are cut out in Cabbins to let in Light, are called *Scuttles*.

SCUTUM. See *Mola Genu*.

SCYPHOS, is the *Infundibulum* in the Brain; likewiſe thoſe Paſſages which convey the Spittle from the *Os Cribriforme* to the Pallat, are ſo called by ſome Writers. *Blanchard*.

SEA-*Gate*, when two Ships are aboard one another, by means of a Wave or Billow: The Seamen ſay, They lie aboard one another in a *Sea-Gate*.

SEA-*Quadrant*. See *Back-ſtaff*.

SEA-*York*, when the Sea is ſo rough, that they cannot govern the Helm with their Hands, then the Seamen ſeize two Blocks to the end of the Helm, one on each ſide, and then reeving two ſmall Ropes through them, which they call Falls, and which are faſtned to the ſides of the Ship, by having ſome Men at each Tackle, they govern the Helm according to Direction. This they call a Yoke to ſteer by. Sometimes they make a Yoke, by taking a double turn about the end of the Helm by a ſingle Rope, the ends being laid to the Ship-ſides; and by this means they guide the Helm; but this is not ſo good a Yoke as the other.

SEAMS of a Ship, are Places where her Planks meet and joyn together. There is alſo a kind of peculiar Seam in the ſowing of Sails, which they call a *Monks Seam*; which ſee.

SECANT, is the Right Line drawn from the Centre of a Circle cutting it, and meeting with the Tangent without. See under *Trigonometry*.

SECOND, is the Sixtieth part of a *Minute*.

SECOND *Deliverance*, is a Writ that lies for him, who after a return of Cattle Replevied; Adjudged to him that diſtrained them, by reaſon of a default in the Party that Replevied, for the Replevying of the ſame Cattle again, upon Security put in for the re-delivery of them in caſe the Diſtreſs be Juſtified.

SECONDARY *Circles*, in reference to the Ecliptick, or *Circles of Longitude* of the Stars, are ſuch as paſſing through the Poles of the Ecliptick, are at Right Angles to the Ecliptick (as the Meridian and Hour Circles are to the Equinoctial.) By the help of theſe (Infinitely many Circles, all Points in the Heavens are referred) to the Ecliptick: That is, Any Star, Plane, or other *Phænomenon*, is underſtood to be in that Point of the Ecliptick which is cut by the *Secondary* Semicircle which paſſes through ſuch Star or Phænomenon. And if two Stars, *&c.* are thus referred to the ſame Point of the Ecliptick, they are ſaid to be in *Conjunction*; if in oppoſite Points, they are ſaid to be in *Oppoſition*: If they are referred to two Points at a *Quadrants diſtance*, they are ſaid to be in a *Quartile Aſpect*;

Aſpect; if the Points differ a *ſixth* part of the Ecliptick, the Stars are ſaid to be in a *Sextile Aſpect*, &c.

And in general, all Circles which Interſect one of the ſix greater Circles of the Sphere at Right Angles, may be called *Secondary Circles*; as the Azimuths or Vertical Circles in reſpect of the Horizon, *&c.*

SECONDARY *Planets*, are ſuch as move round others, whom they reſpect as the Centre of their Motion; tho' they move alſo along with the Primary Planets in the Annual Orbit round the Sun. And theſe are otherwiſe called the *Satellites*: Such is the Moon to the Earth; and *Jupiter* hath four moving round him; as *Saturn*, according to *Caſſini*, hath five; *Mars*, *Venus*, and *Mercury*, have no Secondary Planets moving round them, that have been yet diſcovered.

The Learned Dr. *Gregory* in his *Aſtronomia Geom. & Phyſica*, Lib. IV. ſhews and proves at large, That tho' the Motion of the *Primary* Planets be ſufficiently ſimple and uniform, as being compounded only of a projectile Motion forward in a right Line, which is a Tangent to the Orbit, and a Gravitation towards the Sun at the Centre; and alſo being at ſuch vaſt diſtances from each other, that the effects of their mutual Gravitation towards one another are inſenſible; yet is the matter far otherwiſe in reference to the *Secondary* Planets. For every one of theſe (altho' it chiefly gravitate toward its reſpective Primary one, as towards its Centre) at equal diſtances from the Sun, is attracted towards him with equal accelerated Gravity, as the Primary one is towards him; but at a greater diſtance with *leſs*, at a nearer diſtance with *greater*. From which double Tendancy towards the Sun, and towards its own *Primary* Planet, the motion of the *Satellites* or *Secondary* Planets comes to be mightily compounded and affected with many Inequalities. As for Inſtance, he Proves,

1. That the Satellite ſhall be continually *accelerated* in its Motion from the time of its Quadrature with the Sun, to the next following Conjunction or Oppoſition, but that contrariwiſe, from the Syzygys to the Quadratures, it ſhall be *retarded*, and therefore will not always move Swifter in or near the Syzygys, and Slower near the Quadratures. From whence will follow,

2. That the Orbits of theſe Secondary Planets will be of a Figure more circular in the Quadratures, than in the Syzygys, where the ſwiftneſs of the Motion will make the Figure of the Orbit more Rectilinear. And therefore the Satellite will run farther from its Primary Planet in the Quadratures, than at the Syzygys; ſo that the Orbit will be a little Eliptical, having the Primary Planet for its Centre; and the longer Diameter will coincide with the Line of the Quadratures, and the ſhorter with that of the Syzygys.

And theſe irregularities will ariſe, if the Sun's power of perterbing the motion of the Satillite be excluded; and the Orbit be concentrick with that of the Primary Planet. For, if the Orbit be eccentrical, it may happen that the Satellite ſhall be farther off from the Primary one in the Syzygys, and ſo move ſlower, than it ſhall do at the Quadratures.

And when this is the caſe, that the Satellite's Orbit, is not a Circle concentrick to the Primary Orbit, but an Elipſis in one of whoſe Focus's the Primary Planet is placed; then the motion of the Satellite will be ſo diſturbed by the Sun, that as it runs into its Orbit, the *Apſes* of the Orbit ſhall be moved ſometimes in *Conſequentia*, and ſometimes in *Antecedentia* (whereas he proves before, that the *Nodes* and *Apſes* of the Primary Planets are at reſt.)

3. When the Plane of the Satellite's Orbit, is inclined to the Plane of the Primary Orbit, the Line of the Nodes of the Secondary Orbit will be moved in *Antecedentia*, with an angular motion, and an unequal Velocity; for it will recede moſt ſwiftly when the Nodes are in Quadrature to the Sun; after which, it will move ſlower; and at the time of the Nodes being in the Syzygys, it will be perfectly at reſt.

4. The Inclination alſo of the Plane of the Secondary Orbit to the Primary one, will be continually varying, and will be *greateſt* when the Nodes are in the Syzygys with the Sun; and *leſs* (*cæteris paribus*) when they are in the Quadratures; and from the time of the Nodes being in the Syzygys to the Quadratures, it will be always decreaſing; and from the time of their being in the Quadratures to the Syzygys, continually encreaſing.

And he proves, that all theſe Irregularities, whether in any excentrick or concentrick Orbit, will always be ſomething greater when the Satellites is in *Conjunction* with the Sun, that when he is in *Oppoſition* to him.

After this, he proceeds to ſhew, what Errors or Irregularities in the motion of theſe Secondary Planets will be produced by the Sun, ſuppoſing the Primary Planet to move in an excentrick Orbit round the Sun. Of which, Sect. IV. of the ſaid Book IV.

SECRETION, is the ſeparation of one Fluid from another in the Body of an Animal or Vegetable, by the means of Glands or ſomething analogous to them.

Dr. *Havers* in his *Oſteologia*, explains *Glandular Secretion*, by obſerving, firſt, That all Motion in its proper Tendency is direct, (which is exactly right) and that the Glands which are ſeated on the ſides of the Arteries all over the Body, are ſo placed, as to favour the motion of any Particles that ſtrike againſt them in a Right Line, more than the Veins; and having Pores adapted to the Figure of the Particles which they ſeparate, the Particles endeavour in their motion to get into thoſe Glandules; and being there received, are ſeparated and diſtinguiſhed from the reſt of the maſs of Blood, and ſo aſſume the form of that Liquor which we find ſeperated by every Gland. And that the Glands are ſo ſituated as to favour the motion of a Particle in a Right Line more than the Veins, he ſaith, is apparent from Obſervation of the gradual conſtruction of the Arterial Channel. See *Vol.* II.

SECTA *ad Curiam*, is a Writ that lies againſt him who refuſes to perform Suit either to the *County* or *Court-Baron*.

SECTA *facienda per illam quæ habet æniciam partem*, is a Writ to compel the Heir that hath the Elder's part of the Co-heirs to perform Service for all the Co-parceners.

SECTA *unica tantum facienda pro pluribus hæreditatibus*, is a Writ that lies for that Heir that is diſtrained by the Lord to more Suits than one, in reſpect of the Land of divers Heirs deſcended unto him.

SECTIO *Cæsaria*. See *Hysteratomotocia*.

SECTION *Conick*, is the Figure made by the ſolidity of a Cone's being ſuppoſed to be cut by a Plane.

If the *Section* be made by the *Axis*, or through the Vertex, the Figure ariſing is a Triangle. If by a Plane, Parallel to the *Baſe* of the Corner, or *ſubcontrarily* poſited, the Figure produced is a *Circle*.

If the *Section* be made Parallel to one ſide of the Cone, the Figure produced is a *Parabola*: If thro' both ſides of the Cone, 'tis an *Ellipſis*; and if thro' one ſide of the Cone, thro' the Baſe, and not Parallel to the other ſide of the Cone, 'tis an *Hyperbola*.

Archimedes, *Euclid* and other ancient Mathematicians, called that only a *Conick Section*, when the Plane cutting the Cone was *at right Angles to the ſide of the Cone*; and according as the Angle made by the ſides of the Cone meeting in the Vertex, as it was a *right*, *obtuſe*, or *acute* one, they called it the Section of *Right-angled*, *Obtuſe-angled*, or *Acute-angled Cone*. By which Words they underſtood what we now call the *Parabola*, the *Hyperbola*, and the *Ellipſis*: Which three Sections, (as alſo the Circle) *Apolonius Pergæus* (juſtly called *Magnus Geometra*) found out to be producible in any Cone, according to the four ways of cutting it, as above-mentioned.

SECTION, in Mathematicks, ſignifies the cutting of one *Plane* by another, or a *Solid* by a *Plane*.

The *common Section* of two Planes is always a right Line, being the Line ſuppoſed to be drawn on one Plane by the Section of the other, or by its Entrance into it.

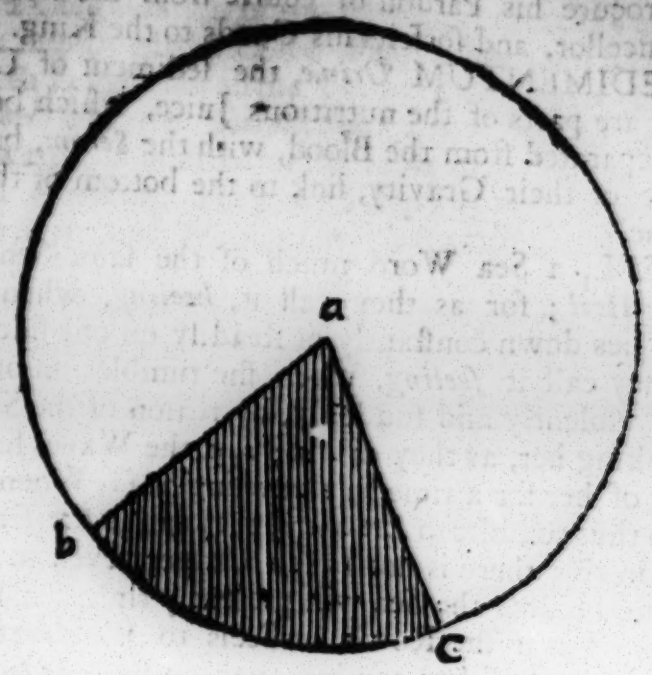
SECTION *of a Building*, in Architecture, is underſtood of the Perfile or Delineation of its Heights and Depths raiſed on the Plane; as if the Fabrick were cut aſunder to diſcover the Inſide.

SECTIS *non faciendis*, is a Writ that lies for a Woman, who, for her Dower, ought not to perform Suit of Court.

SECTOR, is an Inſtrument made of Wood, Ivory, Braſs, *&c.* with a Joint, and ſometimes a piece to turn out to make a true Square, with Lines of Sines, Tangents, Secants, Equal Parts. Rumbs, Polygons, Hours, Latitudes, Metals, Solids, *&c.* and is generally uſeful in all the Practical Parts of the Mathematicks, and particularly contrived for *Navigation*, *Surveying*, *Aſtronomy*, *Dyaling*, *Projection of the Sphere*, &c. By *Gunter*, *Foſter*, *Collins*, and others. There are likewiſe *Sectors* for *Fortification* and *Gunnery*, by Sir *Jonas Moor*.

The great Advantage of the Sector above any other Rule or Plain-ſcale, is that all its Lines can be accommodated to any Radius; which is done by taking off all Diviſions Parallelwiſe, and not Lengthwiſe. The ground of which Practice is this, That Parallels to the Baſs of any Plain Triangle, bear the ſame Proportion to it :: as the Parts of the Legs above the Parallel do to the whole Legs.

SECTOR of a Circle, is a mixt Triangle comprehended between the Radius and an Ark of the Circle.



As here,

The Sector *a b c*, made by the Legs *a b* and *a c*, and the Ark *b c*.

To find the ſuperficial Content of any *Sector*, ſee *Area*, N. 9.

SECUNDA *ſuperoneratione paſturæ*, is a Writ that lies where Admeaſurement of *Paſture* hath been made; and he that firſt ſurcharged the Common, doth again ſurcharge it, notwithſtanding the Admeaſurement.

SECUNDANS, in Mathematicks, is an infinite ſeries of Numbers, beginning from Nothing, proceeding as the ſquares of Numbers in Arithmetical Proportion.

As for Inſtance,

0, 2, 4, 9, 16, 25, 36, 49, 64, *&c.*

SECONDARY; that Officer who is the ſecond, or next to the chief Officer; as the *Secondaries* of the Fine Office; the *Secondaries* of the Compters, who is next to the Sheriff of *London* in each of the two Compters; *Secondary* of the Office of the Privy-Seal; *Secondaries* of the Pipe, two; *Secondary* to the Remembrancers, which are two Officers in the Exchequer.

SECUNDINE, the Secunding or After-Birth, are the three Membranes, *Chorion*, *Alantois*, and *Amnion*, which with the *Placenta*, are excluded after the Birth.

SECURITATE *pacis*, is a Writ that lies for one who is threatned Death or Danger, againſt him that ſo threatneth, and is taken out of the *Chancery*, and directed to the Sheriff.

SECURITATEM *inveniendi quod ſe non divertat ad partes exteras ſine licentia Regis*, is a Writ that lies for the King againſt any of his Subjects, to ſtay them from going out of his Kingdom: The ground of which is, That every Man is bound to ſerve and defend the Common-wealth, as the King ſhall think meet.

SE *defendendo*, is a Plea for him that is charged with the Death of another, ſaying, he was neceſſitated to do that which he did in his *own defence*; the other ſo Aſſaulting him, That if he had not done as he did, he muſt have been in hazard of his own Life; But this Danger ought to be ſo great, that it ſeems inevitable; and tho' he juſtifie it to be done in his own Defence, yet he is driven

to procure his Pardon of course from the Lord-Chancellor, and forfeits his Goods to the King.

SEDIMENTUM *Urinæ*, the sediment of Urine, are parts of the nutritious Juice, which being separated from the Blood, with the *Serum*, because of their Gravity, sink to the bottom of the Urine.

SEEL, a Sea Word much of the same Sense with *Heel*; for as they call it, *heeling*, when a Ship lies down constantly or steadily on one side; so they call it *seeling*, when she tumbles on one side violently and suddenly, by reason of the Sea forsaking her, as they call it; *i. e.* the Waves leaving of her for a time in a rowling Sea: When a Ship thus tumbles to *Lee-ward*, they call it *Lee-seel*; and in this there is not much danger, even in a Storm, because the Sea will presently right her up again; but if she Rowls or Seels to Windward, there is fear of her coming over too short or suddenly, and so by having the Sea break right into her, be either foundred, or else have some of her upper Works carried away.

SEGMENT *of a Circle*, is a Figure contain'd between a Chord and an Ark of the same Circle.

To find the Superficial Content of any Segment of a Circle, see *Area*, N. 10.

SEGMENT *of a Sphere*, is a part of it cut off by a Plane; and therefore the Base of such a Segment must always be a Circle, and its Superficies a part of the Surface of the Sphere.

Its solid Content is found by multiplying the Surface of the whole Sphere, by the Altitude of the Segment, and then dividing the Project by the Diameter of the Sphere, and to the Quotient, adding the *Area* of the Bass of the Segment.

Or if it is less than an *Hemisphere* thus:

Take the Altitude of the Segment from the Radius of the Sphere, and by the Difference multiply the Area of the Base of the Segment; and Substract this Product from that which will arise from multiplying the Semi-Axis of the Sphere into the Convex surface of the Segment; then divide the Remainder by 3, and the Quotient is the Solidity sought.

This latter Method supposes the Axis of the Sphere to be given; if not, it may be found thus.

Let the Altitude of the Segment be called a, and its Semi-diameter s.

Then will

$a . s :: s . \frac{s\,s}{a}$; add $\frac{s\,s}{a}$ to a, and that shall give the Axis sought. 13. *è* 6. *Euclid.*

SEGMOIDALES, or *Semilunaries*, are Valves of the *Arteria Pulmonaria*, and are so called, because they resemble a Half-moon, or Segment of a Circle; their substance is Membranous: When they separate, they give passage to the Blood, from the Ventricle into the Artery; but they shut the Passage, and are thrust together by the Blood, if it endeavours to return.

SEGREIANT, the Heralds Word for *Griffins*, when drawn in a leaping or saliant Posture.

SEJANT, (*i. e.* sitting) the Term is used in Heraldry for a Lyon, or other Beast, when it is drawn in an Escutcheon sitting like a Cat, with his Forefeet strait.

SEISIN, from the *French Seisine*, *possessio*. So *primier Seisin*, is the first possession; and *to Seise*, is to take possession.

Seisin, according to the common Law, is twofold; *Seisin in fact*, and *Seisin in Law*.

Seisin in Fact, is when a Corporal Possession is taken.

Seisin in Law, when something is done which the Law accounteth a *Seisin*, as an Inrolment: And this *Seisin in Law*, is as much as a Right to Lands and Tenements, tho' the Owner be by Wrong disseised of them: And he who hath had an Hours Possession quietly taken, hath *Seisin de droit & de claime*, whereof no Man may disseise him by his own force or subtilty, but must be driven to his Action; and 'tis called by *Coke*, *Seisin in Law*, or *Actual Seisin*.

The *Civilians* call the one *Civilem Possessionem*, the other *Naturalem*.

SESINA *habenda, quia Rex habuit annum, diem & vastum*, is a Writ that lies for Delivery of *Seisin* to the Lord of his Lands or Tenements, after the King, in the Right of his Prerogative, hath had the Years, Day, and Waste.

SEIZING, or *Seasing*, in the Sea Language, is the same as *Fastening*, (*viz.*) of two Ropes together with some Rope-yarn, *&c.* Also the fastening of a Block at the end of a Pendant or Tackle, Garnet, *&c.* is called *Seizing*.

The *Boats seasing*, is a Rope by which a Ring, or little Chain is made fast in the Foreship of the Boat, whereby, in a Harbour, the Boat is fastened to the Ship's side.

SELLA *Equina, seu Turcica*, or *Sphænoides*, a part of the Brain, is compounded of four Processes of the Bone *Sphænoides*, or the Wedge-like Bone; it contains the *Pituitarian* Glandule; and in Brutes, the *Rete Mirabile*.

SEMEIOSIS. See *Diagnosis*.

SEMEIOTICA, is that part of Physick, or the Art of Medicine, which treats of the Signs of Health and Sickness; assisting the Physician to make probable Guesses and Conjectures of the Constitution and State of his Patient.

SEMETS, according to Dr. *Grew*, are the Apices of the Attire of a Plant. See *Apices*.

SEMI-BREVE, a Term in Musick. See *Notes* and *Time*.

SEMI-CIRCLE, is the Figure contained between the Diameter of a Circle, and half the Circumference.

Also an Instrument for *Surveying*, made of Brass, and divided into 180 Degrees, being half the *Theodolite*.

SEMI-COLON, is a Stop, or Point in a Sentence, between a *Comma* and a *Colon*, and mark'd thus (;) and expresses a Pause greater than the former, and less than the latter.

SEMI-CUBICAL *Paroboloid*, is a Curve whose Ordinates are in *Subtriplicate of the Duplicate* proportion of the Diameter: That is, the Cubes of the Ordinates are as the Squares of the Diameters.

In this *Paraboloid*, the Segments of the Curve, cut by Ordinates (at equal Distances) are as the Ordinates in a *Parabola*; and therefore their Squares increased by Equals in Arithmetical Progression; and consequently that Curve to a Right Line, as the Trunk of a *Parabola* to a *Parabola*.

SEMI-

SEMI-CUPIUM, is a Bath, in which the Patient is only up to the Navel in Water.

SEMI-DIAMETER, or *Radius*, is that Line that is drawn from the Center to the Circumference of a Circle.

SEMI-DIAMETER, in Fortification, is twofold, *viz.* the Greater and Leſſer: The former being a Line compoſed of the Capital, and the Small Semi-diameter of the Polygon: And the other, a Line drawn to the Circumference from the Centre thro' the *Gorges*.

SEMI-DIAPASON, a Term in Muſick, ſignifying a Defective or Imperfect *Octave*.

SEMI-DIAPENTE, a Term in Muſick, ſignifying an *Imperfect Fifth*.

SEMI-DITONE, in Muſick, is the Leſſer Third having its Terms as ſix to five.

SEMI-LUNARES *Valvulæ*. See *Segmoidales*.

SEMI-MEMBRANOSUS, is a Muſcle of the Leg, ſo called from its being half Tendinous and Membrane-like, lying immediately under the *Seminervoſus*: It ariſeth broad and tendinous from the Protuberance of the *Os Iſchium*, and in its deſcent becomes broader; and in leſs than half its Progreſs begins to grow fleſhy, and is dilated into a large and fleſhy Belly, lying under the long round Tendon of the *Semi-nervoſus*, becoming a ſhort thick Tendon, inſerted to the ſuperior part of the upper Appendix of the *Tibia* backwards. Its Uſe is to help to bend the *Tibia*.

SEMINAL *Leaves*: much the greateſt part of all Seeds which are ſown in the Earth, come up, or ſhoot forth at firſt with too little, plain, ſoft, and undivided Leaves; which becauſe they are uſually very different from the Leaves of the ſucceeding Plant in Magnitude, Figure, Surface, and Poſition, are called very properly by this Name *Seminal Leaves*: As the little embrionated Plant which lies in Minature in every Seed, is called, the *Plantula Seminalis*.

SEMI-NERVOSUS, *ſeu Semi-tendinoſus*, a Muſcle of the Thigh, which is ſo called from its being half Tendinous, and Nerve-like. It ariſeth partly Tendinous and partly Fleſhy from the External part of the Protuberance of the *Os Iſchium*, and preſently being dilated to a large fleſhy Belly, becomes a round Tendon in half its Progreſs, which deſcending over the fleſhy Belly of the *Semi-membranoſus*, marcheth cloſe by the *Gaſterocnemius*, on the poſterior part of the Superior Appendix of the *Tibia*; from whence it paſſes forwards to its Inſertion in the ſaid Bone immediately below the termination of the *Gracilis*: This with the *Gracilis* acting, bend the *Tibia* directly backwards. Its Tendon, together with the *Sartorius*, *Gracilis*, *Semi-membranoſus* and *Biceps*, make the inward Hamſtrings, as they are commonly called.

SEMI-QUADRATE, the ſame with *Semi-quartile*.

SEMI-QUARTILE, an Aſpect of the Planets when diſtant from each other 45 Degrees, or one Sign and a half.

SEMI-QUAVER, a Term in Muſick. See *Notes* and *Time*.

SEMI-QUINTILE, an Aſpect of the Planets, when at the Diſtance of 36 Degrees, from one another.

SEMI-SEXTILE, an Aſpect of the Planets, when diſtant from one another 30 Degrees, or 1 Sign, and is noted thus, SS.

SEMI-SPINATUS, is a Muſcle which ſeems to be a Continuation of the *Sacer*; and therefore may not improperly be called *Tranſverſalis Dorſi*; it ariſeth fleſhy from all the Tranſverſe Proceſſes of the *Vertebræ* of the *Thorax*, and marching obliquely upwards, is inſerted to the ſuperior Spines of the ſaid *Vertebræ*: Theſe with the *Quadratus Lumborum Sacer*, and *Tranſverſales Colli* acting, move the whole Spine, or *Vertebræ* of the Neck, Back, and Loins, obliquely backwards, as when we endeavour to look very much behind us: If they all act together on each ſide, they aſſiſt in erecting the Trunk of the Body.

SEMI-TENDINOSUS. *Vid. Semi-nervoſus.*

SEMI-TONE, a Term in Muſick, of which there are two ſorts, *viz.* a Greater and a Leſſer; the *Enharmonical Deiſis*, being the Difference between them.

SEMITA *Luminoſa*, is a Name given by Mr. *Childrey* in his *Britannia Baconica*, p. 183, 184. to a kind of Lucid Track in the Heavens, which a little before the Vernal Equinox, (he ſaith) may be ſeen about 6 a Clock at Night, extending from the Weſtern edge of the Horizon up towards the *Pleiades*.

After this, the *Phænomenon* was taken notice of by *Caſſini* and *Fatio*, who both evince, That this Light comes diffuſed from each ſide of the Sun: Its brightneſs is much the ſame with that of the *Via Lactea*, or the Tail of a Comet. 'Tis ſeen plaineſt with us about the beginning of *October*, and towards the end of *February*.

S. *Fatio* conjectures, That the Bodies, or rather the Congeries or Aggregate of thoſe Bodies which occaſion the Light, doth conform to the Sun like a *Lens*; and takes it to have ever been the ſame: But *Caſſini* thinks it ariſes from a vaſt Number of ſmall Planets which encompaſs the Sun, and give this Light by Reflection, eſteeming it alſo not to have exiſted long before he obſerved it: But this latter is overthrown by *Childrey*'s Obſervations, whoſe Book was Printed in 1661; and he ſaith there he had taken notice of it for many Years.

SEND, when a Ship is either at an Anchor, or under Sail, falls with her Head or Stern deep into the *Trough of the Sea* (*i. e.* into a Hollow made between two Waves or Billows) they ſay ſhe *ſends* much that way, whether it be *A-head*, or *A-ſtern*.

SENESCALLO *& Mareſchallo quod non teneant placita de libero tenemento*, &c. is a Writ directed to the Steward, or Marſhal of *England*, inhibiting them to take Cogniſance of any Action in their Court that concerns either Freehold, Debt, or Covenant.

SENSATION is the perceiving of things by our Senſes; and is the Original of moſt of the Idea's which we have, which by our Senſes are derived to our Underſtanding.

The *Carteſians* aſſert Senſation to be only a ſimple Perception, whereby the Motions of external Objects affecting the Extremities of the Nerves in the Organs of the Body, are communicated all along thoſe Nerves to the *Glandula Pinealis*, where the Soul reſiding receives her Informations, and accordingly makes Jugdments upon them.

In which, (except as to that Whim of the Soul's reſiding in the *Glandula Pinealis*) they are certainly much in the right: For Senſation is properly and ultimately made in or by the Mind, or diſcerning Faculty, which probably, from the different Mo-

tions of the internal parts of the Brain, is excited and determined to differing Perceptions; and to theſe we give differing Names, as Heat, Cold, and other Qualities.

SENSIBLE *Horizon.* See *Horizon.*

SENSIBLE *Point.* See *Point Senſible.*

SENSITIVE *Plants*, are ſuch whoſe Frame and Conſtitution is ſo nice and tender, that at the touch, or at the leaſt preſſure of ones Hand, they will contract their Leaves or Flowers, as if they really felt Pain by ſuch a Conract.

Of theſe the Botanick Writers mention many Kinds, ſome of which contract with Heat, others with Cold.

SENSORIUM *Commune*, or the Seat of the common Senſe, is that part of the Brain in which the Nerves, from the Organs of all the Senſes, are terminated, which is the beginning of the *Medulla Oblongata.*

SENSORY, the Organ or Inſtrument of Sence, as the Eye of Seeing, the Ear of Hearing, &c.

SENSUS, *Senſe*, is when the Motion impreſſed by the outward Objects upon the Fibres of the Nerves, is conveyed by the help of the Animal Spirits in the Nerves, to the common *Senſory*, or *Medulla Oblongata.*

SEPARATION, with ſome Writers of Navigation, is the ſame with what is more uſually called, the *Departure*; that is, a Ship's difference of Longitude from any place, or from another Ship. Our Seamen commonly call it *Eaſting* or *Weſting*; according as the Difference of Longitude is Eaſt or Weſt.

SEPHYROS (in ſome Authors) is a hard Inflammation of the Womb.

SEPTAN *Fevers*, intermitting Fevers that return every ſeventh Day.

SEPTANGULAR, the ſame with *Heptangular.*

SECTENTARIUS, a Conſtellation in the Northern Hemiſphere, conſiſting of 30 Stars.

SEPTENTRIONAL *Signs*, are the firſt 6 Signs of the *Zodiack*, ſo called, becauſe they decline towards the North from the Equinoctial, and are the ſame with *Boreal* Signs.

SEPTICA, *ſive Putrefacientia* are thoſe things, which by a Malignant ſharpneſs, rot and corrupt the Fleſh.

SEPTUM *Cordis*, the fleſhy part that divides the Right Ventricle of the Heart from the left.

SEPTUM *Lucidum*, is a Partition, which is diaphanous, upon the account of its thinneſs, it diſtinguiſhes the Ventricles of the Brain.

SEPTUM *Tranſverſum.* See *Diaphragma.*

SEQUATUR *ſub ſuo periculo*, is a Writ that lies where a Summons *ad Warrantiſandum* is awarded, and the Sheriff returns, That he hath nothing whereby he may be ſummoned; then goes out an *Alias* and *Pluries*; and if he come not at the *Pluries*, then goes out this Writ.

SEQUESTER, is a Term uſed in the Civil Law for renouncing, as when a Widow comes into Court, and diſclaims to have any thing to do, or to intermeddle with her Husband's Eſtate, who is Deceaſed; ſhe is ſaid to *Sequeſter.*

SEQUESTRATION, is the ſeparating of a thing in Controverſie from the Poſſeſſion of both thoſe that contend for it: And it is of two ſorts; *Voluntary*, or *Neceſſary.*

Voluntary, is that which is done by Conſent of each Party.

Neceſſary, is that which the Judge doth of his Authority, whether the Parties will or non.

It is uſed alſo for the Act of the Ordinary, diſpoſing of Goods and Chattels of one Deceaſed, whoſe Eſtate no Man will meddle with.

Alſo for the gathering of the Fruits of a Benefice void to the Uſe of the next Incumbent.

SEQUESTRO *habendo*, is a Writ Judicial, for the diſſolving a Sequeſtration of the Fruits of a Benefice made by a Biſhop at the King's Command, thereby to compel the Parſon to appear to the Suit of another: For the Parſon, upon his Appearance, may have this Writ for the Diſcharge of the Sequeſtration.

SERIES, properly ſpeaking, is an orderly Proceſs or Continuation of things one after another. 'Tis commonly in *Algebra* connected with the Word *Infinite*, and there, by *Infinite Series*, is meant certain Progreſſions, or Ranks of Quantities orderly proceeding, which make continual Approaches to, and if infinitely continued, would become equal to what is inquired after.

This Method took its Riſe from the Learned Dr. *Wallis's Arithmetick of Infinites*, and has been of late ſo purſued by ſeveral Worthy Perſons of our own Nation, eſpecially the Incomparable Sir *Iſaac Newton*, that it is now one of the greateſt Improvements of *Algebra.*

SEROSITIES, are ſerous Humours abounding in the Body.

SERPENTINE, ſo the Chymiſts (from its Figure) call that long winding Worm, which is placed in a Tub of Water in the Diſtillation of Spirits. See *Worm.*

SERPENTINE *Line*, the ſame with *Spiral*; which ſee.

SERPIGO. See *Lichen.*

SERRATUS *Major Anticus*, is a Muſcle which ariſes fleſhy from the whole *Baſis Scapulæ*, and paſſing under the *Subſcapularis*, it becomes broader and thicker, ſtill running ſomewhat forwards till it's inſerted to the eight ſuperior Ribs laterally, by ſo many diſtinct fleſhy Portions, or *Digituli*, repreſenting the Teeth of a Saw; the two, and ſometimes three inferior of which, are indented with the *Muſculus Obliquus Deſcendens* of the *Abdomen.* This like the *Serratus Minor Anticus*, dilates the *Thorax*, or moves the *Scapulæ* forwards and downwards, when its Muſcles are relax'd.

SERRATUS *Minor Anticus*, is a Muſcle, by Anatomiſts generally reckoned a Muſcle amongſt thoſe of the *Scapula*: But we are perſwaded (ſays *Cowper*) from its Poſition that it may be equally ſerviceable to the *Thorax*, in elevating thoſe Ribs it is inſerted to; It ariſes fleſhy from the Proceſſus *Coracoides Scapulæ*, and deſcends obliquely forwards, becomes broader and thinner, and is inſerted fleſhy to the bony part of the ſecond, third, fourth, and fifth Ribs. If the *Scapulæ* are elevated by their proper Muſcles, this with its Partner, are then capable of dilating the Breaſt in large Inſpirations. But if they are depreſt, it may be eaſily conceived with what Difficulty that Action muſt be performed.

SERRATUS *inferior poſticus*, is a Muſcle of the *Thorax*, much larger than Authors generally aſſign it: "In a Robuſt Man we obſerved its Conti-
"nuation, (ſays *Cowper*) not only from the Spines of
"the *Vertebra*'s of the Loins, but from all thoſe of
"the *Thorax*, as well underneath as below the for-
"mer Muſcle; its ſuperior and inferior Parts be-
"ing

" ing entirely Tendinous, its Middle growing " fleſhy near its ſerrated Termination at the Cur- " vature of the ninth, tenth, eleventh, and Extre- " mity of the twelfth Ribs. The *Ductus* of the Fi- " bres of this paſſing tranſverſe, and thoſe of the " precedent deſcending obliquely, do decuſſate " each other in Acute Angles; which *Riolan* has " well obſerved, and contrary to the Opinion of " Authors, aſſigns it with its Partner, a different " Uſe in depreſſing the *Thorax*; both performing " the Office of a Bandage in binding together and " conſtringing the Poſterior Muſcles of the Spine, " not unlike the Conſtructive Incloſures of the " Thigh and Cubit.

SERRATUS *ſuperior poſticus*, is a Muſcle of the *Thorax*; which lies immediately under the *Rhomboides*: It ariſes with a thin Tendon from two inferior Spines of the *Vertebræ* of the Neck, and three ſuperior of the *Thorax*, from thence deſcending obliquely over the *Splenius Capites*, and under parts of the *Sacrolumbalis*, and *Dorſi Longiſſimus*, it becomes fleſhy, marching over the *Scapula*, to its Inſertion at the Curvature of the ſecond, third, and fourth Ribs, by ſo many diſtinct fleſhy endings, repreſenting the Teeth of a Saw, whence its Name. This aſſiſts in elevating the Ribs or *Thorax*.

SERVE, to ſerve a Rope (in the Sea Phraſe) is to lay upon it Spun-yarn, Rope-yarn, Sinnet, a piece of Canvas, or the like, which is there rowled faſt round about the Rope, to keep it from fretting or galling in any place.

SERVIENTIBUS, are certain Writs touching Servants and their Maſters violating the Statutes made againſt their Abuſes.

SERVITUS *acquittandis*, is a Writ Judicial, that lies for one diſtrained for Services to *F.* who owes and performs to *R.* for the Acquittal of ſuch Services.

SERUM, is a watery, thin, yellowiſh, and ſaltiſh Humour, which conſiſts chiefly of Water, with a moderate quantity of Salt, and a little Sulphur: The Uſe of it is to be a Vehicle to the Blood: And this is that watery part that ſeparates from the Blood in the Veſſel, after any Perſon is let Blood. A ſmall Heat will Coagulate it.

SESAMOEIDEA *Oſſa*, are 16, 19. 20, and ſometimes more little ones, ſo called from the likeneſs they have to *Seſamum* Seeds, which are found in the Joints of the Hands and Feet.

SESQUIALTER, in Muſick. See *Time*.

SESQUIALTERAL *Proportion*, is when any Number or Quantity contains another once and an half, and the Number ſo contain'd in the Greater, is ſaid to be to it in *Subſelaquiteral Proportion*.

SESQUIQUADRATE, an Aſpect or Poſition of the Planets, when at the Diſtance of 4 Signs and an half, or 135 Degrees from each other.

SESQUIQUINTILE, an Aſpect of the Planets, when 108 Degrees Diſtant from each other.

SESQUITERTIANAL *Proportion*, is when any Number or Quantity contains another once and one third.

SESSIONS, is a ſitting of Juſtices in Court upon Commiſſion, as the *Seſſions of Oyer and Terminer*, *Quarter-ſeſſions*, otherwiſe called *General-ſeſſions*, oppoſite whereto, are *Eſpecial*, otherwiſe called *Privy-ſeſſions*, which are procured upon ſome ſpecial occaſion, for the more ſpeedy diſpatch of Juſtice.

Seſſions of Parliament, is a *Seſſions* which continues till it be prorogued or diſſolved.

SETACEUM, is when the Skin of the Neck is taken up and run through with a Needle; and the Wound afterward kept open by Briſtles, a Skean of Silk, &c. which is after moved to and fro, to give vent to the Humours that are ill diſpoſed in that Part. 'Tis alſo called *Seton* and *Setum*.

SETON, or *Setum*. See *Setaceum*.

SETT, when the Seamen obſerve on what Point of the Compaſs, the *Sun*, Land, &c. bears, they call it, *Setting* the Sun, or Land, by their Compaſs.

SETTLE *a Deck*, is the Word at Sea for taking a Deck lower than it was at firſt, which they call ſettling a Deck.

SEVERAL *taile*, is that whereby Land is given or entailed ſeverally, to two Men and their Wives, and to the Heirs of their Bodies begotten; the Donees have joint Eſtate for their two Lives, and yet they have *ſeveral* Inheritance, becauſe the Iſſue of the one ſhall have his Moiety, and the Iſſue of the other, the other Moiety.

SEVERAL *Tenancy*, is a Plea or Exception taken to a Writ that is laid againſt two as joint, which are *ſeveral*.

SEVERANCE, is the ſingling or ſevering of two, or more, that are joined in one Writ.

For Example; If two join in a Writ *de libertate probanda*, and the one afterward be Non-ſuit: Here *Severance* is permitted; ſo that notwithſtanding the Non-ſuit of the one, the other may ſeverally proceed.

There is alſo *Severance* of the Tenants in an Aſſize, when as one or two, or more Diſſeiſors appear upon the Writ, and not the other.

As alſo *Severance* in *Attaints*, and *Severance* in *Debt*, where two or more Executors are named Plaintiffs, and the one refuſes to proſecute.

Severance of Corn, is the cutting and carying it off from the Ground; and ſometimes the ſetting out the Tythe from the reſt of the Corn, is called *Severance*.

SEW, when a Ship at Low-water comes to lie on the Ground, and to lie dry, they ſay *ſhe is ſewed*; and if ſhe be not quite left dry, they ſay, ſhe *ſews* to ſuch a part.

SEXAGENARY *Tables*, were Tables contrived (formerly) of Parts proportional, where by Inſpection, you may find the Product of two *Sexagenaries* to be multiplied, or the Quotient of two that are to be divided, &c.

SEXAGESIMAL *Fractions*, or *Sexagenaries*, are ſuch as have always 60 for their Denominator: There were antiently no others uſed in Aſtronomical Operations; and they are ſtill retained in many Caſes; tho' *Decimal Arithmetick* begins to grow in Uſe now in Aſtronomical Calculations.

In theſe Fractions, (which ſome call *Aſtronomicals*) the Denominator is uſually omitted, and the Numerator only written down: Thus.

$$4^{\circ}, 59', 32'', 50''', 16''''.$$

Is to be read, 4 Degrees, 59 Minutes, 32 Seconds of a Degree, or 60th parts of a Minute, 50 Thirds, 16 Fourths, &c.

The Ancients, before the introducing of Algoriſm by the Numeral Figures now in uſe, (finding

it troubleſome to expreſs and manage Fractions of divers Denominators, eſpecially when they are to be expreſſed by great Numbers; and troubleſome alſo to expreſs and manage Integers, when they happen to be great Numbers) though fit to divide an Integer into 60 Parts, which they call'd λεπτὰ, which now we call Minutes, or Scruples; and each of theſe into 60 Parts, which they called Seconds, and (if there were yet need of greater Exactneſs) each of theſe into 60 Thirds; and each of theſe into as many Fourths; and ſo onward, as far as there was occaſion, which they called Sexageſms, or Sexageſimal parts.

And (to avoid great Numbers) a Collection of ſixty Integers they called a Sexagene; and ſixty of ſuch, a ſecond Sexagene; and ſixty of theſe a third; and ſo onward, as there was occaſion.

Thus, for $\frac{1}{4}$, the fourth part of an Integer, (be it Hour, Day, Degree, or whatever elſe) they put 15′ (that is, 15 Minutes); for $\frac{1}{8}$, they put 7′ 30″ (that is, 7 Minutes and 30 Seconds); which is exactly the ſame in Value: And for $\frac{1}{7}$, (becauſe this cannot be exactly expreſs'd in a Sexageſms) they would put 8′, (which is pretty near, but ſomewhat too little) or 9′ (which is yet nearer, but ſomewhat too much) or (if theſe be not exact enough for the preſent purpoſe) 8 34″, or 8′ 34″ 17‴; or yet more accurately, if need be, till they come to ſo much exactneſs, as that the ſmall remaining difference might ſafely be neglected.

And ſuch Sexageſms were uſed not only by *Ptolemy*, (by whom the ſeem to have been firſt introduced) and other *Greek* Writers, but by the *Arabs* alſo, (in imitation of *Ptolemy*) and are continued in Uſe with us to this Day.

So for 227015, (which is the Number of Days, whereby the *Arabic* Years of the *Hegira* begin later than our Account by the Years of our Lord) they put 1‴ 3″ 3′ 35°; that is, 1 Third Sexagene, 3 ſeconds Sexagenes, 3 firſt Sexagenes, and 35 Days. And this Account we meet with in the *Alphonſine* Tables, and (of later Times) in thoſe of *Lansbergius*.

And for the better expediting the Work of Multiplication and Diviſion in theſe Sexageſms and Sexagenes, they had a Table for that purpoſe, in ſuch form as this.

1	By	1, 2, 3, 4, &c.	makes	0 1, 0 2, 0 3, 0 4, &c.
5	by	5, 6, 7, 8, &c.	makes	0 25, 0 30, 0 35, 0 40, &c.
10	by	10, 11, 12, 13, &c.	makes	1 40, 1 50, 2 00, 2 10, &c.
11	by	11, 12, 13, 14, &c.	makes	2 1, 2 12, 2 23, 2 34, &c.
30	by	30, 31, 32, 33, &c.	makes	15 0, 15 30, 16 00, 16 30, &c.
50	by	50, 51, 52, 53, &c.	makes	41 40, 42 30, 43 20, 44 10, &c.

And ſo onwards, as far as 60 by 60, makes 60 00.

Which Tables they contracted into a ſquare or triangular Form, extending from 1 to 60; of like nature with what we call the *Pythagorical Table* for Multiplication, extending from 1 to 10.

Such a Sexagenary Table there is (or ſhould be, if not torn out) in *Blundevil's* Exerciſes, with a Deſcription, and Directions for the uſe of it; firſt publiſhed about the Year 1600, or ſooner, (for it is mentioned in the Preface to his Theories, publiſhed in the Year 1602, as having been then received with good approbation) and Re-printed a ſeventh time in the Year 1636. And the like in other Writers of Aſtronomical or Sexageſimal Fractions.

And then they had other Tables or Rules to determine the Denomination of the Product; as thus, Multiplication of

Integers into	Primes, Seconds, Thirds, Fourths, &c.	makes	Primes, Seconds, Thirds, Fourths, &c.
Primes into	Primes, Seconds, Thirds, Fourths, &c.	makes	Seconds, Thirds, Fourths, Fifths, &c.
Seconds into	Seconds, Thirds, Fourths, Fifths, &c.	makes	Fourths, Fifths, Sixths, Sevenths, &c.

The ſum of all which Particulars, are equivalent to this one General, the Exponent of the Product, (that is, of the laſt part thereof) is equal to the Exponent of both the Factors put together, as 10′ by 11″ makes 1″. 50‴; and 10′ by 12′ makes 2″ 0‴, &c. So 10″ by 10‴ makes 1‴. 40ᵛ, &c.

My meaning is, That ſuch Tables they had (expreſſed in Numeral Figures) of later times, ſince thoſe Figures were in uſe; but before, they muſt be expreſſed in ſuch a way as this, *viz.*

II° into III′, makes VI′
III′ into IV″, makes XII‴.
IV′ into III″, makes XII′.

That is, 4 Sexagenes into 3 Seconds of the Sexageſms, makes 12 of the firſt Sexageſms, becauſe $+1 \times -2 = -1$.

XVI″ into X‴, makes CLXᵛ; that is, IIˡᵛ, XLᵛ,

(Which

(Which they find for Expedition, by conſulting their Sexageſimal Table, as we do the Table of Multiplication; where finding XVI in the top, and X in the ſide, they have, in the ſquare anſwering to both, II, XL.)

XLV′ into LIV″, makes XL″, XXX‴,

Concerning this Proceſs, by Sexageſimal Multiplication, &c. and the Demonſtration of it, we have a learned and accurate Treatiſe in the *Greek*, of *Barlaam* a Monk, (*Barloamus Monachus*) under the Title of *Logiſtica*, (λογιστικὴ) whom *Voſſius* (cap. 18. *De Scientiis Mathematicis*) placeth about the Year 1350 (but miſtakes of it for a Treatiſe of Algebra): It is publiſhed by *John Chambers*, (then a Fellow of *Eaton* College) with his Latin Tranſlation, and Notes upon it, in the Year 1600, encouraged thereunto by Sir *Henry Savile*, who chanced to light on a *Greek* Manuſcript thereof abroad, and did himſelf, from thence tranſcribe it.

But this way of Multiplication and Diviſion in Sexageſimals, proves ſo perplex and troubleſom, (notwithſtanding ſuch a Table at hand) that ſince the *Indian* Figures came in uſe, whereby we may with more convenience manage great numbers) it is thought leſs troubleſome, (when there is occaſion to Multiply or Divide) to reduce all to the loweſt Denomination; and then, having performed that Work, (of Multiplication or Diviſion, or both) to reduce it back again to the ſeveral Denominations.

As for Inſtance; ſuppoſing the Luner Month of Conjunction, (from New-Moon, to New-Moon) according to the Moon's middle Motion, to be 29 D. 12 H. 44′ 3″ 10‴, *Proximè*; and I would compute how much the Moon moves from the Sun in 6 D. 5 H. 14′ 16″ 35‴. I know well that there be many Aſtronomical Tables computed to expedite ſuch Operations; (which here I do not meddle with) but without ſuch Preparatory Tables, my Work muſt ſtand thus:

if 29 D. 12 H. 44′ 3″ 10‴ (that is, 11′ 48 H. 44′ 3″ 10‴) give 360 Degrees, (that is 6′ 10 D. Sexagenes of Degrees) then 6 D. 5 H. 14′ 16″ 35‴ (that is, 2′ 29 H. 5′ 14″ 16‴ 35⁗) will give, how much?

Now, if I were to Work it by the Sexageſimal Tables of Multiplication, the Work would be ſo perplex, that I will not here repeat it; and therefore it is thought better to reduce the firſt and third Numbers to the loweſt Denomination, that is (here) to third Scruples.

D. H. ′ ″ ‴.	D. H. ′ ″ ‴
29 12 44 3 10.	6 5 14 16 35
× 24	× 24
116	144
58	+ 5
12	149 14′ 163″ 5′′
708 44′ 3″ 10‴.	×60
× 60	8940
42480	+ 14
+ 44	8954′ 16″ 35‴
42524′ 3″ 10‴.	×60
× 60	537240
2551440	+ 16
+ 3	537256″ 35‴.
2551443″ 10‴	+ 60
× 60	32235360
153086580	+ 35
+ 10	32235395‴
153086590‴	

And then the Work will ſtand thus.

If 153086590 Thirds give 360 Degrees;
Then 32235395 Thirds, give how many Degrees?

Where Multiplying the third Number by the ſecond, and dividing by the firſt, I ſhall have the Number of Degrees ſought in Integers, with the common Fraction annexed; which being reduced to Sexageſimals, will give the anſwer in Degrees, Minutes, Seconds, &c. Or I might have reduc'd the 360 Degrees into Thirds alſo, (which muſt have been done, if to theſe Degrees there had been annexed firſt, ſecond, and third Minutes) and then the Anſwer had been in *third Minutes*; and theſe to be reduced to Degrees, Minutes, &c.

Which Operation, tho' it be troubleſom enough, is yet more expedite, than by the Sexageſimal Multiplication and Diviſion, ſince the time that we have learned, (by help of the Numerical Figure) to manage great Numbers, which in *Ptolemy*'s time were not in uſe.

And in like manner, whatever other come to be ſo Multiplied.

According to this Sexageſimal Method, *Ptolemy* divides the Radius or Semi-diameter of a Circle into 60 Parts, (and conſequently, the whole Diameter into 120) and each of thoſe Parts into 60 Minutes, and each of thoſe into 60 Seconds, and ſo forward, as far as occaſion requires. And accordingly, the Arch anſwering to ſuch a Chord; (that is, the ſixth part of the Circumference, whoſe Chard Equals the Radius) into 60 Degr. and conſequently the whole Circumference into 360° and each of theſe Degrees into Minutes, Seconds &c. by a continual Sexagenary Diviſion.

And conſonant hereunto, he makes his Table of Chords of Subtenſes (in ſuch Parts, Minutes, and Seconds) anſwering the ſeveral Arches in a Circle.

Inſtead

Instead of which, the *Arabs* or *Saracens* have introduced (as more Expedient) their Table of Sines, (or half Chords of the double Arch) expressed in like manner by sexagesimal Parts.

Which they did in imitation of *Ptolemy*, than that they were necessitated so to do, having the use of Numeral Figures as we have, which *Ptolemy* and others of the Ancients had not.

But *Arzachel* therein differs thus far from *Ptolemy*, that he divides his Diameter into 300 Parts which *Ptolemy* divides but into 120, and hath therefore less need of Subdivisions.

The reason why the Ancients did thus reduce their ordinary Fractions all to one kind of Denomination, was, to avoid the trouble which would arise from the different Denomination of Fractions, which (when they had not the helps that now we have) would be very great; and therefore chose to admit of Approximations, many times, instead of accurate Equalities.

And why they chose the Number 60, rather than any other Number, was, because if they had made use of 12, or such other small Number, they would be put upon a necessity of the more Subdivisions, and a Number much greater than this they could not well manage; (there being, even in this, trouble enough) and of Numbers about this bigness, this was thought most convenient, as being most capable of exact Divisions, without being put to the necessity of Approximations or Subdivisions; admitting, for Divisors, the six first Numbers, 1, 2, 3, 4, 5, 6, (which none less than it can do) and as many more answering to them 10, 12, 15, 20, 30, 60, (that is Twelve in all there being no Number less than it, admitting of so many Divisors; nor can any, greater than it, admit of more, which is not at least twice as great; which cannot be said again of any greater Number, till we come to 360. And this is that which is made the Number of Degrees in the whole Circle.

And this Division of Integers into Sexagesms (Minutes, Seconds, Thirds, *&c.*) especially in the Parts of Arches, Angles, Time, and Motion; the *Arabs* have retained, in imitation of the *Greeks* (or *Egyptians*) and we from them, even to this Day. *Wallis*'s Algebra, Chap. VII.

SEXANGLE, in Geometry, is a Figure consisting of six Angles.

SEXTANS, is the sixth part of any thing, thus: There is an Astronomical Instrument called a *Sextant*, as being the 6th part of a Circle. This hath a graduated Limb, and is used like a Quadrant.

SEXTILE, the Position or Aspect of the Planets, when at 60 Degrees distant, or at the distance of two Signs from one another; and is marked thus,*.

SHACKLES, aboard a Ship, are those oblong Iron Rings, and bigger at one end than at the other, with which the Ports are shut fast, by thrusting the Wooden *Bar of the Port* through them. There are also a sort of Shackles to lift the Hatches up with, of the former Figure, but smaller; they are fastened at the Corners of the Hatches.

SHALLOP, is a small light Vessel with only a small Main-Mast and Fore-Mast, and Lugg-Sails, to hale up and let down on occasion: They commonly are good Sailers, especially the French *Chaboups*; and are used often as Tenders upon a Man of War.

SHAME, is an uneasiness of the Mind, upon the thought of having done something which is Indecent, or will lessen the valued Esteem which others have of us.

SHANK, or *Shank-Painter*, in a Ship, is a short Chain fastned under the Fore-Mast Shrowds, by a Bolt to the Ships-side; having at the other end a Rope fastned to it. On this Shank-Painter, the whole Weight of the Aft-part of the Anchor rests, when it lies by the Ship's-side. The Rope by which it is haled up, is made fast about a Timber-head.

SHAPOURNETT: The Heralds call a kind of Cap which is born in some Coats of Arms by this Name.

SHEER, or *Sheering*; the Sea Phrase for the going of a Ship when she is not steered steadily; then they say she *sheers* or goes *sheering*; as they do also when she goes in and out by means of the swift running of a Tide-Gate, *&c.* for then being at an Anchor, they say there is danger, lest she should *sheer home her Anchor*, or sheer a-shore.

SHEER-*Hooks*, aboard a Ship; are great Hooks of Iron sometimes used when a Ship designs to board another. They are like a Sickle, and are let into the Main-Yard-Arms and Fore-Yard-Arms in order to spoil, cut or tear the Enemy's Shrouds, Sails, or Rigging.

SHEER-*Shanks*, at Sea, is the term for a kind of Knot, by which they tye up or shorten a Runner when 'tis too long, so that they cannot hoise in the Goods by it over the Ship's-sides. This Knot can be let loose again when they please.

SHEERS, so the Seamen call two Masts Yards, or Poles set up and seized a-cross each other aloft, near the top. This *Pair of Sheers*, as they call it, is placed below on the *Chain-Wales* of the shrouds, and lashed fast to the Ship's-sides to keep them steady aloft. Their use is to set in or take out a Mast; for which end, there is fastned at the place where they cross one another, a strong double Block with a strap. They serve also to hoise in or out of Boats that have Masts, such Goods as are wanted to be taken in or out.

SHEATHING of a Ship, is casing that Part of her which is to be under Water, with something to keep the Worms from eating into her Planks. 'Tis usually done by laying Tar and Hair mixt together all over the old Plank, and then nailing on thin new Boards: But this hinders a Ship's Sailing; and therefore of late some have been sheathed with milled Lead.

'Tis very well worth trying what the Newstone Pitch will do in this case; if it will defend from the Worm, as perhaps it will, a Ship might be Paid with it cheaper than with the Crown-Pitch; and it will not crack nor scale off as that will do, but keep always soft and smooth. I have seen where it hath been on 13 Months, and yet it was very black and soft.

SHEATS in a Ship, are Ropes bent to the Clews of the Sails; serving in the Lower-sails to *Hale-aft* or *Round-off* the Clew of the Sail: But in Top-sails they serve to *Hale-home* as the Word is, or to hale the Clew of the Sale close to the Yard-Arm.

If the Main-sail Sheats are *haled-aft*, 'tis in order to make the Ship keep by a Wind; but when the Fore-sheats are *haled aft*, 'tis that the Ship may fall off from the Wind: And if she will not do it readily, they then hale the Fore-sail (by the sheat) flat in, as near the Ship's-sides as they can; and this they call *Flatting in the Fore-sail*. When they say, *Ease the Sheat*, they mean *Veer it*, or let it go out gently; but when the Word is, *Let fly the*

the Sheat, they mean, let it go all at once, and run out as faſt as it can; and then the Sail will hang looſe, and hold no Wind. In a very great Gale or Guſt of Wind, there is another Rope bent to the Clews of the *Main-ſail* and *Fore-ſail*, above the ſheat Block, to ſuccour and eaſe the *Sheat*, and this they call a *Falſe-ſheat*.

Sheats in a Ship, alſo, are thoſe Planks under Water which come along her *Run*, and are cloſed into the *ſtern Poſt*: So alſo that Part within Board in the *Run* of the Ship, is called the *Stern-ſheats*. The Seamen ſay when they would have the *ſheats* of the Main or Fore-ſail haled aft, *Tally the ſheats*.

SHEWING, in Law, is to be quit of Attachments in any Court, and before whomſoever in Plaints ſhewed, and not avow'd.

SHIFTERS, certain Men aboard a Man of War, who are employed by the Cooks to ſhift or change the Water in which the Fleſh or Fiſh is put and laid for ſome time, in order to fit it for the Kettle.

SHIVERS, ſo the Seamen call thoſe little round Wheels in which the Rope of a Pulley or Block runs. They turn with the Rope, and have pieces of Braſs in their Centres, (which they call the *Cocks*) with Holes in them, into which the Pin of the Block goes, and on which they turn. Theſe *Shivers* are uſually of Wood; but ſome are of Braſs, as thoſe in the *Heels* of the *Top-maſts*.

SHOALE, in the Sea phraſe, is the ſame as ſhallow: They ſay, 'tis *good Shoaling*, when as a Ship ſails towards the ſhoar, ſhe finds by her ſounding, it grows ſhallow by degrees, and not too ſuddenly; for then a Ship may go in ſafety.

SHORT-*Accent*, in Grammar, ſhews that the time of Pronunciation ought to be ſhort, and is marked thus (˘).

SHOT of a Cable, is the ſplicing of two Cables together, that a Ship may ride ſafe in deep Waters, and in great Roads: For a Ship, will Ride eaſier by one ſhot of a Cable, than by three ſhort Cables out a-head.

SHOT, for Ordnance, are of ſeveral ſorts, as *Round-ſhot*, which are round Bullets fitted in proportion to the Bore of the Piece.

Croſs-bar-ſhot, are round ſhot, with a long ſpike of Iron caſt in it, as if it did go through the middle of it.

Trundle-ſhot, being only a Bolt of Iron 16 or 18 Inches long, ſharp-pointed at both ends, and about a Hand's breadth from each end, having a round broad Bowl of Lead caſt upon it, according to the Bore of the Piece.

Langrel-ſhot, which runs looſe with a ſhackle to be ſhortned when it is put into the Piece; and when it flys out, it ſpreads it ſelf. At each end of the Bar it has half a Bullet, either of Lead or Iron.

Chain-ſhot, is two Bullets with a Chain betwixt them, ſome being contrived round, yet ſo that they will ſpread in flying their full Length and Breadth.

Caſe-ſhot, is any thing of ſmall Bullets, Nails, old Iron, and the like, to put into the *Caſe*, to ſhoot out of Ordnance.

SHOULDRING, in Fortification, is a Retrenchment oppoſed to the Enemies, or a Work caſt up for a Defence on one ſide, whether it be made of heaps of Earth caſt up, or of *Gabions* and *Facines*. A *ſhouldring* alſo is a ſquare *Orillon* ſometimes made in the Baſtions on the Flank near the ſhoulder, to cover the Canon of a Caſemate. Again, it is taken for a Demi-baſtion or Work conſiſting of one Face, and one Flank, which ends in a Point at the head of a *Horn-work* or *Crown-work*: Neither is it to be underſtood only of a ſmall Flank added to the ſides of the *Horn-work*, to defend them when they are too long, but alſo of the Redents which are raiſed on a ſtrait Line.

SHROWDS, are great Ropes in a Ship, which come from either ſide of all Maſts. They are faſtned below by Chains to the Ship's ſides, and aloft over the Head of the Maſt, their *Pendants*, *Fore-tackle*, and *Swifters* being firſt put under them: They are alſo *ſerved* there, to prevent their galling the Maſt. The Top-maſt-ſhrowds are faſtned to the *Puttocks* by Plaits of Iron; and by Dead-mens Eyes and Lanniers alſo as the others are. The terms are *Eaſe the ſhrowds*; that is, ſlacken them: *Set Taught the Shrowds*; that is, ſet them ſtiffer The Bolt-ſprit hath no ſhrowds.

SICUT *alias*, is a ſecond Writ ſent out, when the firſt was not executed.

SIDEMEN, or *Queſtmen*, be thoſe that are Yearly Choſen, according to the Cuſtom of every Pariſh, to Aſſiſt the Churchwardens in the Enquiry and repreſenting ſuch Offenders to the Ordinary, as are Puniſhable in the *Court Chriſtian*.

SIDERAL Year. See *Solar Year*.

SIDERATIO. See *Spacelos*.

SIEF, *Album*. See *Collyrium*.

SIEGE, is the encamping or ſitting down of an Army before a Place, in order to take it, either by Force or by Famine.

SIGMOIDE, are the *Apophyſes* of the Bones, repreſenting the Letter C of the ancient *Greeks*. Alſo the *Valves* of the great Artery that hinder the Blood from returning back to the Heart.

SIGNIFICABIT, is a Writ *de Excommunicato capiendo*, which iſſueth out of the *Chancery* upon a Certificate given by the Ordinary, of a Man that ſtands obſtinately Excommunicate, by the ſpace of forty Days, for the laying him up in Priſon without Bail or Mainpriſe, until he ſubmit himſelf to the Authority of the Church. And 'tis ſo called, becauſe the Word *Significavit* is an Emphatical Word in the Writ. There is alſo another Writ in the *Regiſter*, *Fol.* 7. directed to the Juſtices of the Bench, commanding them to ſtay any Suit depending between ſuch and ſuch, by reaſon of an Excommunication alledged againſt the Plaintiff; becauſe the ſentence of the Ordinary that did Excommunicate him, is appealed from, and the Appeal yet depends undecided.

SILIQUA, in Botany, is the Seed-veſſel, *Huſk*, *Cod*, or *Pod*, of ſuch Plants as are of the Leguminous kind.

SILLON, in Fortification, is an elevation of Earth, made in the middle of a Moat, to Fortifie it when too broad: It is otherwiſe called *Envelope*, which is the more common Name.

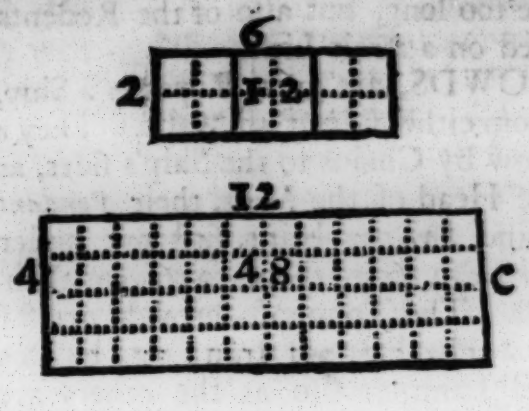
SIMILAR *Arks* of a Circle, are ſuch as are like Parts of their whole Circumference.

SIMILAR *Bodies*, in Natural Philoſophy, are called ſuch as have their Particles of the ſame Kind and Nature one with another.

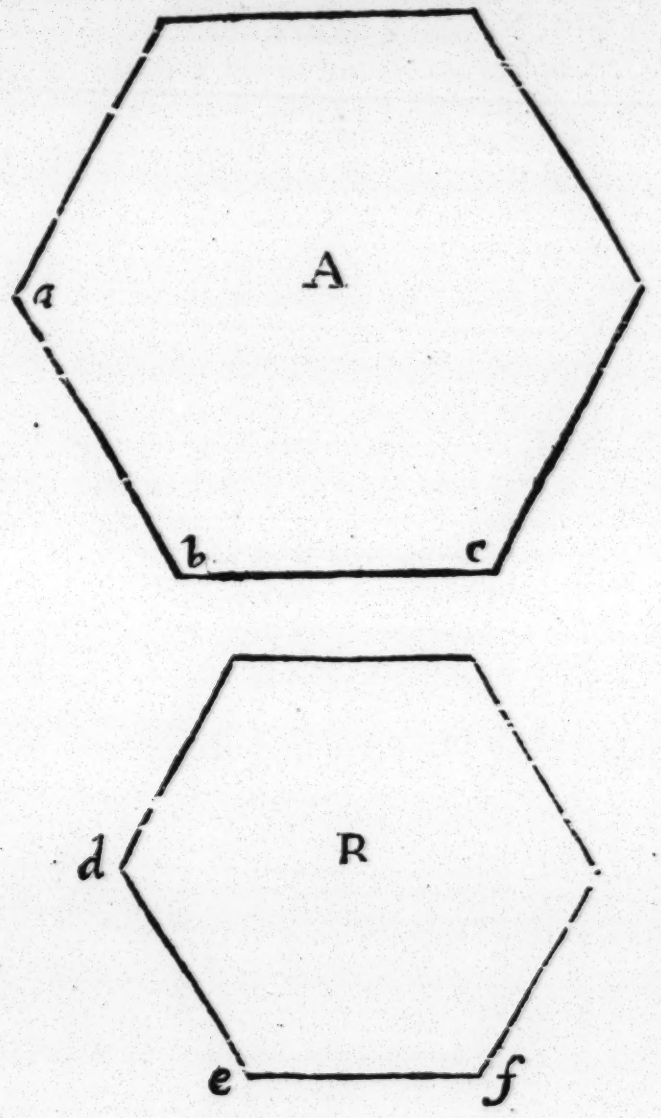
SIMILAR, or *ſimple Parts*, by Anatomiſts are called ſuch as are throughout of the ſame nature and texture, as all the Parts of the Bone are Bony, *&c.*

SIMILAR *Plane Numbers*, are thoſe *Numbers* which may be ranged into the form of *ſimilar Rectangles*;

angles; that is, into Rectangles, whoſe ſides are Proportional, ſuch are 12 and 48; for the ſides of 12 are 6 and 2 (as in Fig. B.) and the ſides of 48 are 12 and 4 (as in Fig. C.) But 6. 2 :: 12. 4, and therefore thoſe *Numbers* are *ſimilar*.

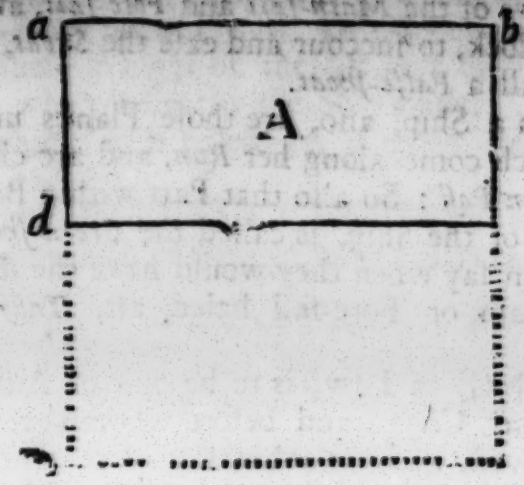


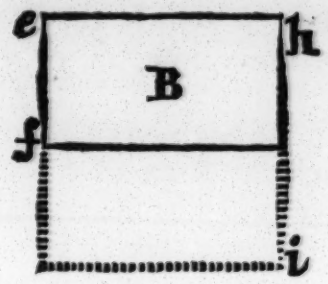
SIMILAR *Polygons*, are ſuch as have their Angles ſeverally Equal, and the ſides about thoſe Angles Proportional.



Thus, if in the Polygon A, all the Angles *a b c*, *&c.* are reſpectively equal to all thoſe *d e f*, *&c.* in the Polygon B. And that alſo *a b* hath the ſame Proportion to *b c* :: as *d e* hath to *e f*. Then thoſe two Polygons are *ſimilar*.

SIMILAR *Rectangles*, are thoſe which have their ſides about the equal Angles Proportional; that is, as *a b* : *e h* :: *a d* : *e f*.





COROLLARY I.

All *Squares* muſt be *ſimilar Rectangles*; for (ſince they have all their Sides equal, and all their Angles right) whatever Proportion the ſide *a m* hath to the ſide *b i* of the other *Rectangle*, the ſame muſt alſo the other ſide *a b* have to the ſide *e h*; becauſe they are equal to *a m*, and to *h i*.

COROLLARY II.

Hence all *ſimilar Rectangles* are to each other as the *ſquares* of their *Homologous-ſides*.

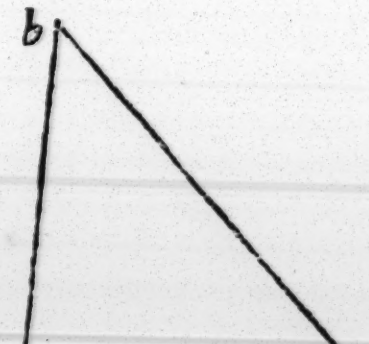
For the *Rectangle* A, is to B :: as the Square *b m* is to the Square *e i*; ſince as well *Squares* as *Rectangles* are in a duplicate Ratio to that of their ſides.

SIMILAR *Right-Lin'd Figures*, are ſuch as have equal Angles, and the ſides about thoſe equal Angles proportional.

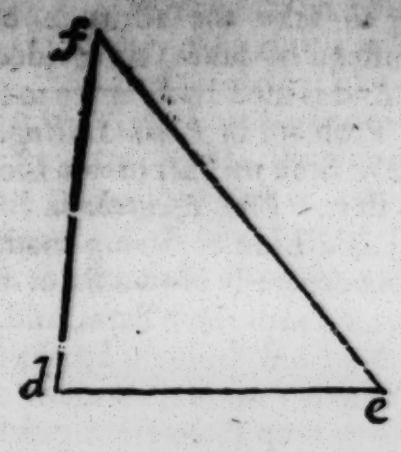
SIMILAR *Segments* of a Circle are ſuch as contain equal Angles.

SIMILAR *ſolid Numbers*, are thoſe, whoſe little Cubes may be ſo ranged as to make *ſimilar* and rectangular Parallelopipeds.

SIMILAR *Triangles*, are ſuch as have all their three Angles reſpectively equal to one another.



As



As if the Angle *a* be equal to *d*, the Angle *c* equal to *e*, and the Angle *b* equal to *f*; then is the Triangle *a b c* ſimilar or *like* to *d f e*: And then the ſides about the Equal Angles are always proportional; that is, *a b* hath the ſame Proportion to *a c* as *f d* hath to *d e*, and is thus written,

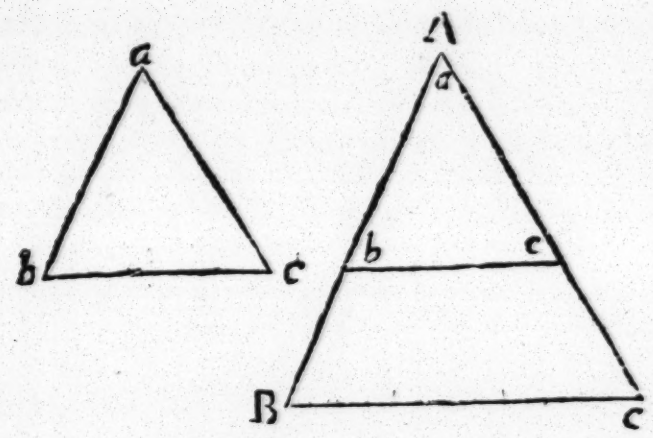
a b . a c : : f d . d e.

PROPOSITION.

All *Similar Triangles*, have the ſides about their Equal Angles Proportional.

Thus in the Figure.

I ſay, A B: *a b* : : A C : *a c* : : C B. *b c*, &c.



For ſet the leſſer Triangle into the greater, by taking A *b* = *a b*, and A *c* = *a c*, then will the Baſe *b c*, be the ſame as in the leſſer Triangle; and the whole Triangle A *b c*, will be equal to *a b c*.

And therefore the Angle A *b c*, will be equal to the Angle B, and A *c b* = C.

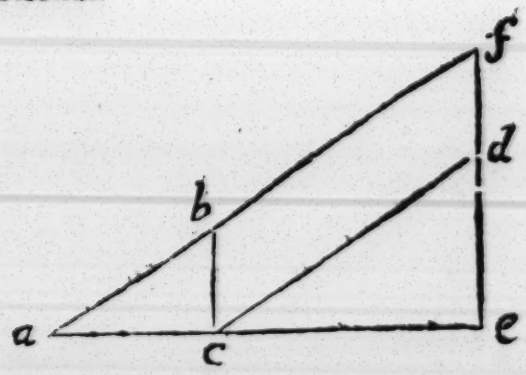
Wherefore the Line *b c*, is Parallel to B *b*: And therefore,

A *b*: A B: A *c*: A C: : *b c*: B C, &c.

Q. E. D.

Otherwiſe thus, according to *Euclid.*

Let the Triangle *a b c*, be ſimilar to *d c e*. Then I ſay, That the ſides about their Equal Angles are Proportional.



Set the Baſes of the two Triangles *a c* and *e c*, ſo together as that they may join and make one Right Line *a e*; and draw out the Lines *a b* and *e d*, till they meet together in the Point *f*.

DEMONSTRATION.

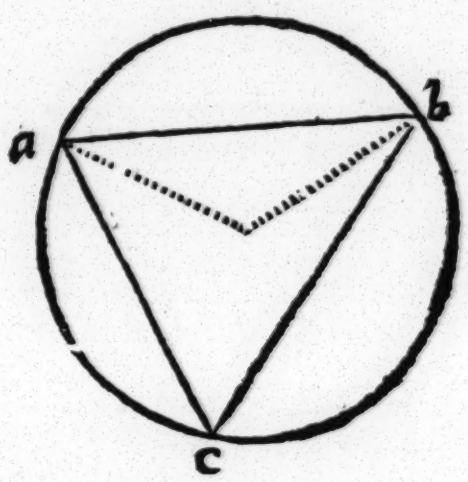
Becauſe the Angle *a* = Angle *d c e*, *a f*, is Parallel to *c d* alſo, becauſe the Angle *a c b*, is equal to the Angle *c e f*; the Lines *b c* and *f e* are Parallel. Wherefore *b c d f*, muſt be a *Parallelogram*, whoſe oppoſite ſides are equal, that *b f* = *c d*, and *b c* = *f d*.

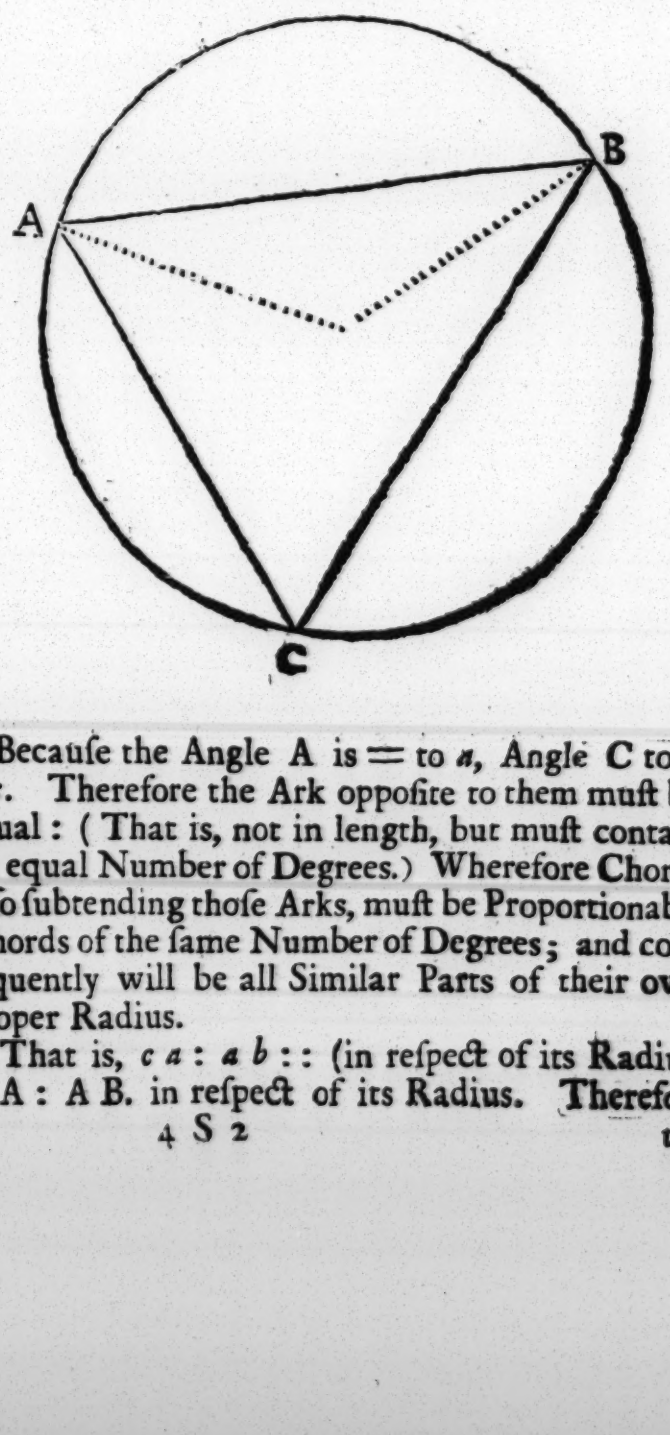
Therefore becauſe *c d* is Parallel to the Baſe *a f*, of the Triangle *f e a*; *d e* : *f d* (or *b c*) : : *e c* : *a c*.

That is, *d e* : *b c* : : *e c* : *a c*. And therefore alternately, *d e* : *c e* : : *b c* : *a c*. And ſo the ſides about *c* and *e* are proved Proportionable.

Alſo becauſe *b c* is Parallel to the Baſe *f e*, of the Triangle *a f e*. Therefore *e c* : *a c* : : *f b*, (or *c d*) : *a b*: That is, *e c* : *a c* : : *c d* : *a b*. And therefore alternately, *e c* : *c d* : : *a c* : *a b*. And ſo the ſides about the equal Angles *a*, and *d c e*, are found Proportional. The ſame may be eaſily done by the Angles *b* and *d*.

Another *Demonſtration* by *Pardie*.





Becauſe the Angle A is = to *a*, Angle C to *c*, &c. Therefore the Ark oppoſite to them muſt be equal: (That is, not in length, but muſt contain an equal Number of Degrees.) Wherefore Chords alſo ſubtending thoſe Arks, muſt be Proportionable Chords of the ſame Number of Degrees; and conſequently will be all Similar Parts of their own proper Radius.

That is, *c a* : *a b* : : (in reſpect of its Radius) C A : A B. in reſpect of its Radius. Therefore

the Sides about the equal Angles will be proportional.

Or, *bc* : *ba* : : BC : BA, *Q. E. D.*

COROLLARY I.

From hence it follows, That all *Similar Triangles* are to one another, as the Squares of their Homologous Sides. For theſe *Triangles* are the Halves of *Simila Triangles* or *Parallelograms*, which are to one another in a *Duplicate Ratio* of their Homologous Sides; Therefore the Halves muſt be as the Wholes.

COROLLARY II.

All *Similar Polygons* are to one another as the Squares of their Homologous Sides. For being made up of *Similar Triangles*; the Aggregates or Sums will be to each other, as the Parts cut, of which they were made.

SIMONY, is an unlawful Contract made to have a Man preſented to a Rectory or Vicarage: It was agreed by all the Juſtices, that if the Patron preſent any Perſon to a Benefice with Cure, for Money, that ſuch Preſentation, *&c.* is void, tho' the Preſentee were not Privy to it, and the Statute gives Preſentation to the King: But this is now repealed.

SIMPLE *Flank.* See *Flank.*

SIMPLE *Place*, a Term in Geometry. See *Place Simple.*

SIMPLE *Problem.* See *Linear Problem.*

SIMPLE *Problem*, in Mathematicks. See a *Linear One.*

SIMPLE *Quantities*, in Algebra, are ſuch as have but one Sign, whether Poſitive or Negative: Thus.

2 *a*, and — 3 *b*, are *Simple Quantities.*

But $a + b$, and $+ d - c + h$ are compound ones.

SIMPLE *Tenaille.* See *Tenaille.*

SINAPISMUS, is a Medicine applied to the Head, and is prepared of Muſtard, Wild Raddiſh, and Leven. *Blanchard.*

SINCIPUT, the Fore-part of the Head, reaching from the Fore-head to the *Coronal Suture.*

SINE, or *Right Sine*, is a right Line drawn from one end of an Arch, perpendicularly upon the Diameter drawn from the other end of that Arch; or it is half the Chord of twice the Arch. See more under the Word *Trigonometry.*

SINE *aſſenſu capitali*, is a Writ againſt him that alienates Lands without conſent of his Chapter or Covent.

SINE *Complement.* See *Complement.*

SINE *die*, in Law, when Judgment is given againſt the Plaintiff, he is ſaid to be *in miſericordia pro falſo clamore ſuo*: But when for the Defendant, then 'tis ſaid, *Eat inde ſine die.*

SINGLE, or *Simple Excentricity.* See *Eccentricity.*

SINGULTUS, or the Hickoup, is a Convulſive Motion of the Midriff, cauſed by tough and irregular Particles, forcing it to this diſordinate Motion. *Blanchard.*

SINICAL *Quadrant*, is made of Braſs or Wood, with Sines drawn from each Side interſecting one another, with an Index divided by Sines alſo, with ninety Degrees on the Limb, and two Sights to the Edge, to take the Altitude of the Sun. Sometimes inſtead of Sines, 'tis divided all into equal Parts: And is uſed by Seamen to ſolve by inſpection any Problem of *Plain Sailing.*

SINESTER Side or Part of an Eſcutcheon, is the left Side Part. *Vide Eſcutcheon.*

SINNET, is a Line or String made of Rope-yarn, conſiſting generally of two, ſix, or nine Strings, which are divided into three Parts, and are platted over one another, and then it is beaten ſmooth and flat, with a Wooden Mallet, its uſe is to *Serve* the Ropes, that is to keep them from gawling.

SI *non omnes*, is a Writ of Aſſociation, whereby, if all in Commiſſion cannot meet at the Day aſſigned, it is allowed, That two, or more of them, may finiſh the Buſineſs.

SINUS, any Cavity in or between the Veſſels of an *Animal Body*, the Anatomiſts call a *Sinus*, and ſome Philoſophical Writers call thoſe Fiſſures or Cavities which are between the ſeveral Strata or Layers of the Earth, in Mines, *&c.* by this Term *Sinus*, for *Sinus* in Mathematicks. See *Sine.*

SINUS *Meningium*, are thoſe 3 Cavities which *Galen* calls the Ventricles of the Thick Membrane. The firſt and ſecond, or the Lateral *Sinus*, are ſeated between the Brain and the *Cerebellum*, and end in the vertebral *Sinus*'s. The third begins from the *Os Cribriforme*, and ends in the middle of the former *Sinus*'s The fourth ariſes from the *Pinealis* Glandule, and ends in the middle of the lateral *Sinus*'s. The Inſertion of theſe *Sinus*'s is called *Trocular Herophili.* The *Sinus*'s, after they have paſſed through the Scull, are partly continued with the Jugular Veins, and partly deſcend through the whole length of the Spinal Marrow down to the *Os Sacrum.* The uſe of them is to ſupply the place of Veins, for they convey the Blood from the Brain and *Cerebellum*, partly into the Jugular Veins, and partly into the Vertebral *Sinus*'s. *Blanchard.* With us the Ventricles of the Brain are accounted only the three Partitions or Subdiviſions of the Forinx; and they ſerve as a Sink to drain away the excrementitious Matter of the Brain.

SINUS *Oſſium*, are thoſe Cavities of the Bones which receive the Heads of other Bones.

SIPHON, a Glaſs or metalline crooked Pipe, Tube, or Cane. See *Syphon.*

SI *Recognoſcant*, is a Writ that lies for a Creditor againſt his Debtor, for Money numbered, that hath before the Sheriff in the *County Court*, acknowledged himſelf to owe his Creditor ſuch a Sum, received of him in *pecuniis numeratis*,

SIRIUS, the *Dog-ſtar*, a bright Star of the firſt Magnitude, in the Conſtellation *Canis major*, its Longitude is 99 Degrees, 47 Minutes, Latitude 39 Degrees, 32 Minutes.

SIRONES, little Puſhes in the Palm of the Hand, and Sole of the Foot, containing certain ſmall Inſects or Worms.

SCARFED, the Sea Term, when one Piece of Timber is let and faſten'd into another. See *Scarfed.*

SKELETON, of a Man or other Animal, is when the Bones are cleaned and dry, and put together according to Art in their natural Order and Poſition.

SKUPPERS, and *Skupper-holes.* See *Scoper-holes.*

SLATCH, when any Rope or Cable hangs ſlack, the Seamen call the middle Part which hangs

hangs down, the *Slatch* of the Cable or Rope, ſo alſo after long foul Weather, if there come a ſmall Intervail of fair, they ſay, this is a *Slatch* of fair Weather.

SLEEPERS, Timbers lying before and aft in the bottom of a Ship as the Rung-heads do; the lowermoſt of them is bolted to the Rung-heads, and the uppermoſt to the *Futtocks*, in order to ſtrengthen and faſten the *Futtocks* and *Rungs*.

SLIDING *Rules*, or Scales, are Inſtruments to be uſed without Compaſſes, in Gauging, Meaſuring, &c. having their Lines fitted ſo as to anſwer Proportions by Inſpection; they are very Ingeniouſly contrived and applied by *Gunter*, *Partridge*, *Cogſhall*, *Everard*, *Hunt*, and others, who have Written particular Treatiſes about their Uſe and Application.

SLING, a Word uſed variouſly at Sea, there are *Slings* to hoiſe up Casks or any other heavy things; which are made of Ropes, ſpliced into themſelves at either end, with an Eye big enough to hold the thing to be *Slung*.

There are other *Slings* which are made longer and with a ſmall Eye at each end, one of which is put over the Breech of a Piece of Ordnance, and the other Eye comes over the end of an Iron Crow, which is put into the Mouth of the Piece, to Weigh and Hoiſe the Gun as they pleaſe.

There are alſo *Slings* for the Yards, which is done by binding them faſt to the *Croſs-tree* aloft, and to the Head of the Maſt with a ſtrong Rope or Chain, that if the Tye ſhould happen to break, or to be ſhot to pieces in a Fight, the Yard nevertheleſs may not fall down upon the Hatches.

SMELLING, is probably occaſioned by the *Effluvia* of Odorous Bodies mingling themſelves with the Air, and entring up the Noſtrils, which are covered with a very Nervous and Senſible Coat, and there inſinuating themſelves into the Proceſſes of the Olfactory Nerve, do move it variouſly according to their various and different Nature, and ſo communicate to the Brain, ſuch correſponding Motions, as enables the Soul to judge differently of the Bodies emitting ſuch *Effluvia*: And from hence when the *Effluvia* produces a grateful Senſation, we ſay its hath a ſweet Smell, but when a diſagreeable one, we ſay it ſtinks.

SMITEING-Line, in a Ship, is a ſmall Rope faſtened to the Miſſen-yard Arm, below at the Deck, and is always furled up with the Miſſen-ſail, even to the upper end of the Yard, and from thence it comes down to the Poope. Its Uſe is to looſe the Miſſen-ſail without ſtriking down the Yard, which is eaſily done, becauſe the Miſſen-ſail is furled up only with Rope-yarns; and therefore when this Rope is pulled hard, it breaks all the Rope-yarns, and ſo the Sail falls down of it ſelf: The Word of Art is, *Smite the Miſſen* (whence this Rope takes its Name;) that is, hale by this Rope that the Sail may fall down.

SNATCH *Block*, is a great Block in a Ship, with a Shiver in it, having a Notch cut thro' one of its Cheeks for the more ready receiving in of any Rope: For by this Notch, the middle part of a Rope may be reeved into this Block, without paſſing it in end-ways. This ready Block is commonly faſtened with a Strap about the Main-maſt, cloſe to the Upper Deck, and is chiefly uſed for the *Fall* of the *Winding Tackle*, which is reeved into this Block, and then brought to the Capſtan.

SNOW. The Learned Dr. *Grew*, in *Philoſophical Tranſactions*, N. 92. gives the following Account of Snow, which ſeems very exact and juſt.

1. With Mr. *Des Cartes*, and Dr. *Hook*, he obſerves, That many parts hereof are of a Regular Figure; for the moſt part being as it were ſo many little Rowels, or Stars of 6 Points; being perfect and tranſparent Ice, as any one may ſee upon a Pool, or Veſſel of Water; upon each of which 6 Points, are ſet other collateral Points, and thoſe always at the ſame Angles, as are the main Points themſelves.

2. Amongſt theſe Regular Figures, tho' many of them are large and fair; yet from theſe taking our firſt *Item*, many others, alike Regular, but far leſs, may likewiſe be diſcovered.

3. Amongſt theſe, not only Regular, but entire Parts of Snow, looking ſtill more warily, we ſhall perceive, that there are divers others indeed irregular, which yet are chiefly the broken Points, Parcels, and Fragments of the Regular ones.

4. That beſides the broken parts, there are ſome others which ſeem to have loſt their Regularity, not ſo much in being broken, as by various Winds, firſt gently Thaw'd, and then Froze into little irregular Clumpers again.

From whence the true Notion, and external Nature of *Snow*, ſeemeth to appear, *viz.* That not only ſome few parts of *Snow*, but originally, the whole Body of it, or of a Snowy Cloud, is an infinite Maſs of Icicles regularly figured; not one Particle thereof I ſay, originally, not one of ſo many Millions, being indetermined, or irregular; that is to ſay, a Cloud of Vapours being gathered into Drops, the ſaid Drops forthwith deſcend; upon which Deſcent, meeting with a ſoft freezing Wind, or at leaſt paſſing thro' a Colder Region of the Air, each drop is immediately froze into an Icicle, ſhooting it ſelf forth into ſeveral Points or *Stiriæ*, on each Hand fromward its Centre: But ſtill continuing their deſcent, and meeting with ſome ſprinkling and intermixing Gales of Warmer Air, or in their continual Motion and Waftage to and fro, touching upon each other; ſome are a little thaw'd, blunted, froſted, clumper'd, others broken, but the moſt hanked and clung in ſeveral Parcels together, which we call Flanks of *Snow*.

It being known what Snow is, we underſtand, why, though it ſeem to be ſoft, yet 'tis truly hard: becauſe true Ice, the inſeparable property whereof is to be hard; ſeeming only to be ſoft, becauſe upon the firſt touch of the Finger, upon any of its ſharp Edges or Points, they inſtantly thaw; or otherwiſe they would pierce our Fingers as ſo many Lancets.

Why again, though Snow be true Ice, and ſo hard and denſe a Body, yet very light; becauſe of the extream thinneſs of each Icicle in compariſon of its breadth. For ſo Gold, which though of all Bodies it be the moſt ponderous, yet being beaten into Leaves, rides upon the leaſt breath of Air; and ſo in all other Bodies, where there is but little Matter contained within large Dimenſions, and poſſibly in no other Caſe.

Alſo, how it is *White*, not becauſe hard; for there are many ſoft Bodies White; but becauſe conſiſting of parts, all of them ſingly tranſparent, but being mixed together appear White; as the Parts of Froth, Glaſs, Ice, and other tranſparent Bodies, whether ſoft or hard.

Thus much for the *External* Nature of *Snow*; let us next enquire into its *Eſſential* Nature.

Now to make a Judgment of this, is by conſidering, what the general Figure of *Snow* is, and comparing the ſame with ſuch Regular Figures as we ſee in divers other Bodies, in that where we ſee the like Configurations, we may believe there is the like Subject wherein, or the like Efficient *whereby* but thoſe and theſe are made.

As for the Figure of *Snow*, 'tis generally one, *viz.* that which is above deſcribed: Rarely of different ones, which may be reduced chiefly to two general Circulars and Hexagonals, either Simple or Compounded together, more rarely, either to be ſeen of more than 6 Points; but if ſo, then not of 8 or 10 but 12. Or in ſingle Shoots, as ſo many ſhort, ſlender Cylinders, like thoſe of *Nitre*. Or by one of thoſe ſhoots, as the Axle-tree, and touching upon the Centre of a Pair of pointed Icicles, joyned together as the two Wheels. Or the ſame Hexagonal Figure, and of the ſame uſual breadth; but continued in thickneſs and profundity. All theſe are rare, the firſt deſcribed being the general Figure.

As for the Configuration of other Bodies we ſhall find, that there are divers which have ſome a leſs, others a more near reſemblance thereto. *Nitre* is formed as is commonly known in long Cylindrical ſhoots, as alſo all *Lixivial Salts* for the moſt part reſembling, tho' not perfectly, the ſeveral Points of each Starry Icicle of *Snow*. *Salt of Harts-horn*, *Sal Armoniack*, and ſome other volatile Salts, beſides their main and longer ſhoots have others ſhorter Branched out from them; reſembling as thoſe the main, ſo theſe the Collateral Points of the *Snow*, but the Icicles of *Urine* are ſtill more near: For in *Salt of Harts-horn*, altho' the Collateral ſhoots ſtand at acute Angles with the main, yet not by pairs at equal height: And in *Sal Armoniack*, altho' they ſtand Diametrically oppoſite, or at equal height; yet withal at right, not acute Angles: Whereas in the Icicles of *Urine*, they ſtand at equal Heights, and at acute Angles both; in both, like thoſe of *Snow*. And it is obſervable that the Configuration of *Feathers* is likewiſe the ſame. The reaſon whereof is, becauſe Fowls having no Organs for Evacuation of Urine, the Urinous Parts of their Blood are evacuated by the Habit or Skin, where they produce and nouriſh Feathers.

From whence it ſhould ſeem, That every Drop of Rain aforeſaid, containing in it ſelf ſome Spirituous Particles, (as from the height to which they are advanced, the prolifick Vertue of Rain, and its eaſie tendency to Putrefaction, above other Water, is argued they do) and meeting with others in their Deſcent, of a Saline, and that partly Nitrous, but chiefly Urinous, or of an *acide-ſalinous* Nature; the ſaid Spirituous Parts are apprehended by them, and with thoſe the Watry; and ſo the whole Drop is fix'd, yet not into any indifferent and irregular ſhape, depriving their Spirituous parts of their Motion in an inſtant; but according to the Energy of the Spirituous, as the Pencil, and the Specifick Nature, or determinate poſſibility of the Saline Parts, as the Ruler, 'tis thus figured into a little Star.

Theſe things ſomewhat further conſidered and cleared, may add a little to that great deal of Light which the Honourable Mr. *Boyle*, hath given to the Nature of Gold, the Air, and the Bodies therein contained, in his Excellent Diſcourſes thereof.

SOC, is a Word ſignifying a Power, or Liberty of Juriſdiction; whence comes the Law *Latine* Word *Soca*, for a Seigniory enfranchiſed by the King, with liberty of holding a Court of his *Sockmen*, or *Socagars*; that is, his Tenants whoſe Tenure is hence called *Socage*.

SOCAGE, is a Tenure of Lands by, or for certain inferior Services of Husbandry to be performed to the Lord of the Fee, or is a Tenure of Lands, when a Man is infeoffed freely without any Service, Word, Relief, or Marriage, and pays to his Lord ſuch Duty as is called, *Petit Sergeanty*, &c.

There is alſo *Free*, or *Common Socage*, and *Baſe Socage*, or *Villenage*.

Other Diviſions thereof there are in Law Books: But by the Statute 12 *Car.* 2. *cap.* 24. all Tenures ſhall be adjudged, and taken to be turned into *free* and *common Socage*.

SOCMANS, or *Sokemans*, are ſuch Tenants as hold their Lands and Tenements by *Socage* Tenure.

SOLÆUS, is a Muſcle that helps to extend the Foot.

SOLAR *Comet*. See *Diſcus*.

SOLAR *Cycle*. See *Cycle of the Sun*.

SOLAR *Spots*. See *Spots of the Sun*.

SOLAR *Year*, is either *Trophical*, or *Siderial*.

Trophical Year, is that ſpace of Time, wherein the *Sun* returns again to the ſame Equinoctial, or Solſtitial Point, which is always equal to 365 Days, 5 Hours, and about 55 Minutes.

The *Siderial Year*; is the ſpace wherein the *Sun* comes back to any particular Fixed Star, which is about 365 Days, 8 Hours, and 9 Minutes,

SOLE *Tenant*, is he or ſhe that holds only in his or her own Right, without any other joined: As, if a Man and his Wife hold Land for their Lives, the Remainder to their Son; here the Man dying, the Lord ſhall not have Heriot, becauſe he dieth not *Sole-Tenant*.

SOLET & *debet*. See *Debet and Solet*.

SOLID, in Geometry, is the Third Species of Magnitude, having three Dimenſions, Length, Breadth and Thickneſs; and is frequently uſed in the ſame ſence with Body. It may be conceived to be formed by the direct Motion, or the Revolution of any Superficies, of what Nature, or Figure ſoever.

SOLID *Angle*, is an *Angle* made by the meeting of three or more Planes, and thoſe joining in a Point, like the point of a Diamond well cut.

SOLID *Baſtion*. See *Baſtion*.

SOLID *Numbers*, are thoſe which ariſe from the Multiplication of a *Plain Number*, by any other whatſoever; as 18 is a *ſolid Number* made of 6, (which is Plane) multiplied by 3; or of 9 multiplied by 2.

SOLID *Place*. See *Place ſolid*.

SOLID *Problem*, in Mathematicks, is one which can't be Geometrically ſolved, but by the Interſection of a Circle, and a Conick Section; or by the Interſection of two other Conick Sections beſides the Circle.

As, *To deſcribe an Iſoſceles Triangle on a given Right Line, whoſe Angle at the Baſe, ſhall be triple to that at the Vertex.*

This will help to Inſcribe a Regular Heptagon, in a given Circle, and may be reſolved by the Interſection of a *Parabola* and a Circle.

The following Problem alſo helps to Inſcribe a *Nonagon* in a Circle; and may be ſolved by the Interſection of a *Parabola*, and an *Hyperbola* between its *Aſymptotes: Viz.*

To deſcribe an Iſoſceles Triangle, whoſe Angle at the Baſe, ſhall be Quadruple of that at the Vertex.

And ſuch a Problem as this, hath 4 ſolutions, and no more; becauſe 2 Conick Sections can cut one another but in 4 Points.

How all ſuch Problems are conſtructed, Mr. *Halley* ſhews in *Philoſoph. Tranſact. N.* 188.

SOLIDITY (ſee *Firmneſs*) is a Quality of a Natural Body contrary to Fluidity, and appears to conſiſt in the Parts of Bodies being interwoven and intangled one with another, ſo that they cannot diffuſe themſelves ſeveral ways, as Fluid Bodies can.

SOLLICITOR, is a Man imploy'd to take care of, and follow Suits depending in Courts of Law, or Equity, formerly allowed only to Nobility, whoſe Menial Servants they were; but now too frequently uſed by others, to the damage of the People, and the increaſe of Champerty and Maintenance.

SOLSTICE, is the Time when the *Sun* entring the Tropical Points, is got furtheſt from the Equator, and before he returns back towards it, ſeems to be for ſome time at a ſtand, being moved in the ſame Parallel, and ſcarce making any other Lines than perfect Circles, ſo ſmall is its Progreſs. Theſe *Solſtices* are two:

Eſtival, or Summer *Solſtice*, when the *Sun* enters *Cancer* the 11th of *June*, making the longeſt Day, and the ſhorteſt Night.

And the *Hyemal*, or Winter *Solſtice*, on the 11th of *December*, when he enters *Capricorn*, the Nights being then at the longeſt, and Days at the ſhorteſt; that is, in Northen Regions, for under the Equator there is no Variation, but a continual Equinox; and in the Southern Parts, the Sun's Entrance into *Capricorn*, makes the longeſt Day; and into *Cancer*, the longeſt Night.

SOLSTITIAL *Colure*. See *Colure*.

SOLUBLE *Tartar*, is made by boiling in 3 Pints of Water, 8 Ounces of Cream of Tartar, and 4 Ounces of the Fix'd Salt of Tartar, for about half an Hour in an Earthen Pan unglazed; and then when 'tis cool, filtrating and evaporating it till 'tis dry: 11 Ounces and 6 Drams of Salt will remain at the Bottom. This is the *Soluble Tartar*. 'Tis accounted a very good Aperitive Medicine.

'Tis called alſo a Vegetable Salt. Sometimes the *Tincture of Mars* is added in this Preparation, and then 'tis called *Soluble Tartar Chalybeate.*

An *Emetick Tartar*, is alſo made of this Soluble Tartar, and Liver of Antimony, which works as the common one.

SOLVENDO *eſſe*, a Term in Law, ſignifying that a Man hath wherewith to pay, or is a Perſon *ſolvent*.

SOLVENT, the ſame with Diſſolvent, being any Corroſive Liquor, or *Menſtruum*, that will diſſolve Bodies.

SOLUTIO *Chymica*, is a reſolving any Body into its Chymical Principles; which are, Spirit, Salt, Sulphur, Earth and Water.

SOLUTIO *continui*, is a Diſſolution of the Unity and Continuity of the Parts: As in Wounds, Ulcers, Fractures, *&c.*

SOLUTION, in Mathematicks, is the anſwering of any Queſtion, of the Reſolution of any Problem.

SOLUTIONE *feodi Militis Parliamenti*, and *Solutione feodi Burgens Parliamenti*, are Writs whereby Knights of the Shire and Burgeſſes may recover their Allowance, if it be denied.

SOLUTIVE. See *Laxative*.

SOMMONS, See *Summons*.

SOMNIFEROUS, or Sleeping Medicines, are ſuch which conſiſting of fœtid Sulphureous Parts, diſſipate and extinguiſh the Animal Spirits, and hinder their Increaſe, whence follows Sleep. *Blanchard.*

SOPHISTICATED, the ſame with counterfeited, debaſed, or adulterated; and is uſually ſpoken of Wines, Chymical Preparations, *&c.* when they are not made good in their Kinds, thro' the Avarice of the Compoſer.

SOPHORIFEROUS. See *Somniferous.*

SORITES, is a ſort of Argument compoſed of ſeveral Propoſitions, of which the ſecond depends upon the firſt, the third upon the ſecond, and ſo forward.

SORROW, is uneaſineſs of the Mind, upon the thought of a Good loſt, which might have been enjoy'd longer; or the ſenſe of a preſent Evil.

SOUND, ſeems to be produced by the ſubtiler, and more Etherial Parts of the Air, being formed and modified into a great many ſmall Maſſes or Contextures, exactly ſimilar in Figure; which Contextures are made by the Colliſion and peculiar Motion of the Sonorous Body, and flying off from it, are diffuſed all around in the Medium, and there do affect the Organ of our Ear in one and the ſame manner.

Sound, alſo appears not to be produced in the Air, ſo much by the ſwiftneſs, as by the very frequent Repercuſſions, and reciprocal Shakings of the Sonorous Body.

Sir *Iſaac Newton* demonſtrates, (in *Prop.* 43. *Lib.* 2. of his *Principles*;) That ſounds, becauſe they ariſe from the Tremulous Motion of Bodies, are nothing elſe but the Propagation of the Pulſe of the Air. And this he ſaith, is confirmed by thoſe great Tremors that ſtrong and grave Sound excite in Bodies round about, as the Ringing of Bells, noiſe of Canon, *&c.*

And in another place he concludes, That Sounds do not conſiſt in the Motion of any Æther, or finer Air, but in the Agitation of the whole common Air; becauſe he found by Experiments, That the Motion of Sound depended on the Denſity of the whole Air.

He found by good Experiments, That *a Sound moves* 968 *Feet*, Engliſh, *in a Second of Time*, pag. 270.

Sup-

Suppoſing the Air by the Pulſe which cauſes Sound, to be in a Motion, like that of the Water when its Waves roul; he calculates the Breadth of the Pulſe, or the Diſtance between Wave and Wave, to be in the Sounds of all open Pipes, double the Length of thoſe Pipes, which he grounds on an Experiment of Father *Merſennus*, in his *Harmonicks*, that an extended String made 104 Vibrations in a Second, when it was an Uniſone with the *C ſa ut* Pipe of an Organ, whoſe Length was 4 Foot open, and 2 Foot ſtop'd, *pag.* 372.

Why the Sound ceaſes always with the Motion of the Sonorous Body; and why they reach the Ear equally ſoon, when far off, or near: He ſhews in *Prop.* 48, *Cor.* where he proves, That the Number of the Pulſes propagated, is always the very ſame with the Number of the Vibrations of the Tremulous Body, and that they are not by any means multiplied as they go from it.

The following Properties have been obſerved of Sound; in many of which, there is a near Relation between it and Light. For,

1. As Light acquaints the Eye with the different Qualities, Magnitudes, and Figures of Bodies, ſo Sound in like manner informs the Ear of many of the ſame Things, in the Sonorous Body.

2. As Light preſently vaniſhes on the Removal, or Total Eclipſe of the Radiating Body, ſo a Sound periſhes as ſoon as the Undulation of the Air ceaſes, which Motion both produces and preſerveth all Sounds.

3. The Diffuſion of Sound from the Sonorous Body is *Spherical*, like the Radiation of Light from its Centre.

4. A great Sound drowns a leſs, as a greater Light Eclipſes a leſs.

5. Too Great, Loud, or Shrill a Sound is Offenſive and Injurious to the Ear, as too great and bright a Light is to the Eye.

6. Sound alſo (like Light) moves ſenſibly from Place to Place, tho' nothing near ſo ſwift as Light. It is Reflected like Light from all hard Bodies; it is hindred and refracted, by paſſing thro' a Denſer Medium. But it differs from Light in this, that whereas Light is always propagated in Right Lines, the Motion of Sound is almoſt always *Curvilinear*.

7. Sound alſo differs much from Light in this, that it is very much weakned by Winds, and ſuch like Motions of the Air, which yet have no Effect on Light. For *Merſennus* Computes, that the Diameter of the Sphere of a ſound heard againſt the Wind is near a third Part leſs, than when coming with the Wind.

8. A very ſmall quantity of Body, ſerves to reflect the Rays of Light: as we perceive manifeſtly in ſmall pieces of Looking-glaſſes, *&c.* But there appears to be neceſſary a Body of much larger Dimenſions to Return a Sound, or to make an Eecho.

9. As to Reflection of Sounds: 'Tis obſerved, that if one ſtand near the Reflecting Body, and the Sound be not very far off, tho' an Eccho be produced, yet it cannot be heard; becauſe the Direct and Reflex Sound, enter the Ear almoſt at the ſame time: But then the Sound appears to be ſtronger than ordinary, and laſts longer: Eſpecially when the Reflexion is made from divers Bodies at once; as from Arches and Vaulted Rooms, from whence the confuſed Bomb of ſuch like Places ariſes.

And from hence probably may be deduced, the Reaſon why Concave Bodies are (*cæteris paribus*) fitteſt to produce great and clear Sounds; ſuch as Bells, *&c.* for in ſuch Bodies the Sound is very ſwiftly and very often Reflected from ſide to ſide, and from one Part of the Cavity to another, and the Bell hanging at liberty, this produces great tremblings and ſhakings of the whole Concave Body, which occaſions the Sound to continue till they ceaſe and are quiet.

10. There is one Phænomenon of Sounds that is indeed very wonderful, That all Sounds great or ſmall, with the Wind or againſt it, from the ſame Diſtance, come to the Ear at the ſame Time.

Dr. *Holder* in his Books of the Natural Grounds and Principles of Harmony; ſays, That if the tremulous Motion which cauſeth Sound, be Uniform, then it produces a Muſical Note, or Sound: But if it be Difform, then it produces a Noiſe.

The *Florentine* Academicks ſound a *Sound* to move one of their Miles (*viz.* 3000 *Braccia*, or 5925 Feet) in Five Seconds of Time: Therefore according to them, it moves 1185 Foot in one Second.

But Sir *Iſaac Newton* found it to move but 968 Foot, in a Second of Time.

Sound, in Geography, is any great Indraught of the Sea, between two Head-lands, where there is no Paſſage through.

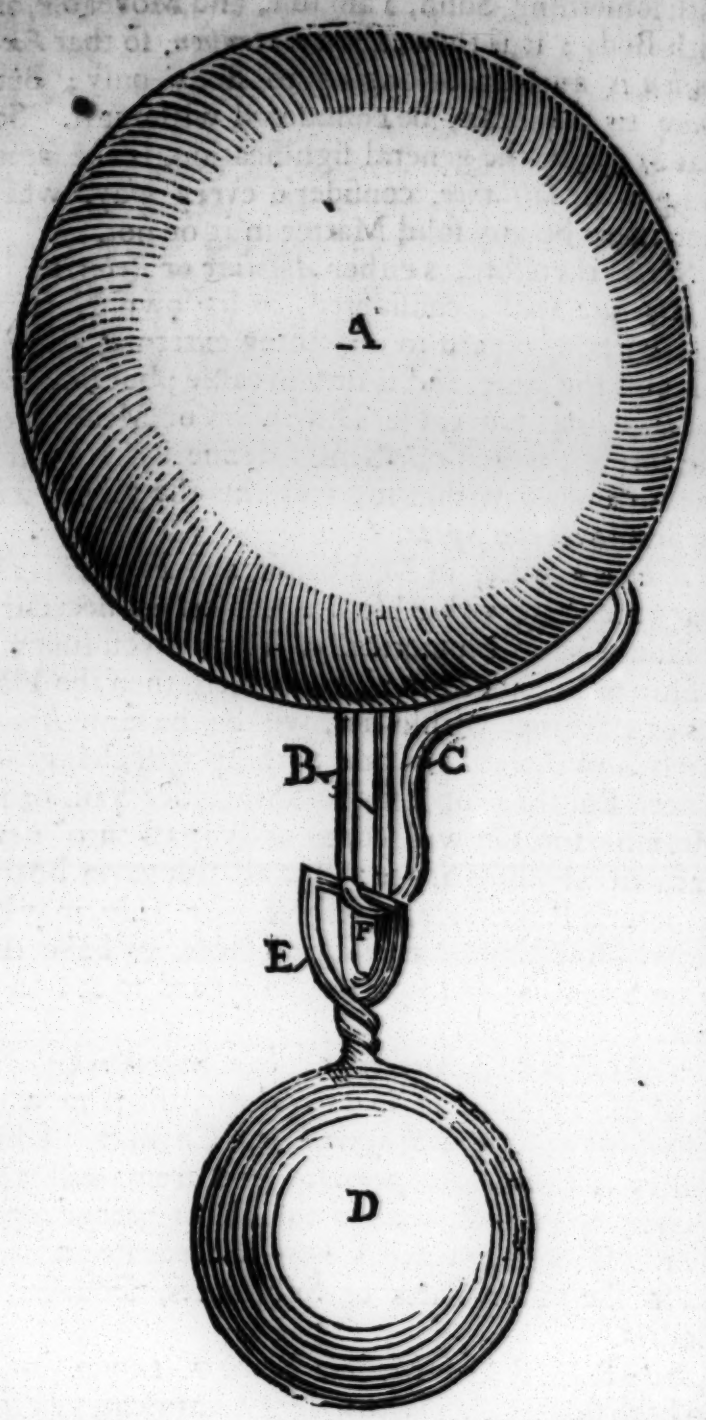
Sounding, when the Seamen try the Depth of the Water with a Line and Plummet, they call it Sounding. But their *Sounding Line*, as thy call it, is a Line different from the *Deep Sea Line*, as being bigger than it, and not much above 20 Fathom in length; and is marked at 2 Fathom, with a piece of Black Leather betwixt the Stranns; ſo alſo at 3 Fathom, and at 4; but at 5 'tis marked with a piece of White Leather, or Cloth.

This Line can be uſed when the Ship is under Sail; but the Deep Sea Line cannot be uſed well, except the Ship be brought upon the Back-ſtays, (See *Deep Sea Line.*)

To ſound the deepeſt Sea without a Line.

Take a Globe of Fir or Maple, or other light Wood, as A; let it be well ſecured by Varniſh, Pitch, or otherwiſe, from imbibing Water; take alſo a piece of Lead or Stone D, conſiderable heavier than will ſink the Globe.

Let



Let there be a long Wire-ſtaple B, in the Ball A, and a ſpringing Wire C, with a bended end F; and into the ſaid Staple, preſs in with your Fingers, the ſpringing Wire on the bended end: And on it hang the Weight D, by its Hook E; and ſo let Globe and all ſink into the Water gently, in the poſture repreſented in the ſaid Figure, to the Bottom, where the Weight D, touching firſt, is thereby ſtop'd; but the Ball being by the *Impetus* it acquired in deſcending, carried downwards, a little after the Weight is ſtopt, ſuffers the ſpringing Wire to fly back, and thereby ſets it ſelf at liberty to re-aſcend: And by obſerving the time of the Balls ſtay under Water, (which may be done by a Watch, having Minutes and Seconds; or by a good Minute-glaſs; or beſt of all by a Pendulum vibrating Seconds; which muſt be 3 Foot, 3 $\frac{1}{2}$ Inches long, *viz.* between the middle of the Bullet, and the upper end of the Thread, where it is faſtened, or held when it Vibrates. By this way, with the help of ſome Tables, you may come to know any Depth of the Sea.

Note, That care muſt be had of proportioning the Weight, and Shape of the Lead, to the Bulk, Weight, and Figure of the Globe, after ſuch a manner, as upon Experience ſhall be found moſt convenient.

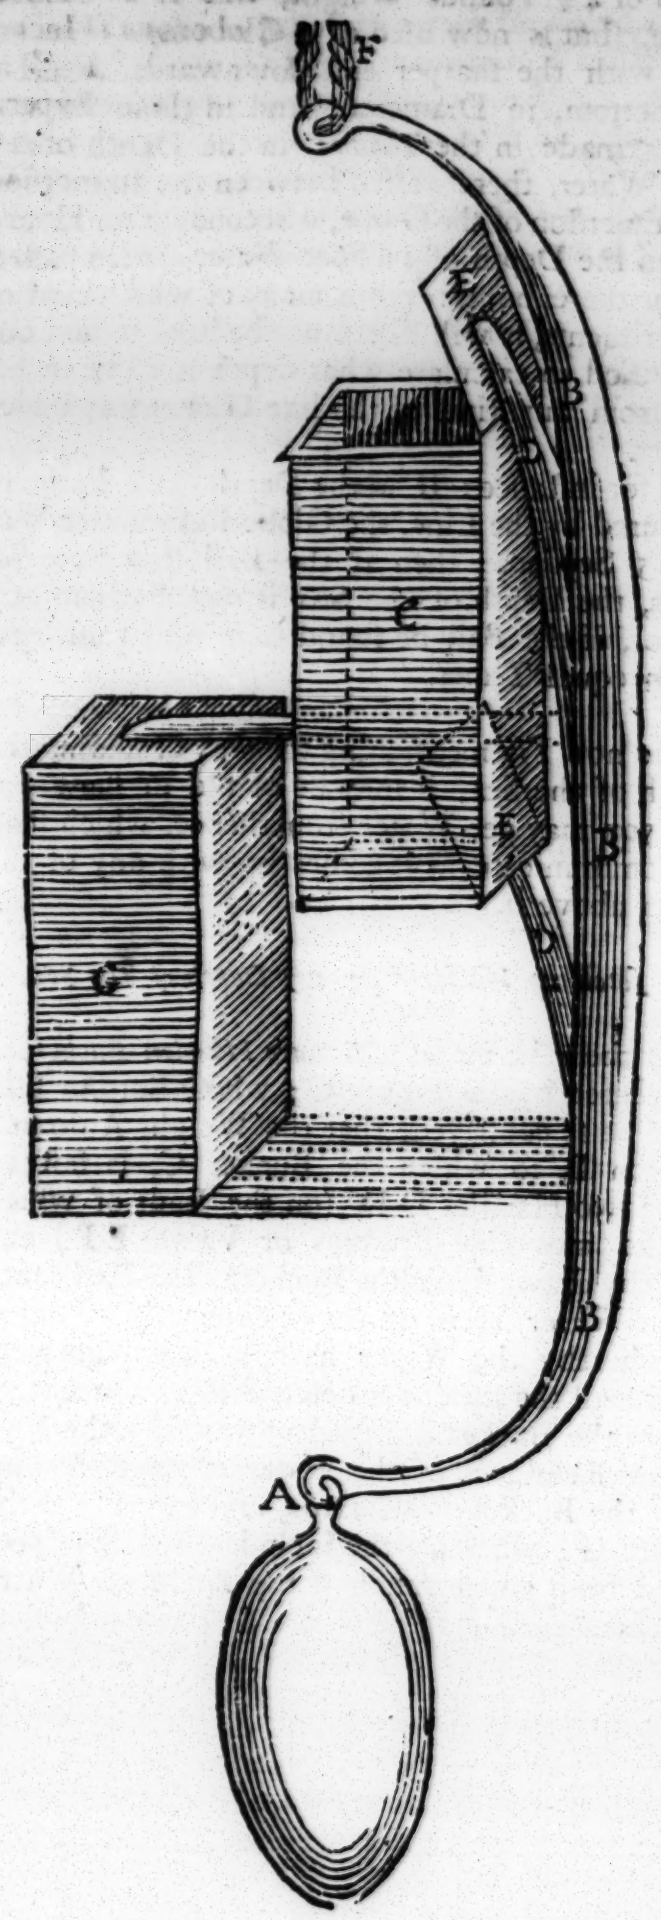
In ſome of the Trials already made with this Inſtrument, the Globe being of Maple-wood, well covered with Pitch, to hinder ſoaking in, was 5 $\frac{13}{17}$ Inches in Diameter, and weighed 2 $\frac{1}{2}$ Pounds; the Lead of 4 $\frac{1}{2}$ Pounds Weight, was of a Conical Form, (but is now uſed of a Globous) 11 Inches long with the ſharper end downwards, 1 $\frac{9}{16}$ at the Bottom, in Diameter: And in thoſe Experiments made in the *Thames*, in the Depth of 19 Foot Water, there paſſed between the Immerſion and Emerſion of the Globe, 6 Seconds of an Hour; and in the Depth of 10 Foot Water, there paſſed 3 $\frac{1}{2}$ or thereabouts: From many of which kind of Experiments, it will likely not be hard to find out a Method to calculate what depth is to be included from any time of the like Globes ſtay under Water.

As for inſtance: If in the Depth of 20 Fathom, meaſured by the Line, the Globe ſtays under Water, 15 Seconds; then if the Ball ſtay 700 Seconds, the Depth of the Sea is 933 Fathom and 2 Foot, if the Ball be found to move equal Spaces in equal Times.

And now I'm mentioning the way of finding the Depth of the Sea, it may be of uſe to ſhew you how you may get Water from thence, which ſhall not communicate as it comes up with any of the Water above it.

To fetch up Water from any Depth of the Sea.

Let there be made a *Square Wooden Bucket*, as repreſented by the Figure C; whoſe Bottom E E, are to be ſo contrived, that the Weight A do ſink the Iron B, to which the Bucket C, is faſtned by the two Handles D D, (on the Ends of which are the moveable Bottoms or Valves E E) and whereby draws down the Bucket: The Reſiſtance of the Water keeps up the Bucket in the Poſture C; whereby the Water hath a clear thorough paſſage all the time it is deſcending; whereas, as ſoon as the Bucket is pulled upwards by the Line F, the Reſiſtance of the Water to that Motion, beats the Bucket downwards, and keeps it in the Poſture G; whereby the included Water is preſerved from going out, and the Ambient Water kept from getting in.



By the Advantage of this, or the like Veſſel, the ſeveral *Degrees of Saltneſs* of Sea-water, may be known, according to its nearneſs to the Top or Bottom; or rather the Conſtitution of the Sea-water in the ſeveral Depths of ſeveral Climates.

SOUTH *Direct Dials.* See *Prime Verticals.*

SOUTHERN *Signs.* See *Auſtral Signs.*

SOWNE, is a Term uſed in the *Exchequer*; where *Eſtreates that Sowne not*, are ſuch as the Sheriff by his Induſtry cannot get, and *Eſtreates that Sowne*, are ſuch as he may gather.

SPACE, if conſidered, barely in Length, between any two Beings, is the ſame Idea that we have of *Diſtance*; but if it be conſidered in Length, Breadth and Thickneſs, it is properly called Capacity: And when conſider'd between the Extremities of Matter, which fills the Capacity of *Space*, with ſomething, Solid, Tangible, and Moveable, or with Body; it is then called *Extenſion*, ſo that *Extenſion* is an Idea belonging to Body only; but *Space* 'tis plain may be conſidered without it. So that *Space*, in the general ſignification, is the ſame thing with *Diſtance*, conſider'd every way, whether there be any ſolid Matter in it or not.

Space therefore, is either *Abſolute* or *Relative*.

Abſolute Space, conſidered, in its own Nature, and without regard to any thing external, always remains the ſame, and is immoveable; but *Relative Space*, is that moveable Dimenſion or Meaſure of the former, which our Senſes define by its Poſitions to Bodies within it; and this the vulgar uſe for immoveable *Space*.

Relative Space, in Magnitude and Figure, is always the ſame with Abſolute, but 'tis not neceſſary it ſhould be ſo Numerically. Thus if you ſuppoſe a Ship to be indeed in abſolute Reſt, then the Places of all things within her, will be the ſame Abſolutely and Relatively, and nothing will change its Place. But then ſuppoſe the Ship under Sail, or in Motion, and ſhe will continually paſs thro' new Parts of abſolute Space: But all things on Board conſider'd Relatively, in reſpect to the Ship, may be notwithſtanding in the ſame Places, or have the ſame Situation and Poſition, in regard to one another.

SPAGYRICA *Medicina.* See *Hermetick.*

SPAGYRICK, or *Spagyrical* Art, the ſame with Chymiſtry; and a *Spagyriſt*, is a Chymiſt. Chymiſtry is called the *Spagyrick* Art, from σπᾶν and ἀγαίρειν, to extract, and to collect, or gather together. Becauſe it teaches how to ſeparate and extract the purer Parts or Subſtances, from mixt Bodies.

SPARADRAPUM, in a Piece of Linen ting'd on both ſides, either with a thick Ointment, or Plaiſter, and is made this way. After you have melted your Ointment, or Plaiſter, dip your Linen in it, extend it, and keep it for uſe. *Blanchard.*

SPASMODICKS, are Medicines againſt Convulſions.

SPASMOLOGIA, is a Treatiſe of Convulſions.

SPASMUS, is any Convulſive Motion: *Cardan* makes two ſorts of Convulſive Affections, *viz. Tetanus Spaſmus*; and by the former he underſtands a conſtant Contraction, whereby the Member becomes rigid and inflexible; by the latter he underſtands ſudden Concuſſions and Motions, which ceaſe and return Alternately. *Blanchard.*

SPASMUS *Cynicus*, a ſort of Convulſions, whereby the Mouth is diſtorted on one ſide thro' the Contraction of the Muſcles.

SPECIALITY, in Law, is moſt commonly taken for a Bond, or Bill, or ſuch like Inſtrument.

SPECIES, in Metaphyſicks, or Logick, is an *Idea*, that relates to another more general one, to which it is ſubſervient, and has only under it *Individuals* and *Singulars*.

SPECIES in Algebra, are thoſe Letters, Notes, Marks, or Symbols, which repreſent the Quantities in any Equation or Demonſtration. This ſhort and advantageous way of Notation, was firſt Introduced by *Vieta*, about the Year 1590, and by it he made many diſcoveries in the Proceſs of *Algebra*, not before taken notice of.

The Reaſon why *Vieta* gave this Name of *Species*, to the Letters of the Alphabet ſubſervient to Algebra, and why he calls it *Arithmetica Speciosa*:

oſa: Seems to have been in Imitation of the *Civilians*, who call Caſes in Law, but abſtractedly between *John a-Nokes* and *John a-Stiles*, or between *A*, *B* and *C*, ſuppoſing thoſe Letters to ſtand for any Perſons indefinitely; ſuch Caſes, I ſay, they call *Species*. Wherefore ſince the Letters of the Alphabet will alſo as well repreſent Quantities, as Perſons, and that too Indefinitely one Quantity as well as another, they may properly enough be called *Species*; that is Symbols, Marks, or Characters. From whence the *Litteral Algebra* is frequently now a-days called *Specious Arithmetick*, or *Algebra* in *Species*.

SPECIES, in Medicine, are properly the Simple Ingredients in the Druggiſts, or Apothecaries Shops, out of which compound Medicines are made: But the Writers of *Pharmacy*, do uſually give this Name to ſome *Aromatick*, or *Cathartick Powders*, becauſe probably they were formerly kept ready prepared in the Shops, to form Electuaries, Tablets, Pills, &c. as ſome are ſtill.

SPECIES, *Viſibles*, are thoſe wonderfully fine ſuperficial Images of the Bodies which the Light produces, and delineates in their due Proportion and Colours in the Bottom of our Eyes. Theſe the *Ariſtotelians* would have to be Immaterial, but a 1000 Experiments prove, That tho' they are admirable ſubtile, yet they are really corporeal.

SPECIFICK is in general, whatever is peculiar to any diſtinct Species of Things, and which diſtinguiſhes them from all others of different Species. Therefore the Logicians ſay, That in every good Definition of any thing, the Specifick Difference ought always to be inſerted. Hence,

SPECIFICK *Gravity*, is the Appropriate and peculiar Gravity or Weight, which any Species of Natural Bodies have, and by which they are Plainly Diſtinguiſhable from all other Bodies of Different kinds. By ſome 'tis not improperly called *Relative Gravity*, to diſtinguiſh it from *Abſolute Gravity*, which encreaſes in Proportion to the Bigneſs of the Body weighed. Thus, if any Body weigh a Pound, one as big again will weigh two Pounds: And let the Bodies be of what Nature or Degree of Specifick Gravity ſoever, a Pound of one will be as much as a Pound of the other, Abſolutely conſidered: Thus as is commonly ſaid, a Pound of Feathers, is as heavy as a Pound of Lead. But if you conſider Lead and Feathers Relatively, the Specifick Gravity of the Former, will be much greater than that of the Latter. Or Lead, or Bulk, for Bulk will be much heavier than Feathers: And Gold heavier than Lead, &c.

'Tis of ſo great Advantage in many reſpects as will appear below to find truly the Specifick Gravities of Bodies, that many Curious Ways have been thought of, and experimented for this Purpoſe. As by forming exact Cubes of different ſubſtances, and taking their Weight accurately in Nice Scales; and by melting Metals of different Gravities, and then caſting them in Moulds of the ſame Dimenſions. But for Practice and Univerſal uſe, nothing is better than the following Method, which is to weigh any Body firſt in Air, and then in Water; which latter being conſiderably a Denſer Fluid than Air, will buoy up the Body immerſed in it in part; and will conſequently make it weigh leſs there than in the Air. And if after this you ſubſtract the Weight found in the Water, from the former in the Air; a Remainder or Difference will be found, which is the Weight of as much Water as is equal to the Bulk of the Body. As *Archimedes* hath demonſtrated Mathematically, and Mr. *Boyle* Phyſically and Experimentally, in his *Hydroſtatical Paradoxes*. So that by this means having two Bodies, one Firm, and the other Liquid, with the Weight of each part, 'tis very eaſie to find the Proportion that one hath to the other, Bulk for Bulk; by only dividing the greater by the leſſer; for the Quotient will ſhew the Specifick Gravity of the heavier Body compared with as much Water as is equal to it in Bulk. As if the Quotient be 2, 3, 6, or 19; the Body will accordingly be twice, thrice, 6, or 19 times as heavy as Common Water.

The Application of which Rule, and the great Advantages which may be made of the uſe of it. You will find in the following Problems or Experiments.

I. *To find the Specifick Gravity of ſuch Bodies as will ſink in Water, and not be diſſolved by it.*

Having ready a Pair of good ſmall Scales which will turn with the $\frac{1}{4}$ of a Grain, (or $\frac{1}{4}$ Part may do well enough) drill a ſmall Hole in the middle of one Scale, thro' which put a Horſe-hair about a Foot in length with a Knot at the upper end of it, and a Loop at the other, put as much Horſe-hair in the oppoſite Scale, as will ſerve to Equiponderate the other, and having well adjuſted your Scales: Weigh firſt the Body in the Air, carefully turn the Weight into Grains, ('twill be beſt to uſe Troy Weight) and write down the Number on a piece of Paper. Then faſten the Body to the Horſe-hair, and leiſurely immerſe it into a Veſſel of Rain; or Spring Water, and putting Weights into the oppoſite Scale, find its Weight exactly in the Water, (where it muſt ſwim about freely, and not touch the Bottom or Sides, of the Veſſel.) Turn alſo this Weight into Grains, and ſubſtract it from the former Weight in Air, and note the Remainder; by which Remainder divide the firſt found Weight in Air; and the Quotient will be the Proportion that the Body bears to Water; that is, will ſhew the Sepcifick Gravity in reſpect of Water, which is pitched on as a Standard to compare it by.

Example.

A Piece of white Marble weighed in Air 1169 Grains, and in Water 738 Grains; which ſubſtracted from the former Weight left 431 Grains; by which Remainder dividing the Weight in Air, 1169, the Quotient was $2\frac{7}{10}$, which is the Specifick Gravity of Marble, in reſpect of as much Water as is equal to it in Bulk.

N. B. If you practice this much, 'twill be beſt to hang your Scales upon a Gibbet, or ſome other Reſt, where they may hang freely; and ſo you will have both your Hands at liberty for more nicely adjuſting the Balance, and your Arm will not be weary with holding the Scale; and be ſure that the Scales play freely, and are no way tangled, and that you do not wet your Weights, nor Scales; for a little careleſsneſs may produce great Errors in ſuch Caſes: Let alſo the Body hang a while in the Water before you weigh it, and move it up and down, and gently knock it againſt the Sides of the Veſſel, to extricate it from all Bubbles of Air, that elſe ſticking to it, may buoy it up a little, and conſequently

ſequently induce you to miſtake its Weight. You ſhould alſo have a ſmall pair of Plyers, or Tongs, to take up your Grains withal, leſt you let them fall; which with your Fingers you may be apt to do, and ſo occaſion your ſelf a needleſs trouble.

'Twill be convenient alſo to make a little Net of Horſe-hair (of ſmall Maſhes) to hold round, or ſmall Bodies, that cannot conveniently be faſtened with one Hair only; be ſure always to Equipoiſe your Scales, before you begin to weigh.

The Uſes of this Experiment.

1. Since common Stone, Marble, and Rock-Chryſtal, *&c.* (See the Table of *Specifick Gravity*) are to Water, but as 2 ½ (or 5 to 2;) if you find a piece of ſtrong Matter, whoſe *Specifick Gravity* exceeds that Proportion, you may conclude, That it hath in it ſomething of a Mineral, or Metalline Nature, in proportion to its exceſs above the Weight of common Stone.

2. By this Method alſo, a Body may be examined, whether it be of a ſtony Nature, or not? So *Coral* and *Pearls*, will be diſcovered to approach rather to a Stony, than to a common Vegetable, or Animal Nature; and *Bezoar*, and the Stones found in the Bladders of Men, or other Animals, will by their great lightneſs ſhew themſelves of a very different Conſtitution from ordinary Stones.

3. By this Method, you may make an Eſtimate of the Goodneſs of ſeveral Stones, or Bodies of the ſame Kind, or Denomination: For having found the Gravity of ſuch as are Excellent, all others of leſſer Goodneſs, may eaſily be diſtinguiſhed, as they are any way diverſe from that Standard.

4. And thus alſo Genuine Stones, or Minerals, may be eaſily diſtinguiſhed from falſe ones; and counterfeit Money readily known from Sterling, tho' never ſo well waſh'd over, or gilded; for having by your own Trials, or by the help of ſuch a Table as is here annexed, gotten the Specifick Gravity of ſuch Stones, Gems, or Corns, as are True and Genuine, let that be the Standard whereby to eſtimate others by; which laſt uſe, is of univerſal Advantage, and may aſſiſt the Phyſician, Apothecary, or Druggiſt in the Drugs, the Jeweller in Gens, and Precious Stones, and the African Merchant, in the Choice of the Sand or Duſt Gold, which is often Counterfeit.

Had the Curious *Dampier* known this Method, he might perhaps have trucked and gotten ſome of the *Indian* yellow Rings at the *Baſhee Iſland*: (*vid. Dampier's Travels, Edit.* 2. *Chap.* 15. *p.* 427.) which it appears he had no great Encouragement to do, not being able exactly to diſtinguiſh whether they were Gold or not.

II. *To weigh Mercury, or ſuch heavy Fluids that will ſink into, and not mingle with Water; as alſo the Fragments of, or ſmall Precious Stones, Pearls,* &c. *and all Powders that are heavier than Water, ſmall Sands, Filings of Metals, Gold Grains, or Duſt, and ſuch like ſmall things about which a Horſe-hair cannot be faſtened.*

To provide a ſmall Glaſs Jar, or a little Silver or Braſs Cup (but Glaſs is beſt when it can be had) with two Handles or Ears to it, and that ſhall hold about an Ounce and a Half, or two Ounces of Water; and weighing it carefully in the Air firſt, note exactly its Weight, (which lay by in ſome ready Place) then alſo find the Glaſs's Weight in Water, and lay the Weights carefully by, by themſelves; and if you intend to make frequent uſe of this Practice, 'twill be better to get two pieces of Lead, one of the weight of the Glaſs in the Air, the other of its weight in Water, which will be always in readineſs. This done, put the Mercury, Liquor, or Powder you intend to weigh into your Glaſs, (which may be called the *Hydroſtatical Bucket*) and putting into the oppoſite Scale the before-found weight of the Bucket, find the weight of the Matter in Air, and write it down (as in *Experiment* 1.) then take the Bucket out of the Scale, and pour into it, by degrees (that it may mingle well with it, and exclude all Air) Water enough to cover the Matter, or wet it throughly; and then putting into the oppoſite Scale the weight that anſwers to the Bucket in Water, faſten your Bucket by a Horſe-hair to your Scale, and let it down gently into a Veſſel of Water, and ſo find its weight carefully in the Water; then (as in *Experiment* 1.) Subſtract that from the weight in Air, and by the Remainder divide the weight in Air, and the Quotient will be the ſpecifick Gravity of the Liquor, Powder, *&c.* to as much Water as is equal to it in Bulk.

III. *To weigh ſuch ſolid Bodies as will diſſolve in, or be injured in Water.*

Weigh them (as before) firſt in Air, and then inſtead of Water, uſe the *clear Oil* or *Spirit of Turpentine*, which is cheap enough, and may be had at any Druggiſts, in which no *Salts*, nor *Vitriols*, nor *Acid Sublimates* will diſſolve; and proceed in all things, as if you weighed the Body in Water; and ſo you will obtain the ſpecifick Gravity of the Body in reſpect of *Oil of Turpentine*; which may be the Rule for *theſe ſorts of Bodies*, as common Water was for the others. And this way will have the ſame Uſe as the other: For having at any time weighed a piece of any Body (as ſuppoſe *Mercurius dulcis*) *in the Oil*, that you know is good; that may be your Standard to try more of the ſame Sublimate for the future; for if you find it hath not the ſame ſpecifick Gravity that the former (which you weighed) had, but is lighter, you may conclude it hath not its due proportion of *Mercury*; and conſequently, is adulterated, as indeed that which is Sold in the Druggiſts Shops often is; and therefore thoſe that deal much in ſuch things, may make a Table (from their own Experience) of the weights of Bodies in reſpect of *Oil of Turpentine*, which will be of ready Uſe to them: And then their ſpecifick Gravity in reſpect of Water (by a little Calculation) may be eaſily enough found by the following Experiment.

IV. *To find the Specifick Gravity of Liquids and Fluids.*

1. Theſe are of two ſorts, and conſequently 'twill be expedient to be furniſhed with a double Standard to examine them by. In order therefore to find the weight of *Common Water*, *Beer*, *Ale*, *Burning Spirits*, or any *Vegetable* or *Animal Liquors*; get either a piece of *Amber* or *Red hard Sealing*

ing Wax, or a *Roll of common Brimſtone*, and weigh it firſt in the Air, and then in the Liquor you intend to examine; and (proceeding as in *Exper.* 1.) you will thence find the ſpecifick Gravity of that *Body* in reſpect of the *Fluid*, and conſequently of the *Fluid* in reſpect of *that Body*: And therefore pitching on *that Body* as your *common Standard*, 'tis eaſie to compare the Weight of all Liquids of the firſt kind in reference to it; for thoſe in which the Body weighs *leſs*, will be the *Heavier Liquors*: And thoſe in which it weighs *more*, *lighter*, in proportion to the decreaſe or increaſe of the weights of your Standard in the Fluid.

2. But to find the Weights of *ſtrong briny Sea-water*, *ſaline Menſtrua*, and all *acid Spirits* and *Stygian-waters*, as the *Oil of Vitriol*, *Aqua-fortis*, &c. 'twill be neceſſary to employ a heavier Body for your Standard; and therefore *in ſuch*, weigh either a piece of *Rock-Chryſtal*, or which will do as well, *white Marble*, or a piece of ſolid Glaſs; ſuch as the Tobacco ſtoppers of that Metal, *&c.* which being more ponderous, will ſink in theſe Liquors, in which *Amber* or *Wax* will not; and proceed as above in the former part of this Experiment.

USES.

1. By theſe Experiments, the goodneſs of all kinds of Liquors may be examined: For, as to the firſt kind of Liquors before-mentioned, 'tis probable, the more fine and ſpirituous they are, the *lighter* they will be, and the more your piece of *Amber* or *Sealing-wax* will weigh in them; which having once weighed in ſome Liquor of the kind, that you were aſſured was good, the weight of your Piece in that, may be the Standard to compare others by. But the latter ſort of Liquors will require a *contrary* way of *eſtimation*; for the more ponderous they are, the better they may be judged to be; and conſequently, the leſs your piece of *Marble* or *Glaſs* weighs in them, the greater degree of goodneſs you may conclude them to contain. By weighing alſo the Solid in a parcel of any kind of *theſe* that you have proved as good, its weight may be the Standard, to compute the goodneſs of thoſe of the ſame ſort of Liquors.

2. Hence alſo you may moſt accurately diſcover, whether you are impoſed upon by the *Merchant*, *Vintner*, or *Diſtiller*, &c. in Quantities of *Wine* or *Spirits* which you have bought on the Credit of the Sample that was ſhewed you to examine; for if you find that the ſpecifick Gravity of the whole Veſſel *ſent you home*, is different from that parcel which you *tried*, you may be aſſured, that 'tis ſome way mix'd and adulterated.

3. The Chymiſt alſo may by this means adjuſt his *Menſtrua* for the diſſolving of Mineral or Metallick Bodies to the beſt advantage; by ſo tempering them, (either by weakening their Strength, or increaſing it) that they ſhall prove the moſt expedite Diſſolvents: For many know very well, that a *Menſtruum* may as well be too ſtrong, as too weak: And therefore the ſpecifick Gravity of an *apt Menſtruum* may perhaps be the beſt guide to portion another for the ſame purpoſe.

V. *To find the ſolid Content of any ſmall Body, tho' never ſo irregular, (if it be heavier than Water) by weighing it in Water.*

Mr. *Boyle*, by many curious Trials, found that a Cubic Inch of Water is equal in weight to about 256 Grains, or half an Ounce, and 16 Grains *Troy*: Which Number of Grains is very happy for ſuch Trials, becauſe of its many aliquot Parts; and alſo, becauſe every 32 Grains anſwers to juſt $\frac{1}{8}$ of an Inch.

Suppoſe therefore you weigh a Body firſt in Air, and then in Water, and ſhall find it in the latter Medium to loſe of its weight in Air juſt 256 Grains or $\frac{1}{2}$ Ounce 16 Grains, you may conclude that the ſolid Content of that Body is juſt one Cubic Inch; and if it loſe but $\frac{1}{2}$ or $\frac{1}{4}$, or $\frac{1}{8}$ of that number of Grains, the Content is $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$ of a Cubick Inch. So on the other ſide, if it loſe more than 256 *gr.* as 2, 3, or 4 times that weight; its ſolid Content will be accordingly 2, 3, or 4 Cubic Inches. The like is true of all other proportional Decrements of the Bodies weight, in compariſon of 256, the Standard for one Cubick Inch.

The reaſon of this Proceſs is clear enough, if we conſider that every Body weighed in Water, loſes there ſo much of its weight as the Water amounts to, which is equal to that Body in Bulk; or in other words, That it weighs leſs in Water, than in Air, by the weight of as much Water as is equal to the Body in bulk, which is the Fundamental Theorem of all Hydroſtaticks, and is Mathematically demonſtrated by *Archimedes*, and Phyſically by Mr. *Boyle*, in his *Hydroſtatical Paradoxes*.

And ſince alſo, as is before declared, a Cubick Inch of Water weighs exactly 256 Grains, what every Body loſes in Water juſt that Sum (of its former weight in Air) muſt needs be in Solid Content equal to a Cubick Inch; for the Decrement of its weight is equal to the weight of as much Water as its bulk takes up, (by the univerſal Theorem) and that is found to be in weight 256 Gr. which is exactly equal to one Cubick Inch; therefore the Content of that Body is juſt ſo much.

USES.

This is more exact than any Menſuration can be for ſmall Bodies; 'tis very expeditious, and may be of good uſe (beſides its Curioſity) in a great many Caſes, as is obvious to any thinking Perſon.

VI. *To find the ſolid Content of a Body lighter than Water, by its weight in that Medium.*

This Experiment will have two Caſes.

1. When the Body to be meaſured will not be injured by the Contract of the Water, Weigh the Body in Air; and then take a piece of Lead, or ſome ſuch heavy Metal, and of a known and even weight, (as ſuppoſe a Penny-weight or Half a Penny-weight, *&c.* to avoid Fractions) and capable of ſinking your Body in Water. Weigh your Lead in Water, and Subſtract that weight from its weight in Air, and keep the Remainder as the Specifick weight of your piece of Lead in Water. This done, faſten your Lead with Horſe-hair to the

the Body you intend to measure; and weighing the Aggregate also in Water, Subtract this last weight from that just now found in Air, and the difference will be the Specifick weight of the said Aggregate in Water; and lastly Subtract from it the Specifick weight of the Lead alone in Water, and the remainder is the weight of the light Body you intend to measure, or to find the solid Content of; which is easily done by the Process in the close of the 5th Experiment: For this last found weight being divided by 256, or by its Half, ½, &c. will accordingly give you the Body's Solid Content in entire, half, or quarters of Cubick Inches.

Example.

Because this last Process hath something of difficulty in it, (especially to a young Hydrostatitian) I will subjoin the following Example, which will serve not only to enlighten this, but many other Rules of this nature.

	Gr.
1. A Cube of Oak which was made with great Exactness by a good Workman, weighed in Air.	192 ½
2. A piece of Lead just ½ an Ounce (to make it sink) weighed	240
3. The Lead in Water weighed	220
Which Subtracted from 240, the Lead's weight in Air, left for its Specifick weight in Water.	020
4. The Aggregate of the Wood and Lead's weight in Air was	433½
5. The weight of the Aggregate in Water was	162
6. Which Subtracted from the weight of the Aggregate in Air 433 ½ left	271 ½
7. The Specifick weight of the Lead in Water (*viz.* 20) being Subtracted from which last remainder I left for the weight of the Cube in Water	251

Which last Number wants but 4 Gr. and a ½ of 256, the Standard before mentioned, *viz.* Of the weight in Grains of a solid Inch of Water.

CASE 2.

When there is danger of injuring the *Body* by its either being dissolved by Water, or else admitting it too much into its Pores, you may use Oil of Turpentine instead of Water; only instead of the Standard 256 Grains for a Cubick Inch, you must use 221, for that Mr. *Boyle* found a Cubick Inch of that Oil to weigh; and therefore proceed altogether as in the last Case, only use Oil instead of Water, and divide the weight of your Solid in Oil of Turpentine, by 221, and the Quotient will give the Contents of it in Cubick Inches or parts of an Inch.

You may also in some cases, having first found the weight of the Body you would examine in Air, over-lay it carefully with a Coat of Bees-wax, to keep it from being injur'd by the Water, and having then found the weight of the Bees-wax used to cover it, (which is easily done by weighing the Body again when covered, and then from that weight Subtracting the weight of the naked Body before found) sink it in Water with a piece of Lead as before taught; and observing the weight of the Aggragate, then proceed with the remaining part of the Experiment, as is Case 1.

VII. *To find the weight of any Floating Body, tho' never so great, by knowing what part of it is under Water.*

Suppose a Ship should have under Water a part of its Hull equal to 100000 Cubick Feet, I chuse such a round Number to avoid Fractions, (how to find the Content of the Part of a Ship, that is under Water doth not belong to this Place, but it may be easily enough done by one versed in solid Mensuration). 'Tis found by Experience, that a Cubick Foot of Water weighs 76 Pound *Troy*, and *Archimedes* hath demonstrated, That as much Water as is equal in bulk to the part of the floating Body that is under Water, is in weight equal to the whole floating Body. Therefore 'tis plain, That to solve this Problem, you need only Multiply 100000 by 76, (which is 7600000) and the Product is the weight of the whole Ship in Pounds *Troy*.

A Table of Specifick Gravity of Bodies in Proportion to Water, from Mr. Boyle *and my own Experiments.*

	Proportion.
Amber	as 1, 04 to 1
Agate	as 2, 64 to 1
Allom Stone	as 2, 18 to 1
Antimony (Hungarian)	as 4, 07 to 1
Antimony Crude, which seem'd to be very good	as 4, $\frac{17}{121}$ to 1
Regulus, made of that above, and the common way	as 6 $\frac{3}{5}$ to 1
Cinnabar of Antimony	as 7 $\frac{3}{7}$ to 1
Bezoar Stone	as 1, 48 to 1
—— Another	as 1, 64 to 1
A fine Oriental one	as 1, 53 to 1
-----Another	as 1, 34 to 1
A piece of cast Brass	as 7 $\frac{3}{3}$ to 1
An old Brass Gold Weight (mark'd XXXIII.)	as 8, 83 to 1
A piece of hammer'd Brass	as 8, 66 to 1
Coral red	as 2, 63 to 1
Chrystal	as 2, 21 to 1
Cornelian	as 3, 29 to 1
Calculus humanus	as 1, 72 to 1
-----Another	as 1, 47 to 1
-----Another	as 1, 57 to 1
Coco-shell	as 1, 34 to 1
Native Crabs-Eyes	as 1, 89 to 1
Artificial Crabs-Eyes	as 2, 48 to 1
Calx of Lead	as 8, 94 to 1
Copper Stone	as 4, 09 to 1
Copper Ore	as 4, 15 to 1
Copper Ore Rich	as 4, 17 to 1
An old Copper Half-penny, (*Charles* 2d's Coin)	as 9, to 1
Common Cinnabar	as 8, $\frac{1}{50}$ to 1
Cinnabar of Antimony	as 7, 03 to 1
-----Another Piece	as 7, 06 to 1
Coral white	as 2, 54 to 1
Chalk, found by Dr. *Slare* to be	as 1, $\frac{23}{29}$ to 1
Gold Ore not Rich from *India*	as 2, 63 to 1

----An-

——Another lump of the ſame	as 2,	55	to 1
An old Jacobus	as 18	7/8	to 1
A piece of Gold Common-wealth Coin	as 17	5/8	to 1
The Gold of a Seal	as 16	1	to 1
Granatiminera	as 3,	1	to 1
Granate Bohemian	as 4,	36	to 1
A piece of common Glaſs Coffe-Diſh of a brown colour	as 1,	76	to 1
Hæmatites Engliſh	as 3,	76	to 1
A Hone to Set Razors on	as 2,	96	to 1
An Icicle broken from a Grotto, found by Dr. *Slare* to be	as 1,	19	to 1
Ivory	as 1,	91	to 1
A piece of burnt or roaſted Iron Ore	as 3	1/3	to 1
A piece of hammer'd Iron (perhaps part Steel)	as 7	3/5	to 1
Lapis manati	as 2,	86	to 1
Lapis Lazuli	as 2,	98	to 1
Lapis Calaminaris	as 4,	92	to 1
Lapis Judaicus	as 2,	69	to 1
Lead Ore	as 7,	14	to 1
Lead (an ordinary piece)	as 11	1/3	to 1
——Another	as 11,	42	to 1
Lead Ore from *Cumberland* Rich	as 7,	54	to 1
A good Load-ſtone	as 4,	75	to 1
——Another	as 4,	93	to 1
Marcaſites	as 4,	45	to 1
——Another from *Stalbridge*	as 4,	50	to 1
Mercury revived from the Ore	as 14		to 1
Manganeſe	as 3,	57	to 1
Mineral (Corniſh) ſhining like a Marcaſite	as 9,	06	to 1
Marble white	as 2,	7	to 1
Oſteocolla	as 2,	24	to 1
Pearl (a large one)	as 2,	51	to 1
Fine Orient Seed Pearl	as 2,	75	to 1
Rhinoceros-horn	as 1,	99	to 1
Sulphur vive	as 2,		to 1
---Another very fine from *Germany*	as 1,	98	to 1
Slate (Iriſh)	as 2,	49	to 1
A Silver Half-crown (K.W's Coin)	as 10,	75	to 1
Silver Ore, choice from *Saxony*	as 4,	97	to 1
——Another piece	as 7		to 1
A Whetſtone, not fine, ſuch as Cutlers uſe	as 2,	74	to 1
A round Pebble-ſtone (within of Flint)	as 2,	61	to 1
Talc, a piece like Lapis Amianthus	as 2,	28	to 1
Talc (Venetian)	as 2,	73	to 1
Talc (Jamaican)	as 3,		to 1
New Engliſh Tin Ore, Mr. *Huberts*	as 4,	8	to 1
Tin Ore, black, rich	as 4,	18	to 1
Another choice Piece	as 5		to 1
Tutty	as 5		to 1
Tin Glaſs	as 9,	55	to 1
Vitrum Antimonii per ſe	as 4,	76	to 1
Vitriol Engl. a very fine Piece	as 1,	88	to 1
Unicorns-horn, a Piece	as 1,	91	to 1
Human Blood, Mr. *Boyle* found	as 1,	1/25	to 1
Serum of the Blood to Water, he found to be	as :: 302		to 253
Aſphaltum, Mr. *Boyle*,	as 1,	14	to 1
Scotch Coal	as 1,	13	to 1

SPECIFCK *Medicines*, are ſuch as have a Peculiar Vertue againſt ſome Diſeaſe; as the *Quinquina*, or *Cortex Peruviana*, hath to cure Intermitting Fevers: And Phyſicians mention in their Books three kinds of Specifick Medicines.

1. Such as are Eminently, and Peculiarly Friendly to this or that Part of the Body, as to the Heart, the Brain, the Stomach, *&c.*

2. Such as do ſeem to Attract, Expel, or Evacuate ſome determinate Humour by a kind of Specifick Power, that they are endowed with. Thus Jalap Purges, Watry Humors, Rhubarb Bile, *&c.* And,

3. Such as have a Virtue to cure by ſome hidden Property, this or that Particular Diſeaſe.

That there are ſuch Medicines as theſe, in the latter and moſt proper Senſe of the Word, Mr. *Boyle* makes very probable, by theſe Reaſons.

1. The Concurrent Teſtimony of Experience both Ancient and Modern. *Galen* promiſed a Book on this Subject, but it is loſt if he ever Wrote it.

2. 'Tis manifeſt that Inconſiderable Quantities of Poyſon can do very great miſchief, and produce great and diſmal Effects without any manifeſt Quality appearing to be in them: And therefore by Parity of Reaſon, one would conclude, Medicines may be found which ſhall heal and do good the ſame way.

3. The Teſtimony of Phyſicians themſelves who in their Writings, do always mention ſome one Specifick or other, which they believed was really ſuch.

And certainly it would be well worth while to keep an account of the Operations of as many pretended Specificks, as can come to any Phyſicians knowledge, and by no means to reject all things of that Nature, becauſe a Reaſon cannot preſently be given for the Cure; for if we ſhould always do ſo, we muſt reject almoſt every thing.

SPECILLUM, is a Surgeons Inſtrument called uſually a *Probe*, by which he ſearches the Depths, Windings, *&c.* of Wounds and Ulcers.

SPECULUM *Lucidum.* See *Septum Lucidum.*

SPECULUM *Oculi*, the Apple, or Pupil of the Eye. See *Aranea Tunica Oculi.*

SPECULUM *Oris.* See *Dilatatorium.*

SPELL, a *Sea Word* ſignifying to let go the Sheats and Bowlings of a Sail, (chiefly the Miſſen) and Bracing the Weather Brace in the Wind, that the Sail may lie looſe in the Wind: This is done, when a Sail hath too much Wind in it, and there is Danger of Wronging the Maſt. This Word is moſtly uſed about the *Miſſen-ſail.* For there inſtead of ſaying take in the *Miſſen* and *Peek it up*; they ſay in one Word *Spell the Miſſen.*

To do a Spell alſo with them, ſignifies doing any Work for a ſhort time, and then leaving it: Therefore a *Freſh Spell* is when Freſh Men come to Work; and to *give a Spell*, is all one as to ſay Work in ſuch an ones Room.

SPENT, The Seamen ſay a Ship hath *Spent* any Maſt, or Yard, when it is broken down by foul Weather, or any ſuch accident: But if it be done by an Enemies Shot in Fight, they ſay ſuch a *Yard or Maſt was ſhot by the Board.*

SPERMATICK *Veſſels*, and *Parts*, are thoſe Arteries and Veins, which bring the Blood to, and convey it from the Teſticles: Likewiſe thoſe Veſſels through which the Seed paſſes: Likewiſe

all

all whitiſh Parts of the Body, which becauſe of their Colour, were anciently thought to be made of the Seed: Of this ſort are the Nerves, Bones, Membranes, Griſtles, &c.

SPERMATOCELE, a Rupture cauſed by the Contraction of the Veſſels which eject the Seed, and its falling down into the *Scrotum*.

SPHACELUS, is a ſudden Extinction of Life and Senſe in every Part.

SPHÆNOIDALIS *Sutura*, is a Suture that ſurrounds the *Os Sphænoides*, ſeparates it from the *Os Occipitis*, from the *Os Petroſum*, and from the *Os Frontis*.

SPHÆNOIDES, is a Bone of the *Cranium*, common both to the Skull and upper Jaw; it is of a very irregular Figure; and is ſituated in the middle of the Baſis of the Skull, and is joyned to all the Bones of the *Cranium*, by the *Sutura Sphænoidalis*, except in the middle of its Sides, where it is continued to the *Oſſa Petroſa* as if they were one Bone. This Bone has a ſmall Protuberance in the middle thereof, from which the Muſcles of the *Uvula* ariſe: On its Inſide it has 4 Proceſſes called *Clinoides*. Betwixt the two Tables of this Bone, under the *Cella Turica*, there is a *Sinus* divided in two in the middle, which opens by two Holes into the Cavity of the Noſtrils. In this Bone ſome ſay, there are alſo 12 Holes; by the firſt and ſecond paſs the Optick Nerves; by the reſt paſs other Nerves for the Motion of other Parts, as alſo of Veins and Arteries.

SPHÆNOPALATINUS, is a Muſcle of the *Gargareon*, which deſcends from a round fleſhy Origination at a Proceſs of the *Os Sphænoides*, which is in a direct Line between the *Ala Veſpertilionis*, and *Proceſſus Styloides*, thence it becomes a round fleſhy Belly in half its Progreſs, grows leſs again near its lateral Inſertion to the Poſterior Part of the *Gargareon*.

This with its Partner acting, draw the *Gargareon* with the *Uvula* upwards and backwards; which hinders the maſticated Aliment from Regurgitating through the *Foramina Narium* in *Deglutition*.

SPHÆNOPHARINGÆUS, is a pair of Muſcles ariſing from the *Sinus* of the inner Wing of the *Os Cuneforme*, and going Obliquely downward, is extended into the Sides of the Gullet; it dilates the Gullet.

SPHÆNOIS. See *Os Cuneforme*.

SPHÆNOPTERIGOPALATINUS, See *Pterigopalatinus*.

SPHAGITIDES, according to ſome, are the Jugular Veins in the Neck.

SPHERE, is a Solid Body, made by the Rotation of a *Semicircle* about its Diameter.

1. All Spheres are to one another as the Cubes of their Diameters. For under the Word *Cylinder*, you will find it proved, *That Cylinders whoſe Altitudes are equal to the Diameters of their Baſes, are in Proportion to each other as the Cubes of their Diameters*; which is thus expreſs'd $\frac{1}{2}rddd\,\frac{1}{4}r$ DDD :: *ddd*. DDD. wherefore, be the Ratio of a Sphere to a Cylinder of the ſame Diameter and Height to it, what it will, (and what it is, is ſhewn in another place) call it *y*: Therefore $\frac{1}{4}rddd.\,\frac{1}{4}r$ DDD :: $\frac{1}{4}ryddd\,\frac{1}{4}ry$ DDD. But $\frac{1}{4}ryddd.\,ry$ DDD :: *ddd*. DDD. That is, Spheres are to each other as the Cubes of their Diameters. Q. *E. D.*

2. The ſolidity of a Sphere is equal to the Surface multiplied into $\frac{1}{3}$ of the Radius; as is proved from Cor. 1. of Prop. 4. in the word *Cylinder*.

3. A Sphere is equal to $\frac{2}{3}$ of a Cylinder having the Diameter of its Baſe and its Axis equal to that of the Sphere, *i. e.* a Sphere is $\frac{2}{3}$ of the Cylinder circumſcribed: And the Surface of the Sphere and the curved one of the Cylinder circumſcribing it, is the ſame in Quantity; as is proved in *Cylinder*, *Prop.* 4. and *Corollaries*; as alſo very briefly under the word *Indiviſibles*.

4. The Surface of the Sphere is equal to four times the Area of a great Circle. See *Cylinder*, *Prop.* 4. *Coroll.* Wherefore add to the Curve and Surface of the Cylinder its two circular Baſes, and that will make ſix great Circles of the Sphere: So that the Surface of the Sphere is but $\frac{2}{3}$ of the whole Surface of the Cylinder. See alſo *Cylinder*.

An entire Sphere of Glaſs will unite the Parallel Rays of any Object at the Diſtance of near its Semidiameter behind it. *Molyneux Dioptr.* p. 93.

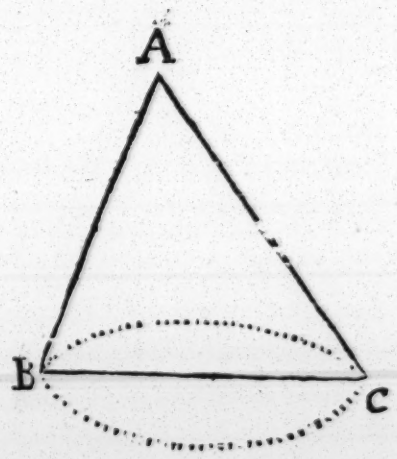
SPHERE *of Activity*, of any Body, is that determinate Space or Extent all round about it, to which, and no farther, the *Effluviums* continually emitted from that Body do reach, and where they operate according to their Nature. Thus we ſee the *Magnetical Effluvia* have certain Bounds and Limits, beyond which they will have no Influence to turn or to attract the Needle: But where-ever a Needle be placed, ſo as that it can be moved by a Load-ſtone, it may be ſaid to be within the *Sphere of Activity* of the Stone.

SPHERICK *Geometry*, or *Projection*, is the Art of Deſcribing on a Plane the Circles of the Sphere, or any Parts of them in their juſt Poſition and Proportion, and of Meaſuring their Arks and Angles when Projected.

As an Introduction to which, you muſt underſtand.

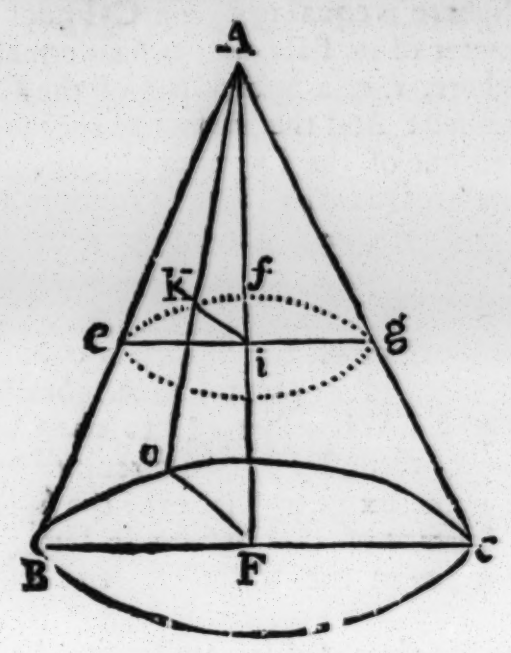
PROPOSITIONS.

I. *If a Cone, as* A B C, *be cut by a Plane, either by the Axis, or through the Vertex, the Section will be a Triangle.*



For the Point A is the Vertex of the Cone, and will be ſo of the Triangle, and B C is a Right Line, becauſe 'tis the Diameter of the Circle of the Baſe, and A B and A C muſt be Right Lines, becauſe the Surface of the Cone will be deſcribed by either of them; wherefore the Section A B C is a Triangle. Q. *E. D.*

II. *If a Cone as* A B C *be cut by a Plane Parallel to its Baſe, the Section e f g h will be a Circle.*



For let F be the Centre of the circular Baſe; then will A F be the Axis; and if the Cone be cut by the Axis, the Section A B C will be a Triangle. Let *e g*, the Diameter of the Section, be drawn, cutting the Axis in *i*, wherefore *e g* the Diameter of the Section will be parallel to B C, the Diameter of the Baſe.

And conſequently,

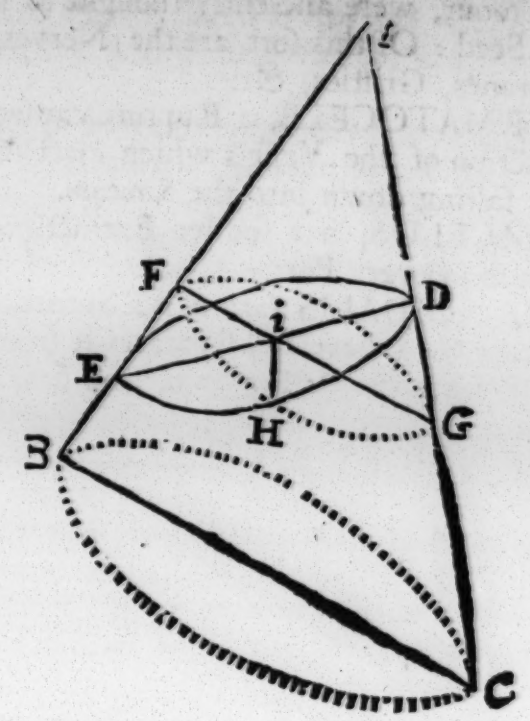
A F : F B : : A *i* : *i e* : and
as A F : F C : : *A i* : *i g*.

Wherefore, by *Inverſe Proportion*, and *ex æquo*, as F C : F B : : *i g* : *i e*.

But B F = F C, therefore *i e* = *i g*.

And the ſame conſequence will ariſe if you take *o* and K, any two other Points in the Baſe and in the Section; for K *i* being parallel to *o* F, and A *o* F being a Triangle. A F : *o* F : : A *i* : K *i*. but as A F : F B : : A *i* : *i e*. Wherefore *ex æquo o* F : F B : : K *i* : *i e*. And therefore K *i*, and *i e* are equal alſo, and conſequently the Section is a Cricle: For *i* is a Point from whence more than two Right Lines drawn to the Curve *e h g f* are equal; wherefore that Curve muſt be a Circle. *Q. E. D.*

III. *If a Scalenous Cone* A B C *be cut by a Plane in a ſubcontrary Poſition to its Baſe, the Section* D E H *will be a Circle.*



1. The Section A B C made through the Axis, is a Triangle.

2. The Triangle A E D is Similar to A B C, tho' placed a contrary way, (by the Suppoſition) (which is called Subcontrary Poſition.)

3. E D being the mutual Interſection of two Planes will be a Right Line, on which take any Point, as (*i*) and through it draw F *i* G parallel to B C, and there let the Cone be cut alſo, then the Plane that cuts it being parallel to the Baſe of the Section, F H G muſt be a Circle, and F G a Diameter.

Now, becauſe both theſe Interſecting Planes are Right to the Plane of the Triangle A B C their common Interſection I H, will alſo be a Right Line, and perpendicular to the Plane of the Triangle, and to the two Lines E D and F G. And then, becauſe the Triangles A B C, A E D and A F G are all Similar, the Angles at G and E muſt be equal; and the Vertical ones at *i* being ſo too, the Triangle F E I muſt be Similar to I D G. Wherefore D I : I G : : F I : I E, therefore U D I E = ∩ F I G; but becauſe F G is the Diameter of a Circle, and I H perpendicular to it, and terminated at the Circumference, 'twill be a middle Proportional between the Segments of the Diameter, and have its Square equal to the Rectangle F I G, (as alſo to its Equal E I D) wherefore the Point H is in the Circumference of a Circle, whoſe Diameter is D E. *Q. E. D.*

DEFINITION I.

A Circle of the Sphere, as to its *Projection* on any Plane, is of four kinds.

1. The *Primitive Circle*, or Limb which bounds the *Projection*, and within which 'tis always made.

2. A *Direct Circle*, whoſe Plane is directly oppoſite to the Eye, or when the Eye is in the Axis of the Plane.

3. A *Right Circle*, whoſe Plane is coincident with the Axis of the Eye; or with the viſual Rays.

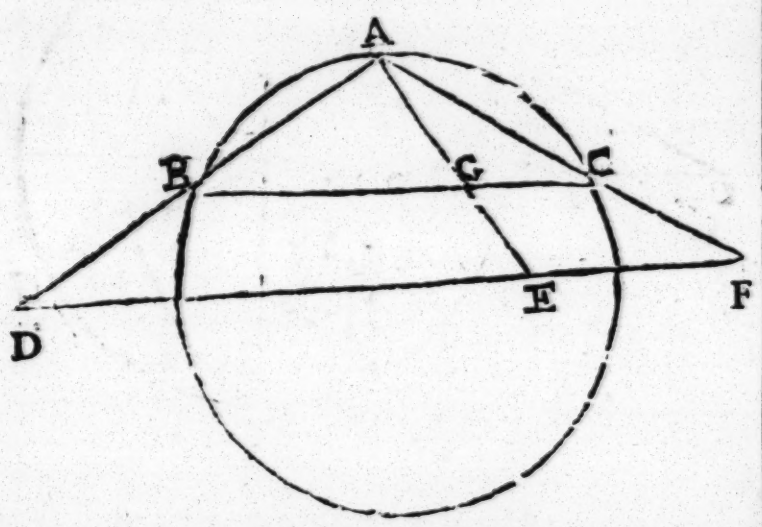
4. An *Oblique Circle*, whoſe Plane lies oblique to the Axis of the Eye, ſo that it makes unequal Angles with it.

To *Project* the *Sphere* truly in *Plano*, is a Part of *Perſpective*; whereof there are ſeveral kinds; but the moſt uſual is what is properly called the *Stereographick*, or *ſolid Projection of the Sphere*; and the *Orthographick*, or the *Analemma*: The latter of which, ſee in *Analemma*.

In the former, the Circles of the Globe are drawn or repreſented on a Plane, which paſſes through its Center, and hath the Eye, ſuppoſed to be in the Pole or 90° diſtant from it; *Projecting* the ſeveral Circles or Arks of Circles on that Plane, or on any one parallel to it.

In this Projection, if a Line paſs through the Eye, or be coincident or parallel to the Axis, it will be repreſented by a Point.

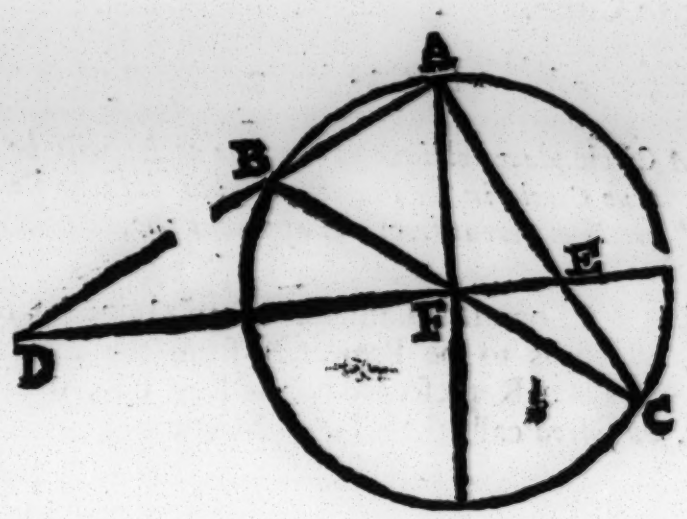
IV. *If a Line be direct to the Eye, it will be projected into a Right Line, whoſe Parts will be in the ſame Proportion to one another, as thoſe of the Primitive Line, of which it is the Repreſentation.*



For, ſince the Line B C (which may be the Diameter of a Parallel Circle) is ſuppoſed to lie Parallel to D F, and is projected into it from the Eye at A, if you draw the Lines A D, A E, and A F, the Triangles A B G and A D E will be Similar; as alſo will A G C and A E F; wherefore as A B: A D:: B C: D F. and as A B: A D:: A G: A E. alſo as A G: A E:: B G: D E:: G C: E F. Wherefore as the whole B C to the whole D F:: the Part B G: to the Part D E:: G C: E F.

PROP. 5.

But if a Line lie oblique to the Eye, the Parts of it in the Projection *will not be in the ſame Proportion, as they are in the Line it ſelf, but thoſe Parts of it which lie neareſt to the Eye, will in the Projection appear longer than thoſe which lie more remote from it.*



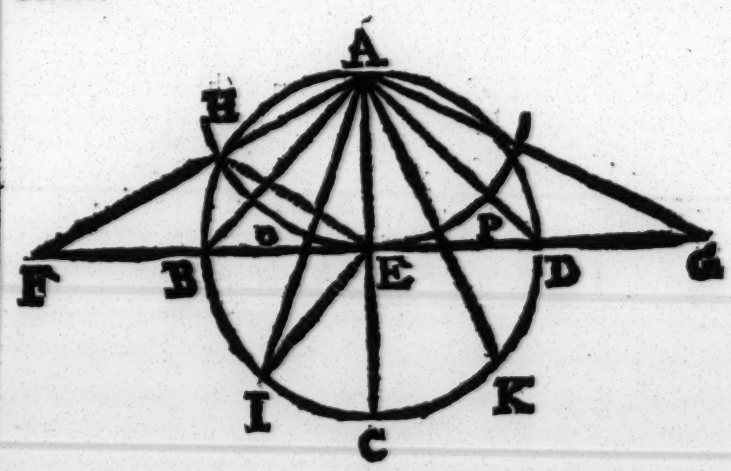
Thus, if the Eye be at A, I lay the Line B C lying oblique to it, will be projected into the Line D E; and its half B F, which lies nearer to the Eye, ſhall be repreſented by the Line D F, which is longer than FE, the Repreſentation of the other half which lies remote from the Eye; as is in a manner ſelf evident.

If a Circle be right to the Eye, or hath its Plane coincident with, or parallel to its Axis, it will be Projected into an infinite right Line.

PROBLEM I.

Prop. 6. *To repreſent on the Plane of the* Projection *a* Right Circle, *and to diſtinguiſh there ſuch Parts and Diviſions as ſhall truly correſpond to thoſe of the* Right Circle *given.*

Let the Circle given be A B C D; and let it be divided into eight equal Parts, as in the Figure; and let the Eye be at A. Draw F G at right Angles to A C, the Axis of the Eye, to repreſent the Plane of the *Projection*; and draw alſo from A, A F, A B, A I, A C, A K, A D, A G, through the ſeveral Diviſions of the given *Circle*; Then will F B, B O, O E, E P, P D, and D G, be the proper Repreſentations of the Parts of the given Circle.



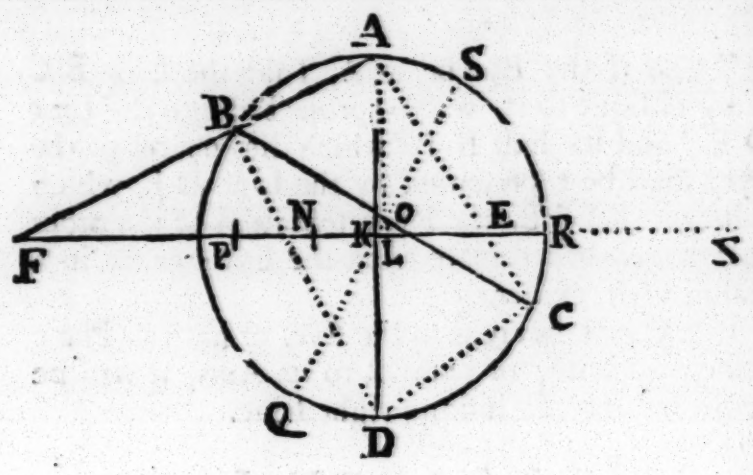
And if on A as a Center with the Diſtance A E, another Circle be deſcribed, 'tis plain, that O E, E B and E F, &c. will be Tangents of the Angles OAE, B A E, F A E, &c. at the Circumference,

ference, which are ſeverally the halves of the Angles I E C, B E C, H E C, &c. at the Centre: Of which latter Angles, the Arks of the Circle given C I, C B, and C H, are the proper meaſures; wherefore the Right Lines O E, B E, F E, &c. are the Tangents of half thoſe Arks; which ſhews us that every Diameter of a great Circle, or its Parts within or without the Primitive, is to be meaſured on the Scale of Half Tangents; and that the Diviſions of it begin at the Centre of the Primitive Circle.

PROP. 7.

A Circle placed oblique to the Eye at A, *will be a true Circle in the Projection; but its true Centre is different from its apparent one.*

Let B C be the Diameter of an oblique Circle, which is to be Projected from the Eye at A, on a Plane Repreſented by the Line F R, which Mr. *Oughtred* calls the *Line of Meaſures.*



1. 'Tis plain the Diameter B C will be repreſented by the Line F E. 'Tis alſo plain, that if right Lines were drawn from A to all the Parts of the oblique Circle, of which B C is the Diameter, they would make an oblique Cone of Rays, as A B C.

2. But I ſay that the Scalenous Cone of Rays A B C is cut by the Plane F R, *ſubcontrarily* to its Baſe, and conſequently the Section will be a Circle (by the 3d) wherefore the giving oblique Circle will always be repreſented by a Circle on the Plane of the *Projection.*

That the Scalenous Cone A B C is cut Subcontrarily to its Baſs, may be thus proved.

Draw A D through the Centre of the Sphere K, and join B D and C D.

The Angle A C D is a right one, (being in a Semicircle) and the Angle A K E is right, by Suppoſition and Conſtruction; and the Angle D A C is common to the two Triangles A K E and A D C; wherefore they are Similar, and conſequently the Angle A D C is equal to the Angle A E K.

But the Angle A D C is equal to the Angle ABC, as being in the ſame Segment; and the Angle ADC was before proved = to the Angle AEK; wherefore the Angle A B C = Angle A E K; and ſince the Angle A B C is common to both, therefore the Angle F muſt be equal to the Angle C, and conſequently the Cone ABC is cut *ſubcontrarily*, and therefore F E is the Diameter of a true Circle, whoſe real Centre will be in P the middle Point; but the apparent Centre of the Circle will be at L, where the Point O (which is the middle Point of B C) is *projected.*

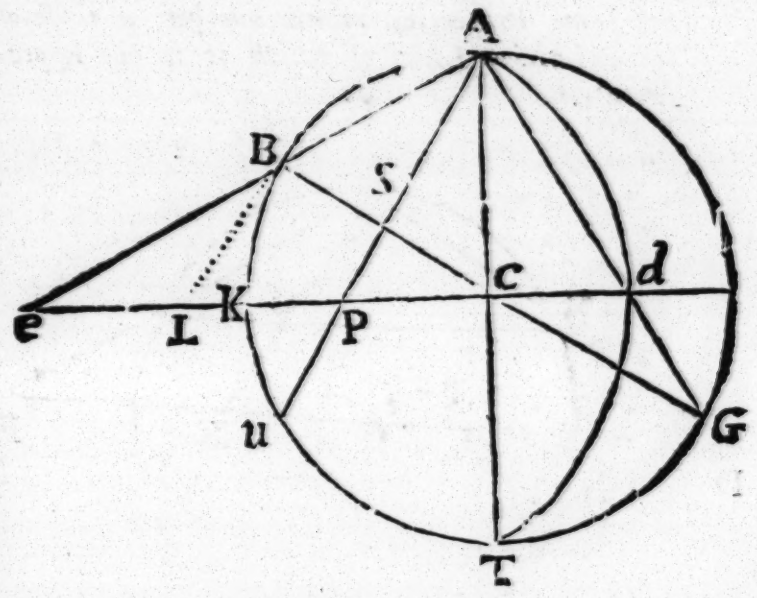
There are ſeveral other ways of finding P the Centre of the *Projected Circle*; but this is as expeditious as any.

To *Project* the Poles of the oblique Circle B C, draw through K the Centre of the Sphere, a right Line as Q S, perpendicular to B C, which therefore will be the Axis of the oblique Circle: Then a Ruler laid from A through Q and S, the Pole of that Axis ſhall *Project* the Polar Points in N and Z.

PROP. VIII.

The Center (P) *of every great Circle* (B G) *which lies oblique to the* Primitive *(in the* Projection*) is ſo far diſtant from* C, *the Centre of the* Primitive, *as is the Tangent of the* Ark of Elevation *of its Plane, above the Plane of the Primitive.*

Make the Ark B *u* = G T, the Complement of the Angle of Elevation, and draw *u* A, which will find the Point P, the Centre of the Projected Circle.



DEMONSTRATION.

Becauſe the Angle B A *u* = Angle C A G as being on equal Arches) and the Angles A B G equal to the Angles A *d e*, (by the Subcontrary Poſition) therefore the Triangles B A S and A C *d* are Similar, and conſequently the Angle B S A (which is equal to the Angle A C *d*) is a right one.

Draw B L perpendicular to B C, wherefore, the Triangles B L C and A P C are Similar; for Angle B L C = Angle P C A, as being both right ones; and the Angle A P C = B L C, becauſe B L and A P, are Parallels; wherefore the Angle B C L = Angle P A C.

But P C is the Tangent of the Angle P A C, and therefore of its equal the Angle B C L, or of the Ark B K, which is equal to the oblique Circle's Elevation above the Plane of *e d*; wherefore P the Centre of the oblique Circle is diſtant from C by the Tangent of its Elevation above the Plane *e d*. *Q. E. D.*

COROL.

Alſo, becauſe the Triangles *e* P A and A C G are Similar, (as having Angle *e* = Angle G, by Subcontrary Poſition) and the Angle B A P = Angle C A G (as being on equal Arks) therefore will

e P : P

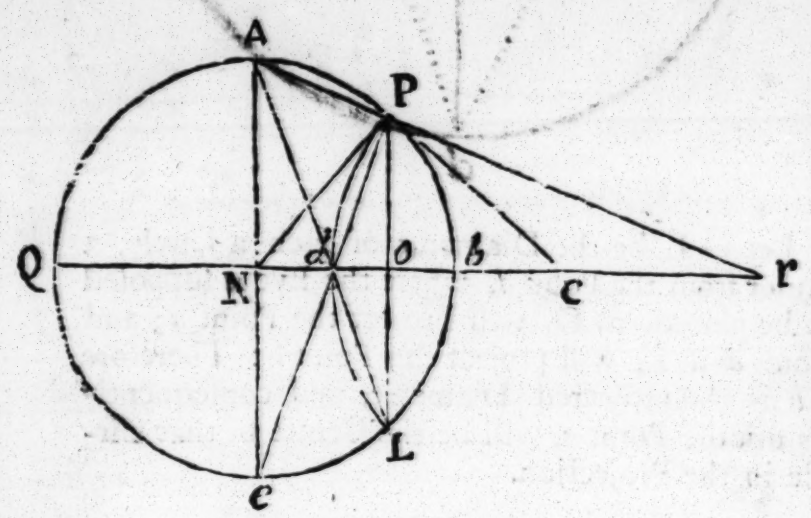
e P : P A :: A C : C G, that is, *e* P = P A. But P A is the Secant of the Angle P A C, or of the Ark B K; wherefore the Secant of the Elevation *e* P ſet from *e*, ſhall find P the Centre as before; P *e*, P A, or P *d* being its Radius.

PROP. IX.

Problem. 2.

To project a Leſſer, or Parallel Circle P L, *whoſe Poles are in the Line of Meaſures* Q, *r*; *repreſenting the Plane of the Projection.*

First, *Project* the Diameter of the Leſſer Circle P L, into that of the *Projection* in the Points *d* and *r*, and draw a Line from P to N; to which erect P C at Right Angles; ſo ſhall C be the true Centre of the projected Circle.



DEMONSTRATION.

The Angle N A P, is equal to the Angle O P *r*; becauſe A N is parallel to P O: Alſo the Angle A *e* P, is equal to the alternate Angle *e* P L: But the Angle *e* A P, added to the Angle *e*, is equal to a Right one. Wherefore the Angle O P *r* + P *r* O, = a Right Angle: That is, The Angle *d* P *r*, is a Right Angle. Wherefore *d r*, is the Diameter of a Circle.

Now N P C, being right by Conſtruction, take from thoſe two right Angles, the common one *d* P C, and the Angle N P *d* (= ∠ *e*) muſt remain equal to the Angle C P *r*, and the Angle *r*, is = to the Angle *e*, becauſe the Triangles N *d e*, and P *d r*, are ſimilar: Wherefore the Triangles P C *r*, and N P *e*, are ſimilar; and conſequently, *e* N : N P :: P C : C *r* but *e* N = N P; therefore P C = C *r*. Therefore both are Radii of a Circle. Q. *E. D.*

And to prove P C = *d* C, *and conſequently that they alſo are Radii.*

I ſay, The Triangle *d* P C, is an Iſoſceles, becauſe the Angle P *d* C, is equal to the Angle *d* P C; which I thus prove.

The Angle P *d o* + ∠ *d* P *o* = Right Angle, = ∠ *d* P C + ∠ C P *r*, but C P *r* = ∠ *e* = *d* P *o*: Therefore taking away the common Angle *d* P *o*, (or its equal C P *r*) *d* P C muſt remain equal to P *d* C: wherefore P C (= C *r*) = C *d*. Wherefore *c* is the true Centre of the projected Circle.

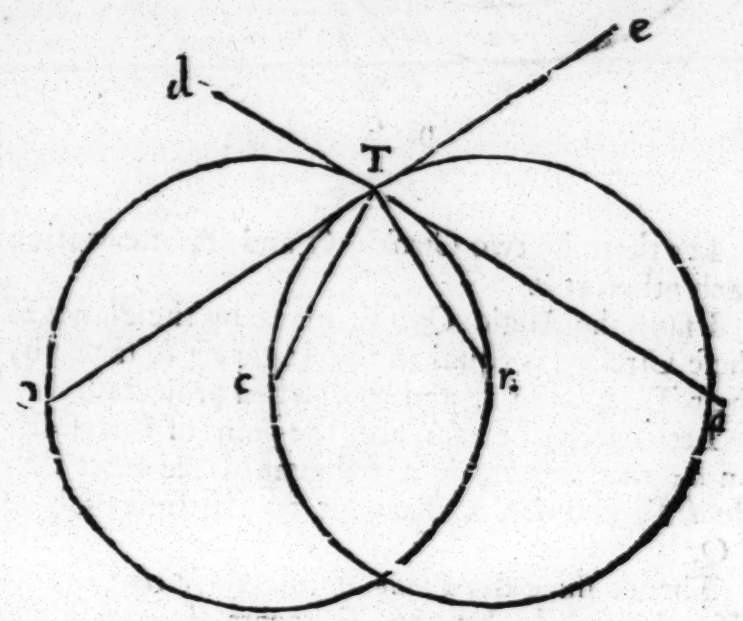
COROLLARY I.

1. Hence 'tis plain, That making N P the Radius of a Circle, whoſe Centre is N, the projected Circles Centre C, is diſtant from N, the Centre of the Primitive, by N C; the Secant of the Ark P *b*, or of that leſſer Circle's Diſtance from its Pole *b*.

2. The Semi-diameter of this projected Circle (C *d*) is equal to (C P) which is the Tangent of the ſaid Ark P *b*, or of that Circle's Diſtance from its Pole.

PROP. X.

The Angle of the Interſection of any two Circles on a Plain, is equal to the Angle made by their Radii drawn from their Centres to the Point of Interſection.



I ſay, The Rectilineal Angle *c* T *n*, made by the two Radii *c* T, and T *n*, is equal to the Curvilineal Angle *o* T *c*, made by the Arks *o* T, and *c* T; which is equal alſo to the Curvilineal Angle *n* T *a*, made by the Arks *n* T, and T *a*.

Draw *o* T, and T *a*, Tangents to the Interſecting Circles.

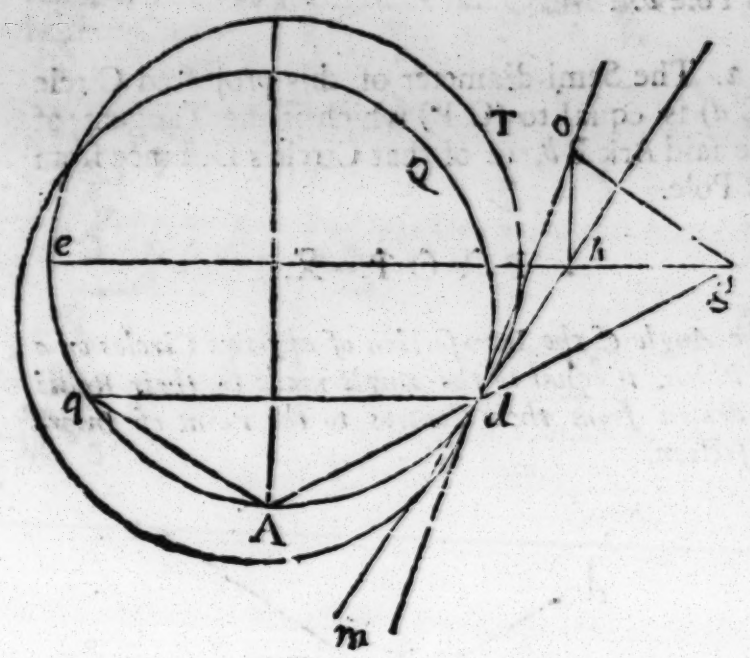
Then the Angles of Contact *o* T *c*, and *n* T *a*, which are made by the Tangents and the Curves, being leſs than any acute ones, and indeed no Quantity; the Tangent *o* T *e*, and *d* T *a* will fall in with the Circles, and make the ſame Angles with one another, as the Arks of thoſe Circles do: Wherefore the Curvilineal Angle *o* T *c*, is equal to the Rectilineal one *o* T *d*; and on the other ſide, the Curvilineal Angle *n* T *a*, is equal to the Rectilineal one *a* T *e*.

Wherefore ſince the Right-lin'd Angles *d* T *c*, and *o* T *n*, are both Right Angles, and equal: If you take away the common Angle *o* T *c*, the Angle *d* T *o*, muſt be equal to the Angle *c* T *n*; and conſequently the Angle *e* T *n*, is equal to the Angle of Interſection *o* T *c*. Q. *E. D.*

PROP. XI.

PROP. XI.

All Angles made by Circles on the Superficies of the Sphere, are equal to those made by their Representatives on the Plane of the Projection.



Let there be two Circles, Q and T, interfecting each other at *d*.

I say, the Angle Q *d* T, made by the Planes of these Circles, is equal to the Angle *o g h*, made by their Tangents *o d*, and *d h*, when projected.

Let the Eye be at A, and the point of Intersection *d*; then draw *d h*, a Tangent to the outer Circle *d* T, and *d o*, a Tangent to the Inner Circle *d* Q.

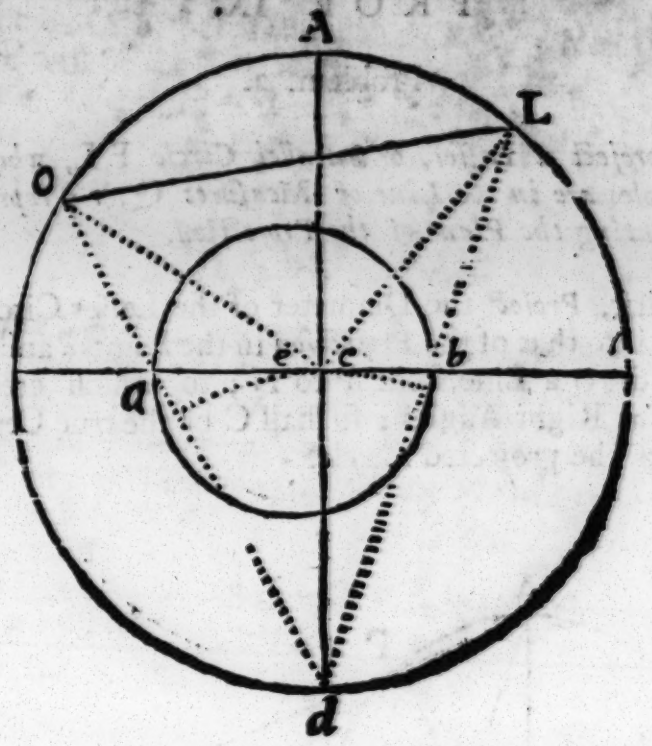
Thence since the *Plane* of the *Projection e g*, as also that made by the Tangents *d h*, and *d o*, (which are in the same Plane) are both perpendicular to the Plane of the Circle *e* T *d* A; their common Intersection *o h*, must be a Right Line, and also perpendicular to *e g*.

Draw all the Lines, as in the Figure; then will the Angle A *d m*, (made by the Tangent and Secant) be equal to the Angle *q*, (in the opposite Segment) which is equal to *q d* A, because the Triangle *q* A *d*, is an *Isosceles*; but the Angle *q d* A = ✓ *h g d*, because *q d* is parallel to *e g*: Therefore the Angle *h g d* = ✓ *A d m* = Vertical Angle *h g d*: Wherefore the Triangle *h d g*, is an *Isosceles*, and consequently *d h* = *h g*.

Hence the Triangle *o d h*, hath two Sides, *o h*, and *h d*, and the Right Angle *o h d*, equal to two Sides, and one Angle, in the Triangle *o h g*: Wherefore all things are equal, and consequently the Angle *o g h*, is equal to the Angle *o d h*, equal to the Curvilineal Angle Q *d* T. *Q. E. D.*

PROP. XII.

To Project a lesser Circle, when its Poles are not in the Plane of the Projection.



Let O L be the Diameter of such a Circle, a Ruler from the Point *d*, where the Eye is supposed to be placed, to O, will Project the Point *a*; and from *d* to L, will project the Point *b*: Therefore *a b* is the projected Diameter, and consequently its middle Point *e*, will be the Centre of that Circle in the Projection.

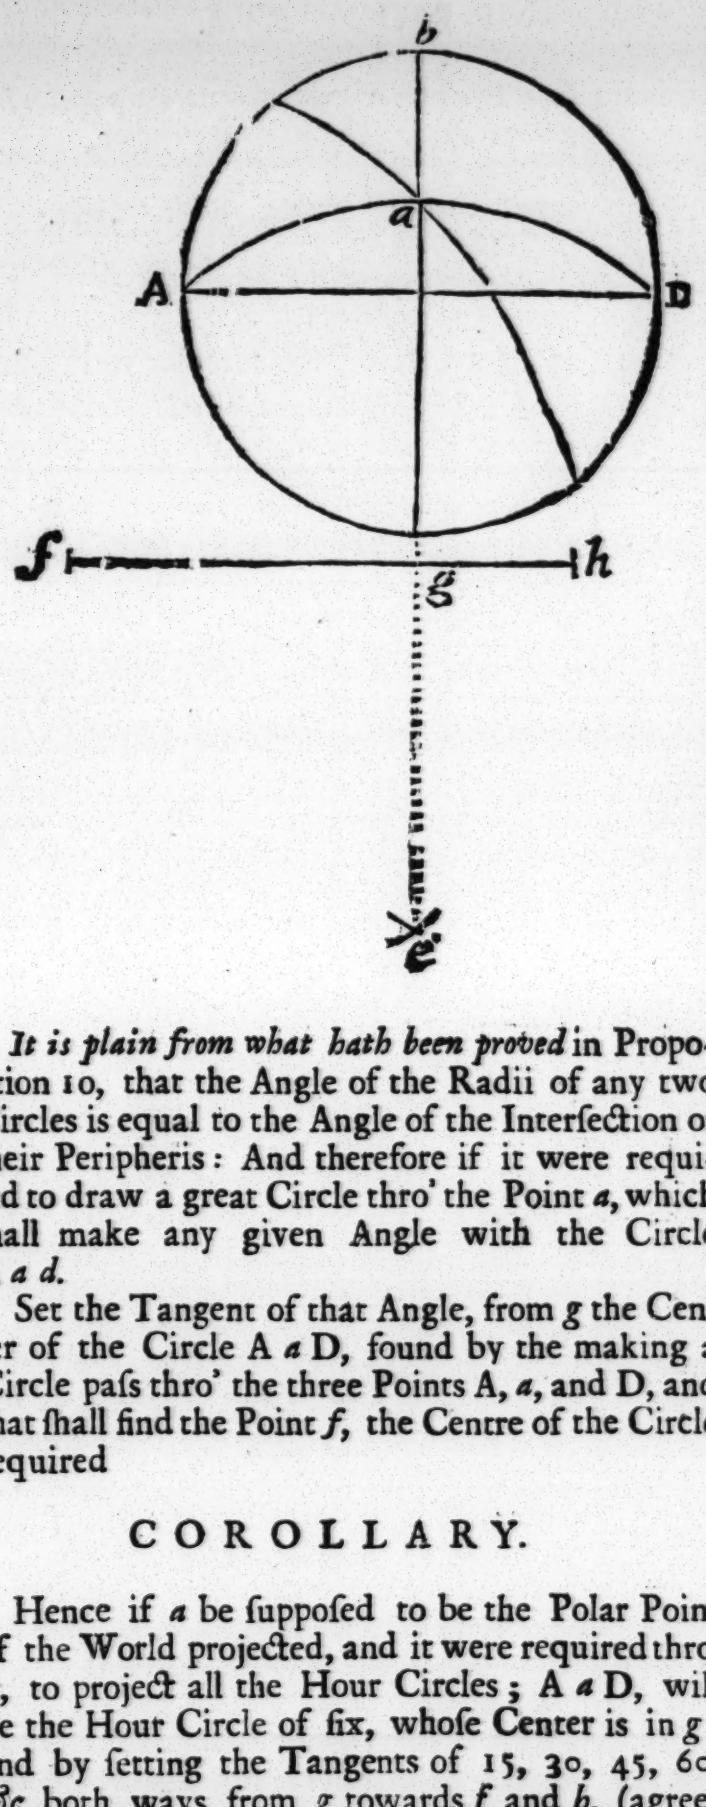
The Demonstration you have universally in *Prop.* 4.

Or, since by (*Prob.* 1.) C *a*, and C *b*, will be the half Tangents of the Arks A O, and A L, (for the Primitive Circle is right to the Eye at *d*:) Therefore to project such a lesser Oblique Circle, you need only take the half Tangents of the Distance of each end of the Diameter of such a lesser Circle from the Point A, opposite to the Eye supposed at *d*; and set them from the Centre C, and they will find the Points *a* and *b*, the ends of the projected Diameter; and *a b* bissected, will give the Centre *e*.

PROP. XIII.

PROP. XIII.

All Great Circles of the Sphere, *passing through any Point* a, *in the Diameter of the Projection, ſhall have their Centres in the Line* g f, *which is perpendicular to the Diameter* g b, *and their Centers will be diſtant from the Point* g, *the Centre of the Circle* A *a* D, *by the Tangent of the Angle of their Interſection with the ſaid Circle* A *a d.*



It is plain from what hath been proved in Propoſition 10, that the Angle of the Radii of any two Circles is equal to the Angle of the Interſection of their Peripheris: And therefore if it were required to draw a great Circle thro' the Point *a*, which ſhall make any given Angle with the Circle A *a d.*

Set the Tangent of that Angle, from *g* the Center of the Circle A *a* D, found by the making a Circle paſs thro' the three Points A, *a*, and D, and that ſhall find the Point *f*, the Centre of the Circle required

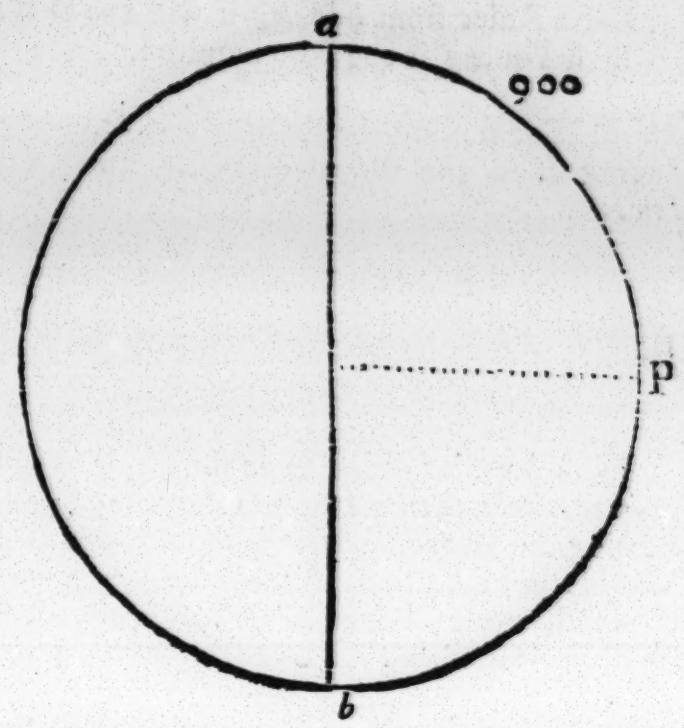
COROLLARY.

Hence if *a* be ſuppoſed to be the Polar Point of the World projected, and it were required thro' it, to project all the Hour Circles; A *a* D, will be the Hour Circle of ſix, whoſe Center is in *g*; and by ſetting the Tangents of 15, 30, 45, 60, *&c.* both ways from *g* towards *f* and *h*, (agreeable to the Radius *a g*) all the other Hour Circles may be deſcribed on the Plane of the *Projection*; from their Centers in the Line *f h.*

Which is the Foundation of all *Dyalling*, or the *True Projection* of the *Hour Circles of the Sphere* on any given Plane.

PROP. XIV.

Problem 3. *To find the Pole of any Great Circle.*



If the *Pole* of the *Primitive Circle* be required 'tis its Centre.

If the *Pole* of a *Right* or *Perpendicular Circle* be ſought, 'tis 90 Degrees diſtant, reckoned upon the Limb from the Points, where this Circle (which is a Diameter) cuts it.

As P is *Pole* of the *Perpendicular Circle a b.*

If the *Pole* of an *Oblique Circle* be deſcribed, which in the Projection will be an Ark of a great Circle.

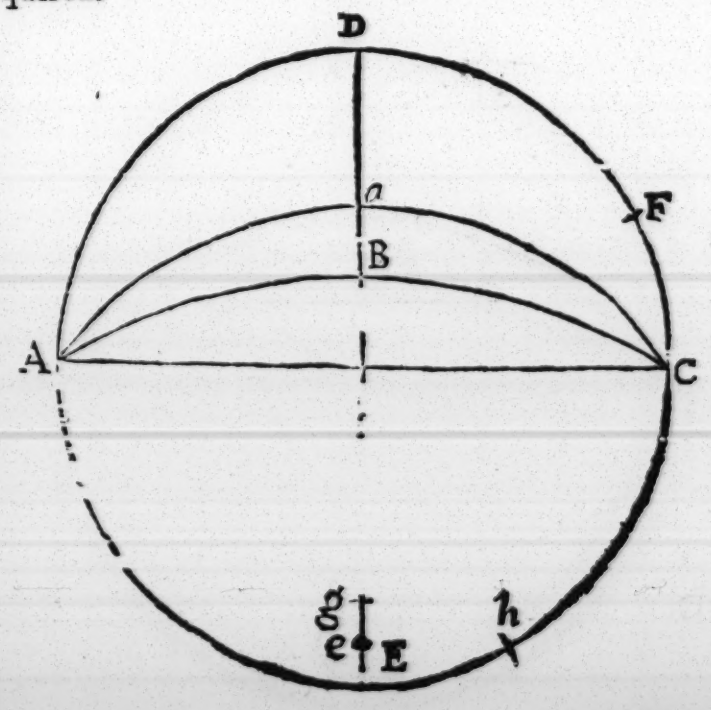
1. Conſider that this Circle muſt cut the Primitive in two Points, that will be diſtant from each other juſt a Diameter, as is the Caſe of the Interſection of all great Circles.

2. The Pole of this Circle muſt be in a Line Perpendicular to its Plane. And,

3. This Circle Poles cannot but lie between the Centre of the Primitive one, and its own.

For Inſtance.

Let the Poles of the *Oblique Circle* A B C, be required.



1. Draw

1. Draw the Diameter A C, and then another as D E, Perpendicular to it.

2. Lay a Ruler from A to B, it will cut the Limb in F; then take the Cord of 90 Degrees, and ſet it from F to *h*.

3. Lay a Ruler from *h* to A, it will cut D E in *g*; which Point *g* is the Pole required.

N. B. The finding the Points *f* and *h*, is called reducing B to the *Primitive Circle*, and to the *Diameter*.

PROP. XV.

Problem 4. *To deſcribe a* Spherical Angle *of any Number of Degrees given.*

1. If the Angular Point be at the Center of the *Primitive Circle*, then 'tis made at any Plane Angle, numbring the Degrees in the Limb, from the Line of Cords: For all Circles paſſing thro' the Centre, and which are at Right Angles with the Limb, muſt be projected into Right Lines.

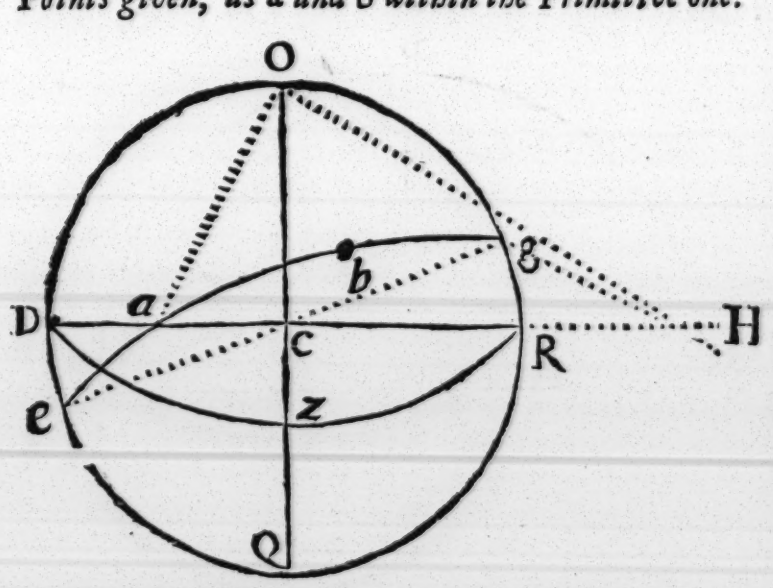
2. If the Angular Point be at the Periphery of the *Primitive Circle*; draw a Diameter as A C; (ſee the laſt Figure:) Then take the ſecant of the Angle given in your compaſſes, (as ſuppoſe 65 Degrees(and ſetting one Foot in A, croſs the Diameter in *e*, or if no Diameter be drawn, placing one Foot in C, and croſſing the former Ark, you will find the ſame Point *e*, which is the Center of the Circle A *a* C, which with the *Primitive* makes an Angle D A *a* of 65 Degrees.

N. B. If the Angle given be obtuſe, take the ſecant of its Supplement to 180 Degrees.

3. If a Point as *a* were aſſigned, thro' which the Ark of the Circle conſtituting the Angle muſt paſs; draw the Diameter A C (as before:) Then take the ſecant of the given Angle, and ſetting one Foot in A or C, ſtrike an Ark as at *e*, and then with the ſecant of the given Angle, ſetting one Foot in *a*, croſs the other Ark in *e*, which will be the Centre of the *Oblique Circle* required.

PROP XVI.

Problem 5. *To draw a great Circle thro' any two Points given, as* a *and* b *within the Primitive one.*



Draw a Diameter thro' that Point which is furtheſt from the Center, as D R, producing it beyond the Limb if there be occaſion; ſet 90 Degrees from D or R to O, and draw O *a*.

Then erect O H, Perpendicularly to *a* O, and produce it till it cuts the Diameter prolonged in H; that Interſection H is a third Point, thro' which as alſo this *a* and *b*, if a Circle be drawn, it will be a great Circle, as *e a b g*.

Which is eaſily proved, by drawing the Line *e* C *g*; for that Line is a Diameter: Becauſe its Parts multiplied into one another, are equal to *a c* + *c* H = O C *q*, by 35. *è* 3, and *Cor.* 8 *è* 6, *Euclid.*

PROP. XVII.

Problem 6. *To draw a great Circle Perpendicular to, or at Right Angles with another.*

Let it paſs thro' it's Poles, and 'tis done.

Of which there will be four Caſes.

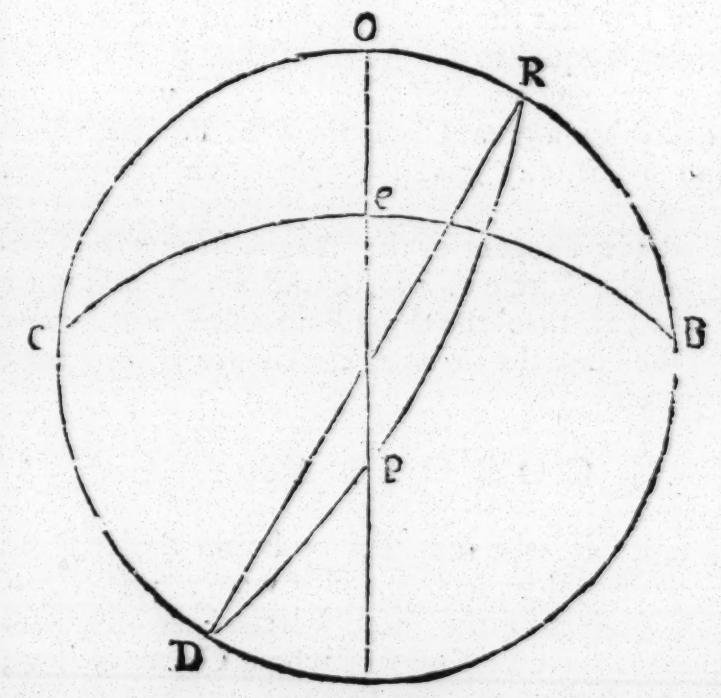
1. To draw a Circle Perpendicular to the Primitive; which is done by any ſtraight Line paſſiin thro' the Centre.

2. To draw a Circle Perpendicular to a Right Circle; is only to draw a Diameter at Right Angles with that Right Circle.

3. To draw an Oblique Circle Perpendicular to a Right one; only draw a Circle which ſhall paſs thro' both the Poles of ſuch a Right Circle, and 'tis done.

Thus the Oblique Circle D ϛ R, is Perpendicular to the Right one O Q, becauſe it paſſes thro' its Poles D and R. See the laſt Figure.

4. To draw one Oblique Circle Perpendicular to another.



Find Firſt P the Pole of the given Oblique Circle C *e* B, and then draw any how the Diameter D R, ſo a Circle drawn thro' the Three Points; D P and R ſhall be the Circle required; for paſſing thro' the Poles of the Oblique Circle C *e* B, it muſt be Perpendicular to it.

PROP. XVIII.

PROP. XVIII.

Problem 7. *To measure the Quantity of the Degrees of any Arch of a great Circle.*

1. If the Arch be part of the Primitive, 'tis measured on the Line of Chords.

2. If the *Arch* be any Part of a Right Circle, the Degrees of it are measured on the *Scale of half Tangents*, supposing the Centre of the Primitive Circle to be in the beginning of the Scale, so that if the Degrees are to be reckoned from the Center, you must account according to the order of the *Scale of half Tangents*.

But if the Degrees are to be accounted from the Periphery of the Primitive, as will often happen, then you must begin to account from the end of the *Scale of half Tangents* calling 80, 10, 70, 20, &c.

3. To measure any Part of an *Oblique Circle*; first find its Pole, and there laying the Ruler, *Reduce the two Extremeties of the Ark required to the Primitive Circle*, and then measure the Distance between those Points on the Chords.

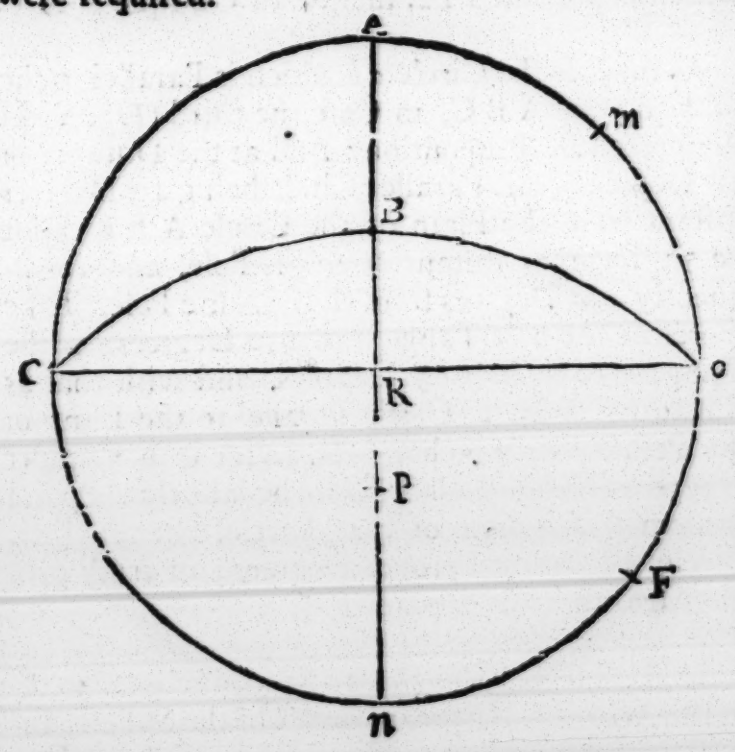
Thus in the last Figure, if the Quantity of *e* B an Arch of the Oblique Circle C *e* B were required; lay a Ruler to P the Pole, and reduce the Points *e* and B, to the Primitive Circle, so shall the Distance between *o* and B, measured on the Chords, be the Quantity of Degrees in the Ark *e B*.

PROP. XIX.

Problem 8. *To measure any* Spherical Angle.

1. If the Angular Point be at the Centre of the Primitive, then the Distance between the Legs taken from the Limb, and measur'd on the Chords, is the Quantity of the Angle.

2. If the Angular Point be at the Periphery of the Primitive Circle, as suppose the Angle A C B were required.



Here the Poles of both Circles being in the same Diameter; find the Pole of the Oblique Circle C B O, which let be B P. Then the Distance R P, measured on the Scale of half Tangents, is the measure of the Angle A C B.

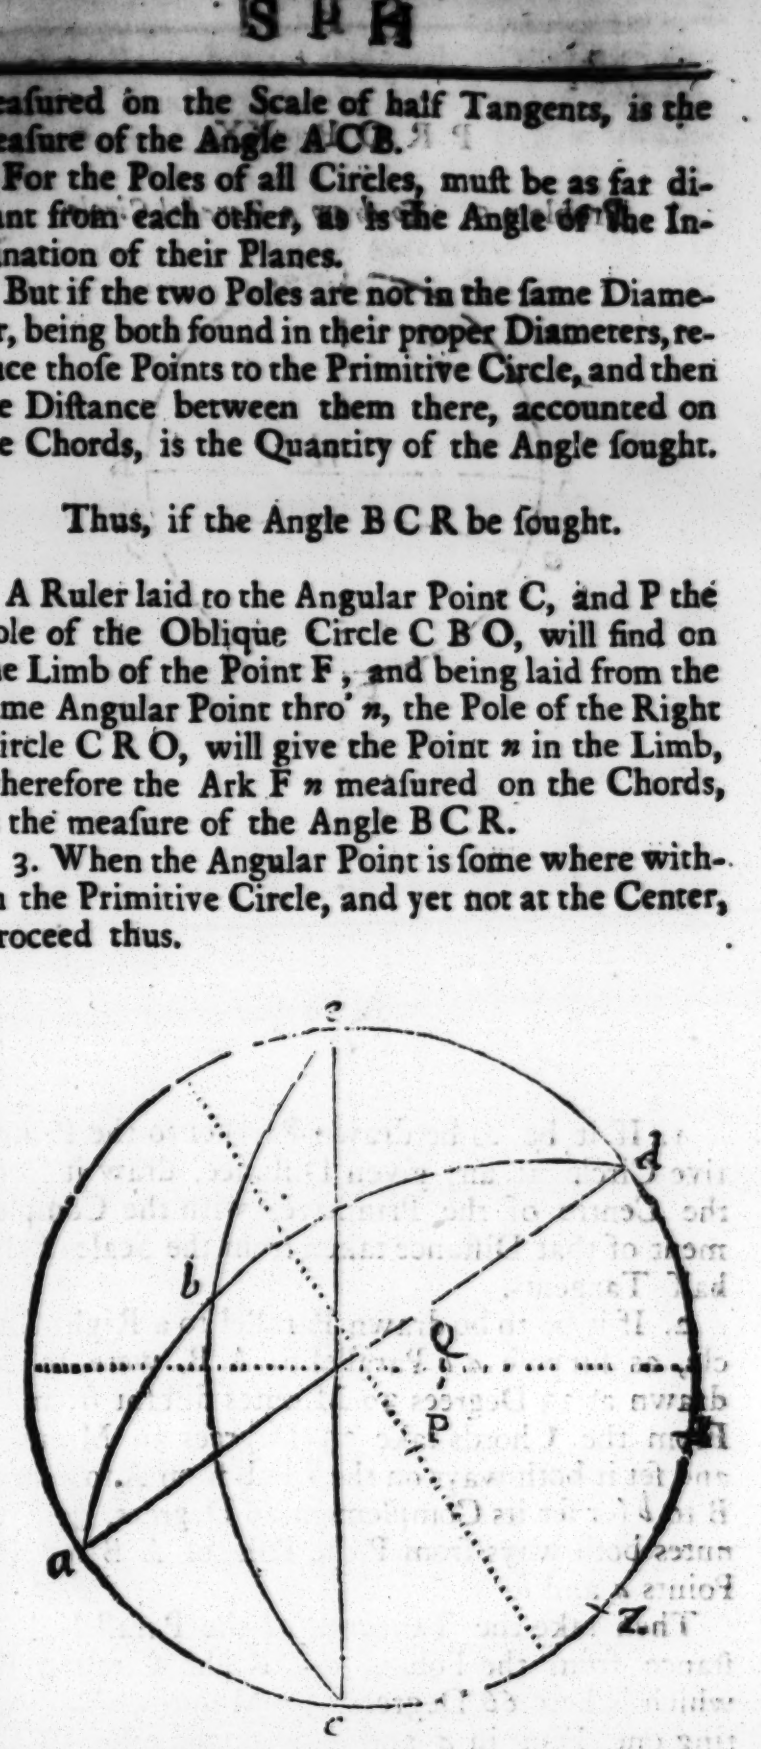
For the Poles of all Circles, must be as far distant from each other, as is the Angle of the Inclination of their Planes.

But if the two Poles are not in the same Diameter, being both found in their proper Diameters, reduce those Points to the Primitive Circle, and then the Distance between them there, accounted on the Chords, is the Quantity of the Angle sought.

Thus, if the Angle B C R be sought.

A Ruler laid to the Angular Point C, and P the Pole of the Oblique Circle C B O, will find on the Limb of the Point F, and being laid from the same Angular Point thro' *n*, the Pole of the Right Circle C R O, will give the Point *n* in the Limb, wherefore the Ark F *n* measured on the Chords, is the measure of the Angle B C R.

3. When the Angular Point is some where within the Primitive Circle, and yet not at the Center, proceed thus.

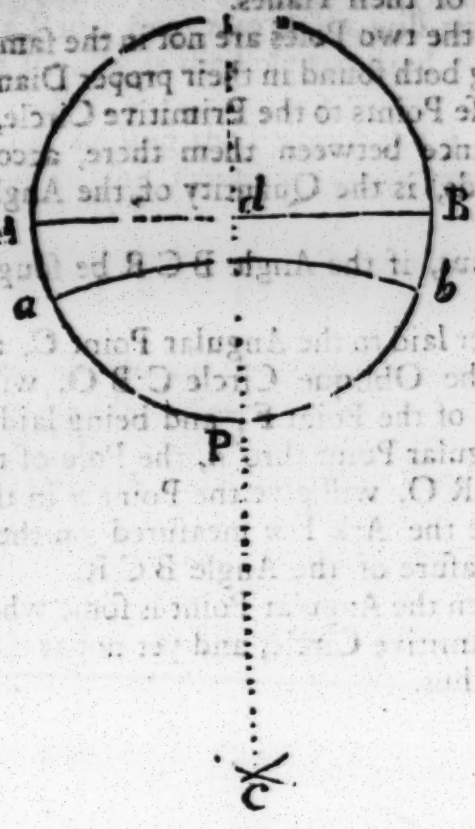


Suppose the Angle *a b c* be sought.

Find the Pole P of the Circle *a b d*, and then the Pole of the Circle *e b* C: After which lay a Ruler to the Angular Point; and the two Poles P and Q. and reduce them to the Primitive Circle, by the Points *x* and *z*; so is the Ark *x z* measured on the Chords, the Measure of the Angle *a b c* required, and C *b d* is its Complement to 180 Degrees.

PROP. XX.

Problem 9. *To draw a Parallel Circle.*

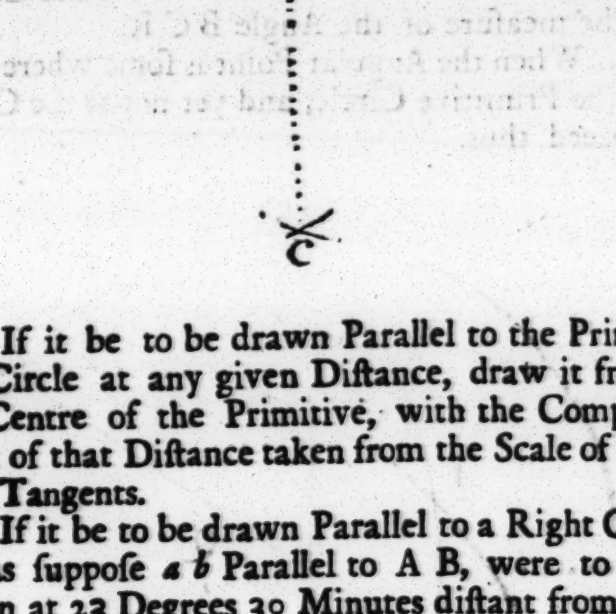


1. If it be to be drawn Parallel to the Primitive Circle at any given Distance, draw it from the Centre of the Primitive, with the Complement of that Distance taken from the Scale of the half Tangents.

2. If it be to be drawn Parallel to a Right Circle, as suppose *a b* Parallel to A B, were to be drawn at 23 Degrees 30 Minutes distant from it; From the Chords take 23 Degrees 30 Minutes, and set it both ways on the Limb from A to *a*, and B to *b* (or set its Complement 66 Degrees, 30 Minutes both ways from P the Pole of A B) to the Points *a* and *b*.

Then take the Tangents of the Parallels Distance from the Pole of the Right Circle A B, which is here 66 Degrees, 30 Minutes, and setting one Foot in *a* and *b*, with the other strike two little Arches to Intersect each other some where above P, which will give C the Centre of the Parallel Circle *a b d* required.

3. If it be to be drawn Parallel to an Oblique Circle, and at the Distance suppose of 40 Degrees.



First, find P the Pole of the Oblique Circle A B C, and then measure on the Scale of half Tangents the Distance g P, which suppose to be 34 Degrees, then add to it 50 Degrees the Complement of the Circles Distance, it will make 84 Degrees, and also subtracting 50 from it, or it from 50, it will make 16 Degrees: Then this Sum and Difference taken from the half Tangents, and set each way from P the Pole of the Oblique Circle, will give the Diameters two extreams *a* and *b*, or the Points of the Intersection of the Parallel; and then the middle Distance between *a* and *b*, is the Centre of the true Parallel Circle P *a b*, which is Parallel to the given Oblique Circle A B C, and at the given Distance of 40 Degrees; or the half Tangent of 84 set from *g*, will give *b*, and the half Tangent of 16 Degrees set also from *g*, will give the Point *a*, the two ends of the Parallel Circles Diameter.

PROP. XXI.

Problem 10. *To measure any Projected Arch of a Parallel Circle.*

Here will be three Varieties.

1. If it be Parallel to the Primitive, then a Ruler laid thro' the Centre and the Division of the Limb, will divide the Parallel into the same Degrees, or determine in the Limb the Quantity of any Ark Parallel to it.

2. If the Circle be Parallel to a Right one, as *a b d* is, in Case the second of the last Proposition, and it were required to measure that Ark *a b*, or to divide it into proper Degrees: Since that Parallel Circle is 66 Degrees, 30 Minutes distant from P, the nearer Pole of the Right Circle A B, and consequently 113 Degrees, 30 Minutes distant from its other Pole, take the half Tangent of 113 Degrees, 30 Minutes, or the Tangent of its half 56 Degrees, 45 Minutes, and with that Distance, and on the Centre of the Primitive, draw a Circle Parallel to the Limb; and divide that half of it, which lies towards the opposite Pole of AB into its Degrees, which is easily done by a Sector: Then a Ruler laid from P, and the equal Divisions of that Semicircle, shall divide *a b*, or measure any Part of it.

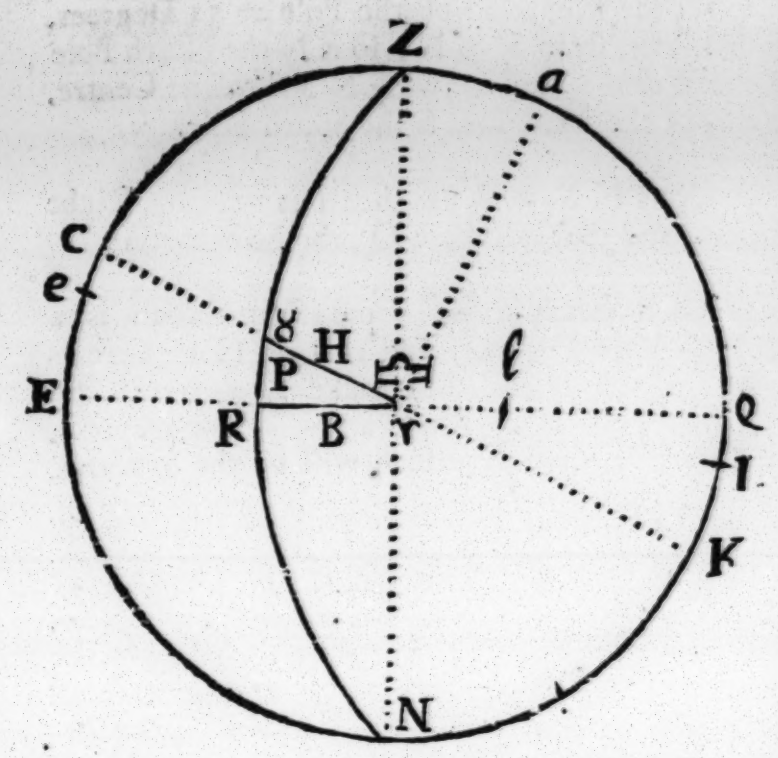
3. To measure or divide the Ark of a Circle which is projected Parallel to an Oblique one.

As suppose the Circle *a b* which is Parallel to the Oblique one A B C, in Case the third (*Fig.* 2.) of the preceding Proposition: And at the Distance of 40 Degrees; this Parallel Circle being 40 Degrees distant from the Plain of the Circle A B C must be 50 Degrees distant from its Pole, and consequently 130 Degrees from the opposite Pole. Take therefore the half Tangent of 130 Degrees, or the Tangent of its half 65 Degrees, and with that as a Radius, draw a Circle Parallel to the Limb of the Primitive; which Circle divide it into proper Degrees: Then shall a Ruler be laid thro' P, and the equal Division of that Circle, cut the little Circle *a b* into its proper Degrees; or truly give the Measure of any part of it.

SPHERICK *Triangle*, is a Space included within the Arks of three great Circles of the Sphere, Intersecting each other on the Surface of the Globe, and every such Triangle is either *Quadrantal*, which hath on one Side (at least a Quadrant and one Angle Right. Or *non Quadrantal*, which hath all its

its Sides more or less than 90 Degrees; and all its Angles bigger or lesser than Right ones.

The Application of Spherick Geometry, *to the Construction and Mensuration of all the Parts of Spherick Triangles.*



In the Right-angled Spherick Triangle ♈ R ♉.

H = 54 Degrees, 15 Minutes, the Sun's Longitude from the next Equinoctial Point, or 24 Degrees, 15 Minutes of ♉.

B = 51 Degrees, 52 Minutes, the Sun's Right Ascension.

P = 18 Degrees, 15 Minutes, the Sun's Declination.

♉ = the Angle of the Sun's Position.

♈, ♎, the Angle of the Sun's greatest Declination.

To make the Triangle.

With 60 Degrees of a Line of Chords, describe the Circle Z C K Q, which is the Limb, or Primitive Circle, and here represents the solsticial Colure. Draw the Diameter E Q, which will be the Equator *g* here represented by a Right Line, because the Eye is at ♈ or ♎, in its Plane. Take 23 Degrees, 30 Minutes from the same Chord, and set it from E to C, so shall C K be the Ecliptick, which will be a Right Line also for the same Reason. Then either the Sun's Place set from ♈ on the Ecliptick, or his Right Ascension set from thence on the Equator, will give the Point ♉, or R, accordingly. Then draw Z N at Right Angles to the Equator, and so you will have three Points Z ♉ N, or Z R N, thro' which the Circle of Declination Z ♉ R N, may be easily drawn.

To measure the Sides and Angles.

The Sides H and B being straight Lines, are measured on the Scale of half Tangents, by *Prop.* 6. of *Spherick Geometry*; and the Side P is measured by finding *l*, the Pole of the Oblique Circle Z ♉ H; and from thence laying a Ruler to the two Extremities of the Side P, (*i. e.*) thro' ♉ and R, in order to reduce them to the Limb in E and *e*; the Ark E *e*, measured on the same Line of Chords, will give the Quantity of the Side ♉ R = 18 Degrees, 15 Minutes.

And this is the general Rule to measure the Arks of all Oblique Circles, Prop. 18. Case 3.

For the Angles.

That at R, is a Right one, and so known.

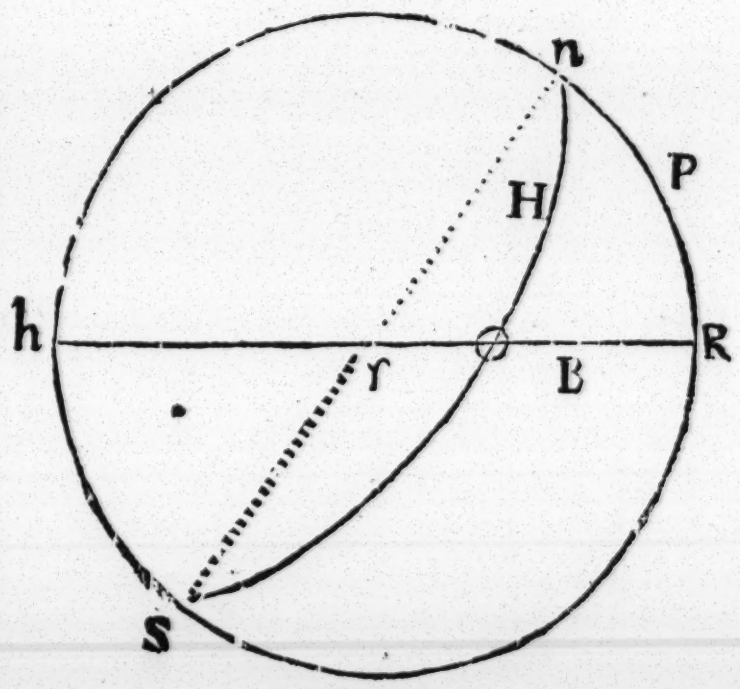
That at ♈, is the Angle of the Sun's greatest Declination = 23 Degrees, 30 Minutes, and its Measure is the Ark E C of the Limb, by *Prop.* 19. *Numb.* 1.

The Angle of the Sun's Position ♉, is measured by laying a Ruler thro' ♉, the Angular Point, and thro' *a* and *l*, the Poles of the Circles C ♈ K, and N ♉ Z, which will find the Points *a* and L in the Limb, and the Ark *a* L = 72 Degrees, is the Measure of the Angle ♉ required, by *Prop.* 19. *Numb.* 3.

You may consider also, the Triangle Z C ♉, where one Angle is at the Periphery of the Primitive Circle, and this will help to shew the Varieties of Right-angled *Spherick Triangles.*

Here the Angle C is a Right one, being made by an Hour Circle, or the Meridians cutting the Equator; for here C K may represent the Equator, and let Z be the Zeinth of any Place, then will C ♉ be the Hour from Noon; C Z will be the Latitude of the Place, and ♉ Z, the Complement of the Sun's Height, being now supposed to be in the Equator. The Angle Z will be the Sun's Azimuth from the South, the Oblique Circle Z ♉ R N, being a Vertical one; and the Angle ♉, will be the Angle of the Sun's Position. Which Triangle C ♉ Z may be formed, and all its Sides and Angles measured by the Propositions and Rules above delivered.

Again,



In the Right-angled Spherick Triangle N ⊙ R.

R = Right Angle made between the Horizon H R and the Meridian *n* R.

B = Complement of the ⊙'s Amplitude = 50 Degrees 8 Minutes.

H = to the Sun's Distance from the Pole above the Horizon *h* R; or the Complement of his Declination.

P = to the Elevation of the Pole, or Latitude of the Place.

⊙ = the Angle of the Sun's Poſition.

⊙ *n* R = the Hour from Midnight.

To deſcribe this Triangle.

Firſt, Draw the Circle *h n* R, repreſenting the Meridian, and then the Diameter *h* R, for the Horizon of *London*: Set the Poles height 51 Degrees, 30 Minutes from R to *n* the North Pole, and draw the Obſcure Axis, *n* ♈ S. Then if the Sun's Amplitude be given, ſet that, Suppoſe 39 Degrees 52 Minutes, from ♈ to ⊙, which will limit the Baſe B, and give a Point thro' which and the two other given Points *n* and S, a great Circle may be drawn, which will form the Triangle. But if inſtead of that, the Angle ⊙ *n* R, or the Time from Midnight had been given, then you muſt turn that Time into Degrees, and by *Prop.* 15. *Caſe* 2. make a Spherick Angle with the Limb, of that Number of Degrees, at the Point *n*, and that will determine the Point ⊙.

The Angle ⊙ *n* R, is meaſured by *Prop.* 19. *Caſe* 2.

Thus alſo in Oblique angled Spherick Triangles, *all the Sides and Angles may (by this Method) be meaſured, and the Triangles conſtructed.*

In the following Obtuſe-angled Spherick Triangle ⊙ Z N.

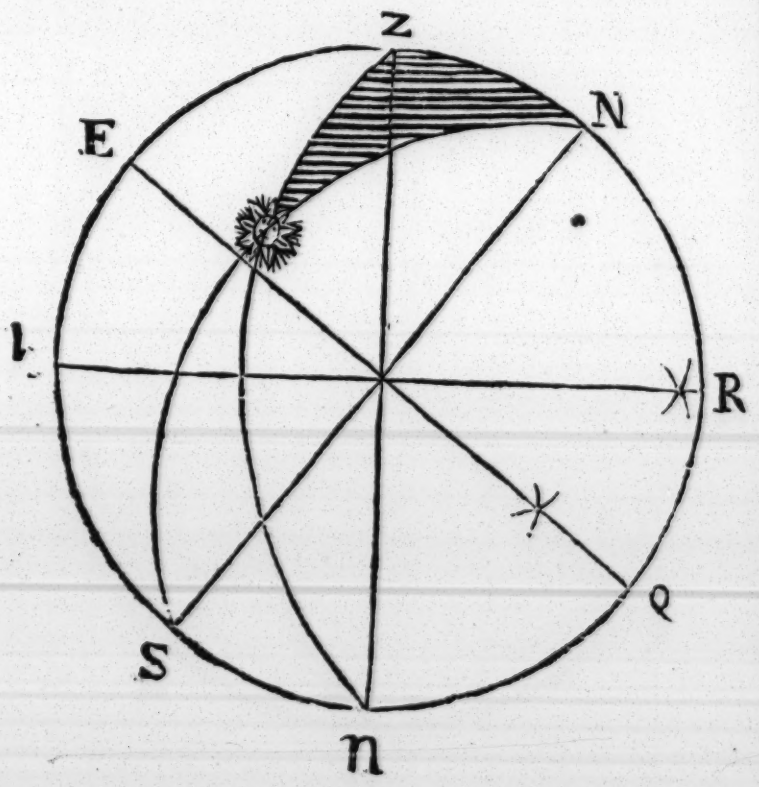
Z N = to the Complement of the Poles Elevation, = 38 Degrees, 30 Minutes.

⊙ N = the Complement of the Sun's Declination from the Equator E Q.

⊙ Z = 46 Degrees, 49 Minutes = the Complement of the Sun's Altitude above the Horizon *h* R.

⊙ N Z = 30 Degrees, is the Hour from Noon or Ten a Clock in the Morning.

⊙ Z N = 137 Degrees, 47 Minutes is the Sun's Azimuth from Z R *n*, the North part of the Meridian.



To Conſtruct the Triangle.

1. With 60 Degrees of a Line of Chords, draw the Primitive Circle Z R *n h*; which croſs in the Centre with two Diameters, *h* R repreſenting the Horizon of *London*, and Z N, the Prime Vertical Circle.

2. Set the Elevation of the Pole = 51 Degrees, 30 Minutes, from R to N; ſo is N the North Pole of the World: And drawing N S thro' the Centre, it will be the Axis, and S the South Pole.

3. Croſs N S with another Diameter at Right Angles, and that will be E Q, the Equinoctial.

4. Then becauſe the Time from Noon is 2 Hours, or 30 Degrees, and that all Hour Circles paſs thro' the Poles, and make Angles with the Meridian; make an Angle at N, of 30 Degrees, by *Prop.* 15. *Caſe* 2. which will be the Spherick Angle E N ⊙.

5. And ſince the Azimuth is 137 Degrees 47 Minutes, from the North, ſubduct that out of 180, and there will remain 42 Degrees, 13 Minutes, the Sun's Azimuth from the South; and becauſe all Azimuths, or Vertical Circles, paſs thro' Z the Zenith; make an Angle with the Primitive at Z, of 42 Degrees, 13 Minutes, (by *Prop.* 19. *Caſe* 2.) and ſo will your Triangle be Stereographically projected, and the Reaſon of the Thing made plain and eaſie.

I don't give Inſtances of the *Analemma*, or of the ſeveral Stereographick Projections on the Plains of the Horizon, Equator, Meridian, *&c.* becauſe you will find them in their proper Places under thoſe Words.

SPHERICAL *Numbers.* See *Circular Numbers.*

SPHEROID, is a ſolid Figure made by the Rotation of a *Semi-Ellipſis* about its Axis; and is always equal to ⅔ of its circumſcribing Cylinder, *Archim. de Conoid. & Spheroid.* 18. & 25. 2.

SPHINCTER, is a Muſcle that contracts the Gullet, *Anus*, Bladder, *&c.*

SPHINCTER *Ani*, is a large, thick, fleſhy Muſcle encompaſſing the *Anus*: Its Figure and Series of Fibres externally, immediately under the Skin, incline to an oblong Oval: It is connected forward, to the *Accelerator Urinæ*; backwards, to the *Os Coccygis*; its Fibres are Circular for near two Inches in breadth; it is much larger in Men than in other Animals, in whom by reaſon of the erect Poſition of the Body, there is greater Force required to retain the *Fæces*, which is the Office of this Muſcle.

SPHINCTER *Gulæ.* See *Oeſophagus Gulæ.*

SPHINCTER *Vaginæ*, is a Muſcle lying immediately under the *Clitoris*, encompaſſing the *Vagina* with Circular Fibres 3 Fingers in Breadth: In ſome Subjects (ſaith Mr. *Cowper*) it ſcarce appeareth fleſhy. When this Muſcle acts, it not only ſtraitens the *Vagina*, but thereby it alſo hinders the Blood in its return from the *Plexus retiformis* of the *Pudendum*, by compreſſing ſome of its Veins that paſs underneath, by which means the *Labia* becomes diſtended, and the *Vagina* contracted.

SPHINCTER *Veſicæ*, is a Muſcle ſeated in the upper part of the Neck of the Bladder, immediately

ately above the *Glandulæ Proſtatæ*; whoſe Contraction hinders the Involuntary Egreſs of the Urine.

SPHYGMICA, is that Part of Phyſick which treats of Pulſes. *Blanchard.*

SPIKES, or as the Seamen call them *Speeks*, are large long Iron Nails with flat Heads; they are of divers Lengths, ſome a Foot or two long, and ſome are jagged, ſo that they cannot be drawn out again. They are uſed to faſten the Planks and Timbers. They call alſo a kind of ſmall *Fidd*, which ſerves them to open and ſplice ſmall Ropes, a *Marling Spike.*

SPIKING *up the Ordnance*, is faſtning a *Coin*, or *Quoin* with Spikes to the Deck, cloſe to the Breech of the Carriages of the Great Guns, that they may keep cloſe and firm to the Ship-ſides and not break looſe when the Ship *Rolls*, and by that means endanger the breaking out of the *Butt-head* of a Plank.

SPINA *Dorſi*, are the hinder Prominences of the *Vertebræ.*

SPINA *Ventoſa*, is an Ulceration, in which the Bones are eaten by a malignant Humour without any Pain of the *Perioſteum*, or Membrane that covers the Bone: After that, a Swelling being riſen without any Pain, the Part affected is quite eaten out with the Ulcer, from whence frequently follows a Neceſſity of Amputation.

SPINALIS *Colli*, is a Muſcle ſo called, becauſe it accompanies the Spines of the Neck; it ariſes from the five ſuperior Tranſverſe Proceſſes of the *Vertebræ* of the *Thorax*, and inferior of the Neck, and in its Aſcent becomes more fleſhy, and is ſo inſerted largely into the inferior Part of the *Vertebræ* of the Neck laterally, *&c.* Theſe draw the *Vertebræ* of the Neck directly backwards.

SPINALIS *Medulla.* See *Medulla Spinalis.*

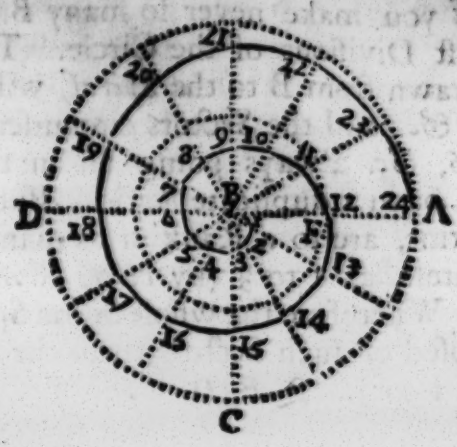
SPINDLE, is the ſmalleſt Part of a Ship's Capſtan which is betwixt the two Decks. The *Spindle* of the *Jeer Capſtan* hath *Whelps* to heave the *Viol.* Alſo the Axis of the Wheel of a Watch or Clock is called the *Spindle*, and its Ends the *Pevets.*

SPINE, the Back-Bone, or long jointed Chine-Bone that goes down the Back.

SPINSTER, a Term in Law, being an Addition uſually given to all unmarried Women, from the Viſcount's Daughter downward.

SPIRAL-*Line*, in Geometry, is according to *Archimedes* thus generated.

If a Right Line as A B, having one end fix'd at B, be equally moved round, ſo as with the other end B, to deſcribe the Periphery of a Circle; and at the ſame time a Point be conceived to move forward equally from B towards A in the right Line B A, ſo as that the Point deſcribes that Line, while the Line generates the Circle. Then will the Point with its two Motions deſcribe the curve Line B, 1, 2, 3, 4, 5, *&c.*



which is called an *Helix* or Spiral Line; and the plane Space contained between the Spiral Line and the Right Line B A, is called the *Spiral Space.*

If alſo you conceive the Point B to move twice as ſlow as the Line A B, ſo as that it ſhall get but half way along B A when that Line ſhall have formed the Circle; and if then you imagine a new Revolution to be made of the Line carrying the Point, ſo that they ſhall end their Motion at laſt together; there will be formed a *Double Spiral Line*, and two Spiral Spaces as you ſee in the Figure. From the Geneſis of which may eaſily be drawn theſe Coroliaries.

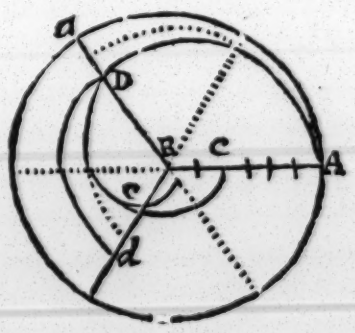
1. That the Lines B 12, B 11, B 10, *&c.* making equal Angles with the firſt and ſecond Spiral, (as alſo B 12, B 10, B 8, *&c.*) are in Arithmetical Proportion.

2. The Lines B 7, B 10, *&c.* drawn any how to the firſt Spiral, are to one another as the Arks of the Circle intercepted betwixt BA and thoſe Lines. Becauſe whatever Parts of the Circumference the Point A deſcribes, as ſuppoſe 7, the Point B will alſo have run over 7 Parts of the Line A B.

3. Any Lines drawn from B to the ſecond Spiral, as B 18, B 22, *&c.* are to each other, as the aforeſaid Arks, together with the whole Periphery added on both ſides: For at the ſame time that the Point A runs over 12, or the whole Periphery, and perhaps 7 Parts more, ſhall that Point B have run over 12 and 7 Parts of the Line A B, which is now ſuppoſed to be divided into 24 equal Parts.

PROPOSITIONS.

I. *The firſt Spiral Space* A D c B *is to the firſt Circle* : : *as* 1 *to* 3.



Divide the Circumference of the Circle into 3 = Parts by Lines drawn from the Center B, beginning from the firſt Line B A; then will (by *Cor.* 1.) B *c* be = 1, B D = 2, and B A = 3; and the Sectors circumſcribed about the Spiral will be as the Squares of the *Radii*, *viz.* C B *c* = 1, D B *d* = 4,

D B d = 4, and A B a = 9; and ſo it will be always, if you make never ſo many Biſſections of the 3 firſt Diviſions of the Circle. That is, the Lines drawn from B to the *Spiral*, will be as 1,2, 3,4,5,6, *&c.* and the Sectors circumſcribed, as 1, 4, 25, 36, *&c.* always going on in the order of Squares, or in a duplicate Ratio. But a Rank of ſuch Terms, are to a Rank of as many, equal to the greateſt, as 1 to 3 (by *N.* 7. of *Arithm. Progreſſion.*) Wherefore the whole Spiral Space (which is compoſed of ſuch Sectors) is to the whole Circle : : as 1 to 3. *Q. E. D.*

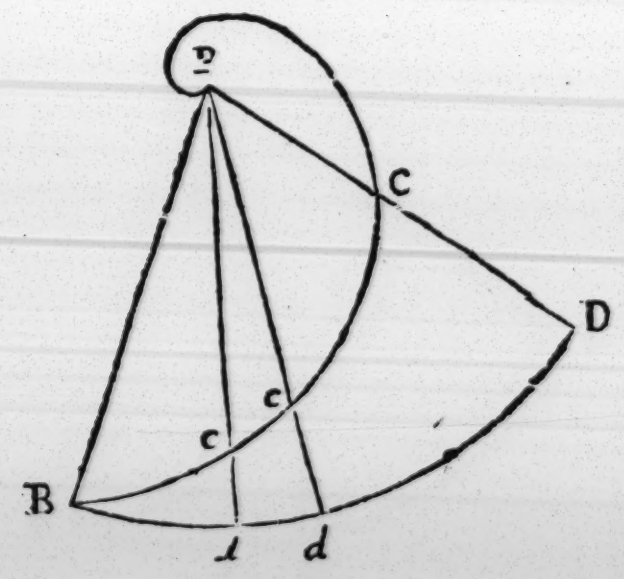
(Or,)

If another Circle be drawn with a Radius double to the former, its Area will be (as the Square of its Diameter) 4 times as great as that of the former. Therefore the firſt Circle to the ſecond will be as 1 to 4, or as 3 to 12. And ſince the Spiral Space is to the firſt Circle as 1 to 3, that Space to the ſecond Circle will be as 1 to 12; and to a 3d Circle ſo deſcribed, as 1 to 27; to a 4th, as 1 to 48, *&c.*

II. *The firſt Spiral Line is equal to half the Periphery of the firſt Circle; for the Radii of the Sectors, and conſequently the Arches are in ſimple Arithmetick Progreſſion, while the Periphery of the Circle contains as many Arches equal to the greateſt; wherefore the Periphery to all thoſe Arches, is to the Spiral-line as* 2 *to* 1 (*by* N. 6. *of* Arithm. Progreſſion.)

I thought one Propoſition, with a Corollary or two, enough on this Subject, to give the Reader a Specimen of the *Geneſis*, *Nature* and *Properties*, and way of Demonſtration uſed about *Spiral Lines*: Thoſe that will ſee more, may conſult *Archimedes*, Dr. *Wallis*'s *Arithmetick of Infinites*, or *Sturmius*'s *Matth. Enucleat.* lib. 2. Chap. 4.

Proportional Spirals, are ſuch Spiral Lines as the Rhumb Lines on the Terreſtial Globe, which becauſe they make equal Angles with every Meridian, muſt alſo (as we ſhew in *Prop.* 7. of Spherick Geometry, which ſee) make equal Angles with the Meridians in the Stereographick Projection on the Plane of the Equator; and therefore will be, as the Learned Capt. *Halley* obſerves, *Proportional Spirals* about the Polar Point. From whence that excellent Mathematician demonſtrates, That the Meridian Line is a Scale of Log. Tangents of the $\frac{1}{2}$ Meridian-complements of the Latitudes. See *Meridian Line.*



In Proportional Spirals; the Angles BPD, BP*d*, *&c.* or the Arches B D, B *d*, *&c.* are *Exponents* of the *Ratio's* of B P to P C. For if the Arch B D be divided into innumerable equal Parts, right Lines drawn from them to the Center P, ſhall divide the Curve B *c c* C into an Infinity of Proportionals; and all the Lines P *c*, P *c*, *&c.* ſhall be an Infinity of Proportionals between P B and B C, whoſe Number is equal to all the Points *d d*, in the Arch B D: But an infinite Number of Proportionals between the two Terms of the Ratio, is to that infinite Number of equal Parts between any other two Terms : : as the Logarithm of the one Ratio is to the Logarithm of the other; therefore, as B D to B *d*, or as the Angle B P D to the Angle B B *c*; ſo is the Logarithm of the Ratio of P B to P C, to the Logarithm of the Ratio of P B to P *c*. *Q. E. D.*

SPIRIT, which the Chymiſts call Mercury, is one of the 5 Principles ſeparable from a mixt, by Fire; 'tis ſubtil, light, penetrating, and active, and hath its Particles in a very quick Motion. This is propably that which cauſes the Growth and Encreaſe of all Bodies; but where it abounds moſt, thoſe Bodies do ſooneſt corrupt, becauſe of its rapid Motion. This appears in Vegetable and Animal Bodies, which yield the greateſt Quantity of Spirit; whereas moſt Minerals, as having but a ſmall Proportion of Spirit in them, are almoſt incorruptible.

This Principle is never drawn pure, any more than the others; and when it comes over involved in a little Oil, 'tis called an Ardent Spirit, ſuch as Spirit of Wine, which therefore ſhould rather be called an exalted Oil; and when it hath in it a little Volatile Salt diſſolved, 'tis called a *Volatile Spirit*, as the Spirit of Hartſhorn, Urine, *&c.* If it be impregnated with Acid Salts, its Volatility is then check'd, and 'tis called an *Acid* or *Fixt Spirit*, as Spirit of Salt, Vitriol, Allum, *&c.* which truly are only an Acid Salt diſſolved and put into Fuſion by a ſtrong Fire.

SPIRIT *of Niter* is thus drawn: Mix one part of Salt-peter with three times as much Potters-earth dried; put this Mixture into a large earthen Retort, and ſet it in a cloſe Reverberatory Fire; diſtil off the Phlegm with a ſmall Fire in about 4 or 5 Hours, and when no more Drops will come, lute on a very large Receiver, and encreaſe the Fire gradually to the 2d Degree, ſome more volatile Spirits will come out in white Clouds: Keep the Fire thus about two Hours, and then encreaſe it to the greateſt Violence you can give it, the Vapours will come red; continue the Fire till no more red Fumes come; in 14 Hours the Operation will be over. If you uſed 2 Pounds of Nitre, you will draw 1 Pound 14 Ounces of Phlegm and Spirit together. The Veſſels had need be large, and $\frac{1}{3}$ of the Retort left empty, elſe there will be danger of breaking all to pieces, the Spirits come forth with that Violence.

This Spirit is the beſt *Aqua-fortis*, and is chiefly uſed for Solution of Metals. But when dulcified, is a good Medicine inwardly in many Caſes.

SPIRIT *of Salt*, is made by drying and powdering the Salt, and then mixing of it with thrice its Weight of Potters-earth powdred: A Paſte is made of theſe two with a little Rain-water, and then the Paſte is made into little Balls or Pellets about as big as Nuts. A large earthen Retort or glaſs one coated, hath one third of it filled with theſe,

theſe, and being placed in a Reverberatory Fire, hath a large Receiver fitted to it. The Junctures muſt not be luted at firſt, but a very moderate Fire uſed for a time, to diſtil out all the Water: But as ſoon as you ſee ſome little white Clouds appear, throw out the incipid Liquor in the Receiver, and Lute it well to the Retort: Then encreaſe the Fire by degrees to the higheſt, and ſo let it continue 12 or 15 Hours, or till no more Clouds appear; when the Operation is ended, you will find the Spirit of Salt in the Receiver. Some rectifie this Spirit afterwards in a Cucurbite, by drawing off ſome of the weaker Spirit in a gentle Sand-heat, and then what remains is very ſtrong of a yellow Colour, and very weighty.

If equal Parts of this acid Spirit and Spirit of Wine are mixed together, and digeſted for about 3 or 4 days, 'tis called *Spirit of Salt dulcified.*

Spirit of Salt will diſſolve Leaf Gold, and will precipitate what *Aqua Fortis* hath diſſolved. Which ſhews how very differently formed and figured the Point and Pores of *Acid Menſtruums* may be, and frequently are.

SPIRIT of *Sulphur*, commonly call'd Oil of Sulphur, *per Campanam*, (from the Veſſels form being like a Glaſs Bell, in which it is uſually drawn) is only the acid Part of Sulphur turned into a Liquor by the means of *Fire*. *Lemery* uſes a great Glaſs Tunnel for this Operation; which ſeems to be the beſt way of drawing this Spirit, *vid.* p. 445. *laſt Edition*. Some make uſe of Salt-petre in the drawing of Spirit of Sulphur, but that is not a good Practice, becauſe the Nitre alters ſomething of the mixture of the Spirit.

SPIRITS *in an Animal Body*, were reckoned of three ſorts; the Animal Spirits in the Brain, the Vital in the Heart, the Natural in the Liver: But late Authors diſtinguiſh 'em only into two kinds; the Animal in the Brain, the Vital and Natural (which are accounted the ſame) in the maſs of Blood. The Animal Spirits are a very thin Liquor, which diſtilling from the Blood in the outward or Cortical Subſtance of the Brain, are by the proper Ferment of the Brain exalted into Spirit, and thence through the Medullar Subſtance of the Brain, the *Corpus Calloſum*, and *Medulla Oblongata*, are deriv'd into the Nerves and Spinal Marrow, and in them perform all the Actions of Senſe and Motion.

The Vital or Natural Spirits are the ſubtileſt Parts of the Blood which actuate and ferment it, and make it fit for Nouriſhment.

SPLANCHNICA, are Medicines proper againſt Diſeaſes of the Inteſtines.

SPLEN, *ſive Lien*, the Spleen, is a Receptacle for the ſalt and earthy Excrements of the Blood, that there, by the Aſſiſtance of the Animal Spirits, it may be volataliz'd, and returning again into the Blood, may concur to its farther Fermentation. The Spleen conſiſts of a great number of little Bladders, between which the Glandules are ſcattered up and down, and ſupply the place of Veins. The Spleen has likewiſe an Artery, Nerves, and Lymphatick Veſſels, firſt diſcover'd by *Fr. Ruiſch*, ſays *Blanchard*. But you will find a much better Account of it in *Gibſon's* Anatomy, p. 106. See Vol. 2.

SPLENA, are Bolſters made of Linen, three, four, or five times doubled, even to the thickneſs of the Spleen: They are uſed upon Wounds, Ulcers, and Fractures. The Figure is threefold, according to the manner of Application, *viz.* at length obliquely, or tranſverſly: They are called alſo *Plumaceoli*, and *Plagulæ*. *Blanchard.*

SPLENETICK *Artery*, is ſaid by ſome to be the greateſt Branch of the *Cœliaca*, whence it goes to the *Spleen*, and therein ends.

SPLENII *Muſculi*, ariſe partly from the five lower *Vertebræ* of the Neck; and partly from the points of five of the upper *Vertebræ* of the Thorax: The Fibres of theſe Muſcles tend obliquely, and are faſtened to the hinder part of the Head. The uſe of 'em is to draw the Head backward. It hath its Name from its Figure, being ſomething like to an Ox's Spleen.

SPLICE. At Sea they ſay a Cable or Rope is *ſpliced*, when the ends of two pieces being untwiſted, the ſeveral Strands are wrought into one another by a Fidd. Alſo when an Eye is to be made at the end of a Rope, the ends of the Strands are by a Fidd drawn into the ends of the other Ropes Strands; and this is called a *Splice*.

SPLIT; the Seamen ſay when a Sail is blown to pieces, it's Spilt.

SPOLIATION, is a Writ that lies for one Incumbent againſt another, in any caſe where the Right of the Patronage cometh not in Debate: As if a Parſon be made a Biſhop, and hath Diſpenſation to keep his Rectory, and afterwards the Patron preſent another to the Church, which is Inſtituted and Inducted; the Biſhop ſhall have againſt this Incumbent, a Writ of *Spoliation* in Court *Chriſtian*.

SPONDÆUS, is the Foot of a Latin Verſe, conſiſting of two Syllables, and both of 'em long, as *Ingens*.

SPONGOEIDEA *oſſa*. See *Cribriformia*.

SPOONING, when a Ship being under Sail in a Storm at Sea, cannot bear it, but is forced to put right before the Wind; then the Seamen ſay, *ſhe ſpoons*; and when in ſuch a caſe there is Danger leſt ſhe ſhould bring her Maſts by the Board with her rowling about, or Seel under Water, and ſo Founder, they uſually ſet up the Fore-ſail to make her go the ſteadier, eſpecially if there be Sea-room enough; and this they call *Spooning with the Fore-ſail*.

SPORADICI *Morbi*, are thoſe Diſeaſes which (tho' different in Nature) ſeize ſeveral People at the ſame time, and in the ſame Country.

SPOTS *in the Sun*. 'Tis certain thoſe opake Maſſes which ſometimes appear at the Sun, are not Planets revolving at any, even the leaſt diſtance from him, but *Spots* or *Maculæ* adhering to him; for whereas they revolve but once in about 26 Days; on Calculation it will appear, that a Planet near the Sun's Surface, as theſe muſt be, cannot have above 3 Hours allowed for its periodical Revolution, which being ſo different from the forementionꝺ ſpace of 26 Days, quite decides that Controverſie, and demonſtrates thoſe Maſſes to be real *Maculæ* adhering to the Body of the Sun, as is here aſſerted.

Anno 1660, *April* 27th, 8 H. A. M. the Honourable Mr. *Boyle* obſerved a *Spot* in the lower Limb of the Sun, a little towards the South of its Equator, which was entred about $\frac{1}{40}$ of the Sun's Diameter, it ſelf being about $\frac{1}{180}$ in its ſhorteſt Diameter of that of the Sun, its longeſt about $\frac{1}{4}$ of the ſame.

May the 8th, about 10 in the Morning, it appeared near about the ſame diſtance from the Weſtward Limb, a little South of its *Equator*; tho' at firſt it appear'd to be from the Eaſtward Limb, a little South alſo of its *Equator*. *May* the 9th, it diſap-

diſappeared. This *Spot* was very dark, and almoſt of a Quadrangular Form, and was encloſed round with a kind of duskiſh Cloud.

May the 25th, the ſame *Spot* appear'd again, and ſeemed to be in a part of the ſame Line it had formerly traced, and was entred about $\frac{1}{13}$ of its Diameter, about 7 h. P. M. At which time there appear'd another *Spot*, which upon its entrance was not above $\frac{1}{13}$ part of the Sun's Diameter: It appear'd to be longeſt towards the North and South, and ſhorteſt towards the Eaſt and Weſt: and there ſeemed to be diſperſed about it divers ſmall Clouds here and there.

Anno 1671, *Auguſt* the 11th, 6 h. P. M. Mr. *Caſſini*, by the help of a Three-foot Glaſs, obſerved in the Sun's Diſk *two Spots* very dark, and diſtant from his apparent Center about $\frac{1}{3}$ of his Semidiameter.

But, that he might the more exactly note their Situation, in reſpect of the ſeveral Parts of the World, he made uſe of two very fine Threads, cutting one another at Right Angles in the common *Focus* of the two Glaſſes, and in the Axis of the Teleſcope; ſo that he might ſee the Sun's Center, and according as one of theſe Threads advanced Weſtward, it mark'd in the Sun a Circle parallel to the *Equator*; and the other Thread marked the Circle of *Declination*, or the *Horary Circle*. Then he obſerved that the *Spots* were in the Southern part of the Sun; that their Elongation from this Parallel, paſſing thro' his Center, could be no more than about $\frac{1}{16}$ of his Diameter; and that they were ſituated on the Eaſtern-ſide in reſpect of the ſaid Center of the Sun. He alſo meaſured ſeveral times, from 6 a Clock at Night, to 7, the time which lapſed between the paſſage of the Sun's Center, and that of the firſt of theſe Spots, thro' the ſaid *Horary Circle*, which ſometimes he found to be 23, ſometimes 22 *Seconds*, the Semidiameter of the Sun then paſſing in 66 *Seconds*.

Auguſt the 12th, he obſerved them from the time of Sun-riſing, and perceived that now they were nearer his Center. The time between the paſſage of the Sun's Center, and that of the interior edge of the Coronet which encompaſſed them both, was then of 16 Seconds. At 7 a Clock it was but of 15, and the Southern Limb of the Coronet touched the Parallel paſſing through the Sun's Center.

From 6 at Night unto 7, the time between the paſſage of the Sun's Center and that of the Coronet's Limb, was found to be one time of 8 Seconds, at another time of 7", and another of 7" $\frac{1}{2}$. The diſtance of the *Spots* unto the Parallel, paſſing thro' the Sun's Center, was near the ſame on the North-ſide, with what it had been obſerved to be in the Morning on the South ſide.

Auguſt the 13th, about 6 in the Morning, the edge of the Coronet was diſtant from the Equator, on the North-ſide, 30 Seconds; and there was but one Second of Time from the paſſage of the Sun's Center into the paſſage of the ſame anterior edge of the Coronet.

At 8 h. 30', the Fore-edge was in the ſame *Horary Circle* with the Sun's Center; ſo that in one Day and an half, theſe Spots have run thro' very near the third part of the Sun's apparent Semidiameter, which giveth an Arch of 19 Degr. 30 Min. of the Circumference of the Sun's Body; and conſequently their Diurnal Motion about the Sun's *Axis* hath been of 13 Degr. and the time of their Periodical Revolution as far as could be conjectured in ſo little Time, muſt be about 27 Days and a half; which was confirmed afterwards by farther Obſervations. *Phil. Tranſ.*

Auguſt the 30th, 1671, Dr. *Hook* obſerved a large *Spot* in the Center of the Sun's Face about Noon.

Sept. the 1ſt, he ſaw the ſame *Spot* again, and obſerved it to be moved about $\frac{1}{4}$ of the Sun's Diameter Weſtward.

April the 25th 1683, Mr. *Flamſtead* ſaw a large *Spot*, having 3' 40" more *North Declination* than the *Sun's Center*, and at 3 h. 35' after Noon he meaſured its *Diſtance* from the next *Limb*, 8', 40".

April the 26th, he ſaw it more remote from the *Limb*, and at 8 a Clock determined its Longitude from the Sun's Axis 66 $\frac{1}{2}$ Degr. and its Declination from the Solar Equator 8 $\frac{1}{2}$ Degr. South.

The Revolution of this *Spot*, Mr. *Flamſtead* found to confirm his former Theory of the Sun's Motion round his Axis in 25 d. 6 h. and that the Angle of his Equator and our Ecliptick is 7 Deg. and the Longitude of his Northern Pole was in ♈ 16°.

SPRING *of the Air*, or its *Elaſtical Force*, ſee more in *Air*.

That there is ſuch a Spring or Elaſticity in the Air, is clear from the following Experiments.

1. That Bladders but half blown up, and having their Necks well tied, did ſwell in their *exhauſted Receiver* as if blown to their full Dimenſions; and that full blown Bladders, and even thin ſquare glaſs Viols well ſtop'd, will break to pieces when once the Air is well pump'd out of the Receiver.

2. A glaſs Syphon whoſe recurved Leg was turn'd up parallel to the upper and longer, and was ſealed Hermetically at the end of the leſſer or ſhorter Leg, had a Quantity of Quickſilver poured into it, and by its being moved often up and down, the Air in the ſealed and ſhorter Leg, was brought to the ſame Temperament of the External. After this more Mercury was poured in, till the Air in the ſealed Leg was compreſſed into about half its uſual Dimenſions, and then the Mercury in the longer Leg was 29 Inches higher than that in the ſhorter: By which it appears plainly, That the Spring of the Air in the ſealed Leg was ſo great, as to equiponderate a Column of Mercury of 29 Inches in Length. *Boyle* againſt *Linus*.

3. A Viol filled to but a 4th part with Quickſilver, had a long and ſlender glaſs Pipe faſtened into its Neck, with Sealing-Wax or Cement, whoſe lower Orifice was a good way under the Quickſilver in the Viol; then having blown in a little Air, to try whether the Viol were well ſtopp'd, it was convey'd into a long and ſlender Receiver; and after the Air was drawn off by the Pump, the Spring of the included Air within the Bottle, impelled the Mercury up to the Height of 27 Inches in the Pipe, and there kept it ſuſpended; till upon the Re-admiſſion of the Air, the Quickſilver fell down to its firſt Station in the Pipe. This Experiment Mr. *Boyle* often tried, and with deſir'd Succeſs.

And when it was tried with a Bottle that held a Quart, the Spring of ſuch a Quantity of Air was able to raiſe the Mercury up to 29 Inches $\frac{1}{8}$. But nothing could make it raiſe above the common Height of the Quickſilver in the Baroſcope.

4. Into a Copper Veſſel of a Cylindrical ſhape, was put almoſt Water enough to fill it, and then was immerſed into it and kept under Water by a Weight, a ſquare glaſs Viol that would hold 9 or 10 Ounces of Water, and was well ſtopp'd: After this, Mr. *Boyle* placed the Copper Veſſel in his *Penumatical Engine*, and pumping up the Air, he found, That the Spring of the Air included in the Viol broke it all to Pieces, tho' under Water, with a great Noiſe, and made a kind of Smoak or Miſt appear above the Surface of the Water.

Which Experiment proves both the great Force of the Natural Spring of the Air, when the Weight of the Atmoſphere is removed; and alſo that the Weight of the Atmoſphere acts upon Bodies under Water; for that could by its univerſal preſſure keep the Spring of the Air in the Bottle bent while it was under the Surface of the Water; but when once *that*, by plying the Pump, was taken off, the Elaſtick Particles unbent themſelves violently, and broke the Viol. *See the Experiments about the Preſſure of the Airs Spring on Bodies under Water.*

The Spring of the Air, is equal every where in a natural State to the Weight of the incumbent Atmoſphere; juſt as if a Perſon ſhould ſqueeze or compreſs together either by the force of his Hand, or by a Weight, any parcel of Wool, or ſuch Elaſtick Bodies, the Wool would by its Spring equally preſs againſt the Hand or Weight. According to the third Axiom of Sir *Iſaac Newton*'s Principia, *Actioni contrariam ſemper & æqualem eſſe Reactionem.*

The Accurate Dr. *Hook* on Experiments well made, thinks we may conclude the Spring of the Air to be *Reciprocal* to its *Extenſion*. *Micrograph.* p. 227.

And the Reſiſtance of the *Spring of the Air*, is found to be nearly equal to the Weight or Force that compreſſes it; and the Spaces that the ſame Air occupies under differing Preſſures, are Reciprocally as thoſe Preſſures.

The Quantity of the Dilatation and Expanſion of Air only by the Operation of its Spring, without any additional Heat, Mr. *Boyle* found to be ſo great, that a Bubble of Air included in a proper glaſs Pipe almoſt filled with Water, was extended to above 150 times its former Dimenſions; and he believes would have taken up 200 times its former Room, had the Tube been long enough to have tried the Experiment. *New Exper. Phyſ. Mech. Edit.* 3. *p.* 32, 33.

He found alſo, that a Cylinder of Air of an Inch in Diameter, and leſs than two Inches in Length, would, when included in a Bladder, and the Weight of the Atmoſphere taken off by pumping, by its bare Spring only, raiſe a Weight of above 10 Pounds *Averdupois*.

He found alſo, that the Spring of a Cylinder of Air of 2 Inches Diameter, and of the former length, was in the ſame Engine able to raiſe up 42 Pound Weight.

Whence it appears, that the Force of the Spring of different Cylinders of Air is in a duplicate Ratio, to the Diameters of thoſe Cylinders.

The Spring of the Air, may be explicated either by ſuppoſing the Air near the Earth to conſiſt of an heap of ſuch little Springy or Elaſtick Bodies lying one upon another reſembling thoſe of a Fleece of Wool.

Or elſe according to *D. Cartes* his way by ſuppoſing, That the Air is nothing but a *Congeries* of flexible Particles of ſeveral kinds of Figures and Sizes, which are raiſed by Heat into the fluid and ſubtile *Ethereal Matter* that ſurrounds the Earth, and by the continual Agitation of that *Matter*, wherein thoſe Particles ſwim, are ſo whirled about, that each Corpuſcle endeavours to beat off all others from coming within the little Sphere requiſite to its Motion about its own Center, and (in caſe any, by intruding into that Sphere ſhall oppoſe its free Rotation) to drive it away.

SPRING *a Maſt*; ſo the Seamen call it, when a Maſt is only crack'd, but not quite broken, in any part of her; as in the *Partners*, the *Hounds*, &c. then they ſay, *The Maſt is Sprung*.

SPRING-*Arbor*, in a Watch, is that part in the middle of the Spring Box which the Spring is wound or turned about, and to which it is hooked at one end.

SPRING-*Box*, is that Cylindrical Caſe or Frame that contains within it the Spring of a Watch or other Movement.

SPRING-*Tide*, is the increaſing higher of a Tide after a dead Neipe; this is about 3 Days before the Full or Change of the Moon; but the top or higheſt of the Spring-Tide is 3 Days after the Full or Change; then the Water runs higheſt with the Flood, and loweſt with the Ebb, and the Tides run more ſtrong and ſwift than in the Neipes.

SPRINGS *and Fountains*. Concerning the Origin of theſe, there is much Diſpute, eſpecially of ſuch as are found on the tops of high Mountains.

Some, as Dr. *Hook*, Dr. *Plott*, and many others, think that they ariſe from the Sea-water percolated through the Bowels of the Earth, which by that means being deprived of its Salt, is rendred much Lighter than before, and ſo is capable of riſing up to the height we commonly find Springs at, as Water riſes in a Filtre, or in very ſmall Tubes, &c.

And Dr. *Hook* hath a pretty Experiment about this, in his *Microgr. p.* 25.

But I cannot ſee how by this Hypotheſis, ſuppoſing the Gravity of the whole Atmoſphere could be taken off, Water can ariſe above 34 or 35 Foot above the level of the Ocean.

The Learned Capt. *Halley* ſuppoſes them to be cauſed from the Vapours exhaled by the Sun out of the Sea, &c. Of which ſee an Account under the Word *Vapour*.

The Ingenious Dr. *Woodward*, in his Natural Hiſtory of the Earth ſuppoſes, That the great Abyſs of Waters placed in the Bowels of the Earth, is the ſtanding Fund and promptuary which ſupplies Water to the Surface of the Earth, and furniſhes as well Springs and Rivers, as Vapours and Rain.

For he aſſerts, That there is a nearly uniform, and conſtant Fire or Heat, diſſeminated thro'out the Body of the Earth, and eſpecially in the inferior Parts of it: The Bottoms of the deeper Mines being very ſultry, and the Stone and Ores there being very ſenſibly hot even in Winter. That 'tis

this ſubterraneous Heat which evaporates and elevates the Waters of the Abyſs, buoying it up indifferently on all Sides, and towards all Parts of the Surface of the Globe.

That this riſing Vapour, or Water, pervades not only the Fiſſures and Intervals of the *Strata*, but the very Bodies of the *Strata* themſelves, permeating the Interſtices of the Sand, Earth, or other Matter, whereof they conſiſt; yea, even the moſt firm and denſe Marble and Sand-ſtone; for theſe give Admiſſion to it, tho' in leſſer Quantity, and are always found ſaturated with it; which is the reaſon that they are ſofter, and can be cut much more eaſily when they are firſt taken out of the Earth, than they can afterwards, when they have lain ſome time expoſed to the Air, and when that Humidity is evaporated.

This Vapour he aſſerts to proceed directly up towards the Surface of the Globe, on all ſides, unleſs when impeded and diverted by the Interpoſition of *Strata* of Marble, the denſer ſorts of Stone, or other like Matter, which is ſo cloſe and compact, that it can admit it only in a ſmaller Quantity, and this very ſlowly too.

And when it is thus intercepted in its Paſſage, the Vapour which cannot penetrate the *Stratum* directly, will ſome of it glide along the lower Surface of the *Stratum*, permeating the Horizontal Interval, which is betwixt that and the next *Stratum* lying underneath it; the reſt will paſs the Interſtices of the Maſs of the ſubjacent *Strata*, whether they be of laxer Stone, of Sand, Marle, or the like, with a Direction parallel to the ſite of thoſe *Strata*, till it arrives at their perpendicular Intervals.

And when the Water is once come to theſe *Intervals*, in caſe the *Strata*, whereby the aſcending Vapour was collected and condenſed into Water, (as we uſually ſpeak) in like manner as by an Alembick, happen to be raiſed above the *Level* of the Earth's Surface; as thoſe *Strata* always are, whereof Mountains do conſiſt; then the Water being likewiſe got above the ſaid *Level*, flows forth of thoſe Intervals or Apertures; and if there be no Obſtacle without, forms *Brooks* and *Rivers*. But where the *Strata*, which ſo condenſe it, are not higher than the mean Surface of the Earth, it ſtagnates at the Apertures, and only forms *ſtanding Springs*.

He adds, That tho' this Supply of Water from the Abyſs, be continual, and nearly the ſame at all Seaſons and alike to all Parts of the Globe, yet when it arrives at or near the *Surface of the Earth*, where the Heat (the Agent which evaporates and bears it up) is *not ſo conſtant* and uniform, as is that reſident within the Globe, but is ſubject to Viciſſitudes and Alterations, being at certain Seaſons greater than at others; being alſo greater in ſome Climates and Parts of the Earth than in others: It thence happens that the Quantity of *Water at the Surface of the Earth*, tho' ſent up from the Abyſs with an almoſt conſtant equality, is *various and uncertain*, as is the Heat there at *ſome Seaſons*, and in *ſome Countries*, the Surface abounding, and being even drown'd with the Plenty of it, the Springs full, and the Rivers high: At *other Seaſons* and in *other Countries*, both Springs and Rivers may be exceeding low, and ſometimes totally fail.

When the Heat in the exterior Parts of the Earth, and in the Ambient Air, is as intenſe as that in the interior Parts of it, then all that *Water* which paſſes the *Strata directly*, mounting up in ſeparate Parcels, or in form of Vapour, does not ſtop at the Surface, becauſe the Heat there, is equal both in Quantity and Power to *That* underneath, which brought it out of the Abyſs.

This Heat therefore takes it here, and *bears it up*, part of it immediately out of the Surface of the Earth; the reſt thro' the Tubes and Veſſels of the Vegetables which grow thereon, Herbs, Shrubs, and Trees, and along with it a ſort of Vegetative Terreſtial Matter, which it detaches from out the uppermoſt *Stratum* wherein theſe are placed; this it depoſes in them for their Nutriment as it paſſes thro' them, and iſſuing out at their Tops and Extremities, it marches ſtill on, and is elevated up into the Atmoſphere, to ſuch an height, that the Heat there being leſs, it becomes condenſed, unites and combines into ſmall Maſſes, or Drops, and at length falls down again in *Rain*, *Dew*, *Hail*, or *Snow*.

And for the other part of the Water, which was condenſed at the Surface of the Earth, and ſent forth collectively into *ſtanding Springs and Rivers*; *this* alſo ſuſtains a Diminution from the Heat above, being evaporated more or leſs in Proportion to the greater or leſſer Intenſeneſs of the Heat, and the greater or leſſer Extent of the Surface of the Water ſo ſent forth.

And as theſe Evaporations are *at ſometimes greater*, according to the greater Heat of the Sun, ſo where ever they alight again in Rain, 'tis ſo much ſuperior in Quantity to the Rain of colder Seaſons, as the Sun's Power is then ſuperior to its Power in *Thoſe Seaſons*: This is apparent in our Northern Clime, where the Sun's Power is never very great, but yet our Rains in *June*, *July*, and *Auguſt*, are much greater than thoſe of the colder Months, the Drops larger, and conſequently heavier, and falling much thicker and faſter than at other times.

But much more apparent is this in the Regions of the Earth, nearer to, or under the Equator, where the Sun having a much greater Force, their Rains (which are Periodical, happening uſually about the ſame time, and laſting ſeveral Months) fall in ſuch Quantities as to be more like deſcending Rivers than Showers; and by theſe are cauſed the mighty Inundations of the *Nile*, and other Rivers in thoſe Regions.

But when the Heat in the *exterior* parts of the Earth, and in the Ambient Air, is leſs than that in the *interior*; the *Evaporations* are likewiſe leſs; and the Springs and Rivers do not only ceaſe to be *diminiſhed*, proportionably to the Relaxation of the Heat, but are much *augmented*, a great part of the Water which aſcends to the Surface of the Earth, ſtopping there for want of Heat to amount it thence up into the Atmoſphere, and ſaturating the ſuperficial, or uppermoſt *Strata* with Water; which by degrees drains down into *Wells*, *Springs*, and *Rivers*, and ſo makes an Addition to them; and is the reaſon that *theſe abound with Water* in the *Colder Seaſons*, ſo much more than they do in the Hotter.

And the Water which is thus diſpenſed to the Earth and Atmoſphere from the great Abyſs, being carried down by *Rains* and by *Rivers*, into the Ocean, which communicates with the Abyſs, is by that means reſtored back again to it; and from thence it returns again in a continual Circulation,

to

to the Surface of the Earth, in Vapours and Springs.

SPRINGY, or *Elaſtick Bodies*, are ſuch as having had their Figure changed by the Stroak or Percuſſion of another Body, can recover again their former Figure; which Bodies which are not Elaſtical will not do. Thus, If a piece of Steel be bent any way, it will recover again its former ſtraitneſs, but a piece of Lead will ſtand bent in any form.

SPUNGING of a great Gun, is clearing of her Inſide, after ſhe hath been diſcharged, with a Wad of Sheep-skins, or the like, rolled about one end of the Rammer: Its deſign is to prevent any parts of Fire from remaining in her; which would endanger the Life of him who ſhould load, or charge her again.

SPUN-YARN, or Rope-yarn, whoſe Ends are beaten or ſcraped thin, in order to faſten one piece to another, that ſo it may be as long as is neceſſary: It is of uſe to make *Caburns*, and for many other Purpoſes aboard a Ship.

SPURIÆ. See *Nothæ coſtæ*.

SPURKETS, are the Spaces in a Ship's Side, betwixt the upper and lower Futtocks, or betwixt the Rungs fore and aft.

SQUAMMOSA *Sutura*, is one of the Sutures of the Bones of the Skull; ſo called, becauſe the Parts of the Bones united by the Suture, do lie very ſlope, and like Scales.

SQUARE, is an Inſtrument of Braſs, or Wood, having one ſide perpendicular, or at Right Angles to the other; ſometimes made with a Joint to fold (for the Pocket) and ſometimes has a Back to uſe on a drawing Board, to guide the *Square*.

SQUARE *Figure*, in Geometry, is one whoſe Right-lined Sides are all equal, and its Angles all right. See *Quadrilateral*: For its *Area*, ſee *Area*.

SQUARE *Number*, is one multiplied into itſelf; as 4, which ariſes from the Multiplication of 2 by 2; and 9, the Product of 3 by 3; alſo 16 made by 4, multiplied by 4, *&c.*

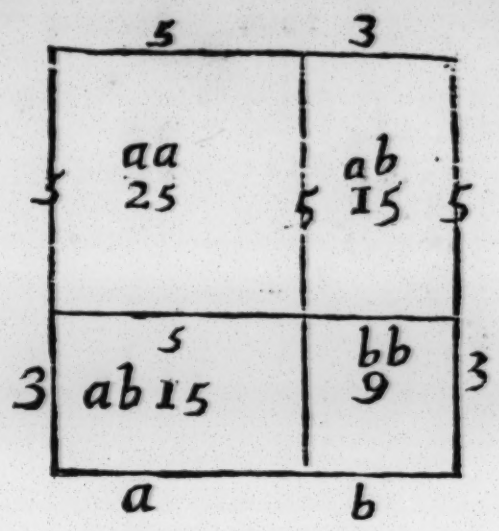
And a *Square Number* may be ranged into the Form of a Square, but that which cannot be ſo ranged, cannot be a *Square Number*.

The Square of any Number, or Line, as $5 + 3$, or $a + b$, divided into two Parts, is equal to the Sum of the Squares of thoſe Parts, and alſo to the double Rectangle, or Product of thoſe Parts, as is plain from only multiplying $a + b$ by it ſelf, Algebraically. See *Euclid. Lib.* 2. *Prop.* 4.

Thus the Square of $5 + 3$, or 8, which is 64, is equal to

$a\ a$	25
$b\ b$	9
$2\ a\ b$	15
	15

$\square a + b = a\ a + 2\ a\ b + b\ b = 64$



To Compoſe any Square Number *according to this Propoſition.*

2 5	
4 . .	$a\ a$
2 0 .	$2\ a\ b$
. 2 5	$b\ b$

$6\ 2\ 5 = \square 25$

1. Write the Number down with the Diſtance of one Place between each Figure.

2. Find the Square of 2, the firſt Figure to the left Hand, writing it down under 2.

3. Then write the double Rectangle of 2 multiplied by 5, *i. e.* 20, under 4, as in the Margin.

4. Then Square 5, and write its Square down in that Order, as you ſee; and adding all together into one Sum, you will have $625 = \square 25$.

When a Number conſiſts of more than two Places, proceed thus.

1. Find the firſt Square as before.

2. Multiply the two firſt Figures (towards the left Hand) and write down the Product twice, one under another.

3. Then find the Square of the ſecond Figure, which write in its proper Order as before; add all theſe into one Sum for a new Square of *a*.

4. Then multiply the third Figure into the ſecond, which taken together make *a*; and write its Product down twice as before (in Step. 2.)

5. Square the third Figure, and ſubſcribe its Square as before (in Step, 3.) then add all into one Sum, and repeat this Proceſs as often as there is Occaſion; the laſt Sum of all is the true Square required.

Thus,

3 6 5

9	$a\,a$
18 ... }	$2\,a\,b$
18 ... }	
36 ..	$b\,b$
1296 ..	$a\,a$
180 . }	$2\,a\,b$
180 . }	
25	$b\,b$

133225 = Square of 365.

From which Method of compoſing a Square, 'twill be eaſie to underſtand the way to extract the Square Root of any Number given,

. . .

As ſuppoſe 133225. For,

1. Beginning at the right Hand, make a Point over the firſt Figure (5); and after that over every other Place alternately: Which Points ſhew you the Number of Places in the Root.

2. Find the neareſt Square Root to the firſt part 13, which is 3, write it in the Quotient, and then place its Square (9) under, and ſubſtract it from 13. This Root is a, and the Square $a\,a$.

3. To the Remainder (4) bring down the next Square 32, which will make 432, and will be equal to $2\,a\,b + b\,b$, in the laſt Step of all, elſe always bigger, and is called the *Reſolvend*. Then double the Figure (3) in the Quotient, and make it a Diviſor to all the *Reſolvend*, except the laſt Figure towards the right Hand, enquiring how often you can have 6 in 42, and place the Anſwer 6 (for tho' you can have it 7 times, yet 7 muſt not be taken, becauſe 'tis too large) in the Quotient, and alſo after 6 in the Diviſor. Then multiply the thus augmented Diviſor by 6, and write the Product under, and ſubſtract it from the *Reſolvend*: To the Remainder 36, bring down the next Square 25, and then you have 3625 for a new Reſolvend: Then, as before, double the Quotient 36, which makes $72 = 2\,a$, for a new Diviſor, and enquire how often you can have 72 in 362, write the Anſwer $5 = a$ in the Quotient, and alſo after the Diviſor; and multiplying the augmented Diviſor by it, you will have a Product 3625, $= 2\,a\,b + b\,b$, which ſubſtracted from the *Reſolvend*, leaves nothing, and ſo the Work is over, and the true Root found to be 365. If there had been more Points, the Work in this third Step muſt have been repeated till all was done.

The *Example* follows.

. . .

133225 (365

$a\,a = 9$

$2\,a + b = 66)$ 432 = Reſolvend.

396 $= 2\,a\,b + b\,b$

$2\,a + b = 725)$ 3625 = Reſolvend.

3625 $= 2\,a\,b + b\,b$

0000

But when a whole Number hath not a Square Root exactly expreſſible by any rational Number, then to approach infinitely near the exact Root, proceed thus.

Place as many Pairs of Cyphers on the right Hand of the Remainder, as you would have Decimal Places in the Root, and work as before, diſtinguiſhing them from the Integers by a Comma, thus: If the Square Root of 12 be deſir'd to three Places in Decimals; annex 6 Cyphers to 12, and 'twill ſtand thus:

. . . . .

12, 000000

Whoſe Square Root being extracted, is found to be 3, 464, or $\frac{464}{1000}$, but becauſe of the Remainder, it muſt be that 3, 464 is leſs than the true Root, and 3, 465 greater than it; yet not wanting the $\frac{1}{1000}$ of an Unite of the true Root.

The Square Root of a Vulgar Fraction, is thus found.

Firſt, if the Fraction be not in its leaſt Terms, let it be reduced to the leaſt Terms; then extract the Square Root of the Denominator for a new Denominator, and of the Numerator for a new Numerator; this new Fraction ſhall be the Square Root of the Fraction propoſed. Thus the Square Root of $\frac{9}{16}$ is $\frac{3}{4}$, of $\frac{1}{4}$ is $\frac{1}{2}$.

If the vulgar Fraction given, be incommenſurable to its Square Root, both in the given Terms, and alſo in any other Terms that it is reducible to; then reduce the ſaid Vulgar Fraction into Decimals, conſiſting of an even Number of Places; and then extract the Square Root thereof by Approximation, according to the Precepts already delivered.

Thus: If the Square Root of $\frac{3}{4}$ be required, its equivalent Decimal is 75, whoſe Square Root, 86602, *&c.* Therefore the Square Root of $\frac{3}{4}$ is, 86602 *fere*.

If a mix'd Number were given for Extraction, whoſe Fractional Part is expreſt in Terms of a Vulgar Fraction; reduce it into an improper Fraction, and (if commenſurable, extract the Square Root of the Numerator and Denominator, (as before;) obſerving to reduce the Fractional Part of the mix'd Number, (or the improper Fraction equivalent to the mix'd Number) into its leaſt Terms.

Thus: The Square Root of $5\frac{4}{9}$ is $2\frac{1}{3}$, for the improper Fraction equivalent to $5\frac{4}{9}$, is $\frac{49}{9}$, and the Square Root of $\frac{49}{9}$, is $\frac{7}{3}$, or $2\frac{1}{3}$.

To extract the Square Root, according to the Method of Converging Series.

Suppoſe $a\,a = c = 2$.

For a take any Binomial, as ſuppoſe $r + S$; 'tis beſt to make $r = 1$, *(i. e.)* to the firſt Root, or Side of the given Square, becauſe then S will converge the ſooner.

Then will $r\,r + 2\,r\,S + S\,S = a\,a = c$.
Reject the Power of S, as being of ſmall Value.
Then will $r\,r + 2\,r\,S = c$, or $2\,r\,S = c - r\,r$.

Divide all by $2\,r$; and then $S = \frac{c - r\,r}{2\,r}$

which is the ſtanding *Theorem*.

Suppoſe therefore $r = 1$; then $\left.\begin{matrix} -c = 2 \\ -r\,r = 1 \end{matrix}\right\} = 1$

Make $2\,r$ the Diviſor) 1, 0 (,5 = S
To the firſt $r = 1$, add ,5 = S, for a ſecond r, in order for a new Operation.

Then 1, 5 is the new r, the Square of which, is 2, 25 $= r\,r$; from which ſubſtract $2 = c$, becauſe 2 is leſs than 2, 25, and 'twill ſtand thus.

$r\,r = 2, 25$
$-c = 2$
$2\,r = 3)\ 0, 25$

Which muſt be divided by $2\,r = 3$, and the Quotient will be $-\ 083 = S$; which having a defective Sign, muſt be ſubſtracted from the laſt.

$r = 1, 5$ 1, 5
$-, 083$
1, 417

Which will be a new r, for a third Operation; and its Square being 2, 007889 $= r\,r$, (as before greater than $2 = c$.) Take $2 = c$ from it, thus.

$r\,r = 2\ 007889$
$-c = 2$
Leaves $-$. 007889 $= S$.

Which being divided by twice the laſt $r = 2, 834$, gives in the Quotient $-$. 002783 $= S$; and this S ſubſtracted from the laſt.

$r = 1, 417$
$, 002783$
$1, 414217 = a$

Which gives the Root at 7 Places at three Operations.

But if more exactneſs be neceſſary, call it a new r, for a fourth Operation, and proceed juſt as before.

N. B. This Method, which is Mr. *Raphſon*'s, is very pretty, but it labours under two Inconveniencies, *viz.* *The greatneſs of the Diviſors*, and *the high Involutions*; eſpecially in extracting Roots out of higher Powers, as the *Cube*, *Biquadrate*, *Fifth*, *Power*, &c.

To obviate which, 'tis much better to uſe the following way, which is Mr. *Ward*'s.

Let as before $a\,a = c = 2$, and $r + S = a$.
Then $r\,r + 2\,r\,S + S\,S = a\,a = C$.
Divide all by 2; then 'tis $\frac{1}{2}\,r\,r + r\,S + \frac{1}{2}\,S\,S = \frac{C}{2}$ the Reſolvend; and $r\,S + \frac{1}{2}\,S\,S = \frac{1}{2}\,C - \frac{1}{2}\,r\,r = D$, the Dividend.

Whence ariſes this *Theorem*, $\frac{D}{r + \frac{1}{2}\,S} = S$, by dividing all by $r + \frac{1}{2}\,S$.

Let then (as before) the Square Root of $2 = C = a\,a$, be required.

Firſt, Take $r = 1$: Then halve the Reſolvend $= \frac{C}{2} = 1$: And from it take $\frac{1}{2}\,r\,r = .5$, there remains $5 = D$. Make

$r = 1$, the Diviſ.) .50 (4 = S. ſubſcri. $\frac{1}{2}SS = 8$ under
$48 = r\,S + \frac{1}{2}\,S\,S$ [the Cypher.

Di. $= r + S = 1,4$) 20 (20 (1, = S
$145 = r\,S + \frac{1}{2}\,S\,S$

Di. $= r + S = 1,41$).5500 (3 = S
$4234,5 = r\,S + \frac{1}{2}\,S\,S$

$r + S = 1,413$) 126550 (8 = S
$113072 = r\,S + \frac{1}{2}\,S\,S$

$r = S = 1,4138$) 1347800 (9 = S
$127246,5 = r\,S + \frac{1}{2}\,S\,S$

1,41389) 7533500 (5 = S
$7069462,5 = r\,S + \frac{1}{2}\,S\,S$

$\therefore a = 1,413895.\ \ 464037,5.$

This Root $a = 1,413895$ differs from the former Root found, but by 0, 000022 (a little more than $\frac{3}{100000}$) for no exact Root can be found by either way.

Here alſo, if more exactneſs had been required, the Remainder encreaſed by Cyphers, might have been made a new Dividend, and 1,413895 a new Diviſor; and ſo you may proceed on as far as you think fit.

The vaſt Advantage of this Method above the former, any one will ſoon find that will try both.

An

An Example of this way, in a true Square Number.

The Square Root of 133225, is required.

$r = 3$ 66612.2 $= \frac{1}{2}$ C.
$-4,5 = \frac{1}{2} r r$ S S

Diviſor $= r = 3)$ 216 $(6 =$ S.
$198 = r$ S $+ \frac{1}{2}$

$r = 36)$ 1812,5 $(5 =$ S
1812,5 $= r$ S $+ \frac{1}{2}$ SS

0000,0

Therefore $a = 365$.

SQUARING. By the Word *Squaring*, Mathematicians underſtand the making of a Square equal to any Figure given. Thus the *Quadrature* or *Squaring* of the Circle, is the finding a Square equal to the Area of a Circle, which hath not yet been done Geometrically.

SQUINANCY, or *Quinſey*, a Swelling and Inflammation in the Throat. See *Angina*.

STAGMA, are Juices of Plants mix'd together in order to Diſtillation.

STALACTITÆ, are a ſort of ſtony, ſparry Iceſiles which hang down from the Top or Arches of Grotto's, Caves, or Subterranean Caverns, and from the Roofs of the Buildings and Capitals of the Pillars of ſuch Places as are built over the *Thermæ*, or Hot Springs. Of this kind are the *Sal Alumen* and *Vitriolum Stalactícum*, the *Minera Ferri-ſtalactica*, the *Vitriolam Capillare*, and the *Alumen Capillare*, &c. Theſe Stalactícæ Dr. *Woodward* ſaith, ſhould rather be called *Stagonitæ*.

STAMINA, in Botany, are thoſe little fine Threds or Capillaments which grow up within the Flowers of Plants encompaſſing round the *Style*, and on which the *Apices* grow, at their Extremities. Whence the Botaniſts call that a

STAMINEOUS *Flower*, which is ſo far imperfect, as to want thoſe coloured Leaves which are called *Petalæ*, and conſiſts only of the *Stylus* and the *Stamina*.

And ſuch Plants as do bear theſe *Stamineous Flowers* Mr. *Ray*, makes to conſtitute a large Genus of Plants, which he calls *Herbæ flore Imperfecto ſive apetalo Stamineove*.

And theſe he divides into ſuch as,

1. Have their Fruit or Seed totally divided from the Flower; and theſe are ſuch Plants as are ſaid to be of *different Sexes*: The reaſon of which is, that from the ſame Seed ſome Plant ſhall ariſe with Flowers and no Fruit, and others with Fruit and no Flowers: As *Hops*, *Hemp*, *ſtinging Nettles*, *Spinach*, *Cynocrumbe*, *Mercarialis*, and *Phyllon*.

2. Such as have their Fruit only a little disjoin'd from their Flowers; as the *Ambroſia*, *Bardana minor*, *Ricinus*, and the *Heliotropium Tricoccon*.

3. Such as have their Fruit immediately contiguous, or adhering to their Flower: And t. Seed of theſe is either,

1. *Triangular*: And of this ſort, ſome are lucid and ſhining, as the *Lapathum*, *Rhabarbarum*, and *Biſtorta*, to which alſo may be reckoned the *Perſicaria*.

Others are rough and not ſhining; as the *Helleborus Albus*, *Fegopyrum*, *Convolvulus niger*, and the *Polygonum*.

2. Such as have a roundiſh Seed a little flatted or compreſſed, or of any other Figure but the former *Triquetrous* or Triangular one. And theſe have their Flower, or the Calyx of the Flower adhering to the *Bottom* or *Baſis* of the Seed or Fruit; as the *Potamogiton*, *Blitum Silveſtre*, *Porietaria*, *Atriplex*, *Blitum Sativum*, *Amuranthes Hoclocerieus*, and the *Saxifraga Aurea*.

3. Such whoſe Flowers adhere to the top or uppermoſt of the Seed; as the *Beta*, *Aſarum*, *Archimilla*.

And to theſe kind of Plants, Mr. *Ray* reduces alſo the *Kaligeniculatum Sedum fruticoſum*, the *Scoparia*, or *Belvidere* of the Italians.

STANCHIONS in a Ship, are thoſe Timbers which being ſet up Pillarwiſe, do ſupport and ſtrengthen the waſt Trees.

STANDING *Part* of the *Sheat*, is that part which is made faſt to a Ring at the Ship's Quarter. When they ſay, *Over-hale the Sheat*, they mean, *Hale upon the ſtanding Part*; But when they ſay, *Hale the Sheat* barely, they intend it only of the Running Part.

STANDING *Ropes*, are thoſe Ropes which do not run in any Blocks, but are ſet taught, or let ſlack, as occaſion ſerves, as the Sheat-ſtays, Back-ſtays, and the like.

STANDING *Part* of a Tackle aboard a Ship, is the end of the Rope where the Block is ſeized or faſten'd; as the other which is haled, is called *Fall*.

STAPES, or the *Stirrop*, becauſe of its reſemblance to a Stirrop, is a little Bone in the Ear, of a Triangular Figure, and is made of two Branches ſet upon a flat Baſis, which ſtands upon the *Foramen Ovale*; the Union of the two Branches is called the Head of the *Stapes*, in which there is a ſmall Cavity, wherein lies another little Bone.

STAPHYLOMA, is a Diſeaſe of the Eye, in which the two Tunicks of the Eye, *Cornea* and *Uvea*, being broken, fall outward in the ſhape of a Grape.

STAR, in Fortification, is a Work with ſeveral Faces generally compoſed of from 5 to 8 Points with Saliant, and Re-entring Angles flanking one another; every one of its Sides containing from 12 to 25 Fathoms.

STARBOARD, the right Hand ſide of a Ship, as Larboard is the left: Thus they ſay, *Starboard the Helm*, or Helm a Starboard; when he that *Conds* would have the Man at the *Helm* put the Helm to the right ſide of the Ship.

STAR-*Fort*. See *Fort*.

STARS. See *Fix'd Stars*.

STATICAL *Baroſcope*, an Inſtrument invented by the Honourable Mr. *R. Boyle*, whoſe Deſcription ſee in *Baroſcope*.

STATICAL *Hygroſcope*. See *Hygroſcope*.

STATICKS, is a Science purely Speculative, being a Species of *Mechanicks*, converſant about Weights, and ſhewing the Properties of the *Heavineſs* and *Lightneſs*, or *Æquilibria* of Bodies. When it is reſtrained to the Specifick Weights and

Æqui-

Æquilibria of Liquors, it is called *Hydroſtaticks*; which ſee.

STATION, in Aſtronomy, ſignifies certain Places of the *Zodiack*, where a Planet being arrived, ſeems to ſtand ſtill for ſome time in the ſame Degree, either in aſcending to its *Apogee*, or deſcending to its *Perigee*.

STATION, is a place where a Man fixes himſelf and his Inſtrument, to take (as in Surveying) any Angles or Diſtances.

STATION-*Line*. See *Line of Station*.

STATION-*Staff*, is an Inſtrument conſiſting of two Rulers that ſlide to ten Foot, divided into Feet and Inches, with a moving Vane or Sight; two of which are uſed with a Level; and on the Edges, there are the Links of the Gunters Chain divided. It is uſed in Surveying for the more eaſie taking Off-ſets.

STATIONARY; a Planet is ſaid to be *Stationary*, when to any Eye placed on the Earth, it appears for ſome time to ſtand ſtill, and to have no progreſſive Motion forward in its Orbit round the Sun.

STATUS *Morbi*. See *Acme*.

STATUTE, is a Word that hath divers Significations; as firſt, it ſignifies an Act of Parliament made by the King and the Three Eſtates of the Realm; in which Senſe it is either General or Special. In another Signification, *Statute* is a Short Writing, called a *Statute-Merchant*, or a *Statute Staple*; which ſee. *Statutes* are alſo vulgarly taken for the *Petit-Seſſions*, by 5 *Eliz. cap.* 4.

STATUTE-*Merchant*, is a Bond acknowledged before one of the Clerks of the *Statutes*-Merchant and Mayor, or Chief-Warden of the City of *London*, or two Merchants of the ſaid City for that purpoſe aſſigned, or before the Mayor, Chief-Warden, or Maſter of other Cities or good Towns, or other ſufficient Men for that purpoſe appointed, Sealed with the Seal of the Debtor and of the King, which is of two pieces; the greater is kept by the Mayor Chief-Warden, *&c.* and the leſſer by the ſaid Clerks.

STATUTE-*Staple*, is ſo called either properly or improperly. A *Statute-Staple*, properly ſo called, is a Bond of Record, acknowledged before the Mayor of the *Staple*, in the Preſence of one of the two Conſtables of the ſame *Staple*; for which Seal, the Fee is of every Pound, if the Sum exceed not 100 *l.* an Half-penny; and if it exceed 100 *l.* a Farthing; and by Virtue of ſuch *Statute-Staple*, the Creditor may forthwith have Execution of the Body, Lands, and Goods of the Debtor. *Statute-Staple* improper, is a Bond of Record, founded upon the Stat. 23 *H.* 8. *cap.* 6. Of the Nature of a proper *Statute-Staple*, as to the Force and Execution of it; and acknowledged before one of the Chief Juſtices; and in their Abſence, before the Mayor of the *Staple*, and Recorder of *London*.

STATUTUM *de Laboratiis*, is a Writ Judicial, for the apprehending of ſuch *Labourers* as refuſe to work according to the Statute, *Reg. Judic. Fol.* 27.

STATUTO *Mercatorio*, is a Writ for the Impriſoning of him that has forfeited a Bond called *Statute-Merchant*, until the Debt be ſatisfied. Of theſe, there is one againſt Lay-perſons, and another againſt Eccleſiaſtical.

STATUTO *Stapulæ*, is a Writ that lies to take his Body to Priſon, to ſeize upon his Lands and Goods, that hath forfeited a Bond called *Statute-Staple*.

STAYS in a Ship, are Ropes whoſe uſe is to keep the Maſt from falling aft: All Maſts, Top-Maſts, and Flag-Staves have Stays, except the Sprit-ſail Top-Maſt; the Stay of the Main-maſt, which is called the *Main-ſtay*, is by a Lannier faſten'd to a Collar, which comes about a Knee belonging to the Head; the *Main-top-maſt Stay* is faſten'd to the Head of the Fore-maſt, by a Strap and a dead Man's Eye, and ſo is the *Main-top-gallant-maſt* ſtayed to the Head of the Fore-top-maſt; the Fore-maſt and Maſts belonging to it, are in the ſame manner ſtayed to the Bolt-ſprit and Sprit-ſail Top-ſail Maſt, which Stays do likewiſe ſtay the Bolt-ſprit it ſelf. The *Miſſen-ſtay* comes to the Main-maſt by the Half-deck, and the Top-maſt Stays come to the Shrouds with Crows-feet. The length of the Stay is the ſame with that of the Maſt it belongs to.

The Main-maſt, Fore-maſt, with the Maſts belonging to them, have alſo *Back-ſtays*, which help to keep the Maſt from pitching forward, or overboard, becauſe they go on either ſide of the Ship; *To bring a Ship upon the*

STAYES, or to *ſtay her*, is in order to her Tacking, which is thus done: At the ſame time bear up the *Helm*, *let fly the Fore-ſail Sheat*, *let go the Fore-bowling*, *Brace the Weather-brace* of the Fore-ſail; the ſame is alſo done to the *Top-ſail* and *Top-gallant-ſail*, only their Sheats muſt be kept faſt. If the Sprit-ſail be out, then at the ſame time let go the Sprit-ſail Sheat alſo, with the Fore-ſheet, and *brace the Weather-brace*: But the *Tacks*, *Sheats*, *Bracings*, and *Bowlings*, of the *Main-ſail*, *Main-top-ſail*, and *Miſſen* are not altered. And when the Wind comes in at the Bow, which before was the *Lee-bow*, it drives all the Sails backward againſt the Shrouds and Maſts, ſo that the Ship makes no way forward, but drives with her Broad-ſide. Thoſe are reckoned the beſt Ships which will ſtay with the feweſt Sails.

STEADY, a Word of Command at Sea, from him that Conns to the Man at Helm, to keep the Ship *ſteady* in her Courſe, and not to make Angles or Yaws (as they call them) in or out.

STATOCELE, is a Rupture or Tumor in the *Scrotum* of a fatty or Suet-like Conſiſtence. *Blanchard*.

STEATOMA is a preternatural Swelling which conſiſts of a Matter almoſt like Suet of the ſame Colour throughout, ſoft; and tho' not eaſily yielding to the Touch, yet ſuddenly returns, the Fingers being removed, to its proper Shape and Bigneſs.

STEEL, is made, according to Mr. *Lemery*, p. 154, by ſtratifying of Plates of Iron in a large Furnace, with the Horns or Nails, of Animals, under which is made a very great Fire: Thus is the Iron calcined; but when red Hot, and near Melting, they take the Plates out and dip them ſuddenly in cold Water, and ſo they become *Steel*.

Steel is not ſo good as Iron for Medicinal Operation, becauſe the volatile Parts are moſtly purged away in the Calcination, and what remains is hardly diſſolvable by the Juice in the Body.

STEER: To ſteer a Ship, is to guide or govern her by the Helm. He is the beſt *Steerſman* that uſes the leaſt Motion in putting the Helm over to and again, and that keeps the Ship beſt from making

making Yaws; that is, from running in and out. There are three ways to Steer by.

1. By any Mark on the Land, ſo as to keep the Ship even by it.

2. By the Compaſs, which is to keep the Ship's Head upon ſuch a Rhumb or Point of the Compaſs, as beſt leads to her deſired Port.

3. To Steer as one is bidden or conned, which is the Duty (in a great Ship) of him that is taking his Turn at Helm.

STEERAGE, a Part of a Ship where he ſtandeth that *Steereth*; that is, guides the *Helm* or *Rudder* of the Ship; and this in a Man of War is always before the Bulk-head of the great Cabbin; and where-ever the *Steerſman* be placed, he muſt ſtand ſo, as that he can ſee the *Letch* of the Sails, whether they be in the Wind or not.

STEEVE; the Seamen ſay that the *Bow-ſprit* or the *Beak-head* of the Ship doth *Steeve*, when either ſtands too upright, and not ſtraight enough forwards.

STEGANOGRAPHY, is the Art of ſecret Writing, which is known only to the Perſons correſponding with one another; and which if the Letters ſhould be opened, no one is ſuppoſed to be able to diſcover, or *Decypher*, as 'tis called. Tho' now-a-days hardly any thing, can be written by this Art, but what may be decyphered, and the Senſe and Meaning of it diſcovered. And in this Art of *Decyphering*, that Excellent Mathematician Dr. *Wallis*, is admirably ready.

STEGNOSIS, is a Conſtriction or ſtopping up of the Pores.

STEGNOTICA. See *Aſtringentia*.

STELLATE *Plants*, are by the Botaniſts call'd ſuch Plants as have their Leaves growing on the Stalks at certain Intervals or Diſtances, in the form of a Radiant Star; and according to Mr. *Ray*, this is the Tenth Genus of Engliſh Plants: Of this kind is *Cruciata* or Croſs-wort, *Mollugo*, *Wild-madder*, *Aſperula* or *Woodruff*, *Gallium* or *Ladies Bed-ſtraw*, *Aparine* or *Cleavers*, *Rubia Tinctorum* or *Dyers Madder*. To which he adds, as a-kin to this Genus, the *Naſturtium Indicum*, Indian Creſſe, or *yellow Lark-ſpur*.

STEM of a Ship, is that main piece of Timber which comes bowing or bending from the Keel below where it is *ſcarfed*, (as they call it) that is, pieced in, right before the Fore-caſtle; this Stem it is which guides the Rake of the Ship; and all the But-ends of the Planks (forwards) are fix'd into it. This in the Section of a Firſt-Rate Ship, is called the *Main-ſtem*.

STENTOROPHONICK-*Tube*, or Inſtrument, is the Speaking-Trumpet, invented by Sir *Samuel Moreland*.

STEP, that piece of Timber in a Ship whereon the Maſts or Capſtans do ſtand at bottom, is called the Step of the Maſt or Capſtan.

STERCOROSUS *Fluxus*, is that in which much liquid Excrement is often voided, proceeding from excrementitious Meats corrupted in the Stomach, or a great Quantity of Excrements heaped up in the Inteſtines. *Blanchard*.

STEREOBATA, in Architecture, is the *Greeks* Word for the firſt beginning of the Wall of any Building, and immediately ſtanding on the Foundation: This is wrongly confounded with *Stylobata*, which is the beginning of a Column, or its *Pedeſtal*.

STEREOGRAPHY, is the Art of drawing the Forms of Solids upon a Plane.

STEREOGRAPHICK *Projection*. See *Projection* of the Sphere *in Plano*.

STEREOMETRY, is the Art of meaſuring all ſorts of ſolid Bodies, which how to do, you will find under the proper Names of each Body.

STERN of a Ship, is all the hindermoſt or aftermoſt Part of her, generally ſpeaking: But properly, 'tis only the outmoſt Part of her, Abaft.

STERNFAST, is ſome faſtnings of Ropes, *&c.* behind the Stern of a Ship, to which a Cable or Hawſer may be brought or fixed, in order to hold her Stern to a Wharf, *&c.*

STERNPOST, is a great Timber let into the Keel at the Stern of a Ship, ſomewhat ſloaping, into which are faſtned the After-Planks; and on this Poſt, by its Pintle and Gudgeons hangs the Rudder.

STERNOHYOIDES, is that Pair of Muſcles which is commonly by Anatomiſts ſaid to ariſe from the uppermoſt part of the Breaſt-Bone: But this is ſince proved a Miſtake, for they ariſe from the internal Part of the *Clavicula*, next where its Origination is broad and fleſhy, and aſcends directly over the *Sternothyreoidæus* and *Larynx*, of an equal Breadth and Thickneſs, to its Inſertion at the Baſis of the Fore-Bone of the *Os Hyoides*. This with its Partner acting, pulls the *Os Hyoides*, together with the Tongue and *Larynx*, directly downwards.

STERNOTHYROEIDES, is a pair of Muſcles which do ariſe broad and fleſhy from the upper and internal Part of the *Sternum*, whence aſcending on the ſides of the Wind-pipe, over the *Glandulæ Thyroideæ*, its inſerted to the inferiour Part of the Thyroidal or Scutiformal Cartilage.

This, with its Partner, pulls the *Larynx* downward, and lengthens the *Canalis* or diſtance between the *Rimula* and Tip of the Tongue, (which latter ſeems to be the true *Plectrum Vocis*) whereby the Tone of the Voice is rendered grave.

STERNUM *Os*, the Breaſt-Bone is joyned to the Ribs in the foremoſt part of the Breaſt, conſiſting of 3 or 4 Bones, and frequently in thoſe that are come to ripeneſs of Age, grows into one Bone; to this is joined in the lower part of it, the *Cartilago Enſiformis*.

STERNUTATION, Sneezing, is a forcible driving out of the Head ſome ſharp Matter which vellicates and diſturbs the Nerves and Fibres: Or, as ſome ſay, 'tis an involuntary Motion of the Brain, which contracts the Muſcles of the Thorax and *Abdomen*, to the intent that the Matter which vellicates the Noſtrils and Brain may be driven out.

STERNUTATORIUM, *ſive Sternutamentum*, a ſneezing Medicine or Snuff.

STEWARD *of a Ship*, is he that receives all the Victuals from the Purſer; and he is to ſee it well ſtowed in the Hold; in his Cuſtody are all things of that Nature belonging to the Ship's uſe. He is to look after the Bread, and to diſtribute out the ſeveral Meſſes of Victuals in the Ship. He hath an Apartment for himſelf in the Hold, which is called the Steward's Room, where he ſleeps and eats.

STILE, in Dialling, is the Gnomon or Cock of a *Dial*, that casts the Shadow upon the Hour-Lines; and is always parallel to the Axis of the Earth, in all kinds of Dials.

STILLATITIOUS *Oils*, in Chymistry, are such as are Extracted out of Mixts, by the Force of Fire; and hereby are distinguished from such as are made by *Expression*, or by pressing.

STILLICIDIUM *Urinæ*. See *Stranguria*.

STIRRUP of a Ship, is a piece of Timber put upon a Ship's *Keel*, when some of her *Keel* happens to be beaten off, and they can't come conveniently to put or fit in a new piece; then they patch in a piece of Timber, and bind it on with an Iron which goes under the Ship's *Keel*, and comes up on each side of the Ship, where 'tis nailed strongly with Spikes; and this they call a *Stirrup*.

STROAKED, when in a Ship the Water in the Bottom can't come to the Well of the Pump, they say, *The Ship is a-stoak*, or *stoaked*: So they say also, *The Limber-holes are stoaked*, when the Water cannot pass through them; and that the Pump is *stoaked*, when something is got into it which choaks it up, so that it will not work.

STOCKS; so the Ship-Carpenters call a Frame of Timber, and great Posts made a-shore to build Pinnaces, Ketches, Boats, and such small Craft, and sometimes small Frigats: Hence we say, a Ship is on the *Stocks*, when she is a building.

STOLONES, are the *Suckers* which spring up from the Root of any Tree or Plant; and which, if not cut off, will hinder the Thriving of the Tree.

STOMACHUS, in Anatomy, is not the Stomach of an Animal, for that is called *Ventriculus*; but is properly the left or upper Orifice of the Ventricle, or Stomach, by which Meats are received into it. To this part descend Nerves from the eighth Pair and intercostal Nerves, and are mixed and interwoven with one another. The *Greeks* calls it καρδία, the Heart: Whence it is that a Pain which is sometimes felt in this part, is corruptly called the *Heart-burn*; and the Region of the Stomach hereabout is called also *Scrobiculus Cordis*, or the *Heart-Pit*. It hath its Fibres Orbicular, that its Orifice may exactly shut or close upon the Meat and Drink received into the Stomach, to prevent Fumes coming up from thence to affect the Head, and to hinder Concoction.

STONES, are such kind of Minerals as are hard and friable: To which also Bishop *Wilkins* annexes

Earthly Concretions, as being of a middle Nature between Stones and Metals, but are more soft usually and brittle than the former. And that Great Man distinguishes Stones into

1. *Vulgar*, and of no Price.
2. *Middle-priced*.
3. *Precious*: And these are of two kinds, either *more* or *less* Transparent.

1. *Vulgar Stones*, or such as are of little or no price are distinguishable from their different Magnitudes, Uses, Consistences, into the

Greater Magnitudes of Stone; used either about
- *Buildings*; whether of
  - *Walls*; chiefly being of a
    - *Softer* Consistence, whether Natural, or Factitious.
      - 1 *Free-stone*, *Brick*.
    - *Harder* Consistence; not easily yielding to the Tool of the Workman, growing either in
      - *Greater* Masses.
        - 2 *Ragg*.
      - *Lesser* Masses; whether such as are for their Figure
        - More Knobbed and Unequal, used for the striking of Fire, either the more common, which is less heavy; or the less common, which is more heavy, as having something in it of a Metaline Mixture.
          - 3 *Flint*. *Marchasite*, *Firestone*.
        - More Round and Even.
          - 4 *Pebble*.
  - *Roof* or *Pavement*, being of a laminated Figure, either natural or Factitious.
    - 5 *Slate*. *Tile*.
- *Metals*, either for the
  - *Sharpening* or trying of them
    - 6 *Whet-stone*. *Touch-stone*.
  - Polishing or cutting of 'em; being either of a more spongy and *soft*, or of a more hard Consistence.
    - 7 *Pumice*. *Emery*.
- *Lesser Magnitudes*, either *more* or *less* minute.
  - 8 *Sand*. *Gravel*.

2. *Middle-priced Stones*, are either of a
- *Shining Politure*, or capable of it; whether of a
  - *Simple white* Colour, and more soft consistence
    - 1 *Alabaster*,
    - Sometimes *White*, sometimes *Black*, or *Green*, and sometimes *Variegated* with Veins, growing in *greater* or *lesser* Masses.
      - 2 *Marble*, *Porphyrie*, *Agat*.
  - *Spotted* with Red upon a Greenish Colour, or with Spots of Gold-colour upon Blue.
    - 3 *Jaspis*, Heliotrope. *Lazul*, Azure-stone.
- *Transparency*, either
  - Brittle; whether Natural or Factitious.
    - 4 *Chrystal-ine*. *Glass*.
  - Fissil, into Flakes, either greater or lesser.
    - 5 *Selenite*, *Muscovia-glass*, *Ising-glass*, *Talk*. (*Spar*.
- Relation to Metals, attracting Iron, or making of Brass.
  - 6 *Load-stone*. *Cadmia*, Calaminaris.
- *Incombustible Nature*.

7 *Amiantus.*

Strange Original; not being properly Minerals, tho' uſually reckoned amongſt them; but either a *Sub-marine Plant*, or ſuppoſed to proceed from a *Liquid Bitumen.*

8 { *Coral-ine,* / *Amber.*

There are ſeveral other ſtony Conſiſtences mentioned in the Authors who Write *de Lapidibus.* Some that are found in the Bodies of Animals, their Stomachs, Guts, Bladders, Kidneys, &c. ſeveral of which are *Denominated* from the *Animals* in which they are found; as *Alectorius, Chelidonius, Bezoar,* &c. Others have peculiar Names from their *Shapes*; as *Aſtroides, Gloſſopetra,* &c. Others made of *Animals,* or Parts of *Animals* petrefy'd, which may be ſufficiently expreſs'd, without being particularly provided for in the *Tables.*

3. *Precious Stones, Gems, Jewels,* are ſuch as for their Variety and Beauty are every where more eſteem'd. Amongſt which, ſome are *leſs Tranſparent,* which are diſtinguiſhable chiefly by their Colours, either,

Repreſenting Variety of Colours, with Dimneſs leſs or more.
- 1 OPAL, / CATS-EYES.

Of Particular Colours.
- Whitiſh and ſhining; tho' this be not properly a Mineral, but a part of a teſtaceous Fiſh.
  - 2 *Pearl.*
- Red.
  - 3 *Sardius,* Cornelian, Blood-ſtone.
- *Pale, Fleſhy* Colour, like that of a Man's Nail.
  - 4 *Onyx.*
- Bluiſh.
  - 5 *Turcois.*
- Pale Purple.
  - 6 *Chalcedony.*

As for that which is commonly ſtil'd a *Toad-ſtone,* that is properly a Tooth of the Fiſh called *Lupus Marinus,* as hath been made evident to the Royal Society, by that Learned and Inquiſitive Perſon, Dr. *Merit.*

4. *More Tranſparent* Gems, may be diſtinguiſh'd into ſuch as are either,

- *Colourleſs*; either moſt hard and bright, or that which is very like to this in other reſpects, but only leſs hard and bright.
  - 1 *Diamond,* Adamant. / *Sapphire white.*
- *Coloured*; to be rang'd according to the Colours in the Rainbow.
  - *Red*; of a Luſtre greater or leſs.
    - 2 *Ruby,* Carbuncle. / *Granate.*
  - *Yellow*; whether paler or deeper.
    - 3 *Chryſolite.* / *Topaz.*
  - *Green*; either moſt bright and pleaſant, or of a darker kind of Sea-green.
    - 4 *Emerald,* Smaragd. / *Beryl.*
  - Bluiſh.
    - 5 *Sapphire.*
  - *Purple,* or *Violaceous*; more inclining to Blue, or to Yellow.
    - 6 *Amethyſt.* / *Hyacinth.*

5. Such *Earthy Concretions* as commonly grow in Mines, together with ſuch other factitious Subſtances as have ſome Analogy to theſe, and are *diſſolvable* by Fire or Water, may be diſtinguiſh'd by their being

- *Not Inflammable*;
  - More Simple; being ſeveral kinds of Salts, whether of the
    - Sea-water, the moſt neceſſary Condiment for Meat; or of the Air, uſed as a chief Ingredient in the making of Gun-powder.
      - 1 *Salt.* / *Nitre,* Salt-petre.
    - *Earth*; of a Styptick Quality, and Abſterſive, proper for the drying of Wounds, commonly boil'd up in a Conſiſtence from a *Mineral Water*; or that other kind of Earthy Salt dug up in great Lumps.
      - 2 *Alume.* / *Sal Gemmæ.*
    - *Metals* of all kinds; ſometimes call'd Sugars and Cryſtals, but agreeing in the common Nature with that which is ſtil'd
      - 3 *Vitriol,* Chalcanthus, Copperas.
    - *Vegetables,* made either by Fermentation, or by Burning.
      - 4 *Tartar.* / *Alcali.*
    - *Animal Subſtances,* made by Diſtillation, called,
      - 5 *Urinous Salt.*
  - More mix'd of other Salts; more Volatile, or Fixed.
    - 6 *Sal-Armoniac.* / *Chryſocolla,* Borax.
- *Inflammable*; of a more
  - *Dry* Conſiſtence, and *yellowiſh* Colour.
    - 7 *Sulphur,* Brimſtone.
  - *Clammy* and tenacious Conſiſtence.
    - Not *ſweet-ſcented*; more Solid, or more Liquid.
      - 8 *Bitumen.* / *Naphtha.*
    - *Sweet-ſcented.*
      - 9 *Ambergris.*

6. *Earthy Concretions not Diſſolvable,* may be diſtinguiſhed by their various Colours; being either

- *White* and ſoft, according to degrees, more or leſs.
  - 1 *Chalk.* / *Marle.*
- *Yellowiſh Red,* whether more Yellow, or more Red.
  - 2 *Oker,* Yellow Oker. / *Red Oker,* Ruddle.
- *Black*; of a finer or coarſer Grain.
  - 3 *Jett.* / *Pit-coal,* Sea-coal.
- *Gold-colour,* of a poiſonous Nature, either as it is dug out of the Earth, or as it is ſublim'd.
  - 4 *Orpiment,* Auripigmentum. / *Arſenick,* Rats-bane.
- *Reddiſh*; often found in the ſame Mines with Orpiment.
  - 5 *Sandarach.*

STOPPER, is a piece of Rope (in a Ship) having a Wale-knot at one end, with a *Lannier* ſpliced into it, and at the other end 'tis made faſt in the place where 'tis to be uſed. Its uſe is to ſtop the main Halliards, or the Cable. The Stopper for the Halliards is faſtened at the Main-Knight, and it ſerves when they are Hoiſing the Main-yard to ſtop it, while the Men that hale may ſtay and reſt a little. But 'tis chiefly uſed for the Cable, to ſtop it, that it don't run out too faſt: They bind the *Wale-knot* about the Cable with the *Lanniers*, and that ſtops it, ſo that it cannot ſlip away. This Stopper is faſtened to the Bottom of the Bitts by the Deck. The Word is, *Lay on the Stoppers.* And a Ship is ſaid to *Ride by the Stoppers*, when the Cable is faſtened or ſtayed only by them, and not *Bitted*; but this is not ſafe Riding in a ſtreſs of Weather.

STRABISMUS, Squinting, is occaſioned by the Relaxation, Contraction, Diſtortion, too great Length, or too great Shortneſs of the Muſcles which move the *Eye*. *Blanchard.*

STRAIT, or *Streight*, in Hydrography, is a narrow Sea ſhut up between Lands on either ſide, affording a Paſſage from one great Sea into another; as the *Strait of Magellan*, the *Strait of Gibralter*, &c.

STRAKE, in the Sea Phraſe, is a Seam between two Planks; as the *Garboard-ſtrake* is the firſt Seam next the Keel. They ſay alſo a Ship heels *a-ſtrake*, that is, hangs or inclines to one ſide, the Quantity of an whole Plank's breadth.

STRANGURY, is a difficulty of Urine, when the Urine comes away by Drops only, accompany'd with a conſtant Inclination of making Water.

STRAP, in a Ship, is the Rope which is ſpliced about any Block, and made with an Eye to faſten it any where on occaſion.

STRATA. Dr. *Woodward*, in his Natural Hiſtory of the Earth, obſerves (and that very truly) That the far greateſt part of the Terreſtrial Globe conſiſts from its Surface downwards to the greateſt Depth we ever Dig or Mine, of ſeveral *Layers* or *Strata* of different kinds of Earthy Matter lying one over another, without any regular Order. This Diſpoſition of the Earth into theſe *Strata*, had been before obſerved by *Steno*; but the Obſervations and Deductions that Dr. *Woodward* made from them, are wholly New, very Numerous, and of great Importance.

STRATARITHMETRY, is the Art of Drawing up an Army or Battallion of Men, according to any Geometrical Figure aſſigned: And alſo of expreſſing the juſt Number of Men contained in ſuch a Figure, as they ſtand in Array, either near at hand, or at a Diſtance.

STRATIFICATION, or *Stratum ſuper Stratum*, as the Chymiſts call it, is putting different Matters *Bed upon Bed*, or one Layer upon another, in a Crucible in order to calcine a *Metal* or *Mineral*. Thus in *Cementation* (which ſee) there is firſt laid a Bed of Cement, then a Plate of Gold; then another Layer of Cement, and then another Plate of Gold; and this is done alternately, till the Crucible is full; which the Chymiſts would expreſs by ſaying, *Stratifie* Gold and Cement in a Crucible.

STREAM-*Anchor*, is only a ſmall one made faſt to a *Stream-Cable* for a Ship to ride by in gentle Streams, and in fair Weather, when they would only ſtop a Tide.

STRETCH; when at Sea they are going to *Hoiſe the Yard*, or *Hale the Sheet*, they ſay, *Stretch forwards the Hale-Yards*, or *Sheets*; meaning that the part which the Men are to Hale by, ſhould be put into their Hands, in order to their Hoiſing or Haling.

STRIÆ, with the Writers of Natural Hiſtory, are the ſmall *Hollows*, *Channels* or *Chamferings*, which are found in the Shells of Cockles, Eſcollops, and other Shell-Fiſhes.

STRIKE, a Sea-word variouſly uſed: When a Ship in a Fight, or on meeting with a Man of War, lets down or lowers her Top-ſails, at leaſt half Maſt high, which they call Striking the Top-ſails upon the Bunt, they ſay, She *Strikes*, meaning, ſhe Yields or Submits, or pays her Devoir to that Man of War as ſhe paſſes by. When a Ship touches Ground in ſhoal Water, they ſay alſo, ſhe *Strikes*. When any Top-maſt is to be taken down, the Word is, *Strike the Top-maſt*: And when any thing is Let or *Lowered*, as they call it, down into the Hold, they call it Striking down into the Hold.

STRIKING-*Wheel*, in a Clock, is that which by ſome is called the *Pin-wheel*; becauſe of the *Pins* which are placed upon the Round or Rim (which in Number are the *Quotient* of the *Pinion* divided by the *Pinion* of the *Detent-wheel.*) In 16 Days Clocks, the *firſt* or *great Wheel* is uſually the *Pin-wheel*; but in Pieces that go 8 Days, the *ſecond* Wheel is the *Pin-wheel* or *Striking-wheel.*

STRUCTURE, is the Combination or Reſult of all thoſe Qualities or Modifications of Matter in any Natural Body, which diſtinguiſh it from others, and are what in other Words, is called the peculiar *Form* or *Texture* of it.

STRUMA. See *Scrophula.*

STUPEA, *ſeu Stupa*, is a piece of Linen dipt in a Liquor, and applied to the part affected.

STYLE, ſo the Botaniſts call that middle prominent part of the Flower of the Plant, which adheres to the Fruit or Seed: 'Tis uſually long and ſlender, whence its Name of *Stylus.*

STYLE, in Dialling, is that Line whoſe Shadow on the Plane of the Dial, ſhews the true Hour-Line. This is always ſuppoſed to be a part of the Axis of the Earth, and therefore muſt always be ſo placed, as that with its two extreme Points it ſhall reſpect the two Poles of the World, and with its Upper-end, the elevated Pole. This Line is the upper Edge of the Cock, Gnomon, or Index.

STYLOBATA, in Architecture, is the Pedeſtal of a Column or Pillar.

STYLOBATON, or *Stylobata*, in Architecture, is the ſame with the Pedeſtal of a Column. This is ſometimes taken for the Trunk of the Pedeſtal, between the Cornice and the Baſe; and then called *Truncus*, as it is alſo by the Name of *Abacus.*

STYLOCERATOHYOIDES, are Muſcles of the *Os Hyoides*, which draws upwards the Tongue and Larynx, as alſo the Jaws in Deglutition, whereby the Maſticated Aliment is not only compreſſed into the latter, (the Fauces being then dilated) but the Epiglottis is alſo depreſſed, and adequately covers the *Rimula* of the *Larynx*, by its Application to it; by which means the deſcent of the leaſt part of the Aliment into the *Aſpera Arteria* is hindred; which is a moſt wonderful Mechaniſm.

They ariſe from the outward Appendix of the *Os Styliforme*, and are extended to the Horns or Points of the *Os Hyoides*. The middle Tendon of the *Digaſtricus* of the Lower-Jaw is tranſmitted through it. 'Tis called alſo *Styloboidæus*.

STYLOEIDES, are Proceſſes of Bone faſhion'd backward like a Pencil faſtned into the Baſis of the Scull it ſelf.

STYLOGLOSSUM, is that pair of Muſcles which lift up the Tongue. They ariſe from the Appendix of the *Os Styliforme*, and are inſerted about the middle of the Tongue.

STYLOHYOIDÆUS. See *Styloceratohyoides*.

STYLOPHARYNGÆUS, is a pair of Muſcles placed at the Foot of the *Proceſſus Styloides*, that dilate the Gullet, and draw the *Fauces* upwards. They deſcend from an Appendix of a Bone in faſhion of a Pencil, and which reaches the Sides of the Gullet.

STYMMA, is that thick Maſs which remains after the ſteeping of Flowers, Herbs, *&c.* and preſſing out their Oil. *Blanchard.*

STYPTICK (Blood-ſtopping) the ſame with Aſtringents in the general; which ſee.

STYPTICK-*Water* of Mr. *Lemery*, is made of Colcothar, Burnt-Allum, Sugar-candy, of each half a Dram; the Urine of a Young Man and Roſe-water, of each half an Ounce; Plantane-water, 2 Ounces: Mix all in a Mortar, and let it ſtand on the Sediment in a Viol; and when you would uſe it, pour off the clear Water by Inclination: 'Tis of very good Uſe to ſtop Bleeding.

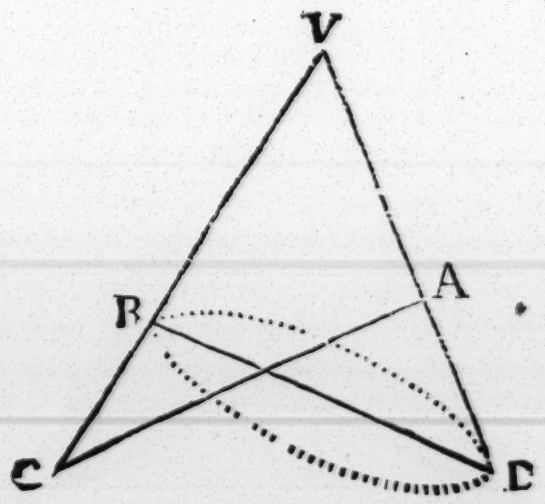
SUBALTERN *Propoſitions*, as ſuch as differ only in Quantity, and agree in Quality; as every Triangle is Right-Angled; ſome Triangles are Right-Angled.

SUBCARTILAGINEUM. See *Hypocondrium*.

SUBCLAVIAN-*Veſſels*, are the Veins and Arteries that paſs under the *Clavicles*.

SUBCLAVIS, is a Muſcle of the *Thorax*, which ariſes from the inferior part of half the *Clavicula*, next its connexion with the *Spina Scapulæ*; hence its Fibres deſcend obliquely forwards to its Inſertion at the ſuperior part of the firſt Rib near the *Sternum*. Its uſe, according to *Spigelius*, who has written a Chapter expreſly about this Muſcle, is to depreſs the *Clavicula*.

SUBCONTRARY *Poſition*, (in Geometry) is when two ſimilar Triangles are ſo placed as to have one common Angle V at the Vertex, and yet their Baſes not parallel.



And therefore if the Scalenous Cone B V D be ſo cut by the Plane C A, as that the Angle at C = D. The Cone is then ſaid to be cut *Subcontrarily* to its Baſe B A. See *Spherick Geometry*, where ſuch a Section of a Cone is demonſtrated to be a Circle.

SUBCONTRARY *Propoſitions*, are ſuch as particularly differ in Quality, and agree in Quantity; as, *ſome Man is a Creature, ſome Man is not a Creature.*

SUBCUTANEUS, a Branch of the *Baſilica*, running towards the inner Condyle of the Arm. It divides into *Ramus Anterior*, and *Poſterior*, which ſee.

SUBDUCTION, the ſame with *Subſtraction*; which ſee.

SUBDUPLE *Proportion*, is when any Number or Quantity is contained in another twice: Thus 3 is ſaid to be *Subduple* of 6, as 6 is double of 3.

SUBETH *Avicennæ*. See *Coma*.

SUBJUNCTIVE *Mood* (in *Grammar*) ſo called, becauſe it has always ſome Condition annexed to what we affirm, and ſo is ſubjoined to, or conjoined with ſome other *Verb*.

SUBLUXATION, a Diſlocation, or putting out of Joint.

SUBLIMATE *Corroſive*, is a Preparation in Chymiſtry, whereby Mercury is impregnated with Acids, and then ſublimed up to the top of the Veſſel: Thus performed.

Pour on a Pound of good running Mercury, 18 Ounces of Spirit of Nitre, ſet the Matraſs in Sand a little warmed, till the Mercury be all diſſolved, evaporate the Diſſolution in a Glaſs, or Earthen Pan, till all the Moiſture be carried off; and then powder the remaining white Maſs in a Glaſs-Mortar, and then mix with it a pound of Vitriol calcined white, and ſo much Salt decrepitated. Put this Mixture into a Matraſs, whoſe 2 Thirds at leaſt remain unfilled; ſet the Veſſel in Sand, and begin with a ſmall Fire for three Hours, after which, that Fire muſt be encreaſed to a good ſtrength: The Sublimate will adhere to the top of the Matraſs, and there will be a pound and three Ounces of it. The Red *Scories* at the Bottom are uſeleſs. 'Tis a more violent Eſcharotick than the *Lapis Infernalis*, and inwardly taken, is one of the ſtrongeſt Poiſons in the World. Of this is made *Mercurius Dulcis*. The Druggiſts ſometimes ſell a ſort of it that is made of *Arſenick*; but you may eaſily diſcover it by rubbing it with a little Salt of Tartar, for then it will turn *Black*, but if it turn *Yellow*, 'tis good.

SUBLIMATION, an Operation in Chymiſtry, whereby the finer and more *ſubtile* Parts of a mixt Body are ſeparated from the reſt, and carried up in the Form of a very fine Powder to the Top of the Veſſel. Theſe Powders they call *Flowers*, as *Flowers of Brimſtone*, of *Benjamin*, &c. the Veſſels that ſerve for theſe Uſes, are called,

SUBLIMING *Pots*, or *Aludels*; (which Word ſee.)

SUBLIMIS, one of the Muſcles that bend the Fingers.

SUBLINGUALES, are Glands, one on each ſide of the Tongue, they have two excretory Ducts (as the *Maxillares*) form'd by the Union of that of each ſmall Gland; they run on each ſide of the Tongue, near its Tip, where they open into the Mouth at a little Diſtance from the Gums; when the *Mylohyoidæus* acteth, it compreſſes them.

SUBLIN-

SUBLINGUINUS, is the ſame with the *Epiglottis* or *Pion*; which ſee.

SUBLUNARY, all things that are in the Earth, or in the Atmoſphere thereof, below the Moon.

SUBMULTIPLY Number, or Quantity, is that which is contained in another Number, a certain Number of Times exactly: Thus, 3 is Submultiply of 21, as being contained in it 7 Times exactly.

SUBMULTIPLY *Proportion*, the Reverſe of *Multiply*; which ſee.

SUBORNATION, is a ſecret or under-hand preparing, inſtructing, or bringing in a falſe Witneſs, or corrupting or alluring to do ſuch a falſe Act. Hence the *Subornation of Perjury*, mention'd in the Act of *General Pardon*, 12 *Car.* 2. *cap.* 8. is the Alluring to Perjury.

SUBPOENA, is a Writ whereby all Perſons, under the Degree of Peerage, are called into *Chancery*, in ſuch Caſe only where the Common Law fails, and hath made no proviſion; ſo as the Party who in Equity hath Wrong, can have no ordinary Remedy by the Rules and Courſe of the Common Law: But Peers of the Realm, in ſuch Caſes, are called by the Lord Chancellor's, or Lork Keeper's Letters, giving notice of the Suit intended againſt them, and requiring them to appear.

There is alſo a *Subpœna ad teſtificandum*, for the ſummoning of Witneſſes, as well in *Chancery*, as other Courts.

There is alſo a *Subpœna* in the *Exchequer*, as well in the Court of Equity there, as in the Office of Pleas.

And theſe Names proceed from the Words in the Writ, which charge the Party ſummoned, to appear at the Day and Place aſſigned; *ſub Pœna centum Librarum.*

SUBSCAPULARIS, or *Immerſus*, is a Muſcle of the Arm, ſo named from its ſituation; by ſome called *Immerſus*. It is a large fleſhy Muſcle filling the Internal Concave, part of the *Scapula*; ariſing fleſhy from its whole *Baſis*, and *Superior* and *Inferior Coſta* Internally, and marcheth forward, leſſening it ſelf according to the Dimenſions of the Bone, and paſſing over the Juncture, is inſerted in a Semicircular manner to the Neck of the *Os Humeri*: When this acteth, the *Os Humeri* is pulled near the Trunk of the Body. The Tendon of this Muſcle, together with the *Supra* and *Infra Spinatus*, and *Teres Minor*, unite near their Inſertions, and environ the Articulation of the *Os Humeri* with the *Scapula* not unlike the *Ligamentum Catum* of the *Coxa*, to prevent frequent Luxations: And by their ſucceſſive alternate acting, the Arm is moved circularly.

SUBSIDY, in Law, ſignifies an Aid, Tax, or Tribute granted by Parliament to the King, for the urgent Occaſions of the Kingdom, to be levied of every Subject, according to the Rate of his Lands or Goods, as the Parliament ſhall think fit.

SUBSTANCE, is whatever ſubſiſts by it ſelf independently from any created Being; and which is the Subject of Accidents and Qualities.

SUBSTANTIA *Corticalis Cerebri*. See *Corticalor Cinentia*.

SUBSTANTIVES (in *Grammar*) are ſuch Words as deſcribe the Abſolute Being of a Thing, and which joined with a Verb, do make a perfect Sentence.

SUBSTYLAR *Line*, in Dialling, is that Line drawn on the Plane of the Dial, over which the Style ſtands at Right Angles with the Plane. This is always the Repreſentation of the Meridian of that place where the Plane of the Dial is Horizontal. The Angle between the Line, and the true Meridian, is the Plane's Difference of Longitude, and is meaſured on the Equinoctial.

SUB-SUPER *particular* Proportion, is contrary to *Super-particular* Proportion; which ſee.

SUBTENSE, or Chord of an Arch, is a Right Line extended from one End of that Arch to the other End thereof.

SUBTERRANEOUS, or *Subterranean*, is whatever is within the Surface, Bowels, or Caverns of the Earth. Thus thoſe Trees, which being left there at the Univerſal Deluge, are ſo plentifully found buried in the Earth, in many Countries, are called *Subterraneous Trees*, and by ſome, *Foſſile-wood.*

SUBTRACTION, in the general, is taking a leſſer Quantity from a greater, to find the Difference between them, which is commonly called the *Remainder*; as the leſſer Quantity to be ſubſtracted is called the *Subtrahend.* The General Sign or Mark of Subſtraction is ——

SUBSTRACTION, in Algebra, or in Species, conjoins the Magnitudes propoſed, changing all the Signs of the *Subtrahend.*

Thus: If from 4 *a*, you ſubſtract *a*, by changing the Sign of the *Subtrahend*, it will ſtand thus:

$$\begin{array}{r} 4\,a \\ -\,a \\ \hline X = 3\,a \end{array}$$

Or thus.

$$4\,a - a = 3\,a.$$

And in Algebra, the Remainder, or Difference is uſually noted by the Letter X, or *d.*

N. B. To ſubſtract +, is the ſame as to add — and to ſubſtract —, is all one as to add +; as is plain from the Reaſons given in Addition in Algebra; which ſee.

Algebraick Subſtraction, in Compound Quantities, will eaſily be performed by only obſerving the General Rule of changing the Signs of the Quantity to be ſubſtracted, and then comparing the ſeveral Members together, and contracting them.

As ſuppoſe from $36\,b + 5\,m\,m - 7\,d\,f$, you would ſubſtract $20\,b + 2\,d\,f + 5\,m\,m$. Write them down one under another, changing all the Signs of the *Subtrahend*; and it will ſtand thus.

$$\begin{array}{r} 36\,b + 5\,m\,m - 7\,d\,f \\ -20\,b - 5\,m\,m - 2\,d\,f \\ \hline 16\,b - 9\,d\,f = X \\ \hline \end{array}$$

Which compared and contracted, will give the Difference or Remainder.

SUBSTRACTION of *Indices*, is done as Algebraical Quantities are, by changing the Sign of the *Subtrahend:* Thus,

From

From 3 take $\overline{2} = 5$, from 3 take $\overline{2} = 5$ from 3 take $\overline{2} = 1$, from 3 take $\overline{2} = 1$.

SUBTRACTION of *Integers*, in *Common Arithmetick*, is performed by ſubſcribing the leſſer Number under the greater, orderly; ſo that Units ſtand under Units, Tens under Tens, *&c.* and then beginning at the place of Units at the Right Hand: Take the leſſer from the greater, writing down the Remainder under the Line: If nothing remain, write down a Cypher, or 0. If the upper Number be in any part (for it cannot be ſo in the whole) leſſer than the Lower, add Ten to it, or call it Ten more than it is, writing down orderly the Exceſs above Ten; and then be ſure to carry that Ten ſo borrowed, to the next Figure, calling it One more than it is, and ſo on, as the following Examples.

	18	756	8254	567438
	15	431	6332	358784
Rem.	3	325	1922	208654

In *Subtraction*, the Number to be ſubtracted, together with the Difference or Remainder, are equal to the Number from which the Subtraction was made, which is a good Proof for Subtraction; as in the third Example, 6332, and the Remainder 1922, makes 8254, the firſt Number.

But if the Numbers be of different Denominations, then 'tis but taking the lower Denomination from that above it, and ſetting down the Remainder: But if any of the upper Denominations be leſſer than their reſpective lower ones, then you muſt borrow one of the former Denominations next to the Left Hand, and ſubtract, remembring to add 1 to the next Denomination below. As in the following Examples.

l.	*s.*	*d.*	*l.*	*s.*	*d.*
375	11	05	1754	11	02
132	09	04	982	13	05
243	02	01	771	17	09

Here the firſt Example has nothing of Difficulty in it; for the Lower is in each Denomination leſſer than its Upper.

In the ſecond Example, ſince 5 *d.* cannot be taken out of 2 *d.* I borrow 12 *d.* and 'twill be 14 *d.* Then I ſay, 5 from 14 leaves 9, which I ſet below: Now the 12 *d.* I borrowed, muſt be added to the 13 *s.* on the left Hand, then 'twill be 14 *s.* which I ſubtract from 31, (borrowing 20) reſts 17: Then, as in whole Numbers, 3 from 4 leaves 1, *&c.*

SUBTRACTION *of Logarithms.* See *Logarithms*, N. 4.

SUBTRACTION *of Vulgar Fractions.* See *Vulgar Fractions.*

SUBTRACTION *of Decimal Fractions.* See in *Decimal Fractions.*

SUBTRIPLE *Proportion*, is when one Number or Quantity is contained in another three times: Thus 2 is ſaid to be *Subtriple* of 6, as 6 is Triple of 2.

SUCCENTURIATI *Renes.* See *Capſulæ attribilaria.*

SUCCESSION *of the Signs*, is that Order in which they are uſually reckoned: As firſt *Aries*, next *Taurus*, then *Gemini*, &c. This is otherwiſe called Conſequence.

SUCCOTRINE *Aloes*, is the fineſt ſort that comes from the Iſland *Succortra*, on the Coaſt of *Arabia*, and from its Colour is called, *Aloes Hepatica*, or Liver-colour'd Aloes.

SUCCUS *Pancreaticus.* See *Ductus Pancreaticus.*

SUCULA or *Succula*, is a Term in Mechanicks for a bare Axis or Cylinder, with Staves in it to move it round, but without any Tympanum, or *Peritrochium.*

SUDAMINA, are little Pimples in the Skin, like Millet Grains; this is frequent in Children and Youths, eſpecially thoſe that are of a hot Temper, and uſe much Exerciſe: They break out in the Neck, Shoulders, Breaſt, Arms and Thighs, *&c. Blanchard.*

SUDOR, Sweat, is a watry Humour which conſiſts of Water chiefly, with a moderate Quantity of Salt and Sulphur; this is driven through the Pores of the Skin by the Heat and Fermentation of the Blood, and ſometimes by its Weakneſs and Colliquation. *Blanchard.*

SUDORIFIKS. See *Hydroticks.*

SUFFITUS, is a thickiſh Powder prepared of Odoriferous Plants, Gums, *&c.* which thrown upon Coals produces a pleaſant Smell. *Blanchard.*

SUFFOCATIO *Uterina.* See *Hiſterica paſſio.*

SUFFRUTEX, is a Name by the Botaniſts, given to a low woody Perennial Plant, ſending out no Leaves from its Root, and beginning to be branched from the very Bottom of the Stalk; ſuch as *Lavender*, *Rue*, *Sage*, &c.

SUFFUSION. See *Hypochyma & Cataract.*

SUGAR *of Lead.* See *Salt of Saturn.*

SUIT, ſignifies a following another, but in divers Senſes.

The firſt, is a Suit in Law, and is divided into *Real* and *Perſonal*, and is all one with *Action Real* and *Perſonal.*

Secondly, *Suit of Court*, or *Suit-ſervice*, is an Attend that Tenants owe to the Court of their Lord.

Thirdly, *Suit-Covenant*, is when your Anceſtor hath covenanted with mine *to Sue* to his Court.

Fourthly, *Suit-cuſtom*, when I and my Anceſtors have been ſeized of their own and their Anceſtors *Suit*, time out of Mind.

Fifthly, *Suit Real* or *Regal*, when Men come to the Sheriffs Turn or Leet.

Sixthly, *Suit* ſignifies the following one in Chace, as *Freſh-ſuit.*

Laſtly, it ſignifies a Petition made to the King, or any great Perſon.

SUIT *of the King's Peace*, is purſuing a Man for Breach of the *King's Peace* by Treaſons, Inſurrections or Treſpaſſes.

SULPHUR, the ſecond Hypoſtatical Principle of the Chymiſts, which we call Oil. See *Oil.*

The

The Conſtituent Character of Sulphur ſeems to be *Inflammability*: And there are three Kinds of Inflammable Bodies obtainable by Chymiſtry.

Firſt, *An Oil.*

Secondly, *An Ardent Spirit.*

Thirdly, *A Conſiſtent Body*, like to common Brimſtone: All which are properly Sulphur.

SULPHUREOUS *Spirit of Vitriol.* After the Spirit and Oil of Vitriol are in Diſtillation of that Mineral, driven out by a moſt violent Fire (for 3 or 4 Days together) into the Receiver, they commonly Rectifie the Matter in a Glaſs-Body; and the firſt Spirit that riſes then with a very gentle degree of Fire, is called the *Sulphureous Spirit of Vitriol.*

SULPHUR *of Antimony.* See *Golden Sulphur of Antimony.*

SUM, in Mathematicks, ſignifies the Quantity that ariſes or reſults from the Addition of two or more Magnitudes, Numbers or Quantities together; this is ſometimes call'd the *Aggregate*: And in Algebra, 'tis uſually denoted by the Letter Z, which ſtands for *Zuma* or *Suma*; and ſometimes by the Initial Letter S.

SUM *of an Equation*, is when the abſolute Number being brought over to the other ſide with a contrary Sign, the whole becomes equal to O. And this *Des Cartes* calls *the Sum of the Equation propoſed.*

SUMMER *Solſtice.* See *Solſtice.*

SUMMONEAS, is a Writ Judicial of great diverſity, according to the divers Caſes wherein it is uſed, which ſee in the Table of the *Regiſter Judicial.*

SUMMONS, in Common Law, is as much as *Vocatio in jus*, or *Citatio* among the *Civilians*: But how *Summons* is divided, and what Circumſtances it has to be obſerved. See *Fleta lib.* 6. *Cap.* 6, 7.

SUMMONS, *in Terra petita*, is that Summons which is made upon the Land, which the Party (at whoſe Suit the *Summons* is ſent forth) ſeeks to have.

SUMMONS *ab Warrantizand.* in Law, is the Proceſs whereby the Vouchee is called.

SUMPTUARY *Laws*, were Laws made to reſtrain Exceſs in Apparel, and to prohibit coſtly Cloaths, of which we had formerly many in *England*, but now are all repealed.

SUN, Our Excellent Sir *Iſaac Newton* ſaith in his *Principia*, That the Denſity of the Sun's Light (which is Proportional to Heat) is ſeven times as great in *Mercury*, as with us; and therefore our Water *there* would be all carried off, and boil away: For he found by Experiments of the *Thermometer*, That an Heat but 7 times as great as that of the Sun-Beams in Summer, will ſerve to make Water boil.

He proves alſo, That the Matter of the Sun to that of *Jupiter*, is nearly as 1100 to 1; and that the Diſtance of that Planet from the Sun, is in the ſame Ratio to the Sun's Semidiameter.

That the Matter of the Sun to that of *Saturn*, is as 2360 to 1; and the Diſtance of *Saturn* from the Sun, is in a Ratio, but a little leſs than that to the Sun's Semidiamiter.

And conſequently that the common Center of Gravity, of the Sun and *Jupiter*, is nearly in the Superficies of the Sun; of *Saturn*, and the Sun a little within it. And by the ſame manner of Calculation it will be found that the common Center of Gravity of all the Planets, cannot be more than the Length of the Solar Diameter diſtant from the Centre of the Sun: This common Centre of Gravity he proves to be at reſt; and therefore tho' the Sun by reaſon of the various Poſition of the Planets may be moved every way, yet it cannot receed far from the common Centre of Gravity. And this he thinks ought to be accounted the Centre of our World. *Book* 3. *Prop.* 12.

By Means of the *Solar Spots* it hath been diſcovered that the Sun revolves round his own Axis, without moving (conſiderably) out of his Place, in about 25 Days. And that the Axis of this Motion is enclined to the Ecliptick, in an Angle of 87 Degrees, 30 Minutes nearly. *Gregor. Aſtronom.*

The Sun's apparent Diameter being ſenſibly ſhorter in *December* than in *June*, as is plain and agreed from Obſervation, the Sun muſt be proportionably nearer to the Earth in Winter than in Summer; in the former of which Seaſons will be the *Perihelion*, in the latter the *Aphelion*: And this is alſo confirmed by the Earth's moving ſwifter in *December*, than it doth in *June*; as it doth about $\frac{5}{115}$.

For ſince, as Sir *Iſaac Newton* hath demonſtrated by a Line drawn to the Sun, the Earth always deſcribes equal Area's in equal Times, when ever it moves ſwifter, it muſt needs be nearer to the Sun. And for this Reaſon there are about 8 Days more from the Sun's Vernal Equinox to the Autumnal, than from the Autumnal to the Vernal.

According to Mr. *Caſſini*, the Sun's greateſt diſtance from the Earth is 22374, his mean Diſtance 2200, and his leaſt Diſtance 8022, Semidiameters of the Earth.

And that the Sun's Diameter is equal to 100 Diameters of the Earth, and therefore the Body of the Sun muſt be 1000000 times greater than that of the Earth.

Mr. *Azout* aſſures us, that he obſerv'd by a very exact Method the Sun's Diameter to be not leſs than 31 Minutes, 45 Seconds in his *Apogee*, and not greater than 32 Minutes, 45 Seconds in his *Perigee.*

The mean Apparent Diameter of the *Sun* according to Sir *Iſaac Newton*, is 32 Minutes 12 Seconds, in his *Theory of the Moon*, 32′ 15″.

If you divide 360 Degrees (*i. e.* the whole Ecliptick) by the Quantity of the Solar Year, it will Quote 59 Minutes 8 Seconds, *&c.* which therefore is the Quantity of the Sun's Diurnal Motion. And if this 59 Minutes, 8 Seconds be divided by 24, you have the Sun's Horary Motion, which is 2 Minutes, 28 Seconds; and if you will divide this laſt by 60, you will have this Motion in a Minute, *&c.* And this way are the Tables of the Sun's mean Motion, which you have in the Books of Aſtronomical Calculation, conſtructed.

The Sun's Horizontal Parallax, Dr. *Gregory* and Sir *Iſaac Newton* makes but 10 Seconds.

The ſame learned Mathematician, at the end of his *Aſtronomiæ Phyſ. & Geometr. Elem.* hath a Comparative Aſtronomy, where among the reſt he conſiders what Phænomina would appear in the Planetary Syſtem, *&c.* to an Eye placed at the Sun, which are ſuch as theſe:

1. That the Fixt Stars would appear in a Concave Sphere, the apparent Centre of which, is the Eye of the Spectator.

2. He would diſtinguiſh the Planets from the Fixt Stars (tho' they would appear to him to be placed among them) by their Periodical Revolutions

ons, and by the Time of thoſe, one Planet from another: And he would judge that Planet to be fartheſt off, whoſe Periodical Revolution was the longeſt; and ſo on in order for the reſt, &c.

3. To this Solar Obſerver's Eye, the Planets would appear always *direct*, and never *Stationary*, nor *Retrograde*, as they do to an Eye at the Earth: And they would be found to return to the ſame Fixt Stars again as Periods of very different lengths; and the Inferior Planets would ſometimes cover the ſuperior ones.

4. If you ſuppoſe the Eye to be moved from the Centre of the Sun to its Surface, then by the Parallax of the Planets ſome better gueſs will be had of their Diſtances, than by the Obſervation of the different Velocity and Tardity of their Motion, could before be obtained: For to the Eye thus placed the Earth's Horizontal Parallax will be 16 Minutes, equal to the Sun's Semidiameter, and conſequently ſenſible enough. That of *Saturn* will be ſomething above one Minute and an half, (that Planet being 10 times the Diſtance of the Earth from the Sun; and the Horizontal Parallax of *Mercury* will be almoſt 50 Minutes: And ſince theſe Parallaxes are ſufficiently ſenſible, the Diſtances of the Planets may be compared with the Sun's Diameter, and with one another.

5. To an Eye thus placed all the Fixt Stars and Planets will ſeem to revolve from Eaſt to Weſt, in the ſpace of 25 of our Natural Days: The North Pole of which Revolution, will be in that part of the Heaven, which we (Inhabitants of the Earth) call the 10th Degree of *Piſces*, with 83 or 84 Degrees of North Latitude: Wherefore the Artick Pole-Star will be at the 2d Flexure of *Draco*, and which will not be above 3 Degrees from the Pole. The South-Pole will be in 10 Degrees of *Virgo*, with 83 or 84 Degrees South Latitude, near a Star of the fourth Magnitude, which in Cap. *Halley*'s Catalogue is in the firſt Oar of the *Argo Navis*.

6. The Planets thus ſeen from the Sun will appear of Different Magnitudes: For the Diameter of *Saturn*, will ſubtend there but an Angle of 18 Seconds: That of *Jupiter* near 40 Seconds: That of *Mars* but 8 Seconds: That of *Venus* 28 Seconds: And the Diameter of *Mercury* 20 Seconds.

But Mr. *Hugens* ſuppoſes the Diameters of the ſuperior Planets will be much larger; as making that of *Jupiter*, to ſubtend an Angle of almoſt 54 Seconds; and that of the Body of *Saturn* without his Ring 27 Seconds.

7. Of theſe ſix Planets thus moving round the Sun, three will appear attended with their Satellites: Of which the Earth will have but one, which is the Moon; and who will appear at the greateſt diſtance, not to be from the Earth above 10 Minutes.

Jupiter will appear with his four Moons, or Satellites; of which the outermoſt will never appear above nine Minutes diſtant from the Primary Planet.

Saturn will appear with his 5 Satellites (if ſo many there be) and the furthermoſt of them will never be above 9 Minutes diſtant from his Body: His Ring alſo will appear compaſſing round the Planet.

The Paths, or Orbits of theſe Satellites being ſeen from the Sun ſometimes more, ſometimes leſs Oblique, will appear accordingly now broader, now narrower Ellipſes; ſometimes the Planes of theſe Orbits being produced, will paſs thro' the Sun: In which Caſe, the former narrow Ellipſes will paſs into Right Lines; which will happen twice in every Revolution of the Orbit round the Sun, if its Plane remain always parallel to its ſelf: Whence the Satellite will now appear to be covered by the primary Planet, and then the Planet by it; and ſometimes will appear round the Planet, without its Disk, in an Ellipſis.

8. The primary Planets, as alſo their Satellites, have not only rough and unpoliſhed Surfaces, but alſo are ſo diſform, that they have their Spots, which are places more or leſs obſcure, (and ſometimes more bright) than the reſt of their Disk: And theſe *Spots*, by the Rotation of the Planet, or Satellite, round its Axis, do deſcribe Circles; and therefore theſe Ways, or Paths of the Spots, being ſeen from the Sun in the Plane of the Planetary Disk, will now appear Elliptical, and now ſtrait Lines, (as before the Paths of the Satellites Disk) according as the Sun is elevated on either ſide, above the Plane of thoſe Circles, or is found in it, as it is when it is in the Equinoctial of that Planet. And if there be a Series or Row, of theſe Spots, (as in the Belts of *Mars* and *Jupiter*) theſe will appear in the Form of Semi-Ellipſes (the one half being behind, or on the other ſide the planes) or will paſs into ſtraight Lines, which will alſo be the Caſe of the outward Edge of the Ring of *Saturn*. But ſome of theſe Spots will now and then be hid, and ſometimes be viſible for a long time, according as they are near to the Planets Pole, which is turned from or towards the Sun.

And this will be moſt obſervable in *Saturn*, and in the Earth, in the others ſcarcely at all, becauſe in them the Illuſtration of the Sun reaches to both their Poles.

9. Beſides theſe ſix primary Planets, and their 10 Satellites, which to our Solar Obſervator, will all appear to move within the Bounds of a Zodiack ſcarce 16 Degrees broad, and not much inclined to the Circle of the firſt Motion, all the ſame way, and in Orbits nearly Concentrical to the Sun: There are alſo another kind of Bodies, whoſe Number is uncertain, which move round the Sun in very Eccentrical Orbits, and which are called *Comets*; and which ſometimes come very near the Sun, and ſometimes are vaſtly remote from him.

Theſe *Comets* do not move all in the ſame Track (altho' each one always keeps his own) but ſome one Way, and ſome another, and moſtly in Orbits very much inclin'd to the Ecliptick, and always in great Circles of the Sphere. Their *Coma* or Tail (to an Eye at the Sun) will not appear oblong, or ſtretch'd out in length, as it doth to us, but every way diffuſed round the Head.

SUNARTHROSIS, is the jointing of Bones, as that of the Ribs with the *Vertebra*, &c.

SUNDAY *Letter*, the ſame with *Dominical Letter*.

SUPERBUS *Muſculus*. See *Attollens Oculorum*.

SUPERCILIUM. See *Cilium*.

SUPERFICIAL *Content*. See *Area*.

SUPERFICIAL *Numbers*; the ſame with *Plain Numbers*.

SUPERFICIES, the ſame with *Surface*; (which ſee) is Length and Breadth only, without Thickneſs.

SUPER-

SUPERFOETATION, is when after one Conception another ſucceeds, ſo that both are in the Womb together: *Sennertus* makes mention of frequent Caſes of this Nature.

SUPER-INSTITUTION, one *Inſtitution* upon another; as where *A.* is admitted and inſtituted to a Benefice upon one Title, and *B.* is *admitted, inſtituted*, &c. by the Preſentment of another.

SUPERONERATIONE *Paſturæ*, is a *Writ Judicial*, that lies againſt him who is impleaded in the County, for the over-burdening of a Common with his Cattle, in caſe where he was formerly impleaded for it in the County, and the Cauſe is removed into the King's Court at *Weſtminſter*.

SUPERPARTICULAR *Proportion*, is when one Number or Quantity, contains another once, and one ſuch Part whoſe Numerator is 1; then the Number ſo contained in the Greater, is ſaid to be to it in *Superparticular Proportion*.

SUPERPARTIENT *Proportion*, is when one Number or Quantity, contains another once, and ſome Number of *Aliquot Parts* remaining; as, $1\frac{2}{3}$, $1\frac{3}{4}$, $1\frac{2}{5}$, &c.

SUPER *Prerogativa Regis*, is a Writ which lay againſt the *King's Widow*, for marrying without his Licence.

SUPER *Statuto*, is a Writ that lay againſt the King's Tenant holding in Chief, which alienateth the King's Land without his Licence.

SUPER *Statuto de Articulo Cleri*, is a Writ againſt the Sheriff, or other Officer, that diſtrains in the King's High-way, or in the Glebe-Lands, anciently given to Rectories.

SUPER *Statuto facto pour Seneſchal & Marſchal de Roy*, &c. is a Writ lying againſt the *Steward*, or *Marſhal*, for holding Plea in the Court of Freehold, or for Treſpaſs, or Contract not made within the King's Houſhold.

SUPERLATIVE Degree, in *Grammar*, is when an *Adjective* hath joyned to its Natural and Ordinary Signification, the Word *moſt* or *very*, as *moſt Wiſe, very Good*.

SUPERPURGATION. See *Hypercatharſis*.

SUPERSCAPULARIS *Superior*. See *Supra-Spinatus*.

SUPERSEDEAS, is a Writ in divers Caſes, and ſignifies in general, a Command to ſtay, or forbear the doing of that which ought not to be done, or in appearance of Law were to be done, were it not for that whereon the Writ is granted.

Thus: A Man regularly, is to have Surety of Peace againſt him of whom he will ſwear he is afraid; and the Juſtice required hereunto cannot deny it him: Yet if the Party be formerly bound to the Peace, either in *Chancery*, or elſewhere, this Writ lies to ſtay the Juſtice from doing that which otherwiſe he ought not to deny.

SUPER *Statutum Edw.* 3. *verſus Servants & Labourers*, is a Writ lying againſt him who keeps my *Servants*, departed out of any Service againſt Law.

SUPER *Statuto de York, quo nul ſera Viteller*, &c. is a Writ that lies againſt him that uſes Victualling either in Groſs, or by Retail in a City, or Borough-Town, during the time he is Mayor, *&c.*

SUPERVISOR, ſignifies a Surveyor, or Overſeer: It was formerly, and is ſtill among ſome a Cuſtom, eſpecially of the better ſort, to make a *Superviſor* of a Will, but it is to little purpoſe: However the firſt might be good, that he ſhould *Superviſe* the Executor, and ſee the Will truly performed.

SUPINATOR *Radii Brevis*, is a Muſcle of the *Radius*, which ariſeth partly Tendinous and Fleſhy from the Superior and external Part of the *Ulna*, next the *Radius*, and paſſing obliquely tranſverſe over that Bone, is ſo inſerted to its ſuperior Part below the Prominence of the *Radius*, where the round Tendon of the *Biceps* endeth: It helps with the *Supinator Longus*, to move the *Radius* outwards.

SUPPEDANEA. See *Supplantalia*.

SUPINATOR *Radii Longus*, is a Muſcle of the *Radius*, which ariſeth broad and fleſhy from the ſuperior and external Part of the *Os Humeri*, three Fingers breadth below the Termination of the *Deltoides*, and deſcending obliquely inwards, it gradually leſſens it ſelf, and becomes a flat, broad Tendon, which likewiſe grows narrower till it is inſerted to the external and inferior Part of the *Radius* near the *Carpus*, it helps with *Supinator Brevis*, to move the *Radius* outwards.

SUPPLANTALIA, are Plaiſters applied to the Feet; theſe for the moſt part are made of Leven, Muſtard, wild Radiſh, Salt, Soap, Gunpowder, Euphorbium, *&c.* they are called alſo *Suppedanea*.

SUPPLEMENT of an Ark, in *Geometry* or *Trigonometry*, is the Number of Degrees that it wants of being an entire Semi-circle; as Complement ſignifies what an Ark wants of being a Quadrant.

SUPPLICAVIT, is a Writ iſſuing out of the *Chancery*, for taking the Surety of Peace againſt a Man: It is directed to the Juſtices of Peace of the County, and the Sheriff, and is grounded upon the Statute, *Anno* 1 *E.* 3. *Cap.* 16. which ordains, That certain Perſons in *Chancery* ſhall be aſſigned to take care of the Peace. This Writ was formerly called *Breve de minis*.

SUPPORTERS, in *Heraldry*, are ſome kind of *Beaſts, Birds*, &c. which in an Atchievement, are drawn ſtanding on each ſide of, and ſupporting the Shield, or Eſcutcheon. No one under the Degree of a *Knight Banneret*, can have his Arms drawn with *Supporters*.

SUPPOSITORY, is an oblong piece of a kind of Paſte, of about a Finger's length, which in ſome Caſes is put up into the Fundament, to purge the Patient; 'tis uſually compounded of Honey, Salt, purging Powders, *&c. Blanchard.*

SUPPURATION. See *Abſceſſus*.

SUPRA *Spinatus*, or *Supra Scapularis*, is a Muſcle ſo called, becauſe it is placed above the Spine of the Shoulder-blade: It ariſeth fleſhy from the ſuperior part of the *Baſis Scapulæ*, that is above its Spine; as alſo from the ſaid Spine and *Coſta ſuperior* of the *Scapula*; from thence paſſing between the *Proceſſus Coracoides*, and *Anchoreformis*, it grows leſs, and becoming Tendinous, marches over the Articulations of the *Humerus*, joining its Tendons with the *Infra-ſpinatus*, is inſerted to the Head of the *Os Humeri*. The proper Uſe of this *Muſcle*, is to lift the Arm upwards towards the *Occiput*.

SURA, the ſame with *Os Fibulæ*.

SURALIS, is a Branch of the *Vena Cruralis*, it divides into two Branches, the one External, and the other Internal, which is the biggeſt; and each of thoſe Branches divide again into two more: This Vein diſtributes its Branches upon the Fat of

the Leg, and makes with the Branches of the *Poplitea*, all thoſe *Plexus* of Veins which are conſpicuous on the upper Part of the Foot.

SURAL *Vein*, is a Vein which runs down on the Calf of the Leg,

SUR *cui in Vita*, is a Writ that lies for the Heir of that Woman, whoſe Husband has alienated her Land in Fee, and ſhe brings not the Writ *Cui in Vita*, for the Recovery of her own Land: In this Caſe her Heir may have this Writ againſt the Tenant after her Deceaſe.

SURD *Roots, or Numbers.*

When any Number or Quantity, hath its Root propoſed to be Extracted, and yet is not a *true Figurate Number of that kind*: That is, if its Square Root being demanded, it is not a *true Square*: If its Cube Root being required, it ſelf be not a *true Cube*, &c. Then 'tis impoſſible to aſſign, either in whole Numbers or Fractions, any exact Root of ſuch Number propoſed. And whenever this happens, 'tis uſual in Mathematicks to mark the required Root of ſuch Numbers or Quantities, by prefixing before it the proper Mark of Radicality, which is $\surd$: Thus $\surd$: 2 ſignifies the Square Root of 2, and $\sqrt[3]{}$: 16. or $\surd$: (3) 16. ſignifies the Cubick Root of 16: Which Roots, becauſe they are impoſſible to be expreſſed in Numbers exactly (for no effable Number, either Integer or Fraction multiplied into it ſelf can ever produce 2; or being multiplied Cubically can ever produce 16) are very properly call'd *Surd Roots*.

There is alſo another way of *Notation* now much in Uſe, whereby Roots are expreſſed, without the Radical Sign, by their *Indexes*: Thus, as x^2. x^3. x^5. &c. ſignifie the Square, Cube, and 5th Power of x; ſo $x^{\frac{1}{2}}$. $x^{\frac{1}{3}}$. $x^{\frac{1}{5}}$. &c. ſignifie the Square Root, Cube Root, &c. of x. The Reaſon of which is plain enough, for ſince $\surd$: x is a Geometrical mean Proportional between 1. and x. So $\frac{1}{2}$ is an Arithmetical mean Proportional between 0 and 1. and therefore as 2 is the Index of the Square of x, $\frac{1}{2}$ will be the proper Index of its Square Root, &c.

Obſerve alſo, that for Convenience or Brevity-ſake, Quantities or Numbers which are not *Surds*, are often expreſſed in the Form of *Surd Roots*, Thus $\surd$: 4 $\surd$: $\frac{9}{4}$ $\sqrt[3]{}$: 27, &c. ſignifie, 2, $\frac{3}{2}$ 3, &c.

But altho' theſe Surd Roots (when truly ſuch) are inexpreſſible in Numbers, they are yet capable of Arithmetical Operations (ſuch as Addition, Subſtraction, Multiplication, Diviſion, &c. which how readily to perform the Algebraiſt ought not to be Ignorant.

Surds are either *Simple*, which are expreſſed by one ſingle Term; or elſe *Compound*, which are formed by the Addition or Subſtraction of ſimple Surds: As $\surd$: 5 + $\surd$: 2: $\surd$: 5 − $\surd$: 2. or $\sqrt[3]{\surd: 7 + \surd: 2}$: Which laſt is called, an *Univerſal Root*: And ſignifies the Cubick Root of that *Number, which is the Reſult of adding 7 to the Square Root of 2.*

The Arithmetick of Surds conſiſts of theſe principal Parts.

I. *To reduce Rational Quantities to the Form of any Surd Roots aſſigned:*

Which is perform'd by Involving the Rational Quantity according to the Index of the Power of the Surd, and then prefixing before it the Radical Sign of the Surd propoſed.

Thus to reduce $a = 10$ to the Form of $\surd$: 15. = $\surd$: b. you muſt ſquare $a = 10$; and prefixing the Sign, it will ſtand thus, $\surd$: $a\,a = \surd$: 100. which is in the Form of the Surd deſired. So alſo if 3. were to be brought to the Form of $\sqrt[4]{}$: 12, you muſt raiſe 3 up to its fourth Power, and then prefixing the Note of Radicality to it, it will be $\sqrt[4]{}$: 81. or $81^{\frac{1}{4}}$, which is in the ſame Form with $\sqrt[4]{}$: 12.

And this way may a ſimple Surd Fraction, whoſe Radical Sign refers only to one of its Terms, be changed into another, which ſhall reſpect both Numerator and Denominator. Thus, $\frac{\surd: 2}{5}$ is reduced to $\surd$: $\frac{2}{25}$ and $\frac{5}{\surd: 4}$, to $\sqrt[3]{}$: $\frac{125}{4}$: Where the Radical Sign affects both Numerator and Denominator alike.

II. *To reduce Simple Surds, having different Radical Signs,* (which are called *Heterogeneal Surds, to others that may have one common Radical Sign, or which are Homogeneal.*

Divide the Indexes of the Powers of the Surds by their greateſt common Diviſor, and ſet the Quotients under the Dividends; then multiply thoſe Indexes croſs-ways by each others Quotients, and before the Products, ſet the common Radical Sign $\surd$: with its proper Index: Then Involve the Powers of the given Roots Alternately, according to the Index of each others Quotient, and before thoſe Products, prefix the common Radical Sign before found.

To Reduce $\sqrt[2]{}$: $a\,a$ and $\sqrt[4]{}$: $b\,b$

2) $\sqrt[2]{}$: $a\,a$ 2) $\sqrt[4]{}$: $b\,b$

1 X 2

$\sqrt[4]{}$: $b\,b$ $\sqrt[4]{}$: $a\,a\,a\,a$

To Reduce $\surd$: 5 and $\sqrt[4]{}$: 7

$\sqrt[2]{}$: 5 $\sqrt[4]{}$: 7.

1 X 2

$\sqrt[4]{}$: 25 $\sqrt[4]{}$: 2401.

III. *To*

III. *To reduce Surds to the loweſt Terms poſſible.*

Divide the Surd by the greateſt Square, Cube, Biquadrate, &c. or any other higher Power, which you can diſcover is contained in it, and will meaſure it without any Remainder, and then prefix the Root of that Power before the Quotient, or Surd ſo divided, and this will produce a new Surd of the ſame Value with the former, but in more ſimple Terms. Thus, $\surd : 16\,a\,a\,b$, by dividing by $16\,a\,a$ and prefixing the Root $4\,a$, will be reduced to this $4\,a\surd : b$ and $\surd : 12$, will be depreſſed to $2\surd : 3$. Alſo $\sqrt[3]{} : c\,b^3\,r$, will be brought down to $b\sqrt[3]{} : c\,r$. And this Reduction is of great Uſe whenever it can be performed: But if no ſuch Square, Cube, Biquadrate, &c. can be found for a Diviſor, then you muſt find out all the Diviſors of the Power of the Surd propos'd; and then ſee whether any of them be a Square, Cube, &c. or ſuch a Power as the Radical Sign denotes; and if any ſuch can be found, let that be uſed in the ſame manner as is above ſaid, to free the Surd Quantity in part from the Radical Sign. Thus, if $\surd : 288$ be propos'd; among its Diviſors will be found the Squares 4. 9. 16. 36. and 144. by which if 288 be divided, there will ariſe the Quotients 72. 32. 18. 8. and 2. wherefore inſtead of $\surd : 288$, you may put $2\surd : 72$, or $3\surd : 32$. or $4\surd : 18$. or $6\surd : 8$. or laſtly: $12\surd : 2$. and the ſame may be done in Species.

IV. *To find whether two Surd Roots given, are Commenſurable or not.*

Thoſe are called *Commenſurable Surds*, which are to one another as Number to Number, as one Rational Quantity to another; or which are, when reduced to their leaſt Terms, true Figurate Quantities of their own kind.

To diſcover therefore, whether they are ſuch or not: If the Surds are of different kinds, (or *Heterogeneal Surds* as ſome call them) they muſt firſt be reduced to one kind, and then divided ſeverally by their greateſt common Meaſure, for if then there will come out Rational Quotients, the firſt Surds are *Commenſurable*; but if the Quotients are Irrational, or Surd Numbers or Quantities, then the propoſed Surds are Incommenſurable.

V. gr. To Examine whether $\surd : 12$. and $\surd : 3$. are Commenſurable Surds, they being Homogeneal, I divide them ſeverally by their greateſt Common Diviſor, which is $\surd : 3$; and the Quotients are $\surd : 4$. and $\surd : 1$. that is 2 and 1. Wherefore, ſince 2 and 1. are Rational Numbers, I ſay that $\surd : 12$ and $\surd : 3$ are Commenſurable Surds; or are to one another as 2 to 1. which is very plain; for no doubt 12, 3 :: as 4 1. and 'tis plain that as Squares are to one another, ſo are their Roots; wherefore 12. 3. as $\surd : 12\surd : 3$. that is, as $\surd : 4.\surd : 1$. or as 2 to 1.

Whenever two Surds are divided by one common Diviſor, (tho' not the greateſt, if their Quotients come out Rational, or are to one another as Number to Number, thoſe Surds are certainly Commenſurable.

If Fractional Surds were given, not having a common Denominator, they muſt firſt be reduced to their ſmalleſt common Denominator, and then if their Numerators are Commenſurable, you may conclude the firſt Surd Fractions were ſo.

But if either the Numerators or Denominators of two Surds, proper Fractions, or mixt Numbers in the Form of Fractions (neglecting the Radical Sign) be Powers of that kind which the Radical Sign expreſſes, then they will need no Reduction: For if their Numerators or Denominators are Commenſurable, the whole Surd Fractions propoſed are certainly ſo. Thus, if it were enquired whether $\surd : \frac{50}{16}$ and $\surd : \frac{72}{25}$ are Commenſurable Surds; becauſe 16 and 25 are Squares, or ſuch Powers as the Radical Sign expreſſes or denotes, omitting the Sign $\surd :$ you need only compare the Numerators $\surd : 50$ and $\surd : 72$; which being divided by their greateſt common Diviſor, $\surd : 2$, the Quotients will be 5 and 6 (*i. e.* $\surd : 25$ and $\surd : 36$) Wherefore the given Surds are Commenſurable, and are to one another, as $\frac{5}{4}$ to $\frac{6}{5}$ and conſequently, by the precedent Rule may be expreſſed thus, $\frac{5}{4}\surd :$ 2 and $\frac{6}{5}\surd : 2$.

For an Inſtance in *Species*; ſuppoſe that it were enquired whether $\surd : 27\,a\,a$ and $\surd : 12\,a\,a$ were Commenſurable Surds; Divide each by the greateſt common Diviſor $\surd : 3\,a\,a$: And the Quotients $\surd : 9$ and $\surd : 4$. that is, 3 and 2. are Rational Numbers; and conſequently, the propoſed Surds are Commenſurable.

Multiplication of ſimple Surd Roots.

If the Surds propoſed be of the ſame kind, Multiply them one by another, and prefix the common Radical Sign to the Product; but if the Surds are Heterogeneal, or of different kinds, they muſt be reduced firſt (according to Rule 2.) to Surds, having the ſame radical Sign.

Thus to multiply $\surd : 7$ by $\surd : 8$. the Product will be $\surd : 56$.

For ſince in all Multiplication, as 1. is to one Factor, ſo is the other to the Product; therefore here $\surd : 1.\surd : 7 :: \surd : 8.\surd : 56$. But if 4 Terms are Proportionable, their Squares will be ſo too; wherefore 1. 7. :: 8. 56. that is, 56 is the true Square of $\surd : 56$ and $\surd : 56$. the true Root of $7 \times 8 = 56$.

Other Examples.

I. If $\surd : 8$ were to be multiplied into $\sqrt[3]{} : 4$. becauſe they are not Homogeneal Surds, they muſt be reduced to ſuch by *Rule* 2. and then they will ſtand thus, $\sqrt[6]{} : 512\ \sqrt[6]{} : 16$, which being multiplied into each other, and the common Radical Sign prefix'd, will make $\sqrt[6]{} : 8193$; and thus the $\sqrt[3]{} : 27$ multiplied by $\surd : 9$. when reduced, and rightly multiplied, produces $\sqrt[6]{} : 531441$.

II. When a Surd is to be multiplied by a Rational Quantity, that Rational Quantity ought firſt to be reduced to a Surd of like Nature with the true Surd. But 'tis oftentimes convenient only to connect them together, by prefixing the Rational Quantity to the Left-hand of the Surd. As ſuppoſe $\surd$ 27 were to be multiplied by 6, the Product may commodiouſly be expreſſed thus, $6 \surd : 27$, and ſo if $\sqrt[4]{} : 9$ were to be multiplied by 10, it will ſtand thus, $10 \sqrt[4]{} : 9$.

III. And when two Rational Quantities are thus prefix'd to two Surds of the ſame kind, you may find the Product of them, by multiplying the Rational Part by the Rational, and the Surd Part by the Surd, then thoſe joyned together, will be the Product required. Thus, $6 \sqrt[3]{} : 7$ multiplied by $5 \sqrt[3]{} : 3$ produces $30 \sqrt[3]{} : 21$.

IV. If any Surd Root be to be multiplied into it ſelf, or *Involved*, according to the Index of its proper Power, you need only caſt away the Radical Sign, and then the Quantity, or Number remaining, is always the Square, Cube, or other Power required; and will always be Rational.

Thus the Square of $\surd : 11$, is 11.

The Cube of $\sqrt[3]{} : 30$, is 30.

Alſo $2 \surd : 3$ multiplied by $8 \surd : 3 = 48$. and $3 \surd : 5$ multiplied by $2 \surd : 5 = 30$.

V. And if the Index of the Power be any even compound Number greater than two, and 'tis required to ſquare ſuch a Surd: There need only a Radical Sign, whoſe Index is half the former, be prefix'd to the Quantity, inſtead of the former Compound one, and it is done.

V. gr. Suppoſe you would *Square* this Surd, $\sqrt[4]{} : 12$; becauſe the Index 4, is compounded of 2 and 2; $\surd : 12$. is the true Product, or the true Square of the *Surd Root* $\sqrt[4]{} : 12$. ſo alſo the *Square* of $\sqrt[6]{} : 10$, is $\sqrt[3]{} : 10$.

The Reaſon of which, is plain: For ſuppoſe the $\sqrt[4]{} : 16 = 2$ were to be ſquared; its *Square in Surds* will be expreſſed thus, $\surd : 16 = 4$.

But when a ſimple Surd Quantity, whoſe Radical Sign hath for its Index ſome Ternary Number greater than 3, as 6, 9, &c. And 'tis required to Involve this Surd Cubically. Then only prefix before the Quantity a Radical Sign, with an Index, which is one third of the former, and 'tis done.

Thus, if $\sqrt[6]{} : 64$, were to be Cubed, it will be $\sqrt[2]{} : 64$, and the Cube of $\sqrt[9]{} : 512$, is $\sqrt[3]{} : 512$, &c. alſo the Biquadrate of $\surd : 5$. is 25 (as being the Square of the Square of $\surd : 5$.) and the Cube of $\sqrt[6]{} : 81$, will be $\surd : 81$ or 9.

In the general, to *Square*, *Cube*, &c. any *Surd Root*, is only to Square or Cube the Power, retaining the ſame Note of Radicality; but 'tis beter where it can be done, to take one half, $\frac{1}{3}$ Part, &c. of the Exponent of the Root, as is above ſhewn in the laſt particular Rules.

On the contrary, if you would extract the *Square*, *Cube*, or other Root of any Surd, you muſt double or triple, &c. the Exponent of the Radicality. Thus the *Square Root* of $\surd : 16$ is $\sqrt[4]{} : 16$. the *Square Root* of $\sqrt[3]{} : 27$ is $\sqrt[6]{} : 27$, &c.

Diviſion of ſimple Surd Roots.

I. If the Surds are Similar, Homogeneal, or of the ſame kind, divide one Number, or Quantity, by another, and prefix the common Radical Sign to the Quotient: But if they are Heterogeneal, or not of the ſame kind, they muſt be *reduced* before they can be divided.

Thus, $\surd : 9) \surd : 576 (\surd : 64 = 8$. And $\sqrt[4]{} : 5 (\sqrt[4]{} : 35 (\sqrt[4]{} : 7$.

The Demonſtration of which General Rule, is the ſame as that in Multiplication; for from the Nature of Diviſion, the Diviſor is to Unity :: as the Dividend to the Quotient. Therefore in our firſt Inſtance, $\surd : 9. \surd : 1 :: \surd : 576. \surd : 64$. but as theſe Roots are, ſo will their Squares be: That is, 9. 1 :: 576. 64. and that theſe Numbers are truly Proportional, is apparent; becauſe the Rectangles of the Extremes and Means are equal: Wherefore, $\surd : 9. \surd : 1 :: \surd : 576. \surd : 64$. and conſequently 64 is the true Quotient.

II. If any Rational Quantity to be divided by its Square Root, the Square Root will be the Quotient: For if $a\,b$ be divided by $\surd : a\,b$, the Quotient muſt be $\surd : a\,b$: And if 50 be divided by $\surd : 50$, the Quotient will alſo be $\surd : 50$. Alſo if any Rational Quantity be to be divided by a Surd, that Rational Quantity muſt firſt be reduced to the Form of a Surd, by *Rule* 1.

III. When a Surd Root having a Rational Quantity prefix'd before it, is to be divided by the Surd Part of it, the Quotient will be the Rational Quantity. Thus, if $5 \surd : 9$, be to be divided by $\surd : 9$, the Quotient muſt be 5: As if $5 \surd : 9$ had been divided by 5, the Quotient would be $\surd : 9$.

IV. When the Dividend and Diviſor are the Products of two Rational Quantities multiplied ſeverally into one common Surd; or when they are Rational Quantities prefix'd before one common Surd; then divide the Rational Part of the Dividend, by the Rational Part of the Diviſor, and what reſults, is the true Quotient.

Thus, if $8 \surd : 5$ be divided by $2 \surd : 5$, the Quotient will be 4, and if $8 \sqrt[3]{} : 7$, be divided by $4 \sqrt[3]{} : 7$, the Quotient will be only 2.

V. But when the Dividend and Diviſor are two Rational Quantities, or Numbers prefix'd to two unequal Surds; then you muſt divide, not only as before, the Rational Part of the Dividend by that of the Diviſor, but alſo the Surd Part; and thoſe two Quotients connected together, ſo as the Rational Part ſtand on the Left-hand, are the true Quotient ſought.

Thus, if $4 \surd : 15$ were to be divided by $3 \surd : 5$, the Quotient will be $2 \surd : 3$ ($= \surd : 12$.) and if $4 \surd : 12$, were to be divided by $3 \surd : 2$, the Quotient will be $\frac{4}{3} \surd : 6$.

Addition and Subſtraction of Surd Roots.

I. When two or more Simple and *Equal Surds* are to be added, multiply one of them by the Number of them all, and the Product is the Sum required.

Thus, The Sum of $\surd : 5$, and $\surd : 5$, is the $\surd : 20$; becauſe $\surd : 5$ multiplied by 2, the Number of the Surds, that is by $\surd : 4$, gives $\surd : 20$ their Sum. Alſo the Sum of $\sqrt[3]{} : 7 + \sqrt[3]{} : 7$, $+ \sqrt[3]{} : 7$; becauſe the Surds are 3 in Number, is $\sqrt[3]{} : 189$; becauſe $\sqrt[3]{} : 7$ multiplied by 3 (*i. e.*) the $\sqrt[3]{}$: of 27 makes $\surd : 189$.

II. But if *Unequal* Simple Surds of the ſame kind are to be added together, or if one to be ſubſtracted from the other, you muſt firſt try whether they are Commenſurable; and if they be, that is, if when they have been divided by their greateſt common Diviſor, their Quotients are Rational Quantities, then you muſt multiply the Sum of thoſe Rational Quantities by the ſaid Common Diviſor, and the Product will be the Sum of the Surds propoſed: Or if the Difference of thoſe Rational Quotients be multiplied by the Common Diviſor, then the Product will be the Difference of the given Surds, when the leſs is taken from the greater.

Thus, if the Sum or Difference of theſe two Surds, $\surd : 50$, and $\surd : 8$. were required; becauſe they are unequal, I try firſt, Whether they are Commenſurable or not, by dividing each by the greateſt common Diviſor $\surd : 2$. And the Quotients are $\surd : 25$ and $\surd : 4$; that is 5 and 2, which are Rational Numbers; and therefore the Surds are Commenſurable: Then their Sum 7, or their Difference 3, multiplied by the common Diviſor $\surd : 2$, produces $7 \surd : 2$ for the Sum, and $3 \surd : 2$ for the Difference of the Surds required.

III. If the Commenſurable Surds propoſed, had been Fractions, or Mixt Numbers, reduced to the Form of Fractions; they muſt (if they have not one) be reduced to a common Denominator in the leaſt Terms; and then to find out the Rational Quotients, you need only divide the two New Numerators, by their greateſt common Diviſor; and then you muſt go on as above, in *Integral Surds.*

Thus, If the Sum and Difference of $\surd : \frac{24}{25}$ and $\surd : \frac{2}{3}$ were required: When reduced to a common Denominator, they will be $\surd : \frac{72}{75}$ and $\surd : \frac{50}{75}$ and theſe divided by their greateſt common Diviſor: $\surd : \frac{2}{75}$ the Quotes are $\surd : \frac{36}{75}$ and $\surd : \frac{25}{75}$ or $6 \surd : \frac{2}{75}$, and $5 \surd : \frac{2}{75}$, whoſe Sum is $\surd : 11 \frac{2}{75}$ and their Difference $1 \surd : \frac{2}{75}$.

IV. If the *Simple Surds* given to be added, or ſubſtracted, are *Incommenſurable*, then they can only (generally ſpeaking) be added or ſubſtracted by the Signs + and −: For neither Sum nor Difference can be expreſſed by any ſingle Root. And from this Addition or Subſtraction of ſimple Surds only by the Signs, ariſes what they call a *Surd Binomial*, or *Reſidual Root.*

Thus, $\surd : 6 + \surd : 7$, is a *Binomial Surd*, and $\surd : 7 - \surd : 6$ is a *Reſidual Surd.*

But from *Prop.* 4. and 7 of *Euclid's ſecond Book*, there ariſes a Rule which helps us to find the Sum or Difference of *Incommenſurable Square Roots*: Which is this.

To or from the Sum of the Squares of the given Surd Roots, add, or ſubſtract, their double Rectangle, and the Square Root of the Sum, or Remainder, is the Sum or Difference ſought, (e. gr.)

To find the Sum and Difference of $\surd : 14$, and $\surd : 12$, their Squares being 14 and 12, their Sum will be 26, and the *Double Rectangle* of $\surd : 14$, into $\surd : 12$, is $2 \surd : 168$. Wherefore $\surd : 26 \pm 2 \surd : 168$ is the $\left\{\begin{matrix}\text{Sum}\\\text{Difference}\end{matrix}\right\}$ required.

Of Compound Surds.

The Arithmetick of *Compound Surds*, depends on the Rules above given about *Simple Surds*, and on the true Knowledge of the Signs + and − in Algebraick Addition, Subſtraction, Multiplication, and Diviſion; only ſome particular Directions may be given as to *Binomials* and *Reſiduals*: As,

I. If any *Binomial* be to be multiplied by its correſponding Reſidual, the Difference of their Squares is the true Product; and therefore will come out a Rational Quantity, as if $\surd : a + e$ be multiplied by $\surd : a - e$, the Product will be a Rational Quantity, *viz.* $aa - ee$.

II. Involution in *Binomials* and *Reſiduals*, is beſt and moſt eaſily performed by a Table of Powers: As becauſe we ſee that $aa + 2ae + ee = \square \overline{a + e}$. We may conclude, That to ſquare any Binomial whatſoever, you need only add the double Rectangle of the Parts, to the Sum of the Squares of thoſe Parts; or take the double Rectangle from that Sum, if it be a Reſidual.

III. For Diviſion in *Compound Surds*, 'tis convenient, if not neceſſary, to reduce them firſt to ſome better, and when it can be done, to a Rational Form. And,

(1.) If a Binomial, conſiſting of two ſimple Square Roots, or of one Square Root, and a Rational Quantity, be multiplied by its correſponding Reſidual, the Product will always be a Rational Quantity.

(2.) If a Binomial, conſiſting of two Biquadratick Simple Roots, or of one *ſuch*, and a Rational Quantity; if this be multiplied by its correſponding Reſidual, the Product will be a Reſidual conſiſting of either two Square Roots, or elſe of one Square

Square Root a Rational Quantity; which Reſidual being multiplied, as is before ſaid, by its Binomial, it produces a Rational Quantity.

(3.) If a Trinomial, having three ſimple Square Roots, be multiplied by it ſelf, with one of the Signs changed; the Product will be either a Binomial, or Reſidual, which being multiplied by its correſpondent Reſidual, or Binomial, will give in the Product, a Quantity entirely Rational.

IV. If a Binomial or Reſidual, conſiſting of two Simple Cubick or Biquadratick Roots, *&c.* or of one Cubick or Biquadratick Root, *&c.* and a Rational Quantity is propoſed for a Diviſor; find ſo many continual Proportionals in the Proportion of the Parts of the Binomial or Reſidual propoſed, as there be Unites in the Index of the Radical Sign, and ſuch whoſe Radical Sign may be the ſame with that of the Parts of the Binomial or Reſidual; but conjoyned in the Binomial by +, and in the Proportionals by + and − alternately; or contrarily, in the Proportionals by +, and in the Reſidual by + and −; the Product of the ſaid Proportionals ſo connexed, multiplied into the Binomial or Reſidual, will be a Quantity entirely Rational. After the ſame manner may a Binomial or Reſidual, having 5 or 6, *&c.* for the Index of a common Radical Sign of the Roots, be reduced to a Quantity entirely Rational.

And *Note*, That when the Roots are of Different Kinds, they muſt firſt be reduced to a common Radical Sign.

V. If the Diviſor be a Simple Quantity, divide each Part of the Dividend by the Diviſor, and connect thoſe particular Products together by their Signs; but if the Diviſor be a Binomial, Trinomial, or Quadrinomial, *&c.* of ſuch Kind as before is ſpecified, reduce that given Diviſor to a new Diviſor that may be a Simple Rational Quantity. Reduce alſo the given Dividend to a new Dividend, by multiplying the former by the Quantities that were Multiplicators, in reducing the given Diviſor to a Rational Quantity; then divide the new Dividend by the new Diviſor: But when the Diviſor cannot be reduced to a Simple Rational Quantity, ſet the Dividend as a Numerator, over the Diviſor as a Denominator.

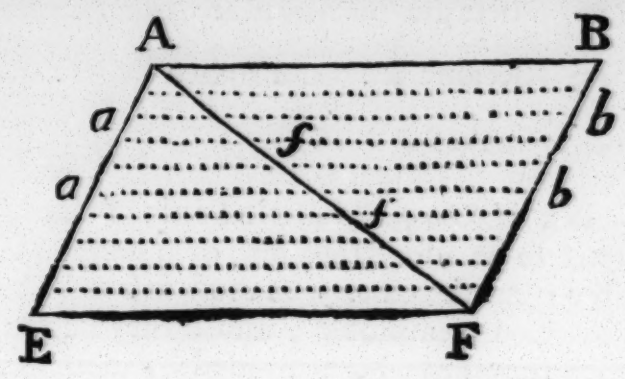
Thus, $12 + \sqrt{} : 63$ divided by 3, the Quotient is $4 + \sqrt{} : 7$; and $8 - \sqrt{} : 12$ divided by 2, the Quotient is $4 - \sqrt{} : 3$; $\sqrt{} : 21 + \sqrt{} : 15$ divided by $\sqrt{} : 3$, the Quotient is $\sqrt{} : 7 + \sqrt{} : 5$; $\sqrt{} : 56 + \sqrt{} : 24$ divided by $\sqrt{} : 6$, the Quotient is $\sqrt{} : 9\frac{1}{6} + 2$: and $\sqrt[3]{} : 28 - \sqrt[3]{} : 14$ divided by $\sqrt[3]{} : 7$, the Quotient is $\sqrt[3]{} : 4 - \sqrt[3]{} : 2$.

SURETY *of the Peace*, (ſo called, becauſe the Party that was in fear, is thereby ſecured) is an acknowledging of a Bond to the Prince taken by a competent Judge of Record, for the *Keeping of the Peace*. This *Peace* may a *Juſtice of the Peace* command, either as a Miniſter, when he is commanded thereto by a higher Authority; or as a Judge, when he doth it of his own Power, derived from his Commiſſion. *Surety of the good adhering*, differs from this, That whereas the *Peace* is not broken without an Affray, or ſuch like; the Surety *de bono geſtu* may be broken by the Number of a Man's Company, or by his or their Weapon and Hardneſs.

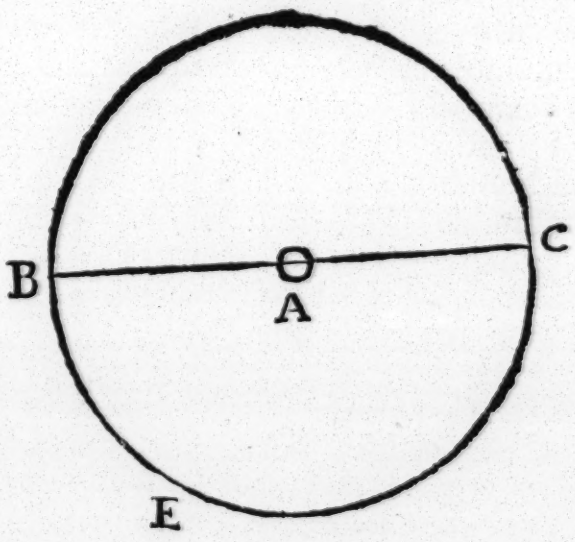
SURFACE, (the ſame with *Superficies*) is the bare outſide of any Body; and conſidered by it ſelf, is Quantity extended in Length and Breadth only, without Thickneſs.

There are *Plane Surfaces*, and there are *Crooked* or *Curved* ones.

A Plane Surface or *Superficies*, is made by the Motion of a *Right Line* always keeping in the ſame Plane.

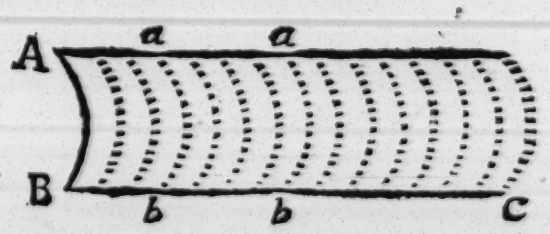


Thus, if the Line A B be conceived to move (with a Motion parallel to it ſelf in its firſt ſituation) in the ſame Plane downward, and at laſt to ſtop in the Poſition E F, it will deſcribe the Plane Figure or Surface A B F E, which is called a *Parallelogram*: As alſo the Two Plane Figures or Surfaces A B F and A E F, which are called *Triangles*.

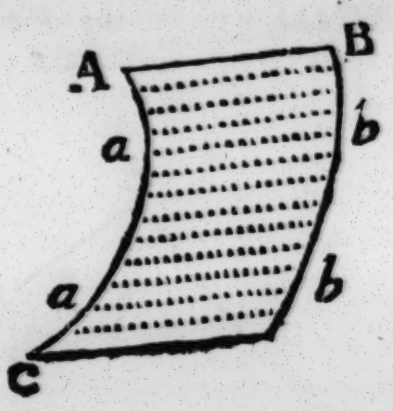


Alſo, if the Right Line C A having one end as A fix'd as on a Center, be moved quite round in the ſame Plane, till the Point C come to C again; this Line will by its Motion deſcribe a *Plane Figure* or *Surface*, which is called a *Circle*, as C E B A.

Curved Surfaces, are *Convex* above or without, and *Concave* below or within; You may conceive them like the *Tilt* of a *Boat* or *Waggon*; And ſuch Surfaces may be generated either by the Motion of a Right Line on a Curve, or a Curve Line on a Right one, *v. gr.* In the Figure.



Let



Let the Curve Line *A a a* C repreſent the Hoop keeping up the Cloth of a Waggon or Boat; and let the Line A B repreſent the Gunnel or the upper Edge of the Boat's-ſide, or the upper Rail of the Waggon. 'Tis plain that if you conceive either the Right Line A B to move up along the Hoop A *a* C till it come to the Top, and then down again on the other ſide till it come to the Bottom, it will by its Motion deſcribe the Figure of the Tilt or curved Surface A *b b* C *a a* A. And the very ſame Figure would be produced by the Motion of one of the Hoops or crooked Line A *a* C, carried (in a Poſition parallel to it ſelf) along the Edges of the Boat or Waggon.

SURGE, the Sailors call a Wave or Billow of the Sea a *Surge*; alſo when they are Heaving at the Capſtan, if the Cable happen to ſlip back a little they ſay the *Cable Surges*.

SURMOUNTED. The Heralds term for Bearing of one Ordinary upon another. A Pile ſurmounted of a Chevron.

SURPLUSAGE, in common Law, ſignifies a Superfluity or Addition more than needeth, which ſometimes is the cauſe that a Writ abateth. It is ſometimes alſo applied to matter of Account, and denotes a greater Disburſement than the Charge of the Accountant amounteth unto.

SURREJOYNDER, is a ſecond Defence of the Plaintiff's Action, oppoſite to the Defendant's *Rejoynder*.

SURRE-BUTTER, is a ſecond *Rebutter*, or a *Rebutting* more than once.

SURRENDER, is an Inſtrument in Writing, teſtifying with apt Words, That the particular Tenant of Lands or Tenements for Life or Years, doth ſufficiently conſent and agree, That he which has the next or immediate Remainder or Reverſion thereof, ſhall alſo have the preſent Eſtate of the ſame in Poſſeſſion, and that he yields and gives up the ſame unto him; for every *Surrender* ought forthwith to give Poſſeſſion of the things *ſurrendred*. There may be alſo a *Surrender* without Writing; and therefore there is ſaid to be a *Surrender in Deed*, and a *Surrender in Law*: ⊙ *Surrender in Deed*, is that which is really and ſenſibly performed: A *Surrender in Law*, is Intendment of Law by way of Conſequent, and not Actual. As if a Man have a Leaſe of a Farm, and during the Term he accept of a new Leaſe; this Act is in Law a *Surrender* of the former: There is alſo a *Cuſtomary Surrender* of the Copyhold Land, as may be ſeen in *Cooke ſup. Littleton*, Sect. 74.

SURROGATE, ſignifies one that is ſubſtituted or appointed in the room of another, moſt commonly of a Biſhop, or of a Biſhop's Chancellor.

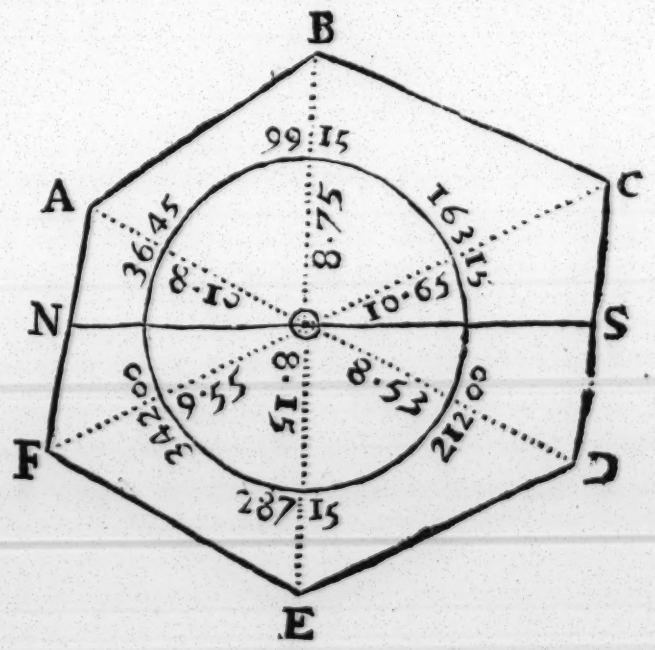
SURSOLID-*Place*. See *Place-ſolid*.

SURSOLID-*Problem*, in Mathematicks, is that which cannot be reſolved, but by Curves of a higher Nature than a Conick-Section, *v. gr.* In order to deſcribe a *Regular Endecagon*, or Figure of eleven Sides in a Circle, 'tis required to deſcribe an Iſoſceles Triangle on a Right Line given, whoſe Angles at the Baſe ſhall be Quintuple to that at the Vertex, which may eaſily be done by the Interſection of a Quadratrix, or any other Curve of the ſecond Gender, as they are called by ſome.

SURVEYING *of Land*, or *Planometria*, is the Art of Meaſuring all manner of Plain Figures, in order to know their ſuperficial Content; which how to do Geometrically, I have ſhewed all along under the particular Name of each Plane Figure. But how to bring this to Practice, ſo as to Meaſure the Area's of Real Lands, Fields, Grounds, *&c.* by the help of proper Inſtruments, is what we uſually call *Surveying*; and this is what is deſign'd to be taught under this Word. The Surveyor being furniſhed with a good Inſtrument to take Angles, as a well made Theodolite, or entire Braſs Circle, with a well graduated Limb, and Teleſcope Sights, as alſo with a well divided Pole-Chain, an Off-ſet Rod, Station-Staves, *&c.* He may proceed after theſe or ſuch like Methods, which a little Practice will familiarize to him.

1. *To take the* Plot of a Field *at* one Station *in any Place thereof, from whence you may ſee all the Angles.*

Suppoſe A B C D E F to be a *Field*, of which you are to take the *Plot*: Having ſet your Inſtrument in any convenient Place thereof, as at ⊙; and let Marks or Station-ſtaves with Paper be ſet up in every Angle: Then ſet your Inſtrument ſo that the Needle hang directly over the *Meridian-Line* of the *Cord*, and there ſcrew faſt the Inſtrument.



Then direct your *Sights* to A, and you will find the *Index* cutting 36° 45′, which note down in your *Field-Book* in the ſecond Column thereof, and meaſure the Diſtance from ⊙ to A, containing ſuppoſe

ſuppoſe 8 *Chains* and 10 *Links*, which ſet down alſo in the third Column of your *Field-Book*.

Then direct your *Sights* to B, the *Index* cutting 99 Deg. 15 Min. and the Diſtance from ⊙ to B, is 8 *Chains* and 75 *Links*, both which ſet down in your *Field-Book*, as before.

Do the like for the reſt of the *Angles* from ⊙ to C, D, E, and F, and ſet them down, as you obſerve them with their Diſtances meaſured from the Station, as you ſee done in this following Table, which is a Copy of the *Field-Book*, and will ſhew you the Method how to Note down your Obſervations.

	D.	M.	*Ch.*	*Lin.*
A	36	45	8	10
B	99	15	8	75
C	163	15	10	65
D	212	00	8	53
E	287	15	8	15
F	342	00	9	55

Having thus finiſhed your Work in the *Field*, the next Buſineſs muſt be to *Protract* the ſame; that is, to lay down a *Plot* thereof upon Paper or Parchment, which is done thus.

Draw a Line as N S, repreſenting the *Meridian-Line*; then in part of that Line, as at ⊙ make a Point, repreſenting your Place of ſtanding in the *Field*; upon this Point place the Center of your *Protractor*, ſo that the Diameter thereof may be directly upon the Line N S.

Then againſt 36° 45′ on the Limb of the *Protractor*, ſet a Point repreſenting the Degrees of your firſt obſerved Angle, and let the ſame be done with the ſecond and third Obſervations.

To prick off the 4th, *viz.* 212. the *Protractor* muſt be turned downwards, becauſe the Degrees are greater than a Semicircle. Then proceed to *protract* the reſt of the Angles.

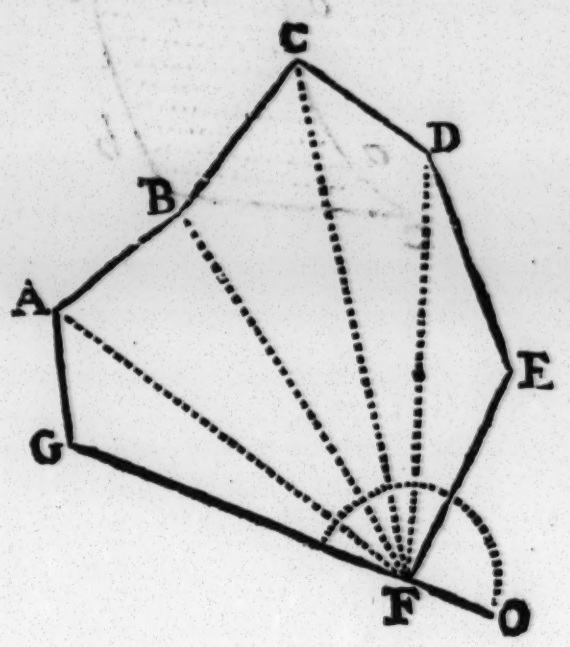
Then take away the *Protractor*, and laying a Ruler to the Station-point ⊙, draw obſcure Lines from thence to thoſe Points, on which Lines ſet their reſpective Meaſures from your Scale; as 8 *Chains* 10 *Links* from ⊙ to A, and 8 *Chains* 75 *Links* from ⊙ to B, and ſo of the reſt, as you have them down in your *Field-Book*.

Then connect theſe Points by the Lines AB, BC, C D, DE, E F, and F A, ſo ſhall you have the true Figure of the Field.

But this way obliges you to more Meaſuring with the Chain than is needful, and therefore is not ſo good for Practice in moſt Caſes as another I ſhall by and by ſhew you; only it hath this Advantage, That you may ſoon know whether you have taken your Angles truly; for all about the Point ⊙ = 36°.

2. *To take the* Plot *of a* Field *at one Station, in any Angle thereof, from whence the other Angles may be ſeen.*

Let A B C D E F G be the *Field*, and F the Angle, at which you would take your Obſervations.



Having placed your Inſtrument at F, turn it about (the North-Point of the Card from you) till through the *Sights* you eſpy the Mark at G; then faſten the Inſtrument, and move the Index till you ſee the Mark at A, the Deg. cut on the Limb being 20; then move it till you ſee B, where it cuts 40 Degrees: Do the ſame at C, and there it cuts 60 Degrees; likewiſe at D 77 Degr. and at E 100 Degr. All theſe Angles note down in your *Field-Book*; next with the Chain, meaſure all the Lines running from the Station, as from F to G 14 *Chains*, 60 *Links*, and from F to A. 18 *Ch.* 20 *Links*, and ſo of the reſt, as you ſee them in this Table.

Ang.	D.	M.	*Ch.*	*Lin.*
G	00	00	14	60
A	20	00	18	20
B	40	00	16	80
C	60	00	23	20
D	77	00	16	95
E	100	00	8	50

To protract theſe Obſervations.

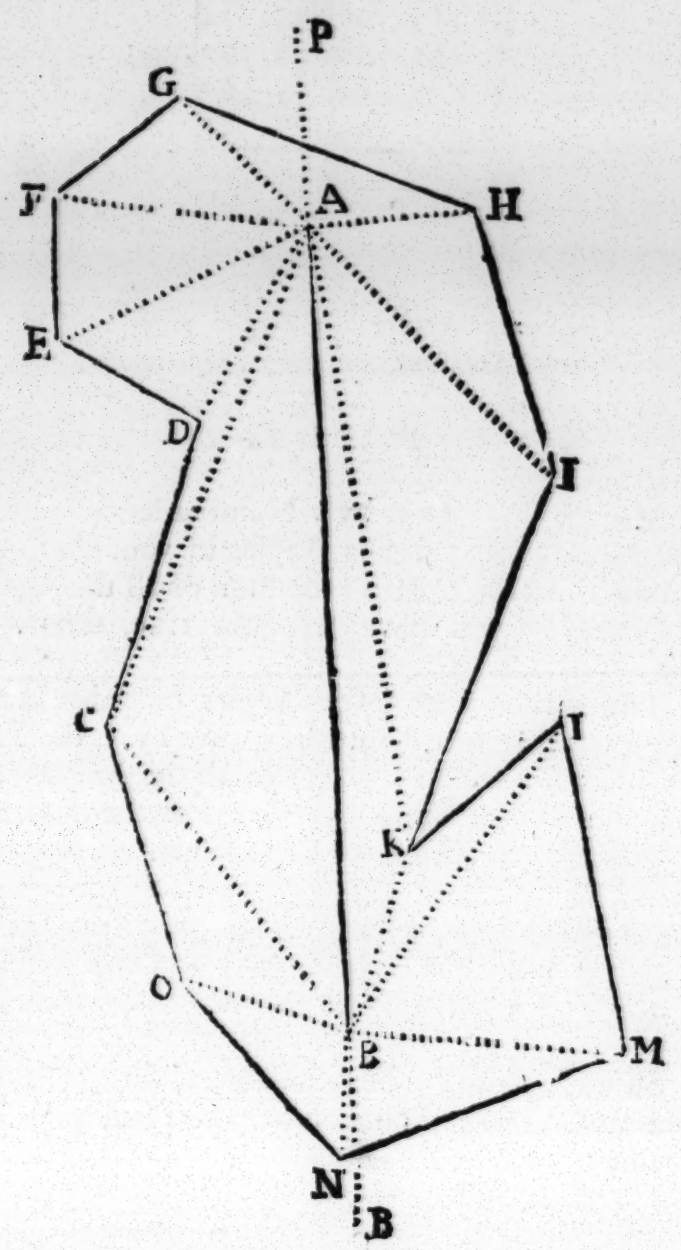
Draw a Line at pleaſure as G F, upon which lay the Diameter of your *Protractor*, with the Center in F; then make Marks at every Angle round the *Protractor*, as you find them in your *Field-Book*, *viz.* againſt 20, 40, 60, 77, 100; which done, take away the *Protractor*, and draw Lines F A, F B, F C, F D, and F E, through each of theſe Marks; on which Lines ſet off the Diſtances by a Scale, as you find them in your *Field-Book*; and where the End of thoſe Diſtances fall, let there be Lines drawn to connect them, as G A, A B, B C, C D, DE, E F, and F G, and you have your *Field* compleat.

Note, That you may as well take the Plot of a Field at one Station, ſtanding on any Side thereof, as in an Angle.

3. *To take the* Plot *of a* Field *at two Stations, when the* Field *is ſo Irregular, that from one Station you cannot ſee all the Angles.*

Let

Let C D E F G H I K L M N O be the *Field*, in which from no one Place thereof all the Angles may be ſeen. Therefore chuſe two Places for your Stations, as A and B.



Set your Inſtrument at A, and look through the *Sights* towards your 2d Station B, and then fix your Inſtrument. And, as before taught, with the Index take all the *Angles* at that end of the *Field*, as C D E F G H I K, and meaſure the Diſtance between your Inſtrument and each Angle, as alſo the Diſtance between the two Stations.

Then remove your Inſtrument to the ſecond Station B, and having made it faſt, ſo as through the *Back-Sights* you may ſee the firſt Station A: Take that Angles at the end of the *Field*, as N O C K L M, and meaſure their Diſtances, as before: All which being done, your *Field-Book* will ſtand thus.

Firſt Station.

	D.	M.	Ch.	Lin.
Ang.	25	00	20	75
C	31	00	8	10
D	67	00	9	85
F	101	00	10	80
G	137	00	7	00
H	262	00	6	70
I	316	00	13	70
K	354	00	24	50

The Diſtance between the two Stations A and B is 31 *Ch.* 60 *Lin.*

Second Station.

Ang.	D.	M.	Ch.	Lin
N	3	30	4	20
O	111	00	7	00
C	145	00	15	60
K	205	00	8	40
L	220	00	15	00
M	274	00	11	20

To *Protract* this, draw a Right Line at adventure, as P A B B, whereon ſet from your Scale 31 *Ch.* and 60 *Links* (the Diſtance between the two Stations) making Marks with the Compaſſes, as A and B for your firſt and ſecond Station.

Lay the *Protractor* to A, the North-end of the Diameter being towards B, and mark out the ſeveral Angles obſerved at your firſt Station, draw Lines, and ſet off the Diſtances meaſured.

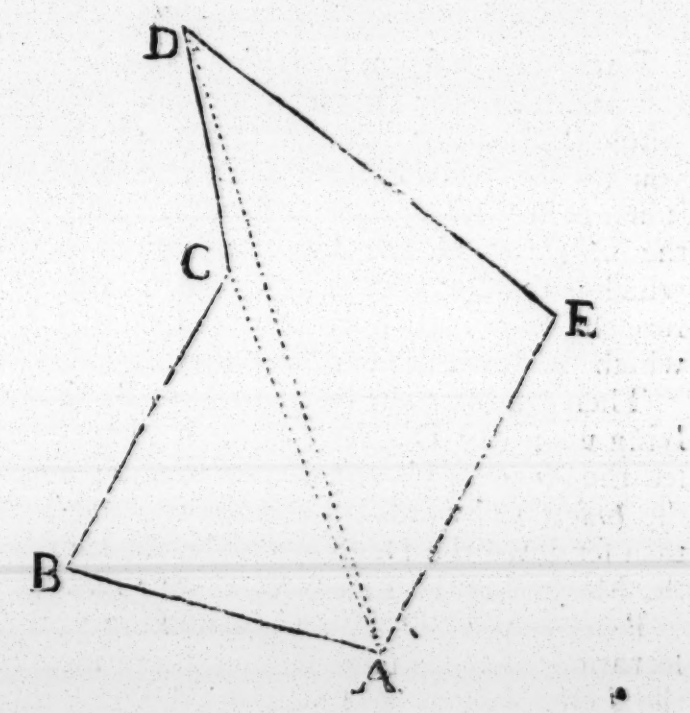
Do the ſame at B, the ſecond Station; and when you have marked out all the Diſtances between thoſe Marks, draw the Bound-lines.

Note, If a *Field* be very irregular, you may after the ſame manner make 3, 4, or 5 Stations, if you pleaſe: Tho' 'tis much better to go round ſuch a Field, and meaſure the Bounding-Lines.

4. *To take the* Plot *of a* Field *at one Station, in an Angle (ſo that from that Angle you may ſee all the other Angles) by Meaſuring round about the ſaid* Field.

Suppoſe A B C D E the *Field*, and A the Angle appointed for the Station.

Place your Inſtrument in A, and turn it round till you ſee (through the *fixed Sights*) the Mark at B; then ſcrew it faſt, and turn the Index to C, obſerving what Degrees are there cut on the Limb, which ſuppoſe to be 68 Degrees; turn it further,



till you ſee D, and Note down the Degrees there cut, *viz.* 76 Degrees; do the like at E, and the Index will cut 124 Degrees: This done, meaſure round the *Field*, Noting down the Length of the Side-Lines between Angle and Angle.

Then your Field-Book *will ſtand thus.*

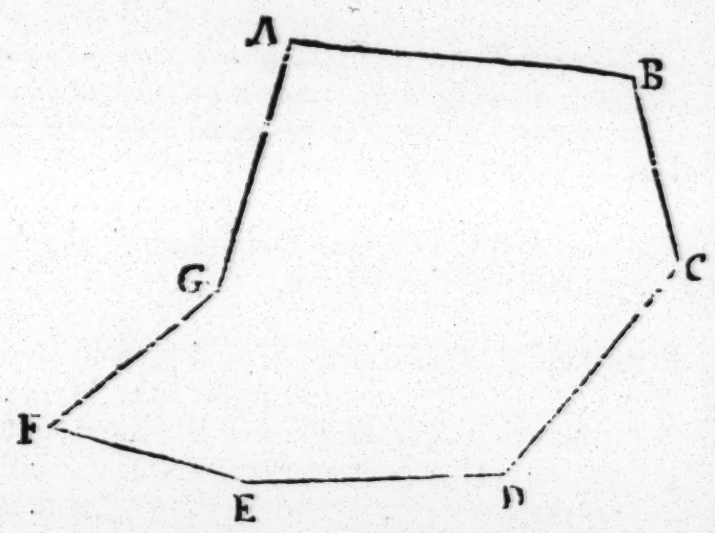
Ang.	D.	M.
C	68	00
D	76	00
E	124	00

Lines	Ch.	Lin.
A B	14	00
B B	15	00
C D	7	00
D E	14	40
E A	14	05

To Protract which, draw the Line A B as you pleaſe, and applying the Center of the Protractor to A, (the Diameter lying upon the Line A B) prick off the Angles, and make Marks, through which draw Lines A C, A D, and A E, in which you may find the Points C, D, E, by the Meaſures taken, as you have them in your *Field-Book*, and taken of a Scale; then draw the Bounding-Lines, and you have done.

5. *To take the* Plot *of a* Park Wood, *a very great* Common, *or a large* Champian Field, *by going round about the ſame, and making Obſervations at every Angle thereof.*

Let A B C D E F G be a large *Field* or *Wood*, through which you cannot ſee to take the Angles, but muſt be forced to go round the ſame.



Place your Inſtrument at the Angle A, and lay the Index on the Diameter thereof, moving the whole Inſtrument about, till through the Sights you ſee the ſecond *Angle* at B, and there fix it: Then turn the *Index* about backwards till you ſee the *Angle* at G, the *Index* cutting 97 Degrees, which is the Quantity of the *Angle* G A B; Meaſure the Line A B, it contains 12 *Chains*, 5 *Links*, which ſet down in your *Field-Book*.

Then remove your Inſtrument to B, the *Index* lying upon the Diameter, turn it about till you ſee the *Angle* at C, and there faſten it; and turn the *Index* backwards till you ſee the *Angle* at A; then ſet down the Degrees cut on the Limb, and the Meaſure of the Line B C in your *Field-Book*.

Remove to C, D, F, and G, making your Obſervations after the ſame manner; and meaſuring the Length of every Line, they'll ſtand thus in the *Field-Book*.

	D.	M.	Ch.	Lin.
A	97	00	12	5
B	120	30	4	45
C	132	00	8	85
D	125	00	13	4
E	121	30	7	70
F	80	00	5	67
G	227	00	7	87

The manner of *Protracting* this, is nearly the ſame as before.

How to diſcover whether the Angles made at their ſeveral Stations, be truly taken or not.

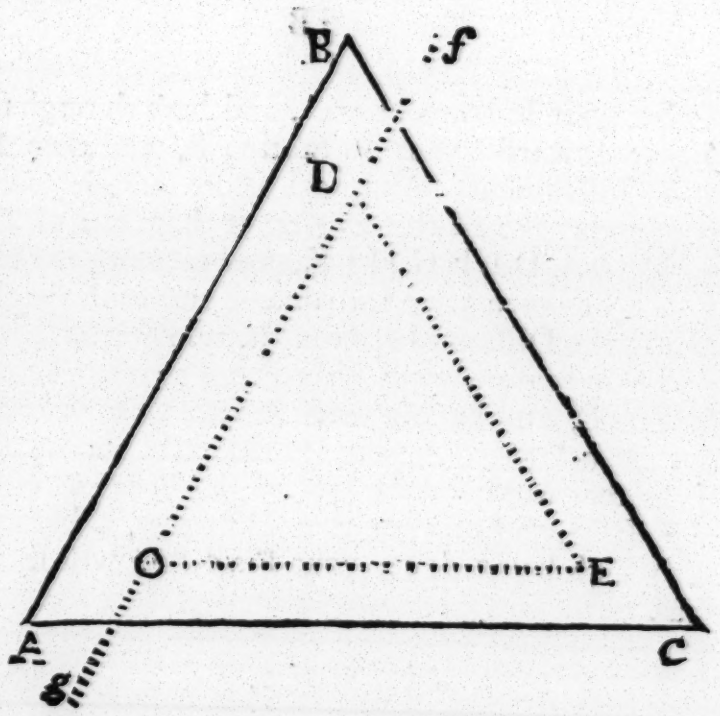
RULE.

Multiply 180 Deg. by a Number leſs by 2 than the Number of Sides or Angles in your *Plot*, the Product ſhall be equal to the Sum of all the Angles obſerved, if you have wrought true, otherwiſe not.

Thus, there were ſeven Angles or Sides in the laſt *Plot*, therefore I multiply 180 by 5, the Product is 900, which is equal to all the Angles reckoned in the inſide of the *Plot*: For the outward Angles are not included in the Rule.

6. *To meaſure parallel to a Hedge (when you cannot go cloſe along the Hedge it ſelf) and alſo in ſuch a caſe, how to take your Angles.*

Suppoſe A B C to be a Field, and for the Buſhes you cannot come nigher than ⊖ to plant your Inſtrument.

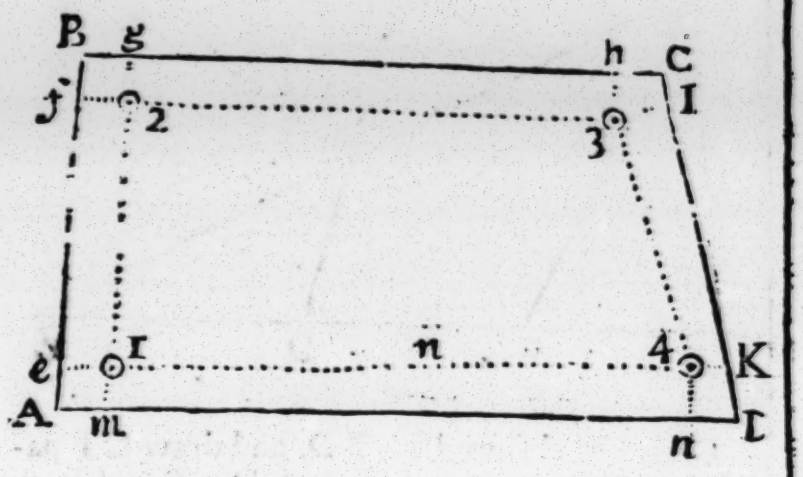


Then ſet up Marks, and with your Off-ſet Rod or Chain, if the Diſtance be large, take the Diſtance between the Inſtrument ⊖, and the Hedge A B; which Diſtance ſet off again nigh B, and ſet up Marks at D: Likewiſe take the Diſtance between ⊖ and the Hedge A C, and accordingly ſet up Marks at E. Then take the Angle D ⊖ E, which will be the ſame as the Angle B A C: Do thus for the reſt of the Angles. But when the Lines are meaſured, they muſt be meaſured of the ſame Length with the outſide Lines, as the Line ⊖ D, meaſured from *g* to *f*.

7. To

7. *To take the Plot of a Field or Wood, by obſerving near every Angle, and meaſuring the Diſtance between the Marks of Obſervation, by taking in every Line, two Off-ſett to the Hedge.*

Suppoſe A B C D to be a Wood or a Field to be thus meaſured.



Let Marks be ſet up in every Angle, not regarding the Diſtance from the Hedges, ſo much as the Convenience for planting the Inſtrument, ſo as you may ſee from one Mark to another. Then beginning at ⊖ 1, take the Quantity of that Angle, and meaſure the Diſtance 1, 2. But before you begin to meaſure the Line, take the Off-ſet to the Hedge, *viz.* the Diſtance ⊖ *e*; and in taking of it, you muſt make that Line ⊖ *e* perpendicular to 1, 2, by directing the Diameter of your Inſtrument towards 2, and turning the Index till it lie upon 90 *Degrees*, which then will point to what place of the Hedge to meaſure to, as *e*: Then ſet the Meaſure of the Line ⊖ *e* in your Field-Book under Title *Off-ſet*. So likewiſe when you come to 2, meaſure the Line 2, 3, and the *Off-ſets* 2 *g*, 3 *h*: Do the like by all the reſt of the Lines and Angles in the Field, how many ſoever they be.

And when you come to lay this down upon Paper; firſt (as before directed) protract the Figure 1, 2, 3, 4. That done, ſet off your *Off-ſets*, as you find them in your *Field-Book*, *viz.* ⊖ *e*, and ⊖ *f* perpendicular to the Line 1, 2; alſo ⊖ *g* and ⊖ *h* perpendicular to the Line 2, 3; making Marks at *e*, *f*, *g*, *h*, &c. through which draw Lines, which ſhall interſect each other at the true Angles, and deſcribe the true Bound-Lines of the Field or Wood. And then if many intermediate Off-ſets between Angle and Angle be taken, when neceſſary, is the very beſt and moſt expeditious Method of Surveying.

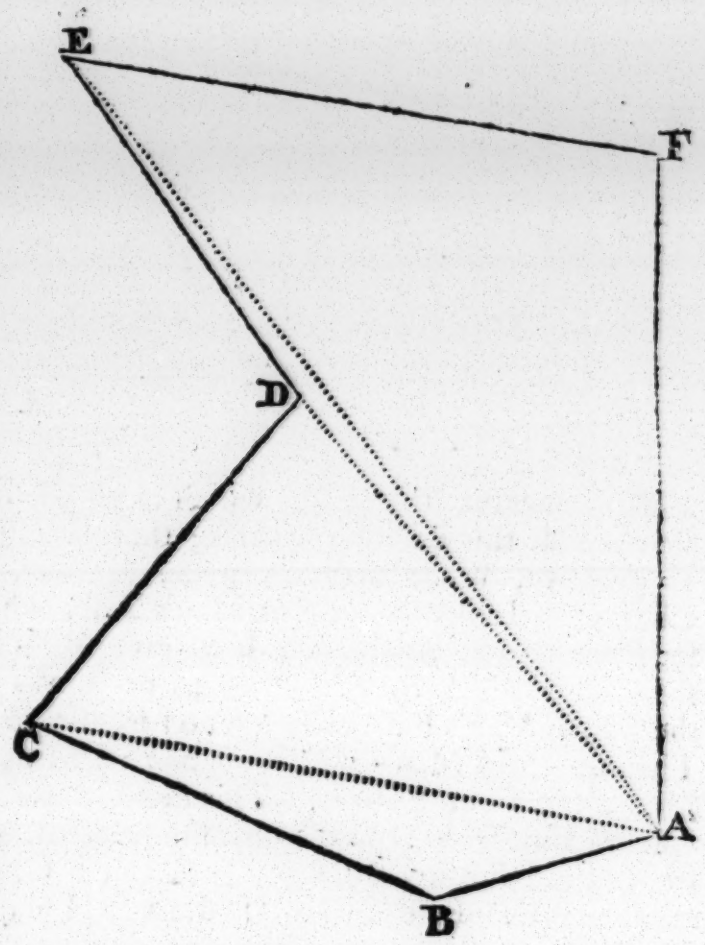
In working after this manner, obſerve,

1. If the Wood be ſo thick, that you cannot work within it, you may then perform the ſame thing by going on the outſide round the Wood.

2. If the Diſtances are ſo far, that you cannot ſee from Angle to Angle, cauſe your Aſſiſtant to ſet up a Mark ſo far from you as you can conveniently ſee it, as at *n*; meaſure the Diſtance ⊖ *n*, and take the *Off-ſets* from *n* to the Hedge; and proceed on the Line till you come to an Angle.

8. *The common Way uſed by Surveyors for taking the Plot of a Field by a Chain only.*

Suppoſe A B C D E F to be the Field, whoſe Plot is required.



1. Meaſure round the Field, and note down in your *Field-Book* every Side thereof.

2. Reduce your *Field* into Triangles, by the Diagonals A C, A D, A E, which meaſure and ſet down in your *Field-Book*; as ſuppoſe them to ſtand thus.

Diagonals.

		Ch.	*Lin.*
A	C	33	70
A	D	25	70
A	E	45	40

Sides

		Ch.	*Lin.*
A	B	12	50
B	C	23	37
C	D	19	30
D	E	20	00
E	F	29	00
F	A	31	50

To Plot which, draw a Line at Pleaſure, as A C, whereon ſet off 33 *Ch.* 70 *Links*; then with the Meaſures of the Sides A B, C B, compleat the Triangle A B C.

Alſo, with the Meaſures of the Diagonal A D, and the Side C D, compleat the Triangle A D C, upon the ſame Baſe C A.

Then with the Meaſures of the Diagonal A E, and the Side D E, make up the Triangle A D E.

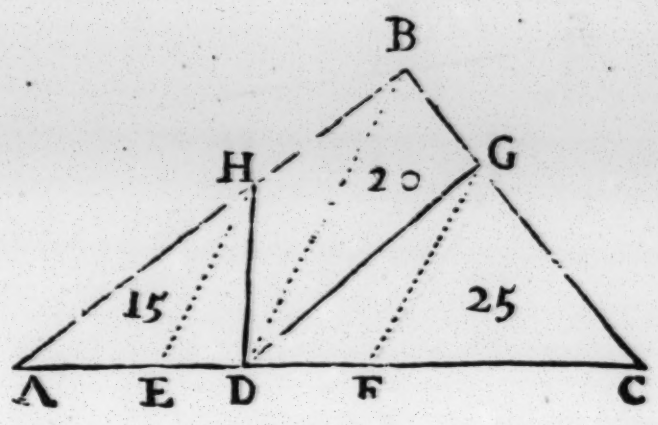
Laſtly, Upon the Baſe A E, with the Meaſures of the Sides A F, E F, compleat the Triangle A F E. So you have the true Figure of the Field, conſiſting of four Triangles, which are to be meaſured by the Direction given under the Word *Chain*.

3. *The Practice of Surveying, as it relates to dividing of Lands.*

To divide a Triangular piece of Land into any Number of equal and unequal Parts, by Lines proceeding

ceeding from any Point aſſigned in any Side thereof.

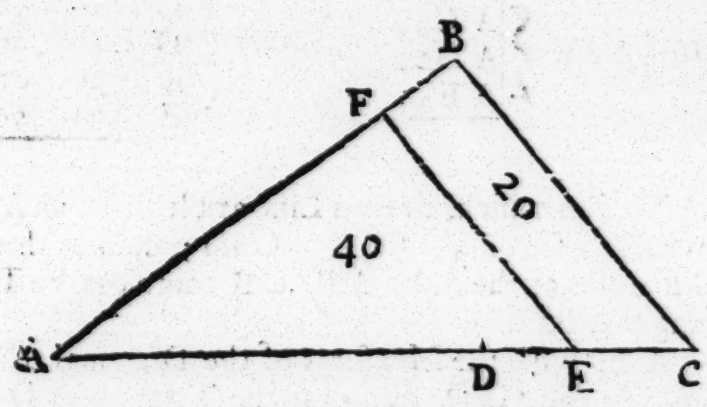
Let A B C be the Triangular piece of Land, containing 60 Acres, to be divided between three Men: The firſt to have 15 Acres, the ſecond 20, and the third 25 Acres; and the Lines of Diviſion to proceed from D.



Firſt, meaſure the Baſe, which is 50 Chains; then divide this Baſe into 3 parts; thus, ſaying, If 60 give 50, What ſhall 15 give? Anſwer, 12 Chains 50 Links for the firſt Man's Baſe, which ſet from A to E. Again, ſay, If 60 give 50, What ſhall 20 give? Anſwer, 16 Chains 66 Links for the ſecond Man's Baſe, which ſet off from E to F; Then the third Man's Baſe muſt be 20 Chains 84 Links, *viz.* from F to C. This done, draw an obſcure Line from D to the oppoſite Angle B, and from E and F draw the Lines E H and F G, parallel to B D. Laſtly, from D, draw D H and D G, which ſhall divide the Triangle into three ſuch parts as were required.

10. *To divide a Triangular Piece of Land, according to any Proportion given, by a Line drawn parallel to one of the Sides.*

A B C is the Triangular Piece of Land, containing 60 Acres, the Baſe A C is 50 Chains: This Piece of Land is to be divided between two Men, by a Line drawn parallel to B C, in ſuch Proportion, that one have 40 Acres, the other 20.

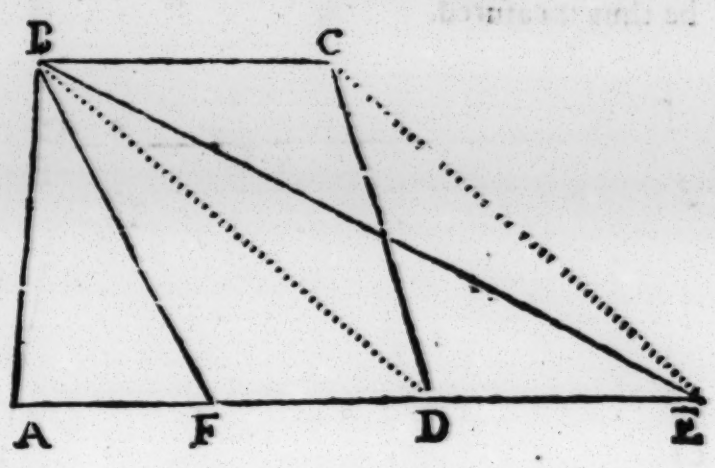


1. Divide the Baſe, as has been before taught, and the Point of Diviſion ſhall fall in D. A D is 33 Chains 33 Links; D C 16 Chains 67 Links.

2. Find a mean Proportion between A D and A C, by multiplying the whole Baſe 50 by A D 33, 33, the Product is 16665000, of which Sum extract the Square Root, 'twill be 40 Ch. 82 Lin. which ſet from A to E; then draw E T parallel to B C, ſo the Triangle is divided as required.

11. *To reduce a Trapezia into a Triangle, by Lines drawn from any Angle thereof.*

Let A B C D be the Trapezia to be reduced into a Triangle, and B the Angle aſſigned.



Draw the obſcure Line B D, and draw C E parallel to D B, produce the Baſe A D to E, and draw B E, which ſhall make the Triangle B A E equal to the *Trapezia* A B C D.

Now to divide this *Trapezia* according to any aſſigned Proportion, is no more but to divide the Triangle A B E, as before taught, which will alſo divide the *Trapezia*.

Example.

Suppoſe the *Trapezia* A B C D, containing 124 Acres, 3 Rods, and 8 Perches, is to be divided between two Men; the firſt to have 50 Acres, 2 Rods, and 3 Perches; the other 74 Acres, 1 Rod, and 5 Perches, and the Line of Diviſion to proceed from B.

Firſt, Reduce the Shares into Perches, and 'twill be 8083 for the firſt Man, and 11885 Perches for the ſecond Man's Share.

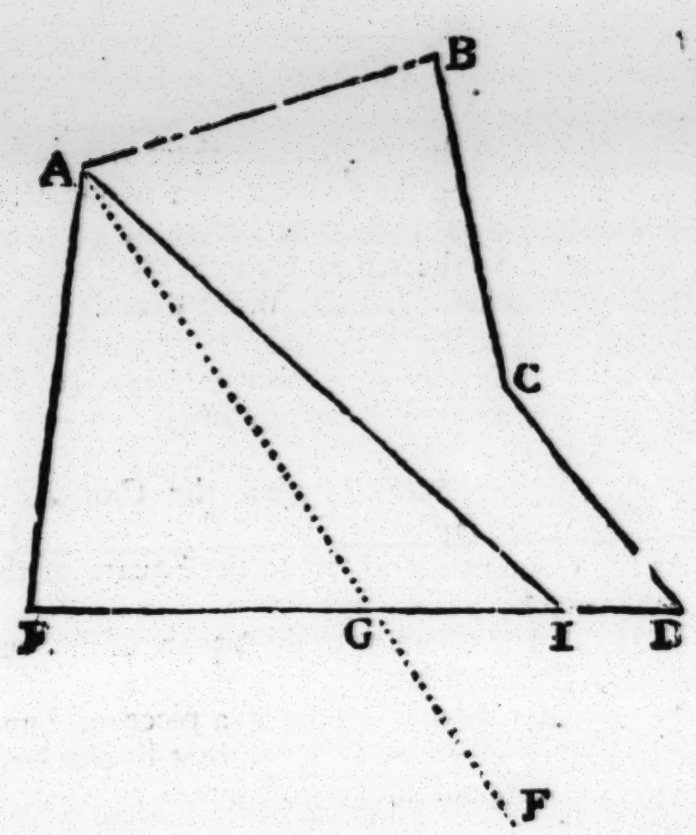
Secondly, Meaſure the Baſe of the Triangle, *viz.* A E, 78 *Chains* 00 *Links*.

Then ſay, If 19968, the whole Content, give for its Baſe 78 *Ch.* What ſhall 8083, the firſt Man's Part, give; Anſwer, 31 *Ch.* 52 *Links*; which ſet off from A to F, draw the Line F B, ſo you divide the *Trapezia* as deſired: The Triangle A B F being the firſt Man's Portion, and the *Trapezia* B C F D, the ſecond's.

12. *To*

12. *To divide an irregular Plot of any Number of Sides, according to any Proportion given, by a ſtrait Line drawn through it.*

As ſuppoſe the Field A B C D E contain 46 Acres to be divided in Halfs between two Men, by a Line proceeding from A.



Firſt draw a Line at pleaſure through the Figure as A F; then caſt up the Content of either Half, and ſee what it wants, or what it is more than the true Half ſhould be.

Thus I caſt up the Content of A E G, and find it to be but 15 Acres; whereas the true Half is 23 Acres; 8 Acres being in the Part A B C D G more than in A E G; therefore I make a Triangle containing 8 Acres, and add it to A E G, as the Triangle A G I; then the Line A I parts the Figure into equal Halfs.

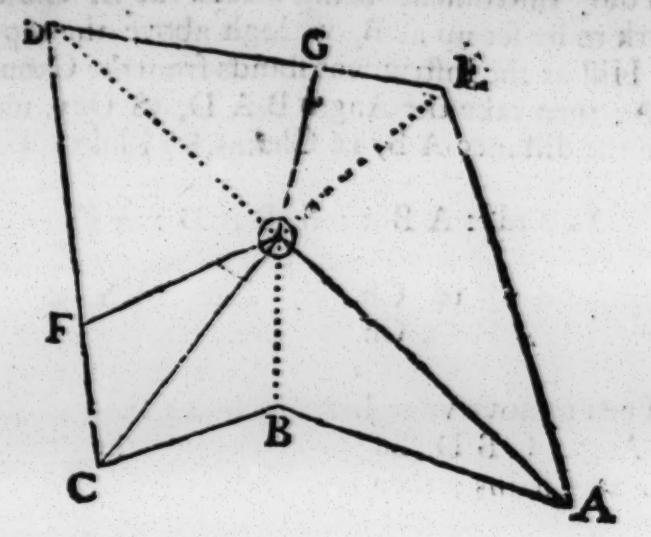
Thus you may divide any piece of Land of never ſo many Sides and Angles, according to any Proportion, by ſtreight Lines drawn through it, with as much Certainty, and more expeditiouſly than by any other way yet known.

Another Example will make all plain.

Suppoſe the following Field, containing 27 Acres, is to be divided between three Men, each to have 9 Acres, and the Lines of Diviſion to run from a Pond to a Field, ſo every one may have the Benefit of the Water, without going over one another's Land.

Firſt, from the Pond ⊖ draw Lines to every Angle, as ⊖ A, ⊖ B, ⊖ C, ⊖ D, ⊖ E; and then the Figure is divided into 5 Triangles, each of which Meaſure, and put the Contents down ſeverally; which Contents reduce into all Perches, and ſo will the Triangle,

A ⊖ B	be	390	Perches.
B ⊖ C		1238	
C ⊖ D		911	
D ⊖ E		1107	
E ⊖ F			



The whole Content being 4320 Perches, or 27 Acres, each Man's Proportion being 1440 Perches.

From ⊙ to any Angle draw a Line for the Diviſion Line, as ⊙ A: Then conſider that the firſt Triangle A ⊙ B is but 674 Perches, and the ſecond Triangle B ⊙ C 390, both together but 1064 Perches, leſs by 376 than 1440, one Man's Portion. You muſt therefore cut off from the third Triangle C ⊙ D, 376 Perches for the firſt Man's dividing Line, which thus you do: The Baſe D C is 18 Chains, the Content of the Triangle 1238; ſay then, If 1238 Perches give bare 18 Chains, What ſhall 376 Perches give? Anſwer, 5 Chains, 45 Links; which ſet from C to F, and drawing ⊙ F, you have the firſt Man's Part, *viz.* A ⊙ F.

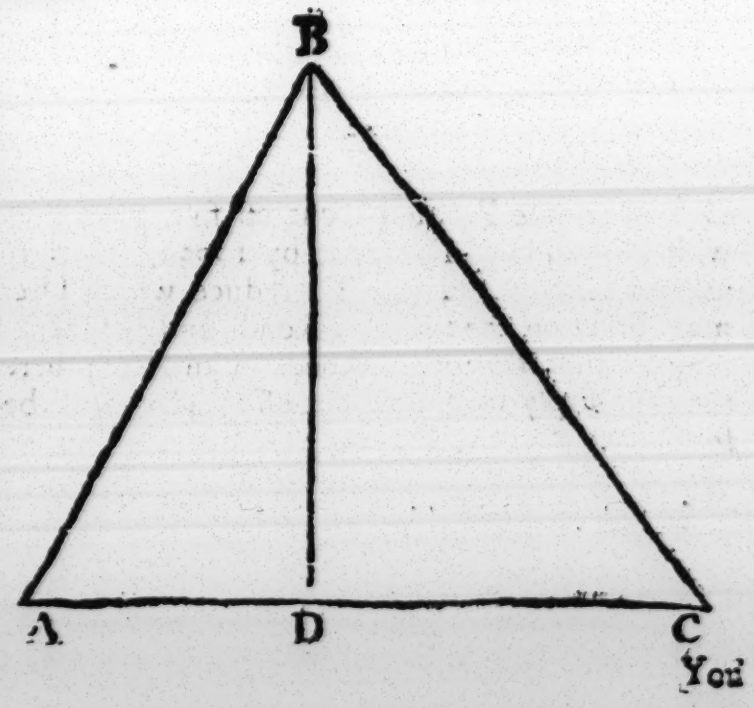
Then ſee what remains of the Triangle C ⊙ D 376, being taken out, and you'll find it to be 862 Perches, which is leſs by 578 than 1440.

Therefore from the Triangle D ⊙ E cut off 578 Perches, and the Point of Diviſion will fall in G. Draw the Line ⊙ G, which with ⊙ A and ⊙ F, divides the Figure into three equal Parts.

13. *To take the Horizontal-Line of a Hill.*

When you meaſure a Hill, you muſt meaſure the Superficies thereof, and accordingly caſt up the Contents. But when you *Plot* it down, becauſe you cannot make a Convex Superficies upon the Paper, you muſt only *Plot* the *Horizontal-Line* or *Baſe* thereof, which you muſt ſhadow over with the Reſemblance of a Hill. That *Horizontal* or *Baſe-Line* is found after this manner.

Suppoſe A B C D a Hill, whoſe Baſe you would know.



You

Your Inſtrument being placed at A, cauſe a Mark to be ſet up at B, ſo high above the top of the Hill as the Inſtrument ſtands from the Ground at A; then take the Angle B A D, 58 Deg. meaſure the diſtance A B, 16 Chains, 80 Links: Then ſay,

As Rad. : A B :: S, B A D : A D.

S, 90°, 00′ : 16 Ch. 80 Lin. :: S, 32°, 00 : 8 Ch. 90 Lin.

Then remove your Inſtrument to B, and take the Angle C B D, 46 Deg. meaſure the diſtance B C 21 Chains; then ſay,

As Rad. : B C :: S, C B D : D C.

S, 90d, : 21 Ch. :: S, 46d : 15 Ch. 12 Links.

The 15, 12 added to 8, 90, makes 24 Chains 2 Links, for the whole Baſe A C.

Otherwiſe thus.

Take the Angles B A C 58d. and ABC 78 deg. ſubtract theſe two from 180 deg. there will remain the Angle C 44 deg. meaſure A B, then ſay,

As S, C : A B :: S, B : A C.

14. *To find the Content of your Field in Acres and Parts of an Acre.*

Since Mr. *Gunter*'s 4 Pole Chain, all along here uſed, is ſuppoſed to be divided into 100 equal Parts or Links; and that every Acre contains 160 Square Perches or Poles. Therefore 160 Perches × into 160 Perches, = a Square Acre. But the Chain being Decimally divided, ſo that in one 4 Pole Chain, there are 100 Links; therefore 10 Square Chains muſt make an Acre; that is, an Acre will contain 10000 Links.

Suppoſe therefore the Baſe of any Triangle in my Plot were 27 Chains 53 Links, whoſe Area in Acres and Parts of an Acre I would find by multiplying its half Altitude 8 Chains 25 Links, into that Baſe or Side; work juſt as in Decimals, thus:

C. L.
27 53
8 25

13765
5506
22024

22|71225

Only from the Product I cut off five places, (or which is all one, Divide it by 10000) there remains 22 Acres .71225. To reduce which Decimal Fraction .71225 into Roods and Perches, I conſider that there are 4 Roods in an Acre; therefore I multiply by 4, and cut off 5 places as before.

.71225
4

2|84900

This gives me 2 Rod and this Fraction;

84900
40

33|96000

which I multiply by 40, becauſe there are 40 Perches in a Rod, and the Product is 33 96000, from whence cutting off 5 places as before, it gives me 33 Perches. So the whole Content is 22 Acres, 2 Rod, 33 Perches. See the Word *Chain*.

Knowing the Content of a Piece of Land, to find what Scale it was plotted by.

Firſt, By any *Scale* meaſure the Content of the *Plot*; then ſay,

As the Content found, is to the Square of the *Scale* I tried by;

So is the true Content to the Square of the true *Scale* it was plotted by.

As ſuppoſe there is a Plot of a piece of Land containing 10 *Acres*, and I meaſure it by the *Scale* of 11 in an *Inch*, and find it to contain 12 *Acres* $\frac{1}{10}$ of *Acre*.

Then ſay,

As 12 $\frac{1}{10}$: 121 (=) Sq.) :: 10 : 100.

And the Square Root of 100 is 10; therefore I conclude that Plot to be made by a *Scale* of 10 in an Inch.

How to change Cuſtomary Meaſure into Statute-Meaſure, and the contrary.

Say, As the Square of one ſort of Meaſure, is to the Square of the other:

So is the Content of the one, to the Content of the other.

Thus: Suppoſe a *Field* meaſured by a Perch of 18 Foot contain 100 *Acres*, How many *Acres* ſhall the ſame *Field* contain by a Perch of 16 Foot $\frac{1}{2}$?

Say, If the Square of 16 $\frac{1}{2}$ Foot, *viz.* 272, 25, give the Square of 18, *viz.* 324, What ſhall 100 Acres *Cuſtomary* give? Anſwer, 119 $\frac{9}{10}$ *Statute-Acres*.

SURVEYING-*Scale*, the ſame with *Reducing-Scale*.

SURVIVOR, in Law, ſignifies the longer Liver of two *Joint-Tenants*, or of any two joined in the Right of any thing.

SUSPENSION, or *Suſpenſe*, is a Temporal ſtop of a Man's Right; as when a Seignory, Rent, &c. by reaſon of the Unity of Poſſeſſion thereof, and of the Land out of which they iſſue, are not *in eſſe* for a time, and *tunc dormiunt*, but may be revived or awaked, and ſo differs from Extinguiſhment, which dies for ever. And ſometimes this Word Suſpenſion is uſed in Common Law, as it is in the Canon Law, *pro minori Excommunicatione*.

SUSPENSOR *Teſticuli*, the Name of a Muſcle otherwiſe call'd *Cremaſter*; which ſee.

SUSPENSOKIUM, is a Ligament of the *Penis* firſt diſcover'd by our Accurate Mr. *Cowper* the Surgeon

geon. It ariſeth from the Anterior Part of the *Oſſa Pubis*, and fix'd to the upper part of the *Dorſum Penis*, on each ſide its great Vein. Its Uſe is to aſſiſt the *Muſculi Erigentes* in their Action.

SUTURA alſo, is a Connexion of the Sides or Lips of a Wound. This is of two ſorts: Actual, which is done with a Needle of a triangular Point, a Pipe, or Cane, and waxed Thread: Firſt in the middle of the Wound you muſt ſew it together with a double Thread, and having made a Knot, cut it off; the reſt of the Wound muſt be ſewed up with ſingle Thread; Care muſt be taken that the Stitches are not ſet too wide, nor too cloſe, eſpecially not too cloſe, that there may be room for any corrupt Matter bred in the Wound to work out. The other ſort of Suture is much like the way that the Skinners uſe to ſew Skins together: This is proper in Wounds of the Inteſtines, and in Cuts of the Veins and Arteries.

Alſo the *Junctures* of the Parts of the Shells of Fiſhes to one another, are called *Sutures*.

SUTURA *Oſſium*, a Suture in the Juncture of the Bones of the Skull, like the Teeth of Saws meeting together. Thoſe which join the Parts of the Scull to the Bones of the upper Jaw, are of 3 ſorts; the *Tranſverſalis*, the *Ethmoidalis*, and the *Sphænoidalis*; which ſee under thoſe Words. The Sutures joining the parts of the Scull are 4: The *Coronalis*, *Lambdoidalis*, *Sagittalis*, and *Squammoſa*; which ſee.

SWABBER, the Title of an inferior Officer aboard a Man of War, whoſe Office it is to ſee that the Ship be kept neat and clean; in order to which, he is to ſee her waſhed well once or twice a Week at leaſt, eſpecially about the Gun-walls and Chains. He ought to burn Pitch or ſome ſuch thing now and then between Decks, to prevent Infection; and to acquaint the Captain of ſuch as are Naſty and Offenſive.

SWAINMOTE, or *Swainimote*, ſignifies a Court touching Matters of Foreſt, and held by the Charter of the Foreſt thrice in the Year, before the *Verdorors* as Judges. And it is as incident to a Foreſt, as Court of Pye-powder to a Fair.

SWALLOW-*Tail*, in Fortification, is a *ſingle Tenaille*, that is narrower towards the *Place* than towards the Country. See *Queue a'yronde*.

SWEEP. The Seamen call the Mold of a Ship when ſhe begins to compaſs in at the Rungheads, the *Sweep* of her; or the Sweep of the Futtock.

SWEEPING, at Sea, ſignifies dragging along the Ground, at the Bottom of the Sea, or Channel, with a Tree-fluked Grapnel, to find ſome *Hawſer* or *Cable*, which is ſlipped from an Anchor.

SWEETBREAD. See *Pancreas*.

SWIFT *in Motion*, a Planet is ſaid to be ſo, when by its own proper Diurnal Motion, he exceeds, or moves further than his mean Diurnal Motion: *Slow in Motion*, is when his Motion happens to be leſs than his *mean Motion*.

SWIFTERS, in a Ship, are Ropes belonging to the Main-maſts, and Fore-maſts, and help to ſuccour or ſtrengthen the Shrowds, and to keep the Maſts ſtiff: They have Pendants faſtened under the Shrowds at the Head of the Maſts, with a double Block, thro' which the Swifter is reeved; which at the *ſtanding Part* hath a ſingle Block with a Hook, hitched into a Ring at the *Chain Wale*, and ſo the Fall being haled up, helps to ſtrengthen the Maſt, and it is belayed about the Timberheads of the lower Rails aloft.

SWIFTING of a Boat, is compaſſing her Gunwale round with a good Rope, to ſtrengthen her in a Streſs of Weather, that ſhe be not ſhattered by the Violence of the Sea.

SWIFTING of a Ship, is either bringing her aground, or upon a Careen; for then they uſe to *Swift the Maſts*, to eaſe and ſtrengthen them, that all the Weight may not hang by the Head; which is done by laying faſt all the *Pendants* of the *Swifters* and *Tackles* (with a Rope) cloſe to the Maſt, and as near to the Blocks as can be; and then to carry forward the Tackles, and there to *Bowſe*, or hale them down as hard and taught as is poſſible. (So that the Sea Word of Command here, is, *Ho! Bowſe Men!* All this is done alſo to keep the Maſt from riſing out of the *Step*.

SWIFTING the *Capſtan-Bars*, is ſtraining a Rope all round the outer Ends of the *Capſtan-Bars*, in order to ſtrengthen them, and make them bear all alike, and together, when the Men heave or work there.

SWING-WHEEL, in a Royal Pendulum-Clock, is that Wheel which drives the Pendulum: This Wheel in a Watch is called the *Crown-Wheel*, as alſo in a Balance-Clock.

SUPERFICIAL *Fourneau*, a Term in Fortification, the ſame with *Caiſſon*, which is a wooden Cheſt, or Box with 3, 4, 5, or 6 Bombs in it, and ſometimes 'tis filled only with Powder; and is uſed in a cloſe Siege, by being buried under Ground with a Train to it, to blow up any Lodgment that the Enemy ſhall advance to. Therefore they uſually expreſs it thus: "After the *Mine*, "or *Fourneau*, had deſtroyed the *Bonette*, a *Caiſſon* "was buried under the Ground, thrown up, and "the Enemy advancing to make a Lodgment "on the Ruins of the *Bonette*, the *Caiſſon* was "fired, and blew up the Poſt a ſecond time.

SYCOSIS, is an Excreſcence of the Fleſh about the Fundament; 'tis alſo an Ulcer, ſo called from the Reſemblance of a Fig; this is of two kinds, one hard and round, the other ſoft and flat; out of the hard iſſues a very ſmall Quantity of glutinous Matter; out of the moiſt proceeds a greater Quantity, and of an ill ſmell: Theſe Ulcers grow in thoſe Parts only which are covered with Hair; the hard and round chiefly in the Beard; the moiſt for the moſt part in the Scalp. *Blanchard*.

SYDERATION. See *Apoplexy*.

SYDERIAL *Year*. See *Year*.

SYLLEPSIS, or *Conceptio*, (in *Grammar*) is when the Senſe of an Expreſſion is to be conceived otherwiſe than is imported by the Words; and ſo the Conſtruction is made accordingly as ſome define it. But *Voſſius* ſaith, 'tis an Agreement of a Verb or an Adjective, not with that word which is moſt near, but with that which is moſt worthy, honourable, *&c.* in any Sentence, as *Rex & Regina beati*.

SYMBOLS. See *Characters*.

SYMMETRAL, the ſame with *Commenſurable*.

SYMMETRY, is uſually taken in *Architecture* for the Proportion required, according to the Rules of *Geometry*, to make all the Parts of any Structure compleatly agree to, and with the Whole.

SYMPATHETICAL *Inks*, are ſuch as can be made to appear or diſappear very ſuddenly by the Application of ſomething that ſeems to work by Sympathy.

There

There are ſome ways of preparing Inks of this Kind, which are really wonderful and ſurprizing, as well as curious and diverting.

The Experiments are theſe.

Take of good unſlacked Lime, two or three Parts, according to the Strength and Goodneſs of the ſame, and one Part of *Yellow Orpiment*, (which to powder, had beſt be wrapt up in a thick Paper, and ſo beaten, to prevent the dangerous Steams that may affect the Head) both theſe being powder'd and mix'd, put to them 15 or 16 times as much Water in weight, as there was of *Orpin*: Stop the Viol well with Cork and a Bladder, and ſet it in warm Embers, or ſome ſuch Place; ſhaking the Viol now and then for 4 or 5 Hours; then warily decant the clear Part, or which is better, *filtrate* it.

In the mean time burn a piece of Cork throughly; and when it is well inflamed, quench it in common Water (or which is better, *Aqua Vitæ*, or *Brandy*) and by this means reducing of it to a friable Coal, grind it with a ſufficient quantity of fair Water, in which you have diſſolved a little *Gum-Arabick*, and ſo it will make a Liquor as black as common Ink, which will ſerve very well to write any thing with.

While theſe are doing, diſſolve in three times as much diſtilled, or ſtrong Vinegar, over warm Embers, a Quantity of *Red-Lead*, (or *Minium*) or of *Saccharum Saturni*, in three times as much Water, for 3 or 4 Hours, or till you find the Liquor have a very ſweet Taſte. This will likewiſe, as the firſt Liquor, be clear as common Water.

All things being thus ready (for you muſt be pretty quick at it) write on a piece of Paper what you will, with this laſt Liquor, with a clean, or new Pen, and when it is dry, nothing will appear.

Then over that place write with the Ink you made of the Cork, what you pleaſe; it will look juſt as if it had been written with common Ink, which let dry; then dipping a ſmall piece of Rag, or Sponge, in the firſt Liquor, rub it on the Place written, and you will immediately ſee the Black writing vaniſh, and that written with the Inviſible Ink, appear Black and Legible.

Take alſo a Book 4 or 5 Inches thick, and writing on the firſt Blank Leaf with the laſt Liquor, or the Inviſible Ink; or putting in there a Paper ſo written, turn to the other end of the Book, and rub there with a Rag dipt in the firſt Liquor, on that part that is as nearly as you can gueſs, oppoſite to the Writing, and leave alſo the Rag there: And over it clap a folded Paper, and nimbly ſhutting the Book, ſtrike 4 or 5 good Stroaks on it with your Hand, and then turning it t'other ſide uppermoſt, clap it into a Preſs, or lay it between two Boards with a good Weight on it for a Quarter of an Hour (or half that time will do) then taking it out, you'll find the Writing black and legible, which was written with the Inviſible Ink.

This Proceſs, Mr. *Boyle* communicated in his Hiſtory of Gold, *p.* 322. and afterwards *Lemery* publiſhed it in his *Courſe of Chymiſtry*, with the Addition of the latter Experiment.

By whoſe help we may endeavour at a Solution of theſe ſtrange Experiments, if we conſider,

1. That the firſt of theſe Liquors is a Mixture of the Alkalizate, and fiery Salt of Quick-lime, with the Sulphureous Subſtance of the *Orpin*, which is a kind of *Arſenick*.

2. That the Blackneſs of the Ink, which is the ſecond Liquor, proceeds only from the porous, light, and ſooty Parts of the Cork; which are its Oily Parts very much rarified.

3. That the laſt Liquor (or the Inviſible Ink) only the Parts of the Lead held up imperceptibly in the acid Liquor of Vinegar.

Hence then, the Reaſon of the diſappearing of the Ink in the firſt Experiment, is from the penetrating Parts of the firſt Liquor, which conſiſting of an Alkalizate Salt, and a penetrating Oil, or Sulphur, doth make a kind of Soap, which ſoon diſſolves the rarify'd Fuliginoſity of the Ink, as common Soap takes away greaſie Spots out of Cloaths, &c.

And the inviſible Ink then appears black, becauſe the Edges of the acid Liquor that hold the Parts of the Lead diſſolved, being now broken by its Conflict with the Alkali of the firſt Liquor; the Parts of the Lead are, as it were, precipitated on the Paper, and ſo appear in their proper Colour, which is Black.

So that the Viſible Ink diſappears, becauſe its black Parts are diſſolved; and the Inviſible doth appear, becauſe its diſſolved Parts are revived, or reſtored.

The ſecond Experiment ſhews the ſtrange piercing Subtility of the firſt Liquor.

You had beſt make all the Liquors in different Places, leſt they ſhould mingle, and ſo ſpoil the Experiment, as I have known them ſometimes do.

Experiment the Third.

Diſſolve a little white, or green Vitriol in Water; and then write with a clean Pen with the Solution, nothing will appear.

Boil Galls in Water, and dip a Rag of Linen in the Decoction, and with it rub the Place before written, and it will appear Black and Legible.

But if you rub over it with a Feather, or a Rag dipt in Spirit of Vitriol, (or its Oil) the Letters will diſappear again.

Dip another Rag in Oil of *Tartar per Deliquium*, and rub on the Place, the Letters will *appear again*, but of a Yellowiſh Colour. *Lemery's Chymiſtry, laſt Edit. pag.* 330.

REASONS.

The Coagulum of the Vitriol and Galls, is the Cauſe of the firſt Blackneſs, (as is ſeen in making common Ink) which the acid Spirit of Vitriol diſſolves, and ſo the Letters diſappear: But the Oil of Tartar breaking (as it uſes to do in all Precipitations) the Force of this acid Spirit, reſtores the Coagulum, but ſpoils its Colour a little, by mingling it ſelf with it.

SYMPATHETICK *Powder*, is only (ſaid *Lemery*) Green, or *Roman Vitriol*, opened by the Sun-Beams

Beams penetrating into it, and imperfectly calcining it: The Vitriol is uſually expoſed to the Sun's Heat in the Month of *July*, but ſome uſe only Powder of Vitriol. When they uſe it, they ſpread ſome of the Powder upon a Linen-cloth dipt in the Blood of any Wound, and then pretend, that if the Cloth be many Miles off the wounded Perſon, yet he ſhall be healed: But this is ſo far from being true, notwithſtanding the vaunting Stories of Sir *Ken. Digby* and others, that 'twill hardly have its Effect, if done in the ſame Room where the Patient lies; and he is certainly very much wanting to himſelf, who will uſe no other Help.

Vitriol hath its Parts in continual Motion; and 'tis probable, many *Effluvia* may go out from it; and ſome few of thoſe, if Application be made to the Cloth, juſt by the Patient, may perhaps enter into the Wound, and help to ſtop the Bleeding, for Vitriol is a known Styptick; but he that will neglect all other Means, and depend only on this, may probably pay dear for his Credulity.

SYMPEPSIS, is a Coction of thoſe Humours, which are growing into an Impoſtume.

SYMPHYSIS, is the joyning of two Bones of which neither has a proper diſtinct Motion: This is either without any Medium, or elſe with it, as with a Cartilage, or Griſle, a Ligament, or Fleſh, *&c.*

SYMPTOM, is a preternatural Diſpoſition of the Body, occaſioned by ſome Diſeaſe; this is either a Diſeaſe cauſed by another Diſeaſe; or elſe the Cauſe of a Diſeaſe proceeding from another Diſeaſe; or elſe ſimply a Symptom: This laſt is either ſome Action of the Body hindred, or diſturbed, ſome Fault of the Excrement, or change of the Natural Temper. *Blanchard.*

SYMPTOMATICAL *Fevers* according to ſome, are thoſe which ariſe from the Inflammation and Putrefaction of Humours contained in ſome of the Bowels, of which kind are thoſe *Fevers* that accompany the *Pleuriſie*, *Inflammation of the Lungs, and Liver*, *Frenzy*, *Quinſie*, and other Inflammations, as Ulcers of the Internal or External Parts.

SYMPTOTES. See *Aſymptotes.*

SYNACTICA, are Medicines that contract any Part.

SYNALÆPHA, is a Figure in the Dimenſion, or Scanning of a *Latin* Verſe; whereby there is a Coalition of the two Vowels or Diphthongs, one of which ends, and the other begins two contiguous Words in a Verſe, ſo that they make but one.

SYNARTHROSIS, is a joyning of Bones by a Griſle, and is of two ſorts, *viz. Sutura*, and *Gomphoſis*, which ſee.

SYNCHONDROSIS, the ſame with *Synarthroſis.*

SYNCHYSIS, in *Grammar*, is a confuſed and diſorderly placing of Words in a Sentence.

SYNCHYSIS, a Diſeaſe, is a preternatural Confuſion of the Blood, or Humours of the Eyes. *Blanchard.*

SYNCOPALIS *Febris*, or the *Swooning Fever*; is that in which the Patient often Swoons and Faints away. *Blanchard.*

SYNCOPATION, a Term in Muſick, which is when a Note of one Part ends and breaks off upon the middle of a Note of another Part.

SYNCOPE, in Muſick, is the driving a Note, when ſome ſhorter Note prefix'd at the beginning of the Meaſure, or Half-meaſure, is immediately follow'd by two, three, or more Notes of a greater Quantity, before you meet with another ſhort Note equivalent to that which began the driving, to make the Number even. As when an odd *Crotchet* comes before two, three, or more *Minims*, or an odd *Quaver* before two, three, or more *Crotchets.*

SYNCOPE, in Phyſick, is a ſudden Proſtration or Swooning, with a very weak, or no Pulſe, and a Depravation of Senſe and Motion.

SYNCOPE, in *Grammar*, is the taking away a Letter or Letters, out of the middle of a Word: As *Dixti* for *Dixiſti*, *Repoſtum* for *Repoſitum.*

SYNCRITICA, are relaxing Medicines.

SYNDESMUS, or *Syndeſmous*, the ſame with a *Ligament.*

SYNDROME, is a Concurrence of ſeveral Symptoms in the ſame Diſeaſe.

SYNECDOCHE, a Trope in *Rhetorick*, where the Name of the the Whole is put for Part; or the Name of the Part for the Whole: As if we ſhould ſay, *Europe* for *England*, or *England* for *Europe.*

SYNECDOCHE, in *Grammar*, is when the Ablative Caſe of the Part, or the Adjunct, is changed into the Accuſative: As in that of *Virgil*:

Deiphobum vidi lacerum crudeliter Ora.

And in this:

Flores inſcripti nomine Regum.

SYNECHPHONESIS, or *Synizeſis*, is a Figure in *Grammar*, whereby two Vowels are contracted into one, as in this Verſe of *Virgil.*

Seu lento fuerint Alvearia vimina texta.

Where the *ea* in *Alvearea*, are contracted into one Vowel.

SYNEDRENONTA, are common Symptoms which accompany Diſeaſes; and yet neither flow from the Nature of the Diſeaſe, nor are neceſſary Concomitants of it; but do, notwithſtanding, ſignifie the Greatneſs, Continuance, *&c.* of the Diſeaſe.

SYNANCHE, is a ſort of *Squinancy*, which quite ſtops the Breath, or a preternatural Inflammation of the Muſcles of the Jaws.

SYNEUROSIS, is an Articulation of Bones by a Ligament; as the Extremity of the *Ulna*, is joined to the Bones of the *Carpus.*

SYNGULTUS, the *Hiccough*, is a depraved Convulſive Motion of the Stomach, by which it endeavours to expel ſomething that is hurtful, or offenſive.

SYNIZESIS. See *Synechphoneſis.*

SYNOCHA, is a continued intermitting Fever, this laſts for many Days with a great Heat, ſometimes Putrefactions of the Blood; it is either *Quotidian*, *Tertian*, or *Quartan. Blanchard.*

SYNOCHUS, is a continued Fever without any Intermiſſion, or Abatement of the Heat, which continues for many Days: This is either ſimple, or accompanied with Putrefaction. *Blanchard.*

SYNOD, a Meeting or Aſſembly of Eccleſiaſtical Perſons concerning Religion: Of which there are four Kinds.

1. *General*, where Biſhops, *&c.* meet of all Nations.

2. *National*, where thoſe of one Nation only come together.

3. *Provincial*, where they of one only Province meet.

4. *Dioceſan*, where thoſe of but one Dioceſs meet: See *Convocation*, which is the ſame with *Synod*, only the one is a *Greek*, and the other a *Latine* Word. *Cowel's Interpreter.*

SYNODICAL *Month*, is the Space of Time, (*viz*, 29 Days, 12 Hours, 45 Minutes) contained between the Moon's parting from the Sun at a Conjunction, and returning to him again; during which Time ſhe puts on all her Phaſes. And her

SYNODICAL *Revolution*, is that Motion whereby her whole Syſtem is carried along with the Earth round the Sun.

SYNONOMY, is when the ſame thing is expreſs'd by ſeveral Words that have but one and the ſame Signification: As if one ſhould ſay, *He went away, he eſcaped, he fled.*

SYNTASIS, is a preternatural Diſtention of the Parts.

SYNTECTOE, is a kind of Looſeneſs that proceeds from the melting away of the Subſtance of the Body by a violent hot Diſtemper of the ſolid Parts ſuch as ſometimes happen in the Inflammation of the Bowels, and in a vehement burning Fever, Hectick, or Peſtilential; in which a fat Matter, as it were mixt with Oil or Greaſe, is voided by Stool.

SYNTENOSIS, is reckon'd by ſome to be the Unition of one Bone to another, by a *Tendon*; as the Knee-pan to the Thigh-bone and *Tibia*.

SYNTERETICK Medicines, are that Part of Phyſick, which give Rules for the Preſervation of Health.

SYNTEXIS, is a Conſumption and Colliquation of the Body, in which firſt the Fleſh is waſted, and afterwards the Subſtance of the more ſolid Parts. *Blanchard.*

SYNTHESIS, is either the Frame and Structure of the whole Body; or more ſtrictly, the Compoſure of the Bones. 'Tis alſo uſed in *Mathematicks*, in Oppoſition to the Word *Analyſis*; in which Senſe it ſignifies *Compoſition*, or the

SYNTHETICAL Method of *Enquiry*, or *Demonſtration* in *Mathematicks*, is when we purſue the Truth chiefly by Reaſons drawn from Principles before eſtabliſhed, and *Propoſitions* formerly proved, and proceed by a long regular Chain, till we come to the Concluſion: As is done in the Elements of *Euclid*, and in almoſt all the *Demonſtrations* of the Ancients. This is called *Compoſition*, and is oppoſed to the Analytical Method, which is called *Reſolution*; which ſee.

SYNTHESIS is alſo uſed by the *Grammarians*, to ſignifie an Agreement of the Parts of a Sentence as to Senſe, but not as to the Words.

SYNULOTICKS. See *Cicatriſantia*.

SYNYMENSIS, is taken to be the uniting of Bones together by a *Membrane*, as in Infants, the Bones of the *Synciput*, with the *Os Frontis*.

SYPHON, is a Tube, or Pipe of Glaſs, or Metal, which is uſually bent to an Acute Angle, and having one Leg ſhorter than the other; they are frequently to draw off Liquors out of one Barrel or Veſſel into another, without raiſing the Lees, or Dregs, and are called *Cranes*. Sometimes Glaſs Tubes or Pipes, tho' ſtrait, are called *Syphons*.

For the Cauſe of the running of Water, or other Liquors, through the *Syphons* or *Cranes*: See *Hydroſtaticks*, *Paradox* 10.

SYRINGE, is an Inſtrument which is uſed in injecting Liquors into Wounds, Ulcers or any diſeaſed Parts of the Body.

SYRINGOMATA, are Chirurgeons Knives, which they open *Fiſtula's* with.

SYRINGOTOMIA, is the Inciſion of the *Fiſtula*.

SYSSARCOSIS, is the Connexion of Bones by Fleſh. *Blanchard.*

SYSTEM, in Muſick, is the Extent of a certain Number of *Chords*, having its Bounds toward the *Grave* and *Acute*, which hath been differently determined by the different Progreſs made in Muſick, and according to the different Diviſions of the *Monochord*.

The *Syſtem* of the Ancients was compoſed of four *Tetrachords*, and one *Supernumerary Chord*, the whole making Fifteen Chords.

SYSTEM properly is a regular orderly Collection, or Compoſition of many things together.

Thus the *Solar Syſtem*, is the Aggregate Union, or orderly Diſpoſition of all thoſe Planets which move round the Sun as their Centre, in determin'd Orbits, and never deviate farther from him than their proper and uſual Bounds. And a

Syſtem of Philoſophy, is a regular Collection of the Principles and Parts of that Science into one Body, and a treating of them Dogmatically, or in a Scholaſtical Method; which is called the *Syſtematical Way*, in Contra-diſtinction of the *Way of Eſſay*, wherein the Writer delivers himſelf more looſely, eaſily and modeſtly.

The Learned Dr. *Hook*, did in the Year 1674, at the End of his Attempt to prove the Motion of the Earth by Obſervation, promiſe that he would explain a Syſtem of the World, differing in many things from any then known, and yet exactly agreeable to Mechanical Principles. Which Syſtem he there ſays, depends on theſe three Suppoſitions, *viz*.

Firſt, That all the Heavenly Bodies have a gravitating or attracting Power towards their own Centers, whereby they attract not only their own Parts, and keep them from flying off from them, but alſo all other Celeſtial Bodies within the Sphere of their Activity.

Secondly, That all Bodies put into a direct and ſimple Motion, will ſo continue to move forwards in a ſtrait Line, till they are by ſome or other more effectual Power bent or deflected into a Motion, which deſcribes ſome Curve Line.

Thirdly, That theſe attractive Powers are ſo much the more powerful in operating by how much the nearer the Body wrought upon, is to their own Centers.

All which is abundantly confirmed in Sir *Iſaac Newton's Admirable Principia Philoſophiæ Mathematica*.

SYSTOLE, in *Anatomy*, is the Contraction of the Ventricles of the Heart, whereby the Blood is forcibly driven into the great Artery.

SYSTOLE, in *Grammar*, is part of the Poetical Licenſe, whereby a long Syllable is made ſhort: As in that of *Virgil*:

——*Tulerunt faſtidia Menſes.*

SYSTYLE, in *Architecture*, is a Building where the Pillars ſtand thick, but not altogether ſo cloſe as in the *Pychnoſtyle*; the Inter-columniation, or Diſtance between them, being only two Diameters of the Column.

SYZYGIE, in *Aſtronomy*, is the ſame with the Conjunction of any two Planets, or Stars, or when they are both referred to the ſame Point in the Heavens; or when they are referred to the ſame Degree of the Ecliptick, by a Circle of Longitude paſſing through them both.

TABES. *See Atrophia.*

TABES *dorſalis*, a Conſumption in the ſpinal Marrow, incident to thoſe who are too much addicted to Venery, they are without a Fever, eat well, and yet waſte, or conſume away: If you ask one in this Diſeaſe an account of himſelf, he will tell you, that there ſeems as if ſo many Piſmires did crawl from his Head down upon his ſpinal Marrow; when he eaſes Nature, either by Urine or Stool, there flows thin liquid Matter like a *Semen* plentifully; when he goes or runs any way, but eſpecially by a ſteep Place, he grows weak and ſhort-breathed, his Head is Heavy, and his Ears tingle; ſo in proceſs of Time he dies of a Fever called *Lipyria*, where the External Parts are cold, and the Internal burn at the ſame time. *Blanchard.*

TABLE, in Architecture, is a ſmooth and ſimple Part of a different Figure; but moſt commonly in Form of a long Square, or of a Triangle.

Projecturing Table, is that which jets out beyond the naked Face of a Wall, Pedeſtal, or any Part whereof it makes the Ornament: And a

Raked Table, is that which is hollow'd in the Square of a Pedeſtal, or elſewhere.

TABLETS, or ſolid Electuaries, are much the ſame with *Lozenges*, being made uſually of Sugar and Powder, *&c.* incorporated well together, and given in many Diſeaſes, eſpecially thoſe of the Lungs and Breaſt.

TABLING *of Fines*, is the making a Table for every County where his Majeſty's Writ runs, containing the Contents of every *Fine* paſſed in any one Term, as the Name of the County, Towns, and Places, wherein the Lands or Tenements lie; the Name of the Demandant and Deforceant, and of every Manor named in the *Fine*.

TABUM, is a thin ſort of Matter that comes from an ill Ulcer. *Blanchard.*

TACK, in a Ship, is a great Rope having a *Wale knot* at one End, which *ſeized* or faſtened into the *Clew* of the Sail; ſo is reeved firſt thro' the *Cheſſe Trees*, and then is brought thro' a Hole in the Ship's Side. Its Uſe is to carry forwards the Clew of the Sail, and to make it ſtand cloſe by a Wind: And whenever the Sails are thus trimmed, the Main-tack, the Fore-tack, and Miſſen-tack are brought cloſe by the Board, and haled as forward on as they can be. The Bowlings alſo are ſo on the Weather ſide; the Lee-ſheets are haled cloſe aft, and the Lee-braces of all the Sails, are likewiſe braced aft. Hence they ſay, a Ship *Sails*, or *ſtands cloſe upon a Tack*, *i.e.* cloſe by the Wind. *Hale aboard the Tacks*; that is, Bring the Tack down cloſe to the Cheſs-trees. *Eaſe the Tack*, *i.e.* Slacken it, or let it go, or run out. *Let riſe the Tack*, *i.e.* Let it all go out. The Tacks of a Ship are uſually belayed to the *Bitts*, or elſe there is a *Chevil* on purpoſe to faſten them.

TACK *about*: The Word, when a Ship's Head is to be brought about ſo as to lie a contrary Way; to do which, Firſt they make her ſtay, (See Stay) and when ſhe is ſtay'd, they ſay, She is *Pay'd*. The next Word is, *Let riſe and Hale*, that is, Let the *Lee-tack riſe, and Hale aft the Sheets*, and ſo trim all the Sails, by a Wind as they were before; for they caſt off that which was before the *Weather-Bowling*, and ſet up the other taught; and ſo they do alſo by all *Sheets*, *Braces* and *Tacks*, which a Ship that is trimmed by a Wind muſt have.

TACKLES, in a Ship, are ſmall Ropes running in three Parts, having at one End a *Pendant* with a Block faſtened to them, or elſe a *Lannier*; and at the other End, is a Block and an Hook to hang any Goods upon, which is to be heaved into the Ship, or out of it.

There are ſeveral ſorts of theſe *Tackles*.

1. The *Boat Tackles*, which ſerve to hoiſe the Boat in and out, as alſo for many other Uſes: Theſe ſtand on the Main-maſt Shrouds, the other on thoſe of the Fore-maſt.

2. The *Tackles* belonging to the Maſts, theſe ſerve as a kind of Shrouds, to keep the Maſts from ſtraining.

3. The *Gunners-Tackles*, with which the Ordnance are hoiſted in and out.

4. There is alſo another called *Winding-Tackle*; which ſee under that Word.

There is alſo another kind of *Tackle* which is called a *Burnett*. See *Burnett*.

TACTILE *Quantities*, are ſuch as have a primary Relation to the Senſe of Feeling, or to our Touch: As Heat and Cold, *&c.*

TÆNIA, in Architecture, is a Member of the *Dorick* Capital, which reſembles the Shape of a ſquare Fillet, and ſerves inſtead of a *Cymetium*, being faſtened, as it were, to a Capital below the *Triglyphs*, whereof it ſeems to be the Baſe.

TAFFEREL, is the uppermoſt Part, Frame, or Rail of a Ship abaft over the Poop.

TAILE, in common Law, ſignifies two ſeveral Things both grounded upon one Reaſon. Firſt, it

is to be used for the Fee, which is opposite to *Fee Simple*, by reason it is so minced or pared, as it were, that it is not in the Owner's free Power to dispose, but is by the first Giver *cut* or *divided* from all others, and tied to the Issue of the Donee: And this Limitation of *Tail*, is either *General*, or *Special*.

Tail General, is that whereby Lands or Tenements are limited to a Man, and to the Heirs of his Body begotten; and it is so called, how many Wives soever the Tenant holding by this Title, shall have one after another in Lawful Marriage, his Issue by them all, have a Possibility to inherit one after another.

Tail Special, is when Lands or Tenements limited to a Man and his Wife, and the Heirs of their two Bodies begotten; and hath this Term of *Special*, because if the Man bury his Wife before Issue, and take another, the Issue by his second Wife cannot inherit the Land, *&c.* Also, if the Land be given to a Man and his Wife, and their Son *R.* for ever; this is *Tail Special*.

TAIL *after Possibility of Issue Extinct*, is where Land is given to a Man and his Wife, and to the Heirs of their two Bodies, the one over-lives the other without Issue between them begotten; he shall hold the Land for Term of his own Life, as Tenants in *Tail after Possibility of the Issue Extinct*; and notwithstanding that he do waste, he shall never be Impeached of it: And if he Alien, he in the Reversion shall not have a Writ of Entry *in consimili Casu*, but he may enter, and his Entry is Lawful.

TAILLOIR. See *Abacus*.

TAINT, in Law, signifies Substantively, either a Conviction; or Adjectively, a Person Convicted of Felony or Treason, *&c.* See *Attaint*.

TAKE *and leave*, they say at Sea, that when a Ship sails so well that she can come up with another, or out-sail her when she pleases; that *she can Take and Leave upon her*, whenever she will.

TALES, in Law, is taken for a supply of Men, impannelled upon a Jury or Inquest, and not appearing, or at their Appearance challeng'd by either Party as not indifferent; in which Case the Judge upon Motion, grants a Supply to be made by the Sheriff of one or more such there present; and hereupon the very Act of supplying is called a *Tales de Circumstantibus*: But he that hath had one *Tales* either upon Default or Challenge, may not have another to contain so many as the former: For the first *Tales* must be under the principal Pannel, except in a Cause of Appeal, and so every *Tales* less than other, until the Number be made up of Men present in Court, and such as are without Exception; yet this general Rule is not without some Exceptions, as appears by *Stamford Pl. Cor. Lib.* 3. *Cap.* 5. These commonly called *Tales*, may in some sort, and indeed are called *Meliores*, *viz.* when the whole Jury is challenged.

TALLY *the Sheats*, is a Word of Command at Sea, when the Sheats of the Main-sail or Fore-sail are to be halled aft. See *Sheets*.

TALON, a small Member in Architecture composed of a square Fillet, and a straight *Cymetium*. It differs from the *Astragal*, which is a round Member, whereas the *Talon* consists of two Portions of a Circle, one without, and the other within; and when the Concave Part is uppermost, it is called *Reversed Talon*.

TALPA, is a Tumor so called, because that as a Mole (in Latin *Talpa*) creeps under Ground, so this feeds upon the Scull under the Skin: It may be referred to the Species of *Athermas*; which see. *Blanchard*.

TALUS, the same with *Astragulus*. See it described under the word *Tarsus*.

TALUS, or *Talut*, properly signifies any Thing that goes sloping, as the *Talus* of a Wall in Masonry, when its thickness is diminished by Degrees as it rises in height. But in *Fortification*, the *Talus* of a *Bastion* or *Rampart*, is the Slope allowed to such a Work whether it be of Earth or Stone, the better to support its Weight.

TALUS *Exterior*, of a Work, is its Steepness on the Sides of the Field; and is always made as little as possible, to prevent the Enemies *Scalado*, unless the Earth be bad, then it is absolutely necessary to allow a considerable *Talus* for its *Parapet*.

TALUS *Interior*, of a Work, is its Steepness on the inside towards the Place.

TAMPKIN, *Tampion*, or *Tampin*, at Sea, is a round piece of Wood filled with the Muzzle of a great Gun, which serves to stop it so, that no Water or Rain may get in to wet the Powder.

TANGENT, of a Parabola, (or other Conick Section, or Geometrical Curve) is a Right Line drawn, cutting the Ax produced, and touching the *Section* in one Point without cutting it.

In Philos. Transact. N. 90. there is an easie Method of *Slusius*, to draw Tangents to all Geometrical Curves without any Labour of Calculation: The Demonstration of which you have afterwards, *Hunts* 95 communicated by the same Author, and is contained in these three *Lemmata*.

1. The Difference between any two Dignities, or Powers of the same Dimensions or Degrees divided by the Difference between the Roots of those Powers, gives several Parts or Members of the next inferior Powers, which may be formed from those two Roots, as from a Binomial, thus.

$$\frac{x\,xx-y\,yy}{x-y}=x\,x+x\,y+y\,y.$$

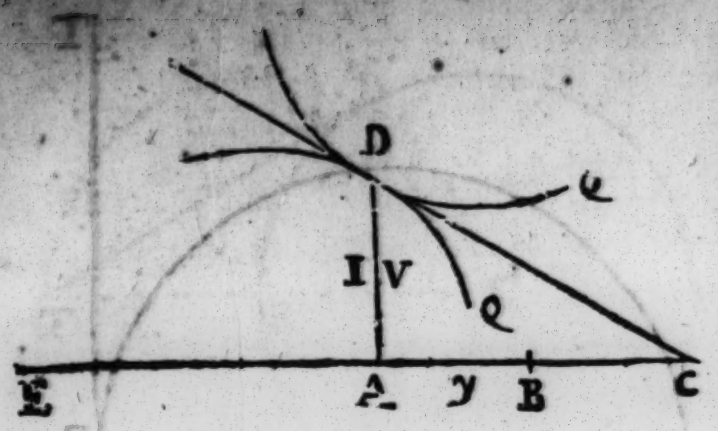
2. There are always so many several Members in any Degree or Power raised from a *Binomial*, as are the Unites in the *Exponent* of the *Power* next above it. Thus in the Square of a *Binomial* there are three Members, in the Cube, there are four, *&c.*

3. If any Quantity divide 2 others whose Ratio is given, the Quotients will be also reciprocally in the same given Ratio; or that the Quotients of any two Numbers, or Quantity, divided by one and the same Quantity, are as the Dividends.

This premised, Let there be *any Curve*, as D Q, whose Points are all referrable to any Right Line given, as E A B, whether that Right Line be the Diameter, or not; or whether there be more given Right Lines than one, if their Powers do but come into the Equation, 'tis enough.

And in all his Equations he puts V always for the Line D A, *y* for B A; and for E B, and the other given Lines, he puts *b d*, &c. *i. e.* always, Consonants.

Then



Then ſuppoſing D C to be drawn touching the Curve in D, and meeting with E B, produced in C, he always calls the ſought Line C A, by the Name of *a*.

To find which he gives this general Method.

RULE I.

He rejects out of the Equation all Members which have not either *V* or *y* with them; then he puts all thoſe that have *y* on one ſide, and all thoſe which have V on the other, with their Signs + or —. And the latter for Diſtinction and eaſe-ſake, he calls the *Right*, the former the *Left Side*.

RULE II.

On the Right Side, let there be prefix'd to each Member, the Exponent of the Power which *u* hath there: Or which is all one, Let that *Exponent* be multiplied into all the Members.

RULE III.

Let the ſame be done alſo on the Left Side, multiplying each Member there by the *Exponent* of the Power of *y*.

Adding this moreover, That one *y* muſt (in each Member) be always changed into *a*.

This done, I ſay, that the Equation thus reformed, will ſhew the Method of drawing the required Tangent to the Point D; and when that is given, as alſo *y*, *u*, and the other Quantities expreſſed by Conſonants, *a* cannot be unknown.

Let there be this Equation $by - yy = VV$, in which E B is *b*, B A $= y$, D A $= V$, and let *a*, or A C be required to find the Point C, from whence C D being drawn, ſhall be a true Tangent to that Curve Q D, in D.

In this Example nothing is to be ejected out of the Equation, becauſe *y* or V, are in each Member: 'Tis alſo ſo diſpos'd as required by *Rule* 1. To each part therefore there muſt be prefixed the Exponent of the Powers of *y* and V, as in *Rule* 2; and on the Left Side let one *y* be changed into *a*: And then the Equation will be in this Form, $ba - 2ya = 2VV$, which Equation reduced, gives eaſily the Value of $a = \frac{2VV}{b-2y} =$ A C. And ſo the Point C is found, from whence the Tangent D C may be drawn.

To determine which way the Tangent is to be drawn, whether towards B or E, he directs to conſider the Numerator and Denominator of the Fraction, which at laſt is found equal to *a*. For,

1. If in both Parts of the Fraction, either all the Signs are Affirmative, or if the Affirmative ones are more in Number, then the Tangent is to run towards B.

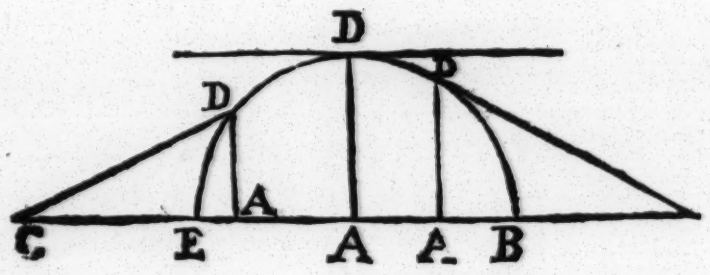
2. If the Affirmative Quantities are greater than the Negative in the *Numerator*, but equal to them in the *Denominator*, the Right Line drawn thro' D, and touching the Curve in that Point, will be parallel to A B: For in this Caſe, *a* is of an infinite Length.

3. If in both Parts of the Fraction, the Affirmative Quantities are leſs than the Negative, changing all the Signs, the Tangent muſt be drawn now alſo towards B: For this Caſe, after the Change, comes to be the ſame with the firſt.

4. If the Affirmative Quantities are greater than the Negative in the *Denominator*, but in the *Numerator* are leſs, or *vice verſa*; then changing the Signs in that Part of the Fraction where they are leſs, the Tangent muſt be drawn a contrary way; *i. e.* A C muſt be taken towards E.

5. But whenever the Affirmative and Negative Quantities are equal in the *Numerator*, let them be how they will in the *Denominator*, *a* will vaniſh into nothing: And conſequently either A D it ſelf is the Tangent, or elſe E A; or at leaſt, a Line Parallel to E A, as will eaſily be found by the Data.

This he gives plain Examples of, in Reference to the Circle, thus.

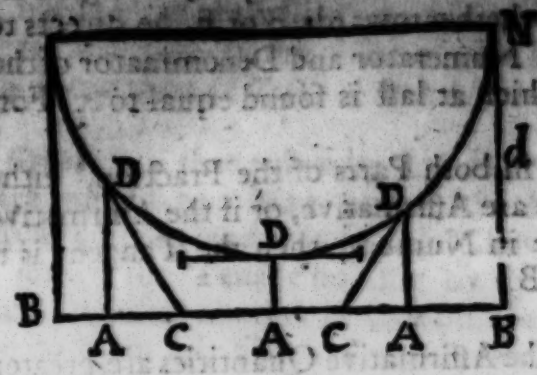


Let there be a Semi-circle, whoſe Diameter is E B, in which there is given any Point; as D, D, D, &c. from which the Perpendicular D A, is let fall to the Diameter.

Let D A $= V$, B A $= y$, B E $= b$: Then the Equation will be $by - yy = VV$, and drawing the Tangent D C, A C or $a = \frac{2VV}{b-2y}$

Now if *b* be greater than 2 *y*, the Tangent muſt be drawn towards B, if leſs, towards E, if it be equal to it, it will be Parallel to E B, as was ſaid in the 1ſt, 2d, and 4th Rules.

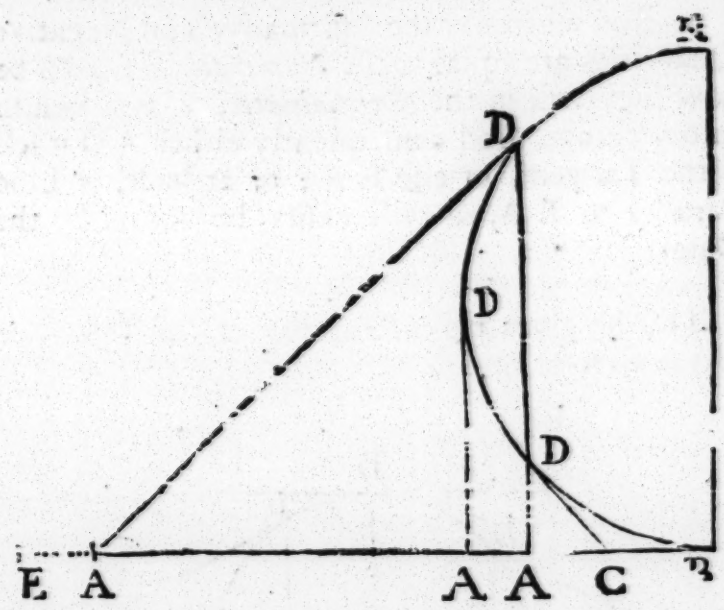
Let



Let there be another Semi-circle inverted; as, N D D; the Points of whoſe Periphery are referred to the Right Line B B, parallel and = to the Diameter.

Let N B be called d; and all things elſe, as before; then the Equation will be $by - yy = dd + VV - 2dV$; which being managed according to his Rules, you have $a = \frac{2VV - 2dV}{b - 2y}$

Now ſince V here is ſuppoſed to be always leſs than d; if b be *greater* than $2y$, then the Tangent muſt be drawn towards E; if *equal*, it will be parallel to B B; if *leſs*, changing all the Signs, the Tangent muſt be drawn towards B, as by *Rule* 4, 5, and 3. But there could be no Tangent drawn, or at leaſt, E B would be it, if N B had been taken equal to the Diameter.



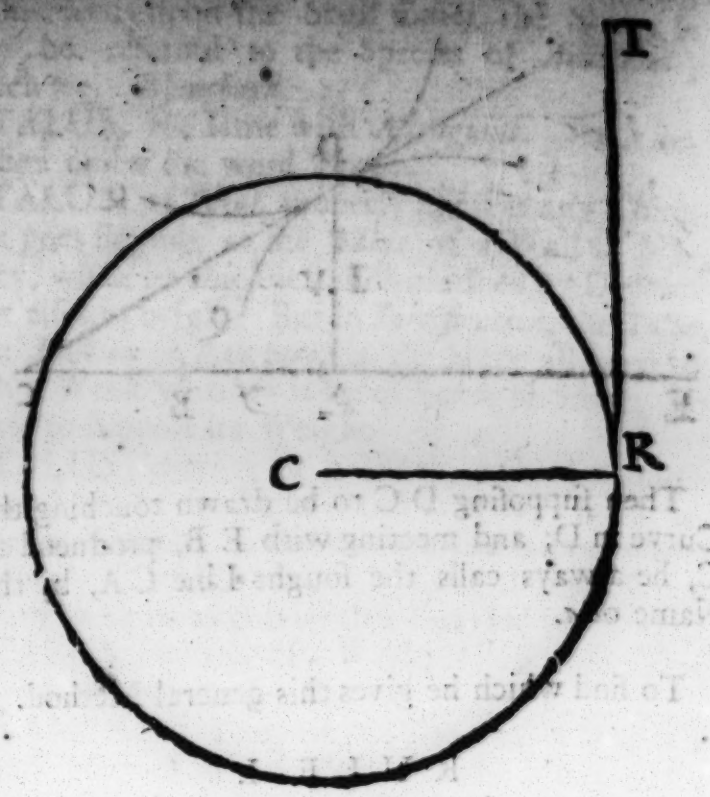
Let there be another Semi-circle, whoſe Diameter N B, is perpendicular to E B, and to which its Points are ſuppoſed to be referred.

Let N B be called b, and all things elſe as above; the Equation will be $yy = bV - VV$, and $a = \frac{bV - 2VV.}{2y}$

If now b be *greater* than 2 V, the Tangent muſt be drawn towards B, if *leſſer*, towards E, if *equal*, D A will be the Tangent; as by *Rule* 1, 4, and 5, appears.

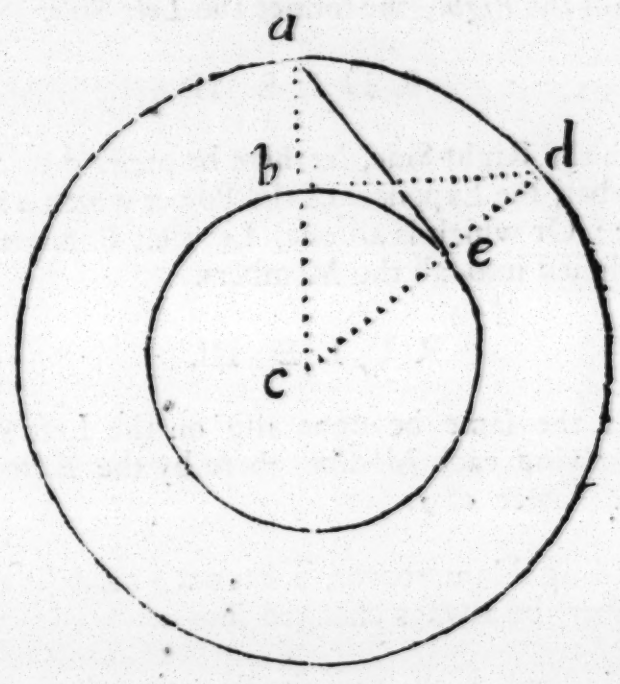
N. B. In the *Acta Eruditorum* for *December*, 1682. there is an univerſal Method for drawing Tangents to all Curves, which is an Improvement of this.

TANGENT *of a Circle in Geometry*, is a Right Line, as T R drawn without the Circle, perpendicular to ſome Radius, as C R, and which touches the Circle but in one Point.



PROBLEM.

To draw from a Point given, as a; *the true* Tangent a e, *to any given Circle, as* c b e.



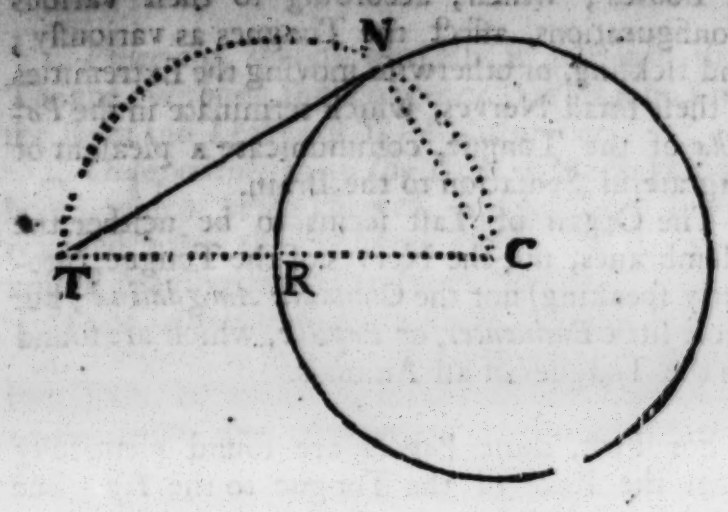
Join the Point a and the Center of the Circle, by drawing the Line $a\,c$. Then with the Radius $a\,c$ on c, deſcribe another Circle; erect a Perpendicular on b, which ſhall cut the latter Circle in d; draw $d\,c$, cutting the former Circle in e; then $a\,c$ being drawn, is the *Tangent* required.

Demonſtration.

The Line $e\,a$ is a true Tangent, becauſe perpendicular to the Radius $c\,e$, and 'tis perpendicular to $c\,e$, becauſe $c\,e\,a$ is a Right Angle; and $c\,e\,a$ is a Right Angle, becauſe 'tis equal to $c\,b\,d$, (which was made ſo by Conſtruction) and 'tis equal to $c\,b\,d$, becauſe the Triangle $c\,b\,d$, is equal to the Triangle $a\,o\,c$, as having two Sides and one Angle equal: Wherefore the Angle $c\,e\,a$, is equal to the Angle $c\,b\,d$, which is a Right Angle. *Q. E. D.*

Another very expeditious way of drawing a Tangent to a Circle, is this.

Let

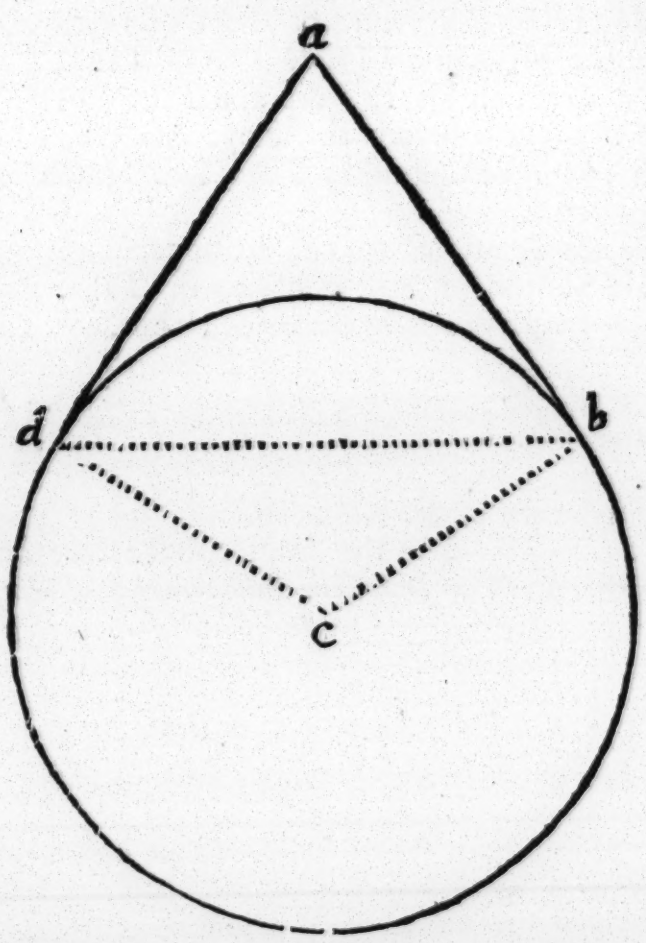


Let the Circle be R N C, the Point of Contact N; transfer the Radius N C, any where from N, downwards into the Poſition R C, ſo that R N be equal to R C; then with R C on the Center R, ſtrike a Semicircle, and a Ruler laid from C thro' R, will find the Point T; from whence T N being drawn, will be a true Tangent, becauſe the Angle T N C being in a Semicircle, is a Right one.

PROPOSITION I.

If two Tangents be drawn to any Circle from a Point (a) without, theſe Tangents ſhall always be equal.

I ſay, $a\,d = a\,b$.

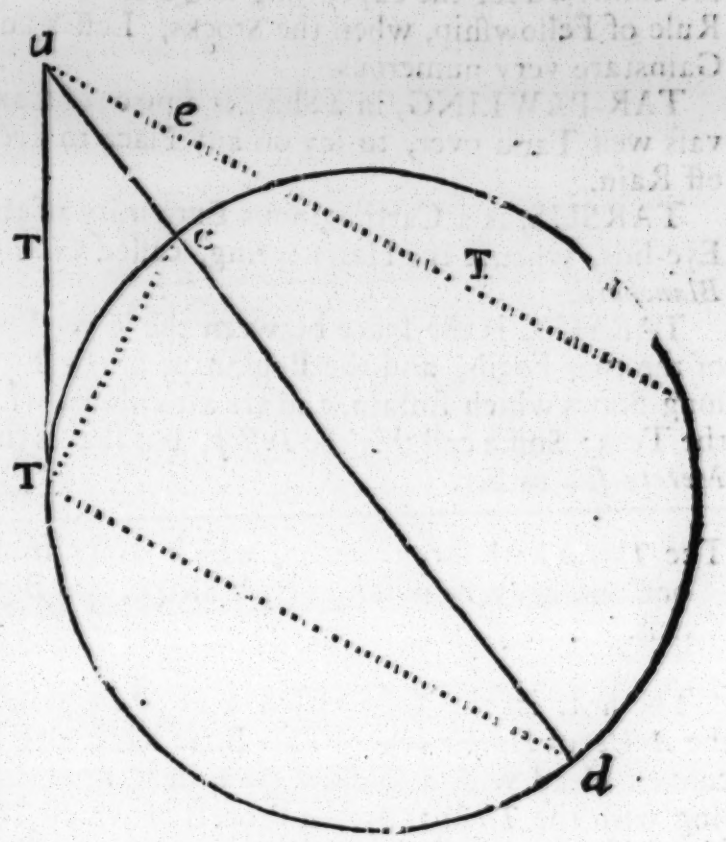


Demonſtration.

The Triangle $d\,b\,c$ being an Iſoceles, the Angle $c\,b\,d$ = Angle $c\,d\,b$; the Right Angles $a\,d\,c$, and $a\,b\,c$ are alſo equal: Wherefore if from theſe right and equal Angles, you ſeverally take the equal Angles $c\,b\,d$, and $c\,d\,b$, the Remainders $a\,b\,d$, and $a\,d\,b$, muſt be equal, and conſequently the oppoſite Sides $a\,d$, and $a\,b$, to thoſe Angles muſt be equal. *Q. E. D.*

PROP. II.

If a Tangent (a T) *and a Secant* (a d) *be drawn from the ſame Point* (a) *without a Circle; the Tangent will be a mean Proportional between the whole Secant* (a T) *and the Part* (a c) *without the Circle.*



Or, as *Euclid* expreſſes it.

The Square of the Tangent (a T) *is equal to the Rectangle made by the whole Secant* (a d) *and the external Part* (a c) *That is,* a T q = ad × a c.

Draw *c* T, and T *d*.

Demonſtration.

Then will the Triangles T *a c*, and T *a d*, be ſimilar; for the Angle *a* is common to both, and *a* T *c* = *d*, becauſe made by a Tangent *a* T, and a Secant *c* T. Therefore *c a* : *a* T :: *a* T : *a d*. That is, *a* T is a mean Proportional between *c a*, and *a d*; and alſo □ *a* T = □ *d a e*. *Q. E. D.*

COROLLARY I.

Hence may a Line be eaſily divided, according to extreme and mean Proportion; if from a Secant-wiſe to the Circle, you draw a Line ſo as that the Part within be equal in length to the Tangent. Thus, Let the prick'd Line be ſo drawn from *a*, that the Part within the Circle be equal to T. Then 'tis plain, if the Part without be called *e*, by this *Propoſition*,

$$e\,e + e\,T = T\,T.$$

TANGIBLE Bodies, are ſuch as are diſcoverable and ſenſible by our Feeling, or Touch.

TAPER-BORED, in *Gunnery*, a Piece of Ordnance is ſaid to be Taper-bored, when it is wider at the Mouth, than towards the Breech.

TARAXIS, is a Perturbation of the Humours of the Eye, the Stomach, or the Entrails. *Blanchard.*

TARE and *Tret*, *Tare* is the Weight of Box, Straw, Cloths, &c. wherein Goods are packed.

The other, *viz. Tret*, is a Conſideration allowed in the Weight for Waſte, in emptying and reſelling the Goods.

TARIF, (in *Arithmetick*) is either a ſmall Table of the Diviſor multiplied by the 9 Digits to expedite Multiplication; or elſe a Proportional Table contrived for the expediting a Queſtion in the Rule of Fellowſhip, when the Stocks, Loſſes and Gains are very numerous.

TAR-PAWLING, in a Ship, is a piece of Canvaſs well Tar'd over, to lay on any Place to keep off Rain.

TARSUS, is a Cartilaginous Extremity of the Eye-lids, whence the Hairs ſpring, called *Cilium*. *Blanchard*.

TARSUS, is the ſpace between the lower End of the two Focils, and the Beginning of the Five long Bones which ſuſtain, and are articulated with the Toes: Some call this the *Inſtep*, but that is the *Metatarſus* rather.

The *Tarſus* hath ſeven Bones, which differ from one another very much in both Shape, and Bigneſs.

The firſt, is the *Talus* called alſo *Aſtragalus*; the *Ankle* or *Huckle-bone*: This Bone has above a convex Head with a ſhallow *Sinus* in it, articulating with the *Tibia*: By the Proceſs of which *Tibia*, which makes the Inner Ankle, it is hedg'd in, as it were, on the inſide, as it is by that of the *Fibula* on the outer; before, it hath a long Neck, on which grows a round Head, that enters into the *Sinus* of the *Os Naviculare*; on which jointing the Foot is moved ſide-ways: Its inner ſide is rough, and above hath a Tranverſe *Sinus* to receive the Ligament of the *Tibia*, and below there is a deſcending *Sinus*, by which the Tendons of the Muſcles of the Foot paſs: At the bottom of all there is a *Sinus* behind, and Protuberance before, by which it is articulated with the *Os Calcis* by a *Ginglymus*.

The ſecond Bone of the Tarſus, is the *Os Calcis*, or *Calcaneum*, which ſee.

The third, is the *Os Scaphoides*, *Naviculare*, or *Cymbiforme*, which ſee.

The remaining Four ſtand all in one Rank, being leſs than the three former; and the firſt, articulates with the *Os Calcis*; the other three, with the *Os Naviculare*: There is no Cartilage between them, but they are knit together on the outſide like a Cartilaginous Ligament. The firſt of theſe is called *Cubiforme*, having ſix almoſt equal ſides, is the greateſt of theſe Four, and is ſeated on the outſide of the Foot. See *Cubiforme*. The other three are called *Oſſa Cuneiformia*, from their Wedge-like Shape; for above they are thick, and below they are thin. See that *Word*.

TARTAR *Emetick*. See *Emetick Tartar*.

TARTAR *Soluble*. See *Soluble Tartar*.

TARTAR *Vitriolate*, is made by pouring Spirit of Vitriol on Oil of Tartar, *per Deliquum*, by little and little; and when the Effervеſcence is over, placing the Glaſs in the Sand, and evaporating the Moiſture with a ſmall Heat, that a very white Salt may remain at the Bottom. This is the Tartar Vitriolate; 'tis a good Apertitive, and a little Purgative Medicine, and works alſo by Urine: Doſe from 10 to 30 Grains.

TAST, is probably cauſed by the Salts that are in Bodies; which, according to their various Configurations, affect the Tongues as variouſly; and tickling, or otherwiſe moving the Extremities of theſe ſmall Nerves, which terminate in the *Papillæ* of the Tongue, communicate a pleaſant or ungrateful Senſation to the Brain.

The Organ of Taſt ſeems to be neither the Membranes, nor the Nerves of the Tongue, (properly ſpeaking) nor the *Glandulæ Amygdalinæ*; but thoſe little *Eminences*, or *Papillæ*, which are found on the Tongues of all Animals.

For Firſt, thoſe *Papillæ* are found plentifully from the Root of the Tongue to the *Tip*; but none from thence to the *String*; or at leaſt but very few.

Secondly, any *Salt*, or ſtrong taſted Object, being placed on the Parts void of thoſe *Papillæ*, affects not the Taſt at all.

Thirdly, In thoſe *Papillæ*, in the Tongues of Live Animals, may (by a Microſcope) be diſcerned many ſmall Holes ſupply'd at the Bottom by ſmall Nerves, which communicate the *Senſation* to the Brain.

That various Taſts may be Mechanically produced, and that Sapours do depend on the Shape, Size, Motion, &c. of the ſmall Saporifick Particles of the Saporous Body.

The Honourable Mr. *Boyle*, hath abundantly made out by Experiments and Obſervations, about the Mechanical Production of Taſts.

Dr. *Grew*, in his Lecture about the Diverſities of Taſts, read before the Royal Society, *March* 25th 1675. diſtinguiſhes Taſts into Simple and Compound.

By the former of which, he underſtands ſuch as are Simple or Single Modes of Taſts, altho' mingled with others in the ſame; thus, the Taſte of a Pepin, is *Aci-dulcis*; of Rhubarb, *Amara-ſtringent*, and therefore compounded in both; but yet in the Pepin the Acid is one Simple Taſt, and the Sweet another; as diſtinct as the Bitter, and Aſtringent are in the Rhubarb.

Two Faults, ſaith the Doctor, have here been committed: The *Defective Enumeration of Simple Taſts, and Reckoning them Indiſtinctly among ſuch as are compounded.*

Simple Taſts, (of which uſually are reckoned not above ſix or ſeven Sorts) are, at leaſt, *ſixteen*.

1. *Bitter*, as in Wormwood, whoſe contrary is,
2. *Sweet*, as in Sugar.
3. *Sower*, as in Vinegar; whoſe contrary is,
4. *Salt*.
5. *Hot*, as in Cloves; to which is oppoſite,
6. *Cold*, as in *Sal Prunellæ*; for we may as properly ſay, a *Cold Taſte*, as an *Hot one*; ſince there are ſome Bodies which do manifeſtly impreſs the Senſe of Cold upon the Tongue, tho' not to the Touch.
7. *Aromatick*; to which is contrary,
8. *Nauſeous*, or malignant.
9. He thinks alſo, that Taſts may be diſtinguiſhed into ſuch as are *Soft*, which are either *Vapid*, as in Water, Starch, Whites of Eggs, &c. or *Unctuous*, as in Oils, Fat, &c.
10. Or ſuch as are *Hard*.

Of

Of which he reckons four Kinds. As,

1. *Penetrant*, which worketh it ſelf into the Tongue, without any Pungency; as is found in the Root and Leaves of Wild Cucumber.

2. *Stupefacient*, as in the Root of black Hellebore; which being chewed, and for ſome Time retained upon the Tongue, affects the Tongue with a Numbneſs, or Paralytick Stupor.

11. 3. *Aſtringent*, as in Galls. And,

4. *Pungent*, as in Spirit of *Sal Armoniack*, which two Taſts he makes contrary to the *Unctuous*; as *Penetrant*, and *Stupefacient*, are contrary to the *Vapid one*.

The compounded Taſts are very numerous, but we have Words to expreſs but ſix of them. As,

1. *Auſtere*, which is *Aſtringent* and *Bitter*; as in the green and ſoft Stones of Grapes.

2. *Acerb*, properly ſo called, is *Aſtringent* and *Acid*; as in the Juice of unripe-Grapes.

3. *Acrid*, which is Pungent and Hot.

4. *Muriatick*, is Salt and Pungent; as in common Salt.

5. *Lixivious*, which is Saltneſs joined with ſome Pungency and Heat.

6. *Nitrous*, which is Saltneſs, joined with Pungency and Cold.

TAUGHT, in the Sea Language is the ſame as ſetting a Rope ſtiff, or faſt. They ſay, *Sett Taught the Shrouds*, to Stays, or any other Ropes which are too ſlack, and looſe.

TAUNT, when the Maſts of a Ship are too tall for her, they ſay ſhe is *Taunt-maſted*, or that her Maſts are very *Taunt*.

TAURUS, is the ſecond Sign of the *Zodiack*.

TAUTOLOGY, is a vain Repetition of Words, which ſerves only to lengthen out Diſcourſe, and tire the Reader.

Tautological Echo's, are ſuch as repeat the ſame Sound of Syllable many times; whereas thoſe which repeat many Syllables or Words diſtinctly, are called *Polyſyllabical Echo's*.

TAW: The Heralds have an Ordinary which they reckon among the Croſſes, called by this Name, and of this Figure.

TECHNICAL, is ſometimes the ſame with *Artificial*, and expreſſes whatever relates to the Arts and Sciences, as the *Term*, *Rules*, &c. So that the Terms of Art are commonly called *Technical Words*.

TEETH. The Teeth are called in *Latine*, *Dentes*, *quaſi Edentes*, from their Office of *eating*, or *chewing*. They are fixed in their *Alveoli*, three manner of Ways.

The firſt and chief is by their Articulation with the Jaw-bones, by *Gomphoſis*.

The ſecond is, by the Nerve which is inſerted into their Root by *Synneuroſis*.

And the laſt is, by the Gums, which cleave to the outſide of their Roots by *Syſſarcoſis*.

Their *Subſtance* is the hardeſt of all other Bones, but more eſpecially that Part of them that ſtands out naked above the Gums. This Part, Dr. *Havers* thinks ought to be eſteemed rather ſtony than bony, and yet not the whole of it neither, but only the outſide, or *cortex*, which like a Shell covers the Bony; which being broken off, or decayed, the Bony quickly rots, and moulders away: Upon which account it is, that when the Gums are eaten away, ſo that ſome part of the Tooth, which is not defended with this ſtony *cortex*, is laid bare, it is eroded; when that Part that naturally ſtands out of the Gums, and is by ſuch a ſolid Subſtance ſecured, ſuffers no ſuch Injury; the ſtony Part is not covered with any *Perioſteum*, but that Part which is within the Sockets of the Jaw-bones, is inveſted with a thin Membrane; which, he ſays, is not the true *Perioſteum*, (though that inveſts the Socket wherein they ſtand) but is propagated from that Membrane that covers the Gums, and is common to the whole Mouth, which does not terminate with the Gums, but when it comes to their extreme Edge, turns in, and is reflected between the other ſide of the Gum, and the Tooth, deſcending into the *Alveolus*, or Socket, and adhering on one ſide, immediately to thoſe Parts of the Teeth which lie within; and on the other, to the hard fleſhy Subſtance of the Gums, which with this, is communicated to the Roots of ſome Teeth (eſpecially in the upper Jaw) to faſten them more firmly in their Sockets; and where none of this hard Fleſh intervenes, it coaleſces, as it were, into one Membrane with the *Perioſteum*, that covers the inſide of the Socket. By this Membrane, and the Nerve inſerted into the Root of every Tooth, theſe lower Parts of the Teeth become exquiſitely Senſible

The Grinders have a manifeſt *Cavity* within (but the *Inciſores* and *Canini*, but an obſcure one) whereinto by the very ſmall Holes of their Roots, they each receive a Capillary Artery from the *Carotides*, a Vein from the Jugulars, and a Twig of a Nerve from the fifth Pair. The Vein, Artery, and Nerve are united together, and clad with a common Membrane when they enter the Jaw, within which they have a proper Channel to run along in, under the Roots of the Teeth, ſending Twigs to each, as they paſs under them.

The Rudiments, or *Principles* of the Teeth, are bred with the other Parts of the Womb, but lie hid for ſome Months within the Jaws and Gums: Theſe Principles are partly Bony, and partly Mucous, and both Parts are at firſt included in a Membranous, and ſomewhat Mucous *Folliculus*, or Caſe, which in Proceſs of Time they break through (ſome ſooner, other later) their Bony Part aſcending upwards out of the Gums; and their Mucous Part (hardening by degrees) deſcending downwards into the Jaw ſo far as there is ſpace for it; the *Folliculus* it ſelf turning to a kind of Cement, whereby the Tooth is faſtened to the ſides of the *Alveolus*.

At what time, and at what order, they *break forth* out of the *Alveoli*, is known to every Nurſe: Omitting therefore to ſpeak of that, I ſhall only Note, That the Teeth alone, of all the Bones in the Body, continue to grow ſo long as a Man Lives (and they continue in his Head) for elſe they would be ſoon worn to the Stumps by their daily Uſe; and we ſee that when a Tooth is loſt out of either Jaw (in the oldeſt People) that which

is oppoſite to it in the other Jaw, will commonly grow longer than the reſt, having none to grind againſt: Though it muſt be confeſt, that the ſeeming length of old Peoples Teeth, is more owing to the falling away of their Gums, than the growth of their Teeth.

When Children come to be ſeven or eight Years old, they change ſeveral of their Teeth; but very rarely, if ever, all. The *Inciſores*, or Fore-teeth; the *Canine*, or Eye-teeth; and the foremoſt Double-teeth moſt change; but the reſt of the Double-teeth very few. Now concerning this changing of the Teeth, we muſt know, that the Old ones do not come out by their Roots, but their upper Part only drops off, their Roots remaining ſtill in the Socket of the Jaw; which (being like Seed for the new ones) by degrees grows up above the Gums, to ſupply the Place of that which is fallen off. Commonly about the twentieth Year (or upwards) there ſpring out two Double-teeth behind the reſt, which till then, had lain hid in their Sockets. Theſe are called *Genuine Teeth*, or *Dentes Sapientiæ*; becauſe Men are then come to Years of Diſcretion.

As for the *Number* of them, commonly there are found ſixteen in each Jaw; if there fall out any difference in Number, as to individual Perſons, it generally falleth out in the *Molares*.

There are three Ranks, or Sorts of Teeth.

Thoſe of the *firſt* Rank (for the foremoſt) are called *Inciſores*, Cutters. Moſt commonly four are found in each Jaw; they have but one Root, or Fang; and ſo eaſily fall, or are pulled out. Theſe firſt make way out of the Gums in Children, becauſe the Tops of them are ſharpeſt.

Thoſe of the *ſecond* Rank, are called *Canini*, or Dog-teeth, from their length, hardneſs, and ſharpneſs above the reſt: In each Jaw there are two; at each ſide of the Cutters, one. They are otherwiſe called *Eye-teeth*, either from an Opinion that their Roots (*viz.* of the upper) reach as far as the Eyes, or that the ſame Nerve that moves the Eye, ſends a Twig to theſe Teeth; neither of which Conceits are true: The Roots of theſe are ſingle, as thoſe of the *Inciſors*, but they are both ſometimes crooked; and if ſuch People in whom they are ſo, chance to have one of them drawn, they can hardly be pulled out, without breaking off a Piece of the *Alveolus*, in which they are fix'd.

Thoſe of the *third* Rank, are called *Molares*, Grinders, becauſe, like Mil-ſtones, they grind the Meat. Moſt commonly they are twenty in Number, five in each ſide of both Jaws. The two foremoſt that ſtand next to the Dog-teeth, are leſs than the reſt, having but two Knobs at the Top; but the three hindmoſt are larger, and have four, being in a manner Four-ſquare.

The two foremoſt alſo, have but two Roots at moſt; but the three hindmoſt commonly three or four. But thoſe of the upper Jaw, have for the moſt part, one Root more than thoſe which are oppoſite to them in the lower; or however their Roots are larger.

The Reaſon whereof may be,

Firſt, Becauſe they are Pendulous, and ſo are the apter to drop out: And,

Secondly, Becauſe the Subſtance of the upper Jaw is not ſo firm, as that of the lower.

The Uſe of the Teeth, is principally to chew the Meat, to prepare it for the Stomach, that it may the eaſier concoct it into Chyle. The *Inciſores* bite of the Morſel, the Dog-teeth break it, and the Grinders make it ſmall; wherefore they are flat in the Top, that they may the better receive and keep the Meat; and rough, that they may grind it the better. The Teeth contributes alſo to the Formation of the Speech, eſpecially the Fore-teeth; for thoſe that have loſt them, Liſp, as we ſay, and cannot pronounce plainly ſuch Syllables as have C, X, &c.

TEINT, is a *French* Term in Painting, ſignifying that Artificial Colour, of which any Object is compoſed.

TELEPHIUM, is the ſame Ulcer with *Chironia*, (which ſee;) it is ſo called from one *Telephius*, who was a long time troubled with this Diſeaſe. *Blanchard.*

TELESCOPE, is an *Optick* Inſtrument which ſerves to diſcover Objects at a Diſtance.

If a Teleſcope conſiſts only of a Convex Object-glaſs and an Eye-glaſs of a much greater Convexity, (or which is a Portion of a much leſſer Sphere) than the Object-glaſs is, (which is the common Form of the Teleſcope for the Night.) Then will the apparent Magnitude of the Object ſeen through it, be to the Object ſeen by the naked Eye at the Station of the Object-glaſs:: as the Focal Length of the Object-glaſs, to the Focal Length of the Eye-glaſs. *Molineux Dioptr. Nov. Prop.* LXII. Thus,

Suppoſe the Focal Length of the Object-glaſs be 12 Foot, or 144 Inches, and that of the Eye-glaſs 3 Inches; then the apparent Diameter of the Object ſeen through the Glaſs, to that ſeen by the naked Eye, will be as:: 144 to 3, or as 48 to 1. Wherefore ſuch a Teleſcope will be ſaid to magnifie the Diameter of the Object 48 times, and its Surface 2344 times (*i. e.* the Square of 28.)

Wherefore if the ſame Object-glaſs be combined with an Eye-glaſs, whoſe Focus is 1: and at another time with an Eye-glaſs whoſe Focus is 2. the former Teleſcope will magnifie twice as much as the latter.

Alſo, if two Teleſcopes have different Lengths, and the Focus of the Eye-glaſs of the *Shorter* be in the ſame Proportion to the Focus of its Object-glaſs:: as the Focus of the Eye-glaſs of the *Longer* bears to its Object-glaſs; then thoſe two Teleſcopes will *magnifie alike.*

But yet long Teleſcopes are of very great Uſe, and 'tis impoſſible to make ſhort ones perform as well: For,

1. Object-glaſſes of a ſhorter Focus, will not bear Eye-glaſſes proportionably ſhort, without colouring the Object, or rendring it dark and obſcure.

For Inſtance: Suppoſe a very good 12 Foot Object-glaſs will receive an Eye-glaſs of no ſhorter Focus than 3 Inches, with clearneſs and diſtinctneſs; yet however an Object-glaſs of 24 Foot, equally good, will bear an Eye-glaſs of leſs than 6 Inches Focus (perhaps of 5 or 4 Inches Focus) with equal clearneſs and diſtinctneſs.

And then, tho' an Object-glaſs of 12 Foot, with an Eye-glaſs of 3 Inches will magnifie but 48 times, as is above proved; yet an Object-glaſs of 24 Foot, with an Eye-glaſs of 4 Inches, will magnifie

nifie 72 times; which is nearer one third more than the former; and this is a vaſt Advantage.

2. The Image of the Moon, or other Object, in the diſtinct Baſe of an Object-glaſs of 24 Foot, is twice as long as the Image of the diſtinct Baſe of an Object-glaſs of 12 Foot: And conſequently the Image in the former will be much more plain and diſtinct.

Hence may be concluded alſo, That if the Object-glaſs be formed on a leſs Sphere than the Eye-glaſs, the Appearance of Objects will be diminiſhed in the aforeſaid Proportion; as is plain by the Caſe, when a Teleſcope is inverted.

Therefore all Perſons which relate Phænomina, obſerved by their Teleſcopes, or Microſcopes, ought to mention not only the Length of the *Tube* in general, but alſo to expreſs the particular Focus of both Eye-glaſs and Object-glaſs, together with the *Aperture* of the Object-glaſs; or elſe one cannot well judge of the Degree of magnifying.

To determine the Angle received by a Teleſcope of this Form, Mr. *Molineux* gives this Rule.

As the Diſtance between Object and Eye-glaſs, is to half the Breadth of the Eye-glaſs :: Radius to the Tangent of the Angle.

If a Teleſcope conſiſt of a Convex Object-glaſs, and 3 Convex Eye-glaſſes, (which is the uſual Form of Teleſcopes to be uſed by Day:) Then the Diſtance between the firſt Eye-glaſs and the ſecond, muſt be the Sum of their *Foci*; the Diſtance between the ſecond and third Eye-glaſſes, muſt be alſo the Sum of their *Foci*; ſo that all the Glaſſes are diſtant from the next adjacent Glaſſes the Sum of their *Foci*; only indeed there may be ſome little Variety in the Diſtance between the firſt and ſecond Eye-glaſs; which is the Reaſon there is a *Draw* always made there, to alter it at pleaſure.

This Teleſcope is only a double one of the former Sort, and as the former Inverts the Objects, this Inverts that Inverſion, by the Addition of two more Glaſſes, and conſequently repreſent all things *Right*, or makes them appear *Erect*.

Teleſcopes may be made with Concave Eye-glaſſes, but then the Area of the Object will be proportioned always to the Breadth of the Pupil of the Eye of the Beholder; whereas in a Convex Eye-glaſs, 'tis determin'd by the Breadth of that Glaſs.

The practical Rule for combining, or putting together this Day-Teleſcope of Four Glaſſes, is this.

Take the two firſt Eye-glaſſes, and combine them by Trials, ſo as to make a diſtinct inverted Teleſcope, conſiſting of a Convex-object-glaſs, and a Convex Eye-glaſs of a leſs Sphere.

Then take the Object glaſs, and firſt Eye-glaſs, and combine them by Trials alſo.

Laſtly, Take both theſe *Teleſcopes*, and without altering the Diſtances of their Glaſſes, in either of them ſingly; by Trials combine both theſe Teleſcopes, till the Appearance be clear and diſtinct.

But what is here done by Trials, may be effected by actual Menſuration, or deſigning out the Diſtances of the Glaſſes from each other, by knowing their Focal Diſtances.

TELESCOPE *Aerial*, ſo Mr. *Ch. Hugens* calls a Teleſcope, (deſcribed in *Phil. Tranſ.* Numb. 161.) which was made for the Night, and to be uſed without a cloſe Tube, (becauſe there is no need of one in a dark Night) and by that means a long Teleſcope becomes much lightened, and more eaſily manageable.

TELESCOPE *Reflecting*, of Sir *Iſaac Newton*, is made thus: The Tube of it, which is large, is open at the end, which reſpects the Object; the other end is cloſe, where a concave metalline *Speculum* is laid; and near the open end, there is a flat oval *Speculum* made as ſmall as may be, the leſs to obſtruct the entrance of the Rays of Light into the Tube by it, and inclined towards the upper part of the Tube, where is a little Hole furniſhed with a ſmall *Plane Convex* Eye-glaſs: So that the Rays coming from the Object, do firſt fall upon the Concave placed at the bottom of the Tube, and are thence reflected to the upper end of it, where they meet with the flat *Speculum* obliquely poſited, by the Reflection of which they are directed to the little *Plano-convex* Glaſs, and ſo to the Spectators Eye, who looking downwards, ſees the Object which the Teleſcope is turned to. This Inſtrument is deſcribed more at large in *Philoſ. Tranſ.* N. 81.

After this firſt Eſſay, the learned Inventor made another Inſtrument of the ſame Nature, with which he ſaith, that he could read in the *Philoſophical Tranſactions* opened in the Sun-ſhine, at an hundred Foot diſtance, and diſcern ſome of the Words at the diſtance of 120; its *Aperture* (define next the Eye) was then equal to above an Inch and $\frac{1}{2}$ of the Object Metal.

The Advantages of this Teleſcope would be very great, if it could be brought to its deſired Perfection. But it is liable to two Inconveniences. Firſt, That 'tis not very eaſie by it to find the Object you would ſee; though this a little Uſe and Practice would obviate; at leaſt, placing a ſmall Proſpect-Glaſs on the outſide parallel to the Axis of the Cavity of the Catoptrick Tube, you might readily enough find the Object by that, and then the Tube it ſelf would be right. The 2d and much greater Inconvenience is the concave metalline Object *Speculum* being ſubject to Tarniſh, ſo that it will not continue long good. But if any Perſon could be ſo happy as to find out a good metalline mixture that would poliſh finely, reflect vividly, and hold without ruſting or tarniſhing, it would be a Diſcovery of very great Advantage, both to Teleſcopical and Microſcopical Improvements.

TELESCOPICAL-*Stars*, are thoſe that are not viſible to the naked Eye, but diſcoverable only by the Help of a *Teleſcope*.

TEMPERATE *Zone*.

TEMPORALIS, alſo *Crotaphites*, is a Muſcle of the upper Jaw, which has a large Semicircular fleſhy beginning, from part of the *Os Frontis*, *Syncipitis*, *Sphænoides*, and *Temporalis*; from theſe Places its Fibres paſs (like Lines drawn from a Circumference to a Center) under the *Os Jugale*, from whence alſo ariſe ſome fleſhy Fibres joining with the former at their united, partly tendinous, and partly fleſhy Inſertion, to the upper part of the *Proceſſus Coronæ* of the lower Jaw: This, with its Partner, draws the lower Jaw upwards.

TEMPORARUM *Oſſa*, are Bones of the Scull ſituated in the lower part of the ſides of the *Cranium*; their upper part, which is thin, conſiſting only of

one Table, is of a circular Figure, and is joined to the *Offa Parietalia* by the *Sutura Squamoſa*; their lower part, which is thick, hard, and unequal, is joined to the *Os Occipitis*, and to the *Os Sphænoides*, this part is called *Os Petroſum*; they have each three external *Apophiſes* or Proceſſes, *viz. Proceſſus Zygometicus*, *Mammillaris* or *Maſtoidæus*, and the *Proceſſus Styliformis*, and one Internal. In the temporal Bones, there are 2 Internal, and 4 External Holes. The firſt of the Internal, is the Hole thro' which the Auditory Nerve paſſes; the ſecond is common to it and the *Os Occipitis*; the 8th pair of Nerves, and the lateral *Sinus* paſſes through it. The firſt of the External, is the *Meatus Auditorius Externus*; the ſecond is opened behind the Palate, it is the end of that Paſſage which comes from the Barrel of the Ear to the Mouth. The 3d is the Orifice of the Conduit, by which the Carotidal Arteries enter the *Cranium*; and the fourth is behind the *Proceſſus Maſtoidæus*; by it paſſes a Vein which carries the Blood from the external Teguments to the lateral *Sinus's*; ſometimes this Hole is wanting; there is another which is between the *Proceſſus Maſtoidæus*, and the *Styliformis*, thro' which the *Portio dura* of the Auditory Nerve Paſſes. They have each a *Sinus* lin'd with a Cartilage under the *Meatus Auditorius*, which receives the condyle of the lower Jaw.

TEMPORARY *Fortification*. See *Fortification*.

TENAILLE, in Fortification, is a kind of Outwork reſembling a *Horn-work*, but generally ſomewhat different, in regard that inſtead of two Demibaſtions, it bears only in Front a Re-entring Angle between the ſame Wings without Flanks; and the Sides are parallel: But when there is more breadth at the *Head* than at the *Gorge*, theſe *Tenailles* are called *Queuve d'yronde*.

TENAILLE *Double* or *Flank'd*, is a Work whoſe Front conſiſts of four Faces, making two *Re-entring Angles*, and three *Saliant*; the Wings or Sides of this Work being in the like manner correſpondent to the Front of the *Gorge*.

TENAILLE *Simple*, is a Work having its Front form'd by two Faces, which make a Re-entring Angle, the Sides running directly parallel from the Head to the Gorge.

TENAILLE *of the Place*, is that which is comprehended between the Points of two neighbouring Baſtions; that is to ſay, the *Curtain*; the two *Flanks* that are raiſed on the Curtain, and the two Sides of the *Baſtions* which face one another: So that 'tis the ſame with what is otherwiſe called, *The Face of a Fortreſs*.

All *Tenailles* are defective in this reſpect, That they are not Flanked or Defended towards their *inward* or *dead Angle*; becauſe the height of the Parapet hinders ſeeing down before the Angle, ſo that the Enemy can lodge himſelf there under Covert: Wherefore *Tenailles* are never made but when they want time to make a *Horn-work*.

TENANT, or *Tenent*, is one that holds or poſſeſſes Lands or Tenements by any kind of Right, either in Fee for Life, Years, or at Will. And 'tis uſed in Law, with divers Additions, as *Tenents in Dower*, which is ſhe that poſſeſſes Land by Virtue of her *Dower*.

Tenent per Statute-Merchant, that holds Land by Virtue of a Statute forfeited by him.

Tenent in Frank-Marriage, is he that holds Lands or Tenements by Virtue of a Gift thereof made to him upon Marriage between him and his Wife.

Tenant by the Courteſie, that holds for his Life, by reaſon of a Child begotten by him of his Wife, being an Inhereritrix, and born alive.

Tenant by Elegit, that holds by Virtue of the Writ called an *Elegit*.

Tenant in Mortgage, that holds by means of a *Mortgage*.

Tenant by the Verge, in ancient Demeſne, is he that is admitted by the Rod in the Court of ancient Demeſne.

Tenant by Copy of Court-Roll, is one admitted Tenant of any Lands, &c. within a Manor, which Time out of Mind, have been demiſable, according to the Cuſtom of the Manor.

Tenant by Charter, is he that holdeth by Feoffment in Writing, or other Deed.

Tenant in Chief, that holdeth of the King in Right of his Crown.

Tenant of the King, is he that holds of the Perſon of the King, or as ſome Honour.

Very Tenant, that holds immediately of his Lord: For if there be Lord, *Meſne* and *Tenement*, the Tenant is *very Tenant* of the Meſne, but not to the Lord above.

Joint-Tenants, that have equal Right in Lands and Tenements, by Virtue of one Title.

Tenants in Common, that have equal Right, but hold by divers Titles.

Particular Tenant, that holds only for this Term.

Sole Tenant, is he that hath no other joined with him.

Several Tenant, is oppoſite to *Joint-Tenants*, or *Tenant in common*.

Tenant al Præcipe, is he againſt whom the Writ *Præcipe* is to be brought.

Tenent in Demeſne, is he that holdeth the Demeans of a Manor for a Rent without Service.

Tenant in Service, is he that holdeth by Service.

Tenant by Execution, is he that holds by Virtue of an Execution upon any Statute, Recogniſance, &c.

There was alſo, *Tenant by Knight-Service*, *Tenant in Burgage*, *Tenant in Socage*, *Tenant in Frank-fee*, *Tenant in Villenage*. And there is *Tenant in Fee-ſimple*, *Tenant in Fee-tail*, *Tenant upon Sufferance*, &c.

TENAR, (the ſame with the *Abductor Pollicis*) is with ſome, the Name of the Muſcle which ſerves to draw the Thumb from the Fingers.

TENASMUS. See *Teneſmus*.

TENDER, in a legal Senſe, ſignifies as much as carefully to offer, or circumſpectly endeavour the Performance of any thing belonging to us. As to *tender Rents*, is to offer it at the Time and Place where and when it ought to be paid. To *tender his Law of Summons*, is to offer himſelf ready to make his Law, whereby to prove that he was not Summoned.

TENDON, is a ſimilar nervous Part annexed to Muſcles and Bones, whereby the voluntary Motion of the Members is chiefly performed. The Generality of Surgeons ſcarce ever diſtinguiſh betwixt a *Tendon* and a Nerve.

TENEMENT, ſignifies the Houſe or Land that a Man holdeth of another, and when join'd with *Frank*, it contains Lands, Houſes and Offices, where-

wherein we have Eſtate for Term of Life, or in Fee.

TENEMENTIS *Legatis*, is a Writ that lies to *London*, or any other Corporation, (where the Cuſtom is, That Men may demiſe Tenements as well as Goods and Chattels by their laſt Will) for the Hearing any Controverſie touching the ſame, and for rectifying the Wrong.

TENENTIBUS *in aſſiſis non onerandis*, &c. is a Writ that lieth for him to whom a Diſſeiſor hath alienated the Land whereof he diſſeiſeth another, that he be not moleſted for the Damages awarded, if the Diſſeiſor have wherewith to ſatisfie them himſelf.

TENESMUS, *Tenaſmus*, is a continual Deſire of going to Stool, yet attended with an Inability of doing any thing, but ſometimes voiding of bloody and ſlimy Matter. *Blanchard.*

TEN-FOOT *Rod.* See *Station-Staff.*

TENNY, or *Tawny*, the Heralds Term for a bright Colour made of Red and Yellow mixed; and is expreſſed in Engraving by thwart Stroakes or Hatches like *Purpure* in the Coats of all below the Degree of Noble, 'tis called *Tenn*, but in thoſe of Nobles 'tis called *Hyacinth*, and in Princes Coats by the Name of the *Dragon's Head.*

TENOR, is the Name of the firſt Mean or middle Part in *Muſick.*

TENORE *indictamenti mittendo*, is a Writ whereby the Record of an Indictment and the Proceſs thereupon is called out of another Court into the *Chancery.*

TENSORS, or *Extenſors*, are thoſe common Muſcles that ſerve to extend the Toes, and have their Tendons inſerted into all the leſſer Toes.

TENTHS, is that yearly Portion or Tribute which all Eccleſiaſtical Livings pay to the King.

TENURE, a Term in Law, ſignifying the manner whereby Tenements are *holden* of their Lords; what may make a *Tenure*, and what not. See *Perkins Cap.* 10. *Reſervation* 70, where you'll find moſt of thoſe *Tenures* that are now uſed in *England.*

TEREBRUM. See *Mediolus.*

TERES *Major*, is a Muſcle which ariſes from the inferior Angle of the *Scapula*, and becoming a round fleſhy Body, aſcends obliquely with the former, but then paſſeth under the ſuperior Head of the *Gemellus*, and makes a ſhort flat Tendon, inſerted below the Neck of the *Os Humeri*, cloſe to that of the Muſcle called *Aniſcaptor* or *Latiſſimus Dorſi.*

TERES *Minor*, is a Muſcle of the Arm, ſo called from its Figure and Magnitude, to diſtinguiſh it from the *Teres Major.*

This Muſcle is in ſome Bodies confounded with the *Infraſpinatus*, but in others it is diſtinct. It ariſes fleſhy from the lower Part of the inferior *Coſta* of the *Scapula*, and deſcends obliquely over the ſuperior Head of the *Gemellus Major*, where becoming tendinous, it is inſerted to the Head of the *Os Humeri*: When this acteth, the Arm is moved backwards and downwards.

TERGIFOETOUS *Plants*, ſuch Herbs (as the *Capillaries*) as bear their Seeds on the back ſides of their Leaves, are for that reaſon called by ſome Botaniſts *Tergifœtæ.*

TERM, in Geometry, is ſometimes taken for the Bounds and Limits of any thing; as a Point is the Term of a Line, a Line of a Superficies, and a Superficies of a Solid: And this is what the Schools call *Terminus Quantitatis.*

TERM, in Law, ſignifies the Bounds and Limitation of Time, as a Leaſe for *Term* of Life or Years. But 'tis moſt commonly uſed for that Time wherein the Tribunals or Places for Judgment are open to all that think fit to complain of Wrong, or to ſeek their own by due Courſe of Law, or Action; the reſt of the Year is called *Vocation.*

Of theſe *Terms* there be Four in every Year, during which Time Matters of Juſtice are diſpatched.

One is called *Hillary Term*, which begins the 23d Day of *January*, or if that be *Sunday*, then the next Day after, and endeth the 12th of *February* following.

The Second is *Eaſter Term*, which begins the *Wedneſday* Fortnight after *Eaſter-day*, and ends the *Monday* next after *Aſcenſion-day.*

The Third is *Trinity Term*, beginning the *Friday* next after *Trinity-Sunday*, and ending the *Wedneſday* Fortnight after.

The Fourth is *Michaelmas Term*, which begins the 23d of *October*, unleſs it be *Sunday*, and then the Day after, and ends the 28th of *November* following.

TERMINTHUS, is a Swelling in the Thighs, with a black Pimple at the top as big as the Fruit of the Turpentine-Tree. *Blanchard.*

TERMS *of an Equation in Algebra*, are the ſeveral Names or Members of which it is compoſed, and ſuch as have the ſame unknown Letter, but in different Powers or Degrees. For if the ſame unknown Letter be found in ſeveral Members in the ſame Degree or Power, they all paſs but for one Term.

Thus in this Equation $aa + ab = R$, the three Terms are, aa, ab and R.

And in this, $aa + ab + ac = Rd + dc$; the Terms are aa, $ab + ac$, and $Rd + dc$; which are but 3, becauſe $ab + ac$, having a in the ſame Dimenſions in both Parts, is taken but for one Term. Hence the firſt

Term in any Equation muſt be that, where the unknown Root hath the higheſt Dimenſions; and that Term which hath the Root in it of one Dimenſion of Power lower, is called the *ſecond Term*, and ſo on.

Des Cartes ſhews a Method of taking away the ſecond Term of any Equation, and the Method is very well known, and in common Uſe. But there is one *D. T.* mentioned in the *Acta Eruditorum*, *May* 1683, which gives a general Analytical Method for taking away all the intermediate Terms of an Equation; which (he ſaith) was never done before, and was thought Impoſſible by many.

TERMS *of Proportion*, in Mathematicks, are ſuch Numbers, Letters or Quantities, as are compared one with another.

Thus if $\begin{matrix} 4 . 8 :: 6 . 12 \\ a . b :: c . d \end{matrix}$ then a, b, c, d, or 4, 8, 6, 12, are called the Terms; of which a is called the firſt Term, b the ſecond Term, &c. a and c are called the two Antecedents, and b and d the two Conſequents.

TERRA *Damnata.* See *Earth.*

TERRA *extendenda*, is a Writ directed to the Eſcheator, &c. willing to enquire and find out the true Yearly Value of any Land, &c. by the Oath of Twelve Men, and to certifie the extent into the *Chancery*, &c.

TERRA-

TERRAQUEOUS, in Geography, ſignifies the Globe of Earth and Water, as they both together conſtitute one Spherical Body.

TERRE-PLAIN, in Fortification, is the Platform or Horizontal Surface of the Rampart lying level, only with a little ſloap on the outſide for the Recoil of the Cannon.

It is terminated by the Parapet on that Side toward the Field, and by the *Inner Talus* on the other toward the Body of the Place.

TERRE-*Tenant*, is he who has the actual Poſſeſſion of the Land, which otherwiſe is called *Occupation*.

Thus a Lord of a Manor hath a Free-holder, who letteth out his Free-hold to another to be Occupied.

This Occupier (having the actual Poſſeſſion) is called the *Terre-Tenant*.

TERELLA: When a Loadſtone is turned into an exact Spherical Figure, and is placed ſo that its Poles and Equator, *&c.* do exactly correſpond to the Poles and Equator of the World; it is called by *Gilbert* μικρόγη, or *Terrella*, a little Earth; becauſe it is a very juſt Repreſentation of the Great Magnetical Globe which we inhabit.

It was believed that ſuch a Terrella as this, if nicely poiſed and placed in a Meridian, like a Globe, would be turned round in 24 Hours, as the Earth is by the Magnetick Particles that pervade it; but this by plain Experience is to be found a Miſtake.

TERRESTRIAL *Globe*. See *Globe*.

TERRESTRIAL *Line*. See *Line Terreſtrial*.

TERRIS, *bonis & catallis rehabendis poſt purgationem*, is a Writ that lies for a Clerk, to recover his Lands, Goods or Chattels, formerly ſeized. after he hath cleared himſelf of that Felony, upon Suſpicion whereof he was formerly Convicted, and delivered to his Ordinary to be purged.

TERRIS *& catallis tentis ultra debitum levatum*, is a Writ Judicial, for the reſtoring of Lands or Goods to a Debtor that is Diſtrained above the Quantity of a Debt.

TERRIS *Liberandis*, is a Writ that lies for a Man Convicted by Attaint, to bring the Record and Proceſs before the King, and to take a Fine for his Impriſonment, to deliver him his Lands and Tenements again, and to releaſe him of the *Strip* and *Waſte*.

It is alſo a Writ for the Delivery of Lands to the Heir after Homage and Relief performed, or upon Security taken, that he ſhall perform them.

TERSION, is Wiping or Cleanſing the outſide of any Body.

TERSOR. See *Latiſſimus Dorſi*.

TERTIAN *Ague*, or Fever, is that which intermits intirely, and then returns again every third Day incluſively.

TERTIATE: To Tertiate a Great Gun, is to know the thickneſs of the Metal at the Touch-hole, the Trunnions, and at the Muzzle; by which to judge of the Strength of a Gun, or whether it be well *Fortified* or not. This is uſually done with a Pair of Calliper Compaſſes; and if the Piece be *Home-bored*, the Diameter leſs by the height divided by 2 is the Thickneſs at any Place.

TEST, the ſame as the *Cuppel*, or Coppel, an Inſtrument uſed by Chymiſts and Refiners, to purifie Gold or Silver. See *Cuppel*.

TESTACEOUS *Fiſhes*, are ſuch whoſe ſtrong and thick Shells are entire and all of one piece; as the Oyſter, Eſcollop, Cockle, *&c.* But thoſe whoſe Shells are ſofter and thinner, and which are divided into diſtinct Joints, and compoſed of ſeveral Pieces, ſuch as Lobſters, Crawfiſh, Crabs, *&c.* are called *Cruſtaceous Fiſhes*.

TESTAMENT, is the Laſt Will or Declaration of the Mind of a Perſon deceaſed; and is of two kinds, *viz*, *A Teſtament in Writing*, and *A Teſtament in Words*, which is called a *Nuncupative Teſtament*; which is, when a Man being Sick, and for fear leſt Death, want of Memory, or Speech, ſhould come ſo ſuddenly upon him, that he ſhould be prevented if he ſtay'd the Writing of his *Teſtament*, deſires his Neighbours and Friends to be Witneſs of his Laſt Will, and then declares the ſame before them by Words, which after his Deceaſe, is proved by Witneſſes, and put in Writing by the Ordinary, and then ſtands in as good Force as if it had at the firſt, in the Life of the Teſtator, been put in Writing, except only for Lands, which are deviſable but by a *Teſtament* put in Writing in the Life of the *Teſtator*.

TESTATUM, is a Writ in Perſonal Actions, as if the Defendant cannot be arreſted upon a *Capias* in the County where the Action is laid, but is returned *non eſt inventus* by the Sheriff.

The Writ ſhall be ſent into any other County, where ſuch Perſon is thought to have wherewith to ſatisfie; and is called a *Teſtatum*, becauſe the Sheriff hath formerly *teſtified*, That the Defendant was not to be found in his Bayliwick.

TESTE, is a Word commonly uſed in the laſt Part of every Writ, wherein the Date is contained, which begins with theſe Words, *Teſte meipſo*, &c.

TESTES; the Teſticles of a Male are juſtly reckoned among the principal Parts, becauſe they are neceſſary to the Conſervation of the *Species*.

But before I proceed to an Anatomical Deſcription of them, 'tis neceſſary to ſay ſomething of the *Vaſa Præparantia*, which prepare the Matter out of which the *Semen* in the Teſticles is elaborated; as I ſhall afterwards deſcribe the *Vaſa Deferentia*, that ſo the Reader may have this great and wonderful *Apparatus* all before him at one View.

In Man, ſome of the *Vaſa Præparantia* afford Matter for the *Semen*, as the *Arteriæ Spermaticæ*; others bring back again the Blood that is ſuperfluous, to the making of the *Semen*, and to the Nouriſhment of the Teſticles; and theſe are the *Venæ Spermaticæ*; and both theſe Arteries and Veins were formerly called *Vaſa Præparantia*: Some make the *Semen*, as the Teſticles; ſome convey it from thence to its Conſervatory or Store-houſe, as the *Vaſa Deferentia*: Some contain the *Semen* till the time of Copulation, and theſe are the *Veſiculæ Seminales*: Some diſcharge the *Semen* into the Matrix in Coition; this is done by the *Penis*; and ſome, laſtly, moiſten the Paſſage (*viz.* the *Urethra*) whereby the *Semen* iſſues, and thoſe are the *Proſtrates*. Of all which in Order. And firſt of the

Vaſa Præparantia, which are ſaid to prepare Matter for the *Semen*, theſe are of two ſorts, *Arteries* and *Veins*.

The *Arteries* are two, and ſpring from the Trunk of the *Aorta*, commonly two Fingers breadth under the Emulgents, not from its Side, but out of its Fore-part, the right whereof climbing over the Trunk

Trunk of the *Vena Cava*, runs obliquely to the Vein of that ſame Side; as alſo the left, marches to the Vein of that Side.

The *Veins* are alſo two. The right ariſes uſually from the Trunk of the *Vena Cava*, a little below the Emulgent; the left from the Emulgent it ſelf, for otherwiſe it muſt have gone over the *Aorta*, whereby it might have been in Danger of breaking; or rather, by the continual Pulſe of the Artery, the Recourſe of the Venal Blood might have been retarded.

Now both theſe Veins and Arteries, a little after their riſe, meet, and are inveſted both in one Membrane, made of the *Peritonæum*, and then run ſtreight through the Region of the Loins above the Muſcles *Pſoæ* on each ſide, and above the *Ureters*, as they go, beſtowing little Slips here and there upon the *Peritonæum*, between whoſe Duplicature they deſcend, and ſo arrive at its Proceſſes. The Veins divide very often into many Branches, and by and by inoſculate and unite again; but the Arteries go along by one Pipe only on each ſide, until within 3 or 4 Fingers breadth of the Teſticles, where each is divided into two Branches, the leſs whereof runs to the *Epididimys*, the larger to the Teſticle; and as I ſaid, they deſcended between the Membranes of the *Peritonæum*, ſo they paſs into the *Scrotum* between them, not perforating the inner in the Proceſſes, as in Dogs and other Creatures, wherein the Proceſſes of the *Peritonæum* are hollow like a Quill; but in Man, the inner Membrane of the *Peritonæum* ſhuts the Hole, leſt the Inteſtines fall by it into the *Scrotum*; of which there is greater danger in him, (and we ſee it often happen) becauſe of his going upright. But to return to the *Vaſa Præparantia*.

It has been generally taught, That there are divers Inoſculations of the Arteries with the Veins in their Paſſage, whereby the Venal and Arterial Blood are mixed; but this Opinion is now exploded, for that granting the Circulation of the Blood, it is impoſſible: For the Blood in the Arteries deſcends towards the Teſticles, and that in the Veins aſcends from them, ſo that if theſe two Veſſels ſhould open one into the other, the Blood in one of them muſt needs be driven back, or elſe ſtagnating, diſtend and break the Veſſels. But the Truth is, the Blood both for Nouriſhment of the Teſticles, and the making of the *Semen*, flows down by the Arteries only, and that in an even undivided Courſe, without any of thoſe Windings and Twirlings like the Tendrels of Veins talk'd ſo much of (as the Curious *de Graef*, from his own frequent Inſpection, teſtifies) and the Veins bring back from the Teſticles what of the Blood remains from their Nouriſhment and making of the *Semen*; and theſe, indeed, come out of their inmoſt Membrane, by almoſt innumerable Roots, by which they imbibe the ſaid Blood, and are moſt admirably interwoven and inoſculated one with another, till about Four or Five Fingers breadth above the Teſticle, which Space is called *Corpus Pyramidale*, *Plexus Pampiniformis*, or *Varicoſus*.

But theſe Veins are ſo far from preparing the *Semen*, as that they only bring back what was ſuperfluous from the making of it. And, indeed, the *Arteries* in Men, do no more merit the Name of *Præparantes*, in reſpect to the *Semen*, than the *Gullet* in reſpect to the Chyle, or the *Ductus Thoracicus Chyliferus* in regard to the Blood; for their Blood acquires no ſenſible Alteration till it come to the Teſticles themſelves. But however, we continue the old Names, declaring only againſt the Reaſon of them. And we will only note two things more.

Firſt, That the Spermatick Veins have from their riſe to their End, ſeveral *Valves* which open upwards, and ſo ſuffer the Blood to aſcend towards the *Cava*, but not to ſlide back again.

2dly, That tho' the Spermatick Arteries go ſuch a direct Courſe in Men, as has been ſaid; yet in Brutes they are more complicated and twiſted with the *Veins*, but without any *Anaſtamoſes* of one into the other.

Theſe *Vaſa Præparantia* thus deſcribed, proceed we to the *Teſtes*.

Theſe have Arteries and Veins (as is ſaid above) from the former *Vaſa Præparantia*, which ſome have thought to reach only to the inmoſt Coat, called *Tunica albuginea*, becauſe they are not conſpicuous in the inner Subſtance of the Teſticles. But tho' this may be true of the Veins which only receive the ſuperfluous Arterial Blood, and have nothing to do with the *Semen*, yet it is not true of the Arteries, namely, of the moſt numerous branches of them. Indeed Blood is ſeldom ſeen in the Subſtance of the Teſticles; but that comes to paſs by reaſon that the Arterial Blood preſently loſes its Colour, and by the Semenifick Faculty of the *Teſtes* is turned into *Semen*, which being whitiſh, of the ſame Colour with the Veſſels, makes them indiſcernible; yet in thoſe Men that have died of languiſhing Diſeaſes, and whoſe *Teſtes* have their Faculty impar'd.

Diemerbroeck affirms, That he has oft diſcover'd ſanguiferous Veſſels in the inmoſt Parts of the *Teſtes*, and has ſhew'd them to many in the Publick Anatomical Theatre.

As for *Nerves*, Dr. *Willis* ſays, he could never obſerve more to go to them than one from a Vertebral Pair, and that too was moſt of it ſpent upon the Muſcle *Cremaſter*.

Diemerbroeck agrees to one Nerve, but thinks it proceeds from the ſixth Pair, (which is Dr. *Willis*'s *Intercoſtal*, as diſtinguiſh'd from that commonly called the *Sixth*, but his *Eighth*.) Others will have Branches from both theſe Nerves to go to them. Concerning the Uſe of theſe Nerves there is great Controverſie. Dr. *Gliſſon*, *Wharton*, &c. will have them to convey a *Succus Genitalis*, which makes the greateſt part of the *Semen*. Dr. *Willis*, as he denies (in *Cerebri Anatom. cap.* 27.) any *Succus Nutritius* to be conveyed by the Nerves to other Parts; ſo that any *Succus Genitalis* is brought by them hither, but only Animal Spirits.

And whereas, to ſtrengthen the former Opinion, 'tis uſually objected, That the *Semen* muſt needs conſiſt of a Nervous Juice, and plenty of Spirits brought from the Brain, becauſe of the great Debility and Enervation that is induced upon the Brain and Nerves, by the too great Expence of it. He thus anſwers, That this comes to paſs, becauſe after great Profuſions of the *Semen*, for the reſtauration of the ſame Humour, (whereof Nature is more ſolicitous, than for the benefit of the Individual) a greater tribute of Spirituous Liquor is required from the Blood, to be beſtowed on the *Teſticles*. Wherefore the Brain being defrauded of

of a due Incoue and Afflux of the ſaid Spirituous Liquor, languiſhes; and ſo the Animal Spirits failing in the Fountain, the whole Nervous Syſtem becomes depauperated and flaggy. Whereto may be added, That alſo the Animal Spirits themſelves that actuate the *Proſtates*, being derived from the Spinal Marrow, are much waſted by Venereal Acts: So that for this Reaſon beſides, the Loins are enervated.

In this Anſwer *Bartholin* acquieſces: And *de Graef*, *Diemerbroeck*, &c. confeſs, indeed, That the Spirituous Arterial Blood is impregnated with Animal Spirits from the Nerves; but affirm, That the Matter out of which the *Semen* is elaborated, is only the ſaid Blood; and to theſe we ſubſcribe.

Lympheducts they have alſo a riſing from betwixt their Coats, and aſcending upwards into the *Abdomen* with the *Vaſa Deferentia*. Theſe have many Valves looking upwards, which hinder any thing from deſcending by them to the *Teſtes*, but permit the *Lympha* to aſcend, which they convey into the Chyliferous Veſſels. *Malphigi* thinks it probable that ſome fall is derived to the Seminary Veſſels for the Generation of the *Semen*, or at leaſt to be mixed with it, ſeeing moſt Creatures grows the fatter upon being Caſtrated.

They have two ſorts of *Coats*, Proper, and Common. The *Common* inveſt both the *Teſtes*, (conſtituting the *Scrotum*) and are two, The outermoſt conſiſts of the *Cuticula* and true Skin (here thinner than in other Places.) It is ſoft and wrinkled, and is generally affirmed by Anatomiſts to be without Fat. On the outſide it has a Suture or Seam that runs Lengthways of the *Scrotum*, and divides it into the Right and Left ſide. The other or inner *common* Coat, is a carnous Membrane, which ſeems to be Muſcular, becauſe of the Power it has to contract and wrinkle it ſelf. It is called δαρτος, and adheres to the proper Cato next under it (call'd *Vaginalis*) by many Membranous Fibres.

This is the common Account of this Part that all Anatomiſts have uſually given; but lately Dr. *Fred. Ruyſch* affirms, That it has the *Membrana adipoſa* alſo under the *Carnoſa*; or rather, That the *Carnoſa* is fatty, (on the inſide) as it is in other Parts of the Body. And beſides, he ſays, that in the *Scrotum*, there is a *Septum* within dividing it into two Parts; of which, ſays he, you have nothing in *Veſalius*, *Bartholin*, *de Graef*, &c. Men that have otherwiſe deſerved very well of Anatomy: And what wonder, ſeeing all things about the *Scrotum* of one newly dead, are ſo ſlippery and moveable, that the true Conſtitution of the *Septum* can hardly appear. Wherefore, if any one would demonſtrate this, the *Scrotum* is to be blown up, and to be cut open after 'tis dried, by which means the *Septum* yields it ſelf to view, and has an Infinity of Blood-veſſels running through it.

Thus he. This *Septum*, *Verheyen* ſays, is the ſame Subſtance with the carnous Membrane above deſcribed, from which it ſeems to ariſe in the ſame manner as the *Mediaſtinum* from the *Pleura*. To each ſide of it the *Teſtes* are firmly knit, by means of their outer Proper Coat, and its *Uſe* is partly to ſuſtain the *Teſtes*, and to hinder them from hitting againſt one another; and partly to help the carnous Membrane to wrinkle, and purſe up the *Scrotum*.

The proper Coats are alſo two, and theſe encloſe each Teſticle apart. The outer is called *Elitroides*, or *Vaginalis*; becauſe it contains the Teſticle as a *Sheath*. It is a thick and ſtrong Membrane, having many Veins; in the outſide it is uneven, by reaſon of the Fibres, by which it is knit to the *Dartos* and *Septum*; but in the inner ſide it is ſmooth. This is nothing elſe but the production of the *Peritonæum*, even as the *Scrotum* is of the Skin and *Membrana carnoſa* of the *Abdomen*. Into this Coat is inſerted the Muſcle *Cremaſter*, of which preſently.

The inmoſt is νευρώδης, the *Nervous Membrane*, called *Albuginea*, from its Colour. It it white, thick and ſtrong, framed of the External Tunicle of the *Vaſa præparantia*: It immediately enwraps the Teſticles, towards which it is rough, but on the outſide next the *Vaginalis*, it is ſmooth; and between theſe two, the Water is contained in an *Hernia aquoſa*.

Into the outer of the proper Membranes (as was ſaid) is inſerted the *Muſcle Cremaſter*. Theſe Muſcles (to each Teſticle one) have their Riſe from the *Oſſa Pubis*; and almoſt encompaſſing round the Proceſſes of the *Peritonæum*, deſcend with them to the *Teſticles*; where their Carnous Fibres run through the whole length of this ſame *Tunica Vaginalis*, eſpecially in its lower Part, and ſo keep the Teſticles ſuſpended, from whence they have their Name (from κρεμάζω *Suſpendo*) from their ſpreading themſelves thus on the outer ſide of the outer proper Coat.

Riolanus reckons them for a third proper Coat, calling it *Erythroides*; and becauſe of its Carnous Fibres, it makes the *Vaginalis* look *Red*; ſuch as take it not for a diſtinct Coat, do give the Name of *Erythroides*, alſo to the *Vaginalis*, calling it by either Name indifferently. Theſe Muſcles pull up the Teſticles in the Act of Generation, that the Veſſels being ſlackened, may the more readily void the *Semen*; and at other times they help to ſuſtain their Weight.

The Muſcles in Sickneſs, and old Age become flaggy, and ſo the *Scrotum* relaxing it ſelf, the Teſticles hang low.

Upon the *Teſtes* as yet clad with the *Tunica Albuginea*, are fixed the *Epididymidæ* (called alſo *Paraſtatæ*, *Standers by*, *or Aſſiſtants*) enwrapped in the ſame Coat with the Spermatick Veſſels; they adhere cloſer to the Teſticles at their ends, than in the midſt.

De Graef defines them to be *Veſſels making with their various Windings, that Body that is fixed on the Back of the Teſticles.*

To find out their Subſtance he directs us thus.

Firſt, Take off the Membrane that encompaſſes them, and knits them to the Teſticles, and then there will appear many Windings, which with the Edge of a Knife, may without hurting the Veſſels be ſo eaſily ſeparated one from another, that they may be drawn out into a length like a thing folded; for they are only folded from one ſide to the other, and are kept in that ſite, by the Membrane received from the *Tunica Albuginea*, (or Spermatick Veſſels.)

But when you have unravell'd half of them, you muſt cut another very thin Membrane, and then you will ſee other Veſſels lie juſt like theſe, and may be unlooſed like them: And the whole

whole being unravel'd, the thicker they are by how much further from their Origin, which is implanted into the upper Part of the Testicle, by six or seven Ramifications; which having run so far, as where they join into one Duct, make it as thick as a small Thread; and this by degrees so thickens, that being encreas'd like a Chord, it makes the *Vas Deferens*.

So that (saith he) it is clear from hence:

First, That the *Testes* do not differ from the *Epididymidæ* (or *Parastatæ*) saving that those consist of divers Ducts; but these, after their six or seven Roots that arise out of the Testicle are united, (which they are in a short Space) but of one, only a little thicker.

Secondly, That the *Epididymidæ* differ not from the *Vasa differentia*, saving that the former go by a serpentine winding Passage, and these by a streight; and that those are a little softer and narrower.

Out of the *Epididymidæ* at their smaller End, arise the two *Vasa deferentia*, otherwise called *Ejaculatoria*, as if in the *Coitu*, the *Semen* were ejaculated from the Testes through them; which indeed was the common Opinion, till the *Vesiculæ seminales* were found out, which are now known to be the Store-houses of the *Semen*, and not the *Testes*; so that the *Vasa deferentia* deserve not the Name of *Ejaculatoria*, except it be that Part of them which reaches from the *Vesiculæ seminales* to the *Prostatæ*, through which indeed, the *Semen* is ejaculated *in Coitu*.

They are white, hardish Bodies, like a pretty large Nerve, with a Cavity not very discernible, but which may be made so, if one open one of them six or seven Fingers breadth above the Testicle, and then either blow into it with a small Pipe, or squirt some colour'd Liquor into it, with a Syringe towards the *Testes*; for then the Vessel will be distended, and the Colour will run along its Cavity towards the *Epididymidæ*: Or if you either blow or squirt Liquor by a Syringe, the other way towards the *Vesiculæ seminales*, the said *Vesiculæ* will be distended.

Now from the *Epididymidæ* these *Vasa deferentia* ascend, and pass out of the *Scrotum* into the *Abdomen*, the same way by which the *Vasa præparantia* came down, *viz.* by the Process of the *Peritonæum*. When they are entred the *Abdomen*, they are carried presently over the *Ureters*, and turning back again, they pass to the back-side of the Bladder; between which, and the *Intestinum rectum*, they march at a little Distance the one from the other, till about the Neck of the Bladder, where they grow wider and thicker; and then just as they are going to meet, their sides open into the *Vesiculæ seminales*, in which they deposite the *Semen*, but not terminating here, but coming close together, and growing smaller and smaller, they go on and end at the *Urethra*, betwixt the *Prostatæ*. At their ending *Verheyen* (with some others) affirms there is a little *Septum* between them, with a Caruncle (which they call a *Cock's Head*) to hinder the *Semen* that comes out at one Orifice, to go in by the other; and the two Orifices by which the *Semen* is ejaculated into the *Urethra*, are called the *Eyes* of the *Cock's Head*.

These *Vesiculæ* are little Cells like those in a Pomegranate, or something like a Bunch of Grapes; *De Graef* compares them to the Guts of a little Bird diversly contorted. They consist of one thin Membrane, through which some small Twigs of both Veins, Arteries and Nerves run. They are about 3 Fingers-breadth long, and 1 broad; but in some Places broader, some narrower, as they run in and out. They are two (one for each *Vas deferens*) divided from one another by a little interstice; and they do severally by a peculiar Passage, emit the *Semen* contained in them into the *Urethra*. They are very anfractuous and winding, and (as was said) consist of many little Cells, and they should not pour out all the *Semen* contained in them in one Act of Coition, but might retain it for several: They have no Communication one with another, not even in their very opening into the *Urethra*; but the *Semen* is brought to the *Vesiculæ seminales* on the right side, by the right *Vas deferens*, issues by its proper passage into the *Urethra*; and that which is brought to the left likewise; so that if by any accident the *Vesiculæ*, or one side be burst, or cut (as in cutting for the Stone they generally are) yet those on the other being entire, may still suffice for Generation: Now when the Seed is emitted out of these *Vesiculæ* in the Act of Coition, it passes out the same way it came in, which in this Case may easily be (though otherwise it be unusual, there should be a contrary Motion in the same Vessel) for as it comes in from the *Vasa deferentia*, it drills along *gently* without any force; but *in Coitu*, when the Muscles in the *Penis*, and all the bordering Parts are much tumified, it is expressed, or ejaculated out of them with some Violence, and passing along their Neck (which is a Continuation of the *Vasa deferentia*) ouzes through a Caruncle into the *Urethra*, for there is one Place as a Valve before the Orifice of each of them, partly to hinder the coming of the Urine into them, partly to hinder the involuntary Effusion of the *Semen*.

Now, though naturally, the little Holes through which the *Semen* passes out of the Necks of the *Vesiculæ* into the *Urethra*, be almost imperceptible; yet if they be either eroded by the Acrimony of the *Semen* (such Acrimony as is contracted by impure Embraces, or in Claps (as they call them;) or if of themselves they be debilitated and so become more lax (as sometimes happens to old and impotent Men that meddle too much) then there happens a *Gonorrhæa*, or continual efflux of the *Semen*. And so *Vesalius* and *Spigelius* have observed them much dilated, in dissecting such as have died with a *Gonorrhæa* upon them.

The *Prostatæ* are placed near to the *Vesiculæ seminales*, *de Graef* calls them *Corpus glandulosum*, supposing them to be one Body, and only divided by the common Ducts of the *Vesiculæ seminales*, and *Vasa deferentia* coming through the midst of it.

They are of a white, spongy, and glandulous Substance, about as big as a small Wallnut, encompass'd with a strong and fibrous Membrane from the Bladder to the beginning of whose Neck they are joined at the Root of the *Penis*: In shape they come nearer to an Oval, save that on their upper and lower sides, they are a little depress, and in that end by which the *Vasa deferentia* enter, they are something hollow like a Tunnel. The Sphincter Muscle of the Bladder encompasses them so that for so far as they cover the Neck of the Bladder, the *Sphincter* touches it not, they coming

between. They have all ſorts of Veſſels, which run moſtly on the outer ſide; in their inner Part, they have ten or more ſmall Ducts, which all unload themſelves into the *Urethra*, by the ſides of the Caruncle, through which the *Semen* paſſes from the *Veſiculæ* into the *Urethra*, and themſelves have each one a ſmall one to ſtop its Orifice, leſt the Liquor that is contained in the *Proſtatæ* ſhould continually flow out, or the Urine ſhould flow in: And theſe ſmall Ducts, I ſuppoſe, are continued from thoſe *Veſiculæ*, which appear in the *Proſtates* of thoſe that die (any way) ſuddenly after Coition. For in ſuch the ſpongy part of the *Proſtatæ* is very turgid with a ſorous Liquor; and in their inner part may be found the ſame *Veſiculæ*, like to *Hydatides*, which if you preſs upon, they will diſcharge themſelves in the aboveſaid Ducts.

What the Liquor they contain ſhould be, or what is their Uſe, there is a great Variety of Opinions: Some think that the *Semen*, that flows from the Teſticles, is further elaborated here: But that cannot be; for that the *Vaſa deferentia* depoſite nothing in them, but all into the *Veſiculæ Seminales*. Others think that from the Blood there is ſeparated in them an acrimonious, and ſerous Humour, which ſerves for procuring the Titillation *in Coitu*. As to this, *de Graef* appeals to the Taſt of it, which has nothing of an Acrimony.

Dr. *Wharton* thinks they make a particular kind of *Semen*, as the Teſticles do another, and the *Veſiculæ Seminales* a third; That theſe laſt make a *Semen* different from that made in the Teſticles, is grounded on a Miſtake in Anatomy, *viz.* That the *Vaſa deferentia* have no Communication with the *Veſiculæ*; whereas they apparently open into them, and depoſite in them all the *Semen* they contain; that the *Proſtatæ* make a peculiar ſort, he endeavours to prove, becauſe caſtrated Animals emit ſome *Semen*. But that is but precarious; for tho' they emit ſomething, 'tis not neceſſary it ſhould be any true *Semen*: Or if it be, it may well be ſuppoſed to proceed from the *Veſiculæ Seminales*, that were full when the Animal was caſtrated. For, for this Reaſon it has been obſerved, that preſently after the Caſtration they have ſometimes got the Female with Young, but not afterwards, when that Stock was ſpent. *Bartholin*, with many others, thinks they make an oily, ſlippery, and fatty Humour, which is preſſed out, as there is need, to beſmear the *Urethra*, whereby to defend it from the Acrimony of the *Semen*, and Urine, and leſt it ſhould dry up. This Humour *Malpighius* thinks to be conveyed hither by the *Ductus adipoſi*, and quotes *Severinus*, affirming that he has obſerved a plain Veſſel in the Fat of the Kidneys, tending to the Spermatick Veſſels. He aſcribes the ſame Uſe to it as *Bartholin*, &c. *Diemerbroeck* confeſſes, that 'tis neceſſary the inſide of the *Urethra* ſhould be kept moiſt, and ſlippery, but thinks that is done here, as in the Bladder, Inteſtines, and many other places, from ſome muced Part of the Nouriſhment of the *Urethra* it ſelf, and concludes that the *Vaſa deferentia* depoſite not all the *Semen* into the *Veſiculæ ſeminales*, but carry a ſmaller Part to theſe *Proſtatæ*.

De Graef denies, that the *Vaſa deferentia* convey any thing to them, or have any Communication with them; and therefore believes, that the Humour that is ſeparated in the *Corpus glanduloſum* (as he calls the *Proſtatæ*) ſerves for a *Menſtruum*, or *Vehicle* of the *Semen*, which flowing but in ſmall Quantities, through ſmall Pores into the *Urethra*; it was neceſſary, that this Humour ſhould be mixt with it, that it might the better reach the Womb. Whatever this Humour be, it is ſqueezed out partly by the Intumeſcence and Erection of the *Penis*; and partly by the Compreſſion of the Sphincter of the Bladder, that girds the *Proſtatæ* about.

Theſe *Proſtates* are often (at leaſt partly) the Seat of the *Gonorrhœa*; and the Humour that they contain, is that which is ſhed.

TESTES *Cerebri*, are the two lower and leſſer Protuberances of the Brain, ſo call'd from the likeneſs they have to Teſticles. Theſe with the *Nates* which lie above them, and the *Protuberantiæ Striatæ*, are the Origin of the *Medulla oblongata*. The Uſes of theſe *Teſtes* you may ſee in *Willis*'s Anatomy of the Brain; but they ſeem but *conjectural*.

TESTUDO, is a ſoft large Swelling, or not very hard, in the Head, broad, in Form of an Arch-Dome, or the Back of a Tortoiſe, from which reſemblance it takes its Name. At the beginning it grows like a Cheſs-nut, afterward like an Egg, wherein is contained a ſoft Matter clothed with a certain Tunick, (whence ſome refer this ſort of Tumour to *Meliceres*, which ſee) which ſticks ſo cloſe to the Skull, that many times it infects and corrupts it. *Blanchard.*

TETANUS, or *Tetanon*, is a Contraction, whereby a Limb grows rigid and inflexible. The cauſe of it is ſometimes a Relaxation or Palſy in ſome other Muſcles, which when they are relaxed, the oppoſite Muſcles act too ſtrongly; ſo that they draw the Part wholly to themſelves, which ought to conſiſt as it were in an *Æquilibrium* betwixt both. Yet ſometimes ſuch a permanent Contraction may proceed from the Tendons being loaded and obſtructed with ſerous Matter, which thereupon grow rigid and ſtiff.

This Diſtemper is frequent in the Scurvy, ſo that the Patient can extend neither Joint nor Limb. The Tendons in the Back are ſometimes contracted into a round globular Form, which by reaſon of ſuch an Afflux of Humours upon them, draw the Bones out of their due places, and cauſe an Hunched Back, or a ſtooping or bending of it. It is uſually diſtinguiſhed into *Univerſal*; of which there are three ſorts, *Emproſthotonos*, *Opiſthotonos*, and *Tetanos*, properly ſo called; and *Particular*, which reſpects a certain Member, or a particular Joint. *Blanchard.*

TETRACHORD, in Muſick, is a Concord or Interval of 3 *Tones*.

The *Tetrachord* of the Ancients, was a Rank of four Strings, accounting the *Tetrachord* for one Tone, as it is often taken in Muſick.

TETRADIAPASON, a Quadruple Diapaſon is a Muſical Chord, otherwiſe called a Quadruple Eighth, or Nine and Twentieth.

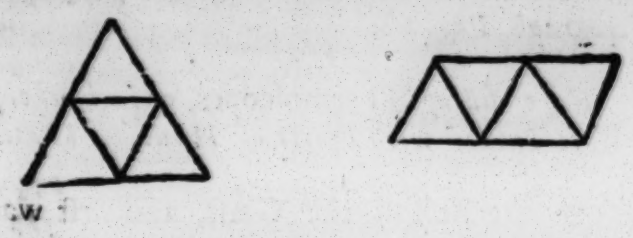
TETRAGONIAS, a Comet whoſe Head is of a Quadrangular Figure, and its Tail or Train, long, thick and uniform, and does not differ much from the Meteor called *Trabs*.

TETRAGONISM, with ſome foreign Writers, is the ſame as the Quadrature of the Circle.

TETRAGONUS. See *Quadratus Genæ*.

TETRAHEDRON. See *Regular Bodies*. N. B. theſe following Figures being cut in Paſt-board and folded up, will either of them repreſent the *Tetrahedron*.

TETRAPE-



TETRAPETALOUS *Flower*, of a Plant, is that which conſiſts of but four ſingle coloured Leaves (which the Botaniſts call *Petala*) ſet round the *Stylus* to compoſe the Flower.

Plants having a Tetrapetalous Flower, conſtitute a *diſtinct Kind*, and by Mr. *Ray* are divided into,

1. Such as have an uniform Tetrapetalous Flower, and their Seed-veſſels a little oblongiſh, which therefore he calls *Siliquoſe*.

As the *Keiri* or *Leucoium Luteum*, and the other common *Leucoium*; the *Dentaria*, the *Leucoium Siliquoſum*, *Alyſſon*, *Viola Lunaris*, *Paronychia*, *Heſperis*, *Alliaria*, *Rapa*, *Napus*, *Sinapis*, *Rapiſtrum*, *Eruca ſpuria*, *Eryſimum*, *Cardamine*, *Turritis*, *Piloſella Siliquoſa*, and the *Raphanus Ruſticanus* and *Aquaticus*.

2. Such as have their Seed-caſe or Veſſel *ſhorter*, which therefore for diſtinction he calls *Capſulatæ* and *Siliculoſa*; as the *Myagrum*, *Draba*, *Leucoium Siliqua ſubtorunda*, *Cochlearia*, *Naſturtium*, *Lepidium vulgare*; *Thlaſpi*, *Braſica marina*, *Glaſtum*, *Eruca marina*, &c.

3. Such as have a kind of, or ſeeming Tetrapetalous Flower, *i. e.* a Monopetalous one divided deeply into 4 Partitions, and theſe he calls *Anomalous*; as the *Papaver*, *Agrèmone*, *Veronica*, *Tithymallus*, *Plantago*, *Coronopus*, *Pſyllium*, *Lyſimachia Siliquoſa*, *Alſine ſpuria*, &c.

TETRAPHARMACUM, is a Medicine conſiſting of four Ingredients, as *Unguentum Baſilicum*.

TETRAPTOTES, are in Grammar, ſuch defective Nouns, as have only four Cales; as, *Plus*, which wants the *Dative* and *Vocative* Singular.

TETRASTYLE, in Architecture, is a Building which hath four Columns in the Faces before and behind.

TEXTURE. The Texture of any Natural Body, is that peculiar diſpoſition of its conſtituent Particles, and making it have ſuch a Form, or be of ſuch a Nature, or be endowed with ſuch Qualities.

THALAMI *Nervorum Opticorum*, are two Prominences of the lateral Ventricles of the *Cerebrum*, ſo called, becauſe the Optick Nerves riſe out of them. They are Medullary without, but a little Cineritious within. They are of an oblong Figure.

THAUGHTS, or *Thoughts*, are the Benches on which the Rowers ſit in a Boat to Row.

THELONIA *rationabili habendo pro Dominis habentibus Dominica Regis ad firmam*, is a Writ that lies for him that hath of the King's Demeſne in Fee-farm, to recover reaſonable *Toll* of the King's Tenants there, if his Demeſne have been accuſtomed to be *Tolled*.

THELONIUM, or *Breve eſſendi quieti de Thelonio*, is a Writ lying for the Citizens of any City, or Burgeſſes of any Town, that have a Charter or Preſcription to free them from *Toll*, againſt the Officers of any Town or Market, who would conſtrain them to pay *Toll* of their Merchandize, contrary to the ſaid Grant or Preſcription.

THENOR, or *Tenor*, according to ſome, is the Name of an abducent Muſcle which draws the Thumb from the Fore-finger.

THEODOLITE, is an Inſtrument uſed in *Surveying*, and taking of Heights and Diſtances.

It conſiſteth of ſeveral Parts: As,

1. *A Circle of Braſs*, divided into four Quadrants, repreſenting the four Cardinal Points of the Compaſs, *Eaſt*, *Weſt*, *North* and *South*, and noted with the Letters, N. S. W. E.

Each of theſe *Quadrants* is divided into 90 Degrees, and ſubdivided as the Largeneſs of the Inſtrument will permit, commonly by *Diagonals*.

Theſe four Quadrants are to be numbred by 10, 20, 30, &c. both ways beginning at the *North* and *South* Points, and ending with 90, at the *Eaſt* and *Weſt* Points.

2. *A Box* and *Needle*, ſo conveniently contrived to ſtand upon the Centre of the Circle, upon which *Centre*, the *Inſtrument*, the *Index*, with its *Sights*, muſt be made to turn about, and yet both the *Inſtrument*, and the *Box* and *Needle* remain firm. At the bottom of the *Box* there muſt be a *Card* or *Mariner's Compaſs* fixed, anſwerable to the Letters E. W. N. S. upon the *Inſtrument*.

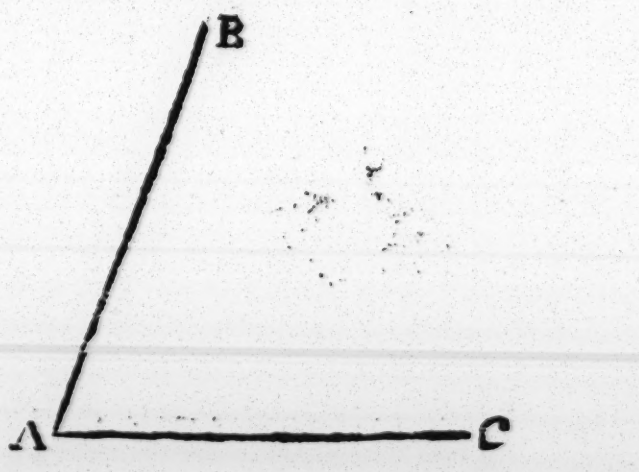
3. *A Socket* on the Back-ſide, (either Plain or with a *Ball*, which is much better) to be put upon the Head of a three-legged Staff.

4. *A Staff* to ſet the *Inſtrument* upon; the Neck at the Head whereof muſt be made to go into the *Socket* on the Backſide of the *Inſtrument*.

Its Uſe is for taking *Heights* and *Diſtances*, as alſo taking of *Angles*, in Surveying of Land, &c.

To take the Quantity of an Angle by the Theodolite.

As ſuppoſe the Angle A, of a Field, two of whoſe Sides is A B or A C.



Place your Inſtrument in the Angle A, or as near as poſſible, and let Marks be ſet up near B and C, ſo far off the Hedges as your Inſtrument at A ſtands (which yet is not neceſſary) then turn the Inſtrument about, till through the fixed Sights you ſee the Mark at B, there ſcrew it faſt; next turn the moveable Index, till through the Sights thereof

you ſee the Mark at C, then the Degrees upon the Limb cut by the Index, gives the Angle B A C.

THEOREM, is a Speculative Proportion, demonſtrating the Properties of any Subject: This is either,

1. *Univerſal*, which extends univerſally to any Quantity without Reſtriction; as, *That the Rectangle of the Sum and Difference of any two Quantities, is equal to the Difference of their Squares.*

2. *Particular*, when it extends only to a particular Quantity.

3. *Negative*, which demonſtrates the Impoſſibility of an Aſſertion; as, *That the Sum of two Biquadrate Numbers cannot make a Square.*

4. *Local*, which relates to a Surface; as, *That Triangle of the ſame Baſe and Altitude are equal.*

5. *A plain Theorem*, is that which relates to either a Rectilneal Surface, or to one terminated by the Circumference of a Circle; as, *That all Angles in the ſame Segment are equal.*

6. *A ſolid Theorem*, is that which treats about a Space terminated by a ſolid Line; that is, by any of the three *Conick Sections*; as, *If a Right Line cut two Aſymptotick Parabola's, its two Parts terminated by them ſhall be equal.*

7. *A Reciprocal Theorem*, is one whoſe Converſe is true; as, *That if a Triangle have two equal Sides, it muſt have two equal Angles.* The Converſe of which is true, *That if it have two equal Angles, it muſt have two equal Sides.*

THERAPEUTICA, is that part of Phyſick, which delivers the Method of Healing.

THERIOMA, is a wild cruel Ulcer, like *Carcinoma*; which ſee. *Blanchard.*

THERMÆ, are the *Bath* or other Medicinal Waters which are Hot. 'Tis moſt probable, as Dr. *Woodward* well obſerves, (*Nat. Hiſt. of the Earth, p.* 144.) That theſe do not owe their Heat to any Colluctation or Effervescence of the Minerals in them, but to the *ſubterranean Heat or Fire*, which communicates with them by ſome *Spiracle* or *Canal*, by which a greater Quantity of Heat is derived thither, than to ordinary Springs. Tho' Mr. *Charas* hath lately revived the former Opinion. *Vid. Memoirs Mathemat. & de Phyſique, A. D.* 1692.

THERMANTICA, are healing Medicines.

THERMOSCOPE, or *Thermometer*, is a Philoſophical Inſtrument, uſually made of Glaſs, filled with tinged Spirit of Wine, or ſome other proper Liquor; and deſigned to meaſure, or eſtimate the Heat and cold of any particular Place; or of the ſame Place in different Seaſons, and at different Times.

At the Bottom is a pretty large Ball filled with the Spirit or tinged Liquor, with a Stem riſing, to about three or four Foot perpendicular. To adjuſt the Diviſions, or Degrees of which; the Ball may be placed in Water, which is juſt beginning to freeze, and then noting the height of the Spirit in the Stem, place againſt that O, and graduate it afterward, up and down, for Heat and Cold.

Dr. *Hook*, in order to adjuſt theſe Graduations with the greater Accuracy, hath contrived, and deſcribed an Inſtrument for that purpoſe. See *Micrograph. Pag.* 38.

The Way of filling Thermoſcopes, *or ſuch other ſmall Glaſs Tubes, with Spirit of Wine, or Water.*

Take the Ball of the Glaſs, and firſt warm it gently between your Hands, then neal it very well (tho' gently) before a good Fire, turning it round, that it may be equally warm, for without this Caution, you'll endanger breaking it. Then applying the Ball to the Flame of a Lamp or Candle, turning it about in it, heat it as hot as you can, without melting the Glaſs, and then ſpeedily immerſing the open end of the Pipe into a Veſſel of that Liquor you intend to fill it withal, the Liquor will riſe into it, and fill it very near full.

The Reaſon of which aſcent of the Liquor is, That the Air within the Ball and Tube, being expelled in great Meaſure by the Heat, or at leaſt, rarified there to a very great Degree; the immerſed open End of the Tube keeps off the Preſſure of the Incumbent Atmoſphere on that part of the Liquor that the end of the Tube covers; but the Atmoſphere preſſes on all other Parts of the Liquor in the open Veſſel; and conſequently (there being none, or but a very ſmall Quantity of Air within the Tube to hinder it) forces it by its weight, up into the Tube, till it gain an Equilibrium with the Preſſure, or Weight of the Air without.

If by this Method the Tube cannot be filled full enough, the reſt may be ſupplied by a ſmall Glaſs-Funnel, whoſe Shank muſt be drawn out exceeding ſlender, and inſerted into the Orifice of the Tube; and then by blowing, you may force with your Breath the *Spirit of Wine* into the Tube, ſo as to fill it quite, or to what Degree you pleaſe.

Dr. *Hook*, in his *Micrographia*, hath an Engine for graduating Thermometers, to make them true Standards of Heat and Cold.

THLIPSIS, is a Compreſſion of the Veſſels in an Animal Body. *Blanchard.*

THORACICA *Inferior*, a Branch of the Subclavial Veins, ſpreading it ſelf upon the ſide of the Breaſts by ſeveral Branches, which communicate by *Anaſtomoſis*, with the Branches of the *Azygos*, under the Muſcles of the Breaſt.

THORACICA *Superior*, is a Branch of the Subclavial Vein, ariſing from the *Baſilica*, and goes to the *Mammilla* and Muſcles of the Breaſt.

THORAX, or *Medius Venter*, the Cheſt; is all the Cavity which is circumſcribed above, by the Neck-bones; below, by the *Diaphragme*; before, by the Breaſt-bone; behind, by the Back-bones; on the Sides, by the Ribs; it is of an Oval Figure, contains the Heart and Lungs, and is cover'd on the inſide with a Membrane called *Pleura.*

Hippocrates and *Ariſtotle*, took all that Space from the Neck-bone, to the very Secrets, both the middle and lowermoſt Cavity, for the Thorax.

THOUGHTS, or *Thaughts*, ſo the Seamen call the Seats or Benches, on which the Men ſit down to row in a Boat.

THOWLES, are thoſe Pines in the Gunnel of a Boat, between which the Men put their Oars when they row.

THREE-LEGG'D-STAFF, is an Inſtrument conſiſting of Wooden Leggs, made with Joints to ſhut all together, and to take off in the middle, for the

the better Carriage; and on its Top is uſually a Ball and Socket to ſupport and adjuſt Inſtruments for Aſtronomy, Surveying, &c.

THROMBUS, is a Coagulation of Blood or Milk into Clots or Cluſters. *Blanchard.*

THYMUS, is a conglobate Glandule in the Throat, growing to the upper part of the *Mediaſtinum*, and ſeated between the Diviſions of the Subclavian Veins and Arteries; it is whitiſh, ſoft and ſpungy, and larger in Children, and in Women, than in Men. The Jugular Veins and Arteries paſs thro' the Gland as they go up the Neck, but this don't ſend any conſpicuous Twigs or Branches to it: Its Uſe ſeems to be to prop and ſtrengthen the Diviſions of the *Aorta* and *Cava*, and to defend them from being compreſſed by the *Claviculæ* when we ſtoop forwards, and perhaps in Infants in whom it is large, and conſiſts in 3 Glands, it may contribute towards the refining and depurating of the Chyle; and poſſibly it may hinder (as *Verheyen* thinks) and too haſty Mixture of the Chyle with the Blood in Children.

THYROARYTÆNOIDES, is a Pair of large Muſcles, that proceed from the Cartilage, called *Scutiformis*, and extending themſelves forward to the ſides of the *Arytænoides*; the fourth and fifth Part of the *Larynx*, ſerve to contract, and cloſe the opening of the *Larynx*.

THYREOIDEÆ *Glandulæ*, are two of a viſcous, ſolid Subſtance, wonderfully adorned with Veſſels of all ſorts, and hard Membranes, almoſt of the bigneſs, and ſhape of an Hen's Egg, ſituate at the lower Part of the *Larynx*, at the ſides of the Cartilages, called *Scutiformis*. Their Uſe ſeems to be to ſeparate a Liquor from the Lubrication of the *Larynx*, whereby the Voice is rendred firm, ſmooth and ſweet; and they contribute alſo to the roundneſs of the Neck, by their filling up the empty Spaces about the *Larynx*.

THYROIDES, is the Cartilage, called *Scutiformis*, of the *Larynx*: Alſo the Hole of the *Os Pubis*, is by ſome called by this Name. See *Scutiformis*.

THYRSUS, is a Word uſed by the Botaniſts, for the upright, and tapering Stalk: And 'tis often uſed for *Spica*, which is an Ear, or Blade of Corn.

TIBIA, the Leg, is the Part betwixt the Knee and the Ancle: It conſiſts of two Bones; one outward, called *Focile Minus*; another inward, and larger, which has uſurped the Name of the whole, and is called *Tibia*; others call it *Focile Majus*, and *Canna Major*: The upper End has a Proceſs, which is received by a Cavity in the Thigh, and two oblong Cavities to admit the Heads of the Thigh-bone; the Depth of which Cavities is encreaſed by a Cartilage that is annexed thereunto by Ligaments: This Cartilage is moveable, ſoft, ſlippery, moiſtened with an unctuous Humour; thick in its Circumference, and ſmaller towards the Center, whence it is called *Lunata*, made like an Half Moon; there are rugged ſharp Ligaments before, which encreaſe the Lunary Cartilages: The fore Part, which is acute and long, is called *Spina*: There is below a prominent and gibbuus Proceſs in the inner Side, nigh the Foot; and is called *Malleolus Internus*, the inner Ancle-bone.

TIBIALIS *Anticus*, a Muſcle of the *Tarſus*, ſo called from its Situation on the Fore-part of the *Tibia*: It's alſo by *Spigelius* called, *Muſculus Catenæ*, becauſe when it is divided, the Patient is forced to uſe a Sling, to ſupport the Foot in walking: Its Origination is fleſhy from the lower Part of the ſuperior Appendage of the *Tibia*, between the Prominence, where the great Tendon of all the extending Muſcles of the Leg is inſerted, and the Origination of the *Muſculus Extenſor magnus Digitorum Pedis*: It alſo continues a diſgregated fleſhy Origination, for near two Thirds of the ſuperior Part of the ſaid *Tibia*, externally Laternal, next the *Fibula*; which compoſing a fleſhy Belly, leſſens it ſelf in half its Progreſs, and growing into a ſtrong, and ſomewhat round Tendon, deſcending obliquely over the inferior Part of the ſaid *Tibia*; and under the Annular Ligament, is inſerted to the inſide of the *Os Cuneiforme Majus*, that ſuſtains the *Os Metatarſus Pollicis*: This pulls the Foot upwards and forwards, directly.

TIBIALIS *Poſticus*, is a Muſcle of the Foot, which being placed on the Back-part of the *Tibia*; is alſo called *Muſculus Nauticus*, becauſe Mariners chiefly uſe it in climbing up the Maſts of their Ships. It lies partly under the *Flexor tertii internodii Pollicis*, which Muſcle muſt be partly raiſed together with the *Flexor tertii internodii Digitorum Pedis*, before we can have a clear ſight of it. It appears Biventral, ariſing partly Tendinous, and partly fleſhy from the Superior and Back-part of the *Fibula*; as alſo from the Ligament that is contained between the ſaid Bone and the *Tibia*; in near half its Progreſs it becomes leſs, and grows fleſhy again, and making a ſtrong round Tendon which runs in a *Sinus*, on the Back-part of the lower Appendage of the *Tibia*, called the *Malleolus Internus* under an Annular Ligament, and is inſerted to the *Os Naviculare*, internally and laterally. This draws the Foot upwards and inwards.

TIDE, the Word *Tide* ſignifies as well the Ebbing as the Flowing of the Sea; the former of which the Seamen call *Tide of Ebb*; the latter, *Tide of Flood*. A *Windward Tide*, is when the Tide runs againſt the Wind. A *Leeward Tide*, is when the Wind and Tide go both the ſame way; when the Tide runs very ſtrong, they call it a *Tide-Gate*. *To tide it over*, or *up* into any Place, is to go in with the Tide of Flood or Ebb, as long as that laſts, and then to ſtay at an Anchor all the Time the contrary *Tide* laſts, and then to ſet in again, when the ſame Tide returns. It's ſaid to flow *Tide* and *Half-tide*, when the Tide runs three Hours (which is four Points of the Compaſs) in the *Offing*, longer than it doth by the Shore. By longer, they do not mean more Hours, for it always Ebbs and Flows ſix Hours, but that if it be high Water a Shoar at Twelve a Clock, it will not be ſo in the *Offing* till Three, which is the Bound, and Time for the running of a Half tide. If it Ebbs and Flows more, they ſay, It runs Half-tide, and half Quarter, that is five Points; when they are to go into a Harbour over a Bar or Sand, their Word is, that they will bring the Tide with them; that is, they will come in with the Flood, that ſo they may get over the Bar or Sand ſafely.

TIDES. Mr. *Henry Philips* in *Philoſoph. Tranſ.* N. 34. gives the following Proportion for finding the *Tides*.

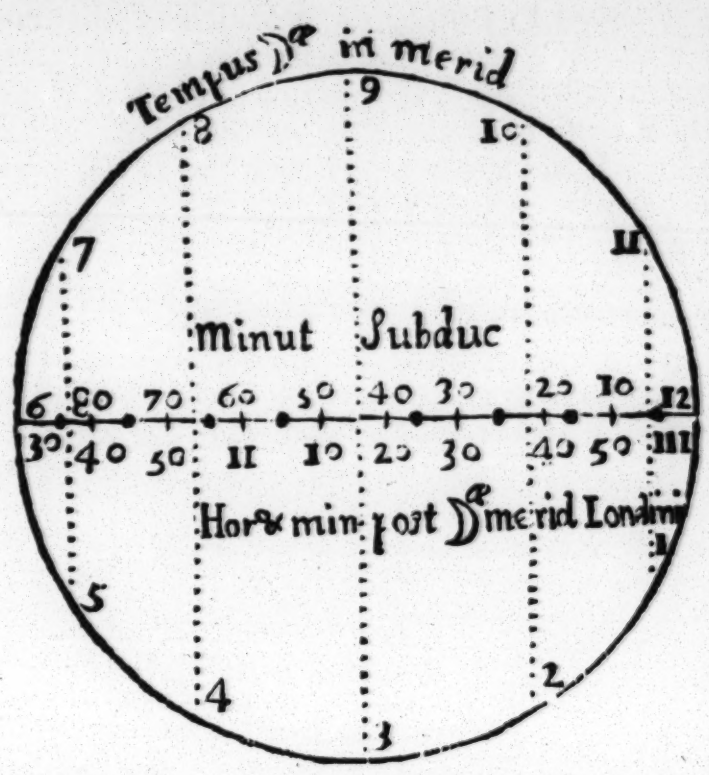
Firſt, Divide a Circle into 12 equal *Parts*, or *Hours*, according to the Moon's Motion, or Diſtance from the Sun, from the *New Moon* to the *Full*.

Second-

Secondly, Let the Diameter of the Circle be divided into 90 *Parts* or *Minutes*, that is according to the Time of the Difference of Tides between the *New*, or *Full Moon*, and the *Quarters*, which is one Hour and a half.

Thirdly, Make *Perpendicular Lines* croſs the Diameter of the Circle, from Hour to Hour.

Fourthly, Reckon the Time of the *Moon*'s coming to the *South* in the Circumference of the Circle, and obſerve the *Perpendicular Line* that falls from that Point upon the Diameter; and the Proportional *Minutes* cut thereby, will ſhew how many *Hours* or *Minutes* are to be ſubtracted from the Time of high Tides at the *New* and *Full Moon*, that ſo you may have the true Time of the *Tides* that preſent Day.



Example.

At *London*, on the Day of the *New* and *Full Moon*, it is *High-tide* at 3 of the Clock; that is, when the *Moon* is 3 Hours paſt the *Meridian*: And ſo by the common Rule, the *Moon* being about 4 Days old, it will be South about 3 of the Clock, and it will be *High-tide* 3 Hours afterwards; that is, at 6 of the Clock. But now by this Rule, if you count this Time of the *Moon*'s coming to the South, in the Circumference, the Perpendicular Line which comes from 3 to 9, cuts the Diameter in the half at 45 *Minutes*: Which ſhews, that ſo much is to be abated from the Time of *High-water* in the *New* and *Full Moon*: So that it is *High-tide* 45 *Minutes* before 6 of the Clock; that is, at 5 *Hours*, 15 *Minutes*, and not at 6 of the Clock, according to the *common Rules*.

The like you may do for any other Port or Place, knowing the Time of *High-water*, at the *New* and *Full Moon* in that Place: And this may be more readily done, if you ſet down the Time of *High-water* at the *New* and *Full Moon* under the *Diameter*, as is done for *London* in this Example, where 'tis *High-tide* at 3 of the Clock. So that when the *Moon* is South at 3 of the Clock, the Perpendicular cuts the Diameter at 2 Hours, 15 Minutes; which added to the Time of the Southing, gives 5 Hours, 15 Minutes; and ſo when the Moon is South at 9 of the Clock, by adding 2 Hours, 15 Minutes, you have the Time of *High-water*, which is 11 Hours, 15 Minutes.

And thus you may eaſily make a *Table*, which by the Southing of the *Moon*, ſhall readily tell you the Time of *High-tide* at any Time of the *Moon*.

Note, If the Difference be not ſo much between the *Neap-tides* and *Spring-tides*, in other Places as it is in this our Example, the Diameter muſt be divided into fewer Parts.

Our learned Aſtronomer Mr. *Flamſtead*, *Philoſ. Tranſ. N.* 143. gives us a new and more correct *Tide-Table*, (which he alſo now publiſhes every Year) improving what Mr. *Philips* had begun, by obſerving that the Tides did not uſually hold out ſo long as Mr. *Philip*'s Calculation made them to do. He found by above 80 Obſervations of the *High-waters* at *Tower-wharf* and *Greenwich*, That the greateſt Differences between the *Moon*'s *true Southing*, and the *High-waters*, were not, as *Philips* ſaid, at *Full*, *New*, and *Quarter Moons*, but the *greateſt* near the *Neaps*, and the *leſs* near the *higheſt Spring-tides*.

There is an Hypotheſis to ſolve the Motion of the Tides, mentioned in *Philoſoph. Tranſ. N.* 16. from that Learned Mathematician Dr. *Wallis*: In which, he ſuppoſes the *Earth* and *Moon* to move round the *Sun*, in a Circle, or Ellipſe, deſcribed by their common Centre of Gravity. But this Hypotheſis places the higheſt *Annual Tides* not near the Equinoxes, but about *Candlemas* and *All-hollantide*; that is, in the beginning of *February* and *November*. But I could never find that the Thing was ſo in Fact; but that on the contrary, they are always greateſt at or near the Equinoxes, as hath been generally obſerved: I ſhall therefore refer the Reader to the Ingenious Hypotheſis it ſelf, without giving any particular Account of it here.

The true Theory of the Tides extracted from that admirable Treatiſe of Sir Iſaac Newton, *Intituled*, Philoſophiæ Naturalis Principia Mathematica; *By that Excellent Mathematician, Captain* Halley.

The Principle upon which this Author proceeds to explain moſt of the great and ſurpriſing Appearances of Nature, is no other than that of *Gravity*, whereby in the Earth all Bodies have a Tendency towards its Centre, as is moſt evident: And from undoubted Arguments 'tis proved, That there is ſuch a *Gravitation* towards the Centre of the Sun, Moon, and all the Planets.

From this Principle, as a neceſſary Conſequence, follows the Spherical Figure of the Earth and Sea, and of all the other Celeſtial Bodies; and tho' the tenacity and firmneſs of the ſolid Parts, ſupport the Inequalities of the Land above the Level; yet the Fluids preſſing equally, and eaſily yielding to each other, do ſoon reſtore the *Equilibrium*, if diſturbed, and maintain the exact Figure of the Globe.

Now this Force of the Deſcent of Bodies towards the Centre, is not in all Places alike, but is ſtill leſs and leſs, as the Diſtance from the Centre encreaſes: And in the ſaid Book it is demonſtrated, That this Force decreaſes as the Square of the Diſtance encreaſes; that is, the Weight of Bodies, and the Force of their Fall is leſs, in Parts more removed from the Cenrre, in the Proportion of the Squares of the Diſtance.

As

As for Example.

A Ton Weight on the Surface of the Earth, if it were raiſed to the height of 4000 Miles, which let be the Semidiameter of the Earth, would weigh but a Quarter of a Ton, or 500 *l.* Weight.

If to 12000 Miles, or 3 Semi-diameters from the Surface; that is, 4 from the Centre, it would weigh but 1 ſixteenth Part of the Weight on the Surface, or a Hundred and a Quarter: So that it would be as eaſie for the Strength of a Man at that height, to carry a Ton Weight, as here on the Surface to carry a Hundred and a Quarter.

And in the ſame Proportion does the Velocities of the Fall of Bodies decreaſe: For whereas on the Surface of the Earth, all things fall 16 Foot in a Second, at one Semi-diameter above; this Fall is but 4 Foot; and at 3 Semi-diameters, or 4 from the Center, it is but $\frac{1}{16}$ of the Fall at the Surface, or but one Foot in a Second, and at greater Diſtances both Weight and Fall become very little; but yet at all given Diſtances, is ſtill ſomething, tho' the Effect become inſenſible.

At the Diſtance of the Moon (which ſuppoſe to be 60 Semi-diameters of the Earth) 3600 Pounds Weight but one Pound, and the Fall of Bodies is but $\frac{16}{3600}$ of a Foot in a Second, or 16 Foot in a Minute; that is, that a Body ſo far off deſcends in a Minute no more than the ſame at the Surface of the Earth would do in a Second of Time.

And as was ſaid before, the ſame force decreaſing after the ſame manner, is evidently found in the *Sun*, *Moon*, and all the *Planets*; but more eſpecially in the *Sun*, whoſe Force is prodigious becoming ſenſible even at the immenſe diſtance of *Saturn*. This gives room to ſuſpect that the force of Gravity is in the Celeſtial Globes proportional to the Quantity of Matter in each of them: And the Sun being at leaſt 10000 times (for Inſtance, tho' he is far bigger) as big as the Earth, its Gravitation or attracting force, is found to be at leaſt 10000 times as much as that of the Earth, acting on Bodies at the ſame Diſtances.

Whence alſo, all the ſurpriſing Phænomina of the Flux and Reflux of the Sea he ſhews in the like manner to proceed from the ſame Principle.

If the Earth were alone, that is to ſay, not affected by the Actions of the *Sun* and *Moon*, it is not to be doubted, but the Ocean being equally preſſed by the force of Gravity towards the Center, would continue in a perfect Stagnation always at the ſame height, without ever ebbing or flowing; but it being by him demonſtrated, That the *Sun* and *Moon* have a like Principle of Gravitation towards their Centers, and that the Earth is within the Activity of their Attractions, it will plainly follow, That the Equality of the Preſſure of Gravity towards the Centre will thereby be diſturbed; and tho' the ſmalneſs of theſe Forces, in reſpect to the Gravitation towards the Earth's Centre, render them altogether imperceptible by any Experiments we can deviſe, yet the Ocean being fluid, and yielding to the leaſt force, by its riſing, ſhews where it is leaſt preſt, and where it is more preſt by its ſinking.

Now if we ſuppoſe the force of the *Moon*'s Attraction to decreaſe as the Square of the Diſtance from its Center increaſes, (as in the Earth, and other Celeſtial Bodies) we ſhall find, that where the *Moon* is perpendicularly either above or below the *Horizon*, either in *Zenith* or *Nadir*, there the force of Gravity is moſt of all diminiſhed, and conſequently that there the Ocean muſt neceſſarily ſwell, by the coming in of the Water from thoſe Parts where the Preſſure is greateſt, *viz.* in thoſe Places where the *Moon* is near the *Horizon*; but that this may be the better underſtood, 'twas thought needful to add the following Scheme, where M is the Moon, E the Earth, C its Centre, Z the Place where the Moon is in the *Zenith*, N where the *Nadir*.

Now by the Hypotheſis it is evident, that the Water in Z, being nearer, is more drawn by the *Moon*, than the Centre of the Earth C, and that again more than the Water in N; therefore the Water in Z has a Tendency towards the *Moon*, contrary to that of Gravity, being equal to the Exceſs of the Gravitation in Z, above that in C. And in the other Caſe, the Water in N tending leſs towards the *Moon*, than the Centre C, will be leſs preſs'd, by as much as is the Difference of the Gravitations towards the *Moon* in C and in N.

This rightly underſtood, it follows plainly, that the Sea, which otherwiſe ſhould be Spherical, upon the Preſſure of the *Moon*, muſt form it ſelf into a Spheroidal, or Oval Figure, whoſe longeſt Diameter is where the *Moon* is Vertical, and ſhorteſt where ſhe is in the *Horizon*; and that the *Moon* ſhifting her Poſition, as ſhe turns round the Earth once a Day, this Oval of Water ſhifts with her, occaſioning thereby the two Floods and Ebbs obſervable in each 25 Hours.

And this may ſuffice as to the general Cauſe of the *Tides*: It remains now to ſhew how naturally this Motion accounts for all the Particulars that have been obſerved about them; ſo that there can be no room left to doubt, but that this is the true Cauſe thereof.

The *Spring-tides*, upon the *New* and *Full Moons*, and the *Neap-tides*, on the Quarters, are occaſion'd by the attractive Force of the *Sun*, in the *New* and *Full*, conſpiring with the Attraction of the *Moon*, and producing a *Tide* by their united Forces; whereas in the Quarters, the *Sun* raiſes the Water where the *Moon* depreſſes it, and on the contrary; ſo as the *Tides* are made only by the Difference of their Attraction.

That the force of the *Sun* is no greater in this Caſe, proceeds from the very ſmall Proportion the Semi-diameter of the Earth bears to the vaſt Diſtance of the Sun.

It is alſo obſerved, That *cæteris paribus*, the *Equinoctial Spring-tides* in *March* and *September*, or near them, are the higheſt, and the *Neap-tides* the loweſt; which proceeds from the greater Agitation of the Waters, when the fluid *Spheroid* revolves about a great Circle of the Earth, that when it turns about in a leſſer Circle; it being plain, that if the *Moon* were conſtituted in the Pole, and there ſtood, that the *Spheroid* would have a fixt Poſition, and that it would be always *High-water* under the Poles, and *Low-water* every where under the Equinoctial; and therefore the nearer the *Moon* approaches the *Poles*, the leſs is the Agitation of the Ocean;

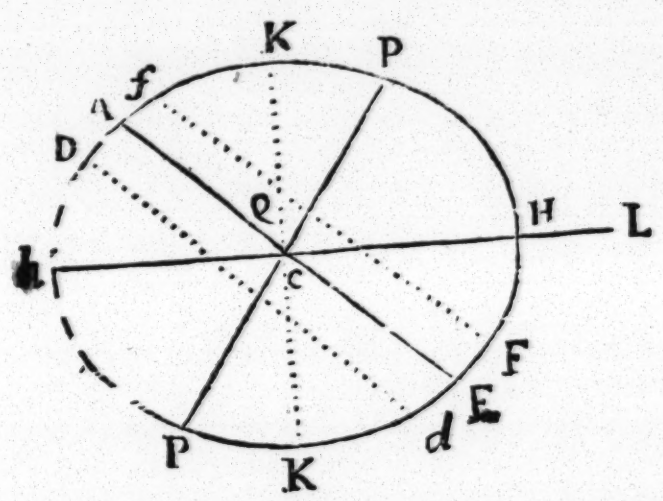
Ocean, which is of all the greateſt, when the *Moon* is in the Equinoctial, or fartheſt diſtant from the Poles.

Whence the *Sun* and *Moon*, being either conjoyn'd or oppoſite in the Equinoctial, produce the greateſt *Spring-tides*; and the ſubſequent *Neap-tides* being produced by the *Tropical Moon* in the Quarters, are always the leaſt *Tides*; whereas in *June* and *December* the *Spring-tides* are made by the *Tropical Sun* and *Moon*, and therefore leſs vigorous; and the *Neap-tides* by the *Equinoctial Moon*, and therefore are the ſtronger.

Hence it happens, that the Difference between the *Spring* and *Neap-tides* in theſe Months, is much leſs conſiderable than in *March* and *September*.

And the Reaſon why the higheſt *Spring-tides* are found to be rather before the *Vernal*, and after the *Autumnal Equinox*, viz. in *February* and *October*, than preciſely upon them, is, becauſe the *Sun* is nearer the Earth in the Winter Months, and ſo comes to have a greater Effect in producing the *Tides*.

Hitherto we have conſidered ſuch Affections of the *Tides* as are univerſal, without Relation to particular Caſes; what follows from the differing Latitudes of Places, will be eaſily underſtood by the following Figures.



Let A P P E P be the Earth covered over with very deep Waters, C its Centre, P P its Poles, A E the Equinoctial, F *f* the Parallel of Latitude of a Place, D *d* another Parallel at equal Diſtance on the other ſide of the Equinoctial, H *h* the two Points where the *Moon* is Vertical, and let K K be the great Circle wherein the Moon appears Horizontal.

It is evident, that a *Spheroid* deſcribed upon H *h* and K K, ſhall nearly repreſent the Figure of the Sea; and C *f*, C D, C F, C *d*, ſhall be the Heights of the Sea in the Places *f*, D, F, *d*, in all which it is *High-water*: And ſeeing that in 12 Hours time, by the diurnal Rotation of the Earth, the Point F is transferr'd to *f* and *d* to D: The Height of the Sea C F, will be that of the *High-water*, when the *Moon* is preſent, and C *f* that of the other *High-water*, when the *Moon* is under the Earth; which in the Caſe of this Figure is leſs than the former C F.

And in the oppoſite Parallel D *d*, the contrary happens: The riſing of the Water being always alternately greater and leſs in each place, when it is produced by the *Moon* declining ſenſibly from the Equinoctial, that being the greateſt of the two *High-waters* in each Diurnal Revolution of the *Moon*, wherein ſhe approaches neareſt either to the *Zenith* or *Nadir* of the Place. Whence it is, that the *Moon* in the Northern Signs in this part of the World, makes the greateſt *Tides* when above the Earth, and in the Southern Signs when under the Earth; the Effect being always the greateſt where the *Moon* is fartheſt from the Horizon, either above or below it.

And this alternate Increaſe and Decreaſe of the *Tides*, has been obſerv'd to hold true on the Coaſt of *England*, at *Briſtol* by Captain *Sturmy*, and at *Plymouth* by Mr. *Colepreſſe*.

But the Motions hitherto mention'd, are ſomewhat altered by the Libration of the Water, whereby tho' the *Action* of the *Luminaries* ſhould ceaſe, the Flux and Reflux of the Sea would for ſome time continue: This Conſervation of the impreſſed Motion diminiſhes the Difference that otherwiſe would be between two conſequent *Tides*, and is the Reaſon why the higheſt *Spring-tides* are not preciſely on the *New* and *Full Moons*, nor the *Neaps* on the Quarters; but generally they are the third *Tides* after them, and ſometimes later.

All theſe things would regularly come to paſs, if the whole Earth were covered with Sea very deep; but by reaſon of the ſhoalneſs of ſome places, and the narrowneſs of the Straits, by which the Tides are in many Places propagated, there ariſes a great diverſity in the Effect, and not to be accounted for, without an exact Knowledge of all the Circumſtances of the Places; as of the Poſition of the Land, and the Breadth and Depth of the Channels by which the *Tide* flows; for a very ſlow and imperceptible Motion of the whole Body of the Water, where it is (for Example) two Miles deep, will ſuffice to raiſe its Surface 10 or 12 Feet in a *Tide*'s Time; whereas, if the ſame Quantity of Water were to be conveyed upon a Channel of 40 Fathom deep, it would require a very great Stream to effect it, in ſo large Inlets as are the Channel of *England*, and the *German* Ocean; whence the *Tide* is found to ſet ſtrongeſt in thoſe Places where the Sea grows narroweſt, the ſame Quantity of Water being to paſs through a ſmaller Paſſage: This is moſt evident in the *Streights* between *Portland* and *C. de Hogue* in *Normandy*, where the *Tide* runs like a Sluce, and would be yet more between *Dover* and *Calais*, if the *Tide* coming about the Iſland from the North did not check it. And this Force being once impreſs'd upon the Water, continues to carry it about the Level of the ordinary height in the Ocean, particularly where the Water meets a direct Obſtacle, as it is in St. *Maloes*; and where it enters into a long Channel, which running far into the Land, grows very ſtrait as its Extremity; as it is in the *Severn-Sea*, at *Chepſtow* and *Briſtol*.

This ſhoalneſs of the Sea, and the Intercurrent Continents, are the Reaſon that in the open Ocean the Time of *High-water* is not at the *Moon*'s Appulſe to the Meridian, but always ſome Hours after it, as it is obſerved upon all the Weſt Coaſt of *Europe* and *Africa*; from *Ireland* to the *Cape of Good Hope*: In all which, a *South-Weſt Moon* makes *High-water*; and the ſame is reported to be on the *Weſt* of *America*.

But it would be endleſs to account all the Particular Solutions, which are eaſie *Corollaries* from this *Hypotheſis*; as, why the Lakes, ſuch as the *Caſpian-Sea*, and *Mediterranean-Sea*; ſuch as the *Black-Sea*, the *Streights*, and *Baltick*, have no ſenſible Tides: For *Lakes*, having no Communication with the Ocean, can neither increaſe or diminiſh

miniſh their Water, whereby to riſe, and fall; and Seas that communicate by ſuch narrow Inlets, and are of ſo immenſe and extent, cannot in a few Hours time receive, or empty Water enough to raiſe, or ſink their Surface in any thing ſenſibly.

Laſtly, to demonſtrate the Excellency of this Doctrine, the Example of the Tides in the Port of *Tunking* in *China*, which are ſo extraordinary, and differing, from all others we have yet heard of, may ſuffice. In this Port there is but one Flood, and Ebb in 24 Hours; and twice in each Month, *viz.* when the *Moon* is near the Equinoctial, there is no *Tide* at all, but the Water is Stagnant; but with the *Moon*'s Declination there begins a *Tide*, which is greateſt when ſhe is in the Tropical Signs; only with this difference, that when the *Moon* is to the *North-ward* of the Equinoctial, it Flows when ſhe is above the Earth, and Ebbs when ſhe is under, ſo as to make *High-Water* at *Moon* ſetting, and *Low-water* at *Moon*'s riſing: But on the contrary, the *Moon* being to the *Southward*, makes *High-water* at riſing, and *Low-water* at ſetting, it Ebbing all the time ſhe is above the Horizon. As may be ſeen more at large, in the *Philoſoph. Tranſact.* N. 162.

The Cauſe of this odd Appearance, is propoſed by Sir *Iſaac Newton*, to be from the concurrence of two *Tides*, the one propagated in 6 Hours, out of the great *South Sea*, along the Coaſt of *China*; the other out of the *Indian Sea*, from between the Iſlands, in 12 Hours, along the Coaſt of *Malacca*, and *Cambodia*.

The one of theſe *Tides*, being produced in North-Latitude, is, as has been ſaid, greater when the *Moon* being to the North of the Equator, is above the Earth, and leſs when ſhe is under the Earth.

The other of them, which is propagated from the *Indian Sea*, being raiſed in South Latitude, is greater when the *Moon* declining to the South is above the Earth, unleſs when ſhe is under the Earth; ſo that of theſe *Tides*, alternately greater and leſſer, there comes always ſucceſſively two of the greater, and two of the leſſer together every Day; and the *High-water* falls always between the times of the arrival of the two greater Floods; and the *Low-water* between the arrival of the two leſſer Floods. And the *Moon* coming to the Equinoctial, and the alternate Floods becoming equal, the *Tide* ceaſes, and the Water ſtagnates; But when ſhe has paſſed to the other ſide of the Equator, thoſe Floods which in the former order were the leaſt, now becoming the greateſt, that which before was the time of the *High-water*, now becomes the *Low-water*, and the Converſe; ſo that the whole appearance of theſe ſtrange *Tides*, is without any forcing naturally deduced from theſe Principles, and is a great Argument of the certainty of the whole *Theory*.

The *Theory of Des Cartes*, whereby he endeavours to explain the Phænomena of *Tides*, ſuppoſes the *Moon* to move round the Earth in an Ellipſis, in whoſe Centre the Earth is placed, ſo that by this means the *Moon* will have two *Apogæums*, and two *Perigæums*; and according to him ſhe muſt always be in one of her *Prigæums*, at the time of her Oppoſition, or Conjunction; ſo that then he ſuppoſes her to preſs more ſtrongly upon the Sea, than ſhe doth at her Quadratures, when he ſaith ſhe is in her *Apogæum*, and conſequently hath a weaker Preſſure: But now beſides that, if this were ſo it would not ſolve the thing, the Fact it ſelf is notoriouſly Falſe; for the *Moon* is as often in her *Apogæum* at New, and Full, as ſhe is in her *Perigæum* at thoſe times; tho' it ſeldom happens, that ſhe is exactly in either, at her Lunations, *Vid.* Mr. *Keil*'s Examination of *Burnet*'s *Theory*, *Introduct.* *P.* 17.

Dr. *Gregory* in his Aſtronomy, *Book* 4. *Prop.* 65 *P.* 384. demonſtrates alſo, That if the Globe of the Earth, were every where covered over with a deep Sea (not now conſidering the Figure, which would ariſe from its Revolution, round its Axis) it would put on the Figure of an oblong Spheroid, whoſe Axis produced, would paſs through the *Moon*; and this by Reaſon of the Gravitation of the Parts the Water towards the *Moon*: And for the ſame Reaſon, the Earth would put on an oblong Spheroidical Figure, whoſe produced Axis, would alſo paſs thro' the *Sun*.

And then in the next Propoſition he proves, That the *Flux, and Reflux of the Sea, is occaſioned by the Water covering our Globe, its putting on two oblong Spheroidical Figures, whoſe Axes produced, would paſs thro' the Moon and Sun.*

And this true Cauſe of the *Tides*, he ſaith, was firſt diſcovered by the great *Kepler*, and afterwards improved very much, by our Incomparable Sir *Iſaac Newton*; which ſhewed that the Sea muſt needs riſe both under the *Moon*, and in the Part Diametrically oppoſite to that.

And this Spheroidical Figure of the Water of the Sea, which like two Mountains is ſtretcht out, one towards the *Moon*, and the other to the Part oppoſite to her, is continually moving, or ſhifting according to the daily Motion of the *Moon*, which it follows; (or rather indeed, the Earth moving towards the Eaſt in its daily Motion, ſhifts it ſelf away from theſe Mountains of Water, which keep as it were immoveable under and oppoſite to the *Moon*, as ſhe more ſlowly moves towards the Eaſt) hence I ſay it muſt needs be, that the Water muſt twice riſe and fall in 25 Hours; in which time the *Moon* moves from the Meridian of any Place, to the ſame again.

And becauſe the Water of the Earth will ſwell, or be raiſed in thoſe Places to whom the *Sun* is in the *Zenith*, or *Nadir*, (as he proves, *Prop.* 64.) altho' much leſs than when the *Moon* is ſo poſited: Therefore in the Conjunction, and Oppoſition of theſe Luminaries, the aforeſaid Protuberance of the Water will be conjoined; and conſequently then the higheſt *Spring-Tides*; and the loweſt Ebbs will be when both thoſe Luminaries are in the Horizon of any Place; becauſe the Water is then elevated, and now depreſſed by the conjoint Force of both.

But in the Quadratures of the Luminaries, the *Sun* elevates the Water where the *Moon* makes it all, and makes it fall where the *Moon* elevates it; ſo that the *Elevation* of the Water depending only on the difference of theſe Forces, will be the leaſt of all, and ſo for the *Depreſſion*. Between the Syzygies, and the Quadratures, the Effects of the Luminaries on the Water, will be at a mean between the two former.

When the Moon is in the Equinoctial, the two oppoſite Protuberances, or Eminences of the Water, will be alſo in the Earth's Equator, and each of them deſcribing that greateſt Circle of the Earth, by its Diurnal Revolution, it will move ſwifter, and when it is thrown towards the Shoars, will

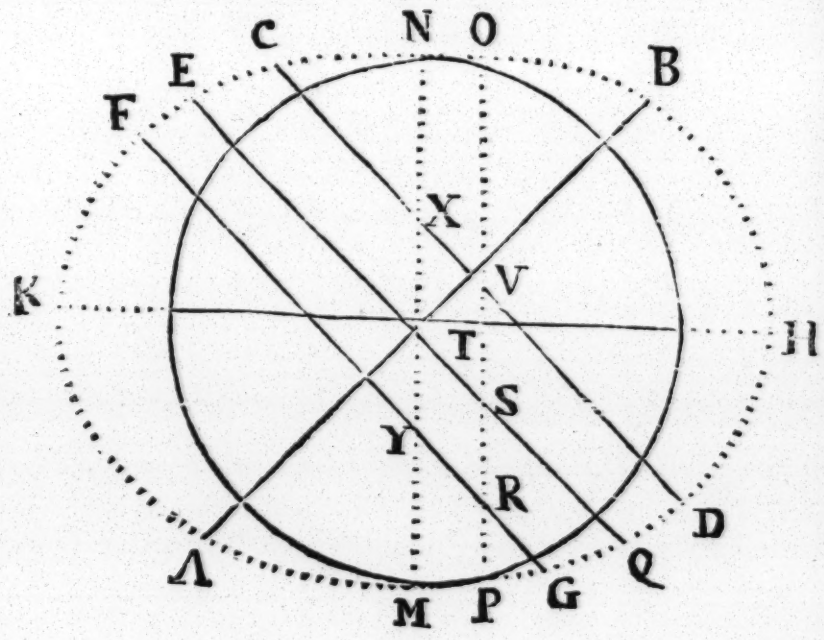
riſe higher there; beſides that, ſomething muſt alſo be allowed for the Equatorial Diameter of the Earth, being its longeſt, and conſequently the Water there being ſomething nearer to the Luminary, will be raiſed higher, by their Influence, than in other Parts.

And therefore whenever the Luminaries are either in Conjunction, or Oppoſition, in the Equator, their Forces will be conjoined to raiſe or elevate the Sea at the Equator; as happens at the Syzygys next the Equinoxes, or in or near *March* and *September*, when we have always the greateſt *Annual Tides*; as the Tides at the Quadratures of thoſe *Moons*, are always the leaſt, or moſt *Neap*.

Again, the Tides, (other things conſidered) are always greateſt when the Luminaries are in *Perigæo*, and leaſt when they are in *Apogæo*; and ſince this is the Caſe of the Moon in every Lunation, but of the Sun only in the Winter, this joined to the former, occaſions that the greateſt Tides in the Syzygys, and the leaſt in the next Quadratures, do precede the Vernal Equinox, and follow the Autumnal one.

Hitherto the Properties of the *Tides* have been conſidered only univerſally, as they affect the whole Globe of the Earth; it remains, that thoſe ſhould be next ſpoken of, which ariſe from the different Latitudes of different Places.

To which purpoſe, let B E K A Q H repreſent the Earth, whoſe Centre is at T, its North Pole A, the other B: E Q the Equator, and C D, F G, two Parallels to it, one toward the North, the other toward the South.



Let the Water round the Earth conform it ſelf into an Oblong Spheroid, (becauſe of the *Moon*'s being near it) whoſe Axis K H, produced towards H, ſhall paſs through the *Moon*: Then ſhall T H, or T K, be the greateſt height of the Water, (reckoning from the Centre T) and T M, or T N, the leaſt; which latter is equal to the height of the Water in any Point of the Circle N M: *v. gr.* where ever it meets with the Parallels, C D, F G, as ſuppoſe in X or Y.

Alſo the Right Lines T C, T F, T D, and T G, (being ſuppoſed to be drawn) will denote the height of the Water in the ſeveral Points C, F, D, and G: Then drawing the Circle P O, parallel to N M, the ſuppoſed Right Lines, T O, T V, T S, T R, and T P, will be the heights of the Water in the Points O, V, S, R and P, where the ſaid Circle meets with the Equator and its Parallels.

This being ſuppoſed, Let us conſider any Place on the Earth, by its Diurnal Rotation, to deſcribe the Parallel C D: It is then plain, that when the Place is at D; T D will then be the greateſt height of that Water, when the *Moon* is in the *Meridian* of the Place; but the Water will be at loweſt, when that Place hath moved to X; and then higheſt again when it is come to C, as hath been before ſhewn.

But now becauſe T D is longer than T C, (as being nearer to the longeſt of all T H) in the preſent Caſe, when the *Moon* declines towards the elevated Pole, the height of the Water will be greater when the *Moon* is in the *Meridian*, above the *Horizon*, than when in the ſame Circle below it.

In like manner T G, will be leſs than T F, (as being nearer the ſhorteſt of all T M) that is in the Place, deſcribing the Path, or Circle F G, by the Earth's Diurnal Motion. T G, will be the greateſt height of the Water, happening while the *Moon* declines toward the depreſſed Pole A, and is on the *Meridian* above the *Horizon*; but this is leſs than its greateſt Altitude which happens when the *Moon* comes to the other half of the *Meridian*.

Moreover, the Difference of this Tide, now greater, now leſſer (in Places ſituate without the Equator, according as the *Moon* moves towards the viſible, or latent part of the *Meridian*) will be greater, if it be conjoined with the Cauſes abovementioned, and which will produce a like Effect, *V. gr.* at the *Solſtices*; for then in the Syzygys, both the Luminaries do moſt of all decline from the Equinoctial; and ſuch a *Declination*, (it hath been ſhewed) occaſions the *Alternation of the Tides*.

And this effect will yet be encreaſed when the aſcending Node of the *Moon*'s *Orbit*, paſſes the Vernal Equinox; for then the *Moon* conjoined to the *Sun*, declines towards the North, or South, by the Quantity of her greateſt Latitude, above the Declination which is equal to the *Sun*'s greateſt Declination.

All which things are in this State if the Earth be ſuppoſed to be quite covered over with Water, to a great Depth; but becauſe of the Land, Iſlands, Straits, *&c.* there will be an infinite Variety in the Phænomena of the *Tides*; yet there is no doubt, but if that the Situation of Places, *&c.* be well conſidered, and Obſervations of the *Tides* there exactly made, all things will be found to agree very well with this Theory, and to be eaſily accountable from it.

TIERCE, or a *Third*, is a Term in *Muſick*, ſignifying a certain Diviſion of the *Monochard*, in which if the Terms be as 5 to 4. 'tis called, a *Tierce Major*, or a *Diton*; but if the Terms are as 6 to 5, then 'tis called a *Tierce Minor*, or *Demi-Diton*.

TIES aboard a Ship, are thoſe Ropes by which the Yards do hang: And when the Halliards are ſtrained to hoiſe the Yards, theſe *Ties* carry them up.

TILLER, the very ſame with the Helm of a *Ship*: It is moſt properly uſed in a Boat where that which would be the Helm in a Ship, is called the *Tiller*.

TIMBRE, (or rather *Timmer*, ſaith *Guillum*) is the Heralds term for the Creſt which in any Atchievement ſtands a top of the Helmet.

TIME, in *Muſick*, is that quantity, or length whereby is aſſign'd to every particular *Note*, its due Meaſure, without making it either longer or ſhorter than it ought to be; and it is twofold, *viz.* *Duple* or *Common*, and *Triple*.

Duple, or *Semi-breve time*, generally called *Common*, becauſe moſt uſed, is when all the *Notes* are encreaſed by two: As 2 *Longs* make a *Large*, 2 *Breves* a *Long*, 2 *Semi-breves* a *Breve*, 2 *Minims* a *Semi-breve*, 2 *Crotchets* a *Minim*, 2 *Quavers* a *Crotchet*, 2 *Semi-quavers* a *Quaver*, and 2 *Demi-Semi-quavers* a *Semi-quaver*.

This ſort of *Time* is uſual in *Anthems*, *Almains*, *Pavans*, *Fantaſies*, &c.

Triple Time, is that wherein the Meaſure is counted by *Threes*: As one *Semi-breve* is equivalent to 3 *Minims*, one *Minim* to 3 *Crotchtes*, &c. So that this ſwifter *Time* or *Meaſure* is proper for Airy Songs, and Light Leſſons: As *Courants*, *Sarabands*, *Jiggs*, &c.

To theſe ſorts of *Time* may be added, *Seſquialteran Proportion*, which ſignifies a *Triple* Meaſure of three *Notes*, to two ſuch like *Notes* of the *Common Time*.

TIME, is a certain Meaſure depending on the Motion of the Luminaries, by which the Diſtance and Duration of things is meaſured; and is either *Aſtronomical*, which is ſimply taken from the Motion of the Stars: Or *Civil*, which is Aſtronomical Time accommodated to Vulgar Uſes.

Aſtronomical, *Mathematical*, or *Abſolute Time*, flows equably in its ſelf without Relation to any thing External; and by another Word is called *Duration*.

But *Relative*, *Apparent*, or *Vulgar Time*, is the ſenſible, and external Meaſure of any Duration eſtimated by Motion, and this the vulgar Uſes, inſtead of true *Time*.

TIN-GLASS. See *Biſmuth*.

TINEA, when a ſort of running Sores in the Head, full of little Holes (called *Achores*) continue long, or be too ſlowly or ill cured, they grow into *Tinea's*, *i. e.* cruſty ſtinking Ulcers of the Head, which gnaw, and conſume its Skin; therefore 'tis deſervedly reckoned amongſt the Diſeaſes of Children, but when they are a little grown; for tho' adult Perſons are ſometimes troubled with this Diſeaſe, yet they contracted the rudiments, and Seeds of it in their Infancy. It is called *Tinea*, which ſignifies a Moth, from thoſe little Worms which eat, and conſume Cloths; becauſe thoſe Ulcers prey upon the Skin of the Head, as thoſe Animals upon Cloths. What the *Greeks* called this Diſtemper, is not ſo obvious. *Blanchard*.

TINCTURE, the Heralds call the Colours in an Eſcutcheon, or Coat of Arms, *Tinctures*.

TINCTURE, in Chymiſtry, is a Diſſolution of the more fine, and volatile Parts of a mixt Body in Spirit of Wine, or ſome ſuch proper Menſtruum. The Matter is bruiſed in a Mortar, and then put into a Matraſs, and on it the Spirit of Wine (uſually) is poured to the height of two, or three Fingers above it: Then the Glaſs is cloſe ſtopt and ſet in Digeſtion in a Sand Heat for four or five Days, till the Spirit is well impregnated, and hath received an high Colour, or Tincture from the Matter. Thus the Tincture of Cinnamon, and all Odoriferous Vegetables are drawn.

And when Tinctures are drawn from Minerals, or Metals; this Spirit is the common Menſtruum made uſe of.

TINNITUS *Aurium*, is a certain buzzing, or tingling in the Ears, proceeding from Obſtruction, or ſomething that irritates the Ear, whereby the Air that is ſhut up, is continually moved by the beating of the Arteries; and the Drum of the Ear is lightly verberated; whence ariſes a buzzing, or noiſe.

TIRE, or as the Seamen pronounce it *Teer* of Guns, are a Rank of them placed along a Ship's ſide, either above, upon Deck, or below: The former of which, are called the *upper Tire of Guns*; the latter, the *lower Tire*. There is alſo in ſome Ships half a *Tire* on the *Fore-deck*, and *Half decks*.

TITE, the Seamen ſay a Ship is *Tight* or *Tite*, when ſhe is ſo ſtaunch as to let in but very little Water; and this is known by the ſmell of the Water Pumpt out, for if ſhe let in but little Water, it will always ſtink, otherwiſe not.

TITILLATION, is that Senſation we have in any Part of the Body when tickled.

TITLE *of Entry*, is when one is ſeiſed of Land in *Fee*, makes a Feoffment thereof on Condition, and the Condition is broken; after which the Feoffer hath *Title* to enter into the Land, and may do ſo at his Pleaſure, and by his *Entry* the Freehold ſhall be ſaid to be in him preſently: And 'tis called *Title of Entry*, becauſe he cannot have a Writ of Right againſt his Feoffee upon Condition, for his Right was out of him by the Feoffment, which cannot be reduced with *Entry*, and the *Entry* muſt be for the Breach of the Condition.

TIMESIS, is a Figure in the Grammar, whereby a compound Word hath its Parts ſeparated from one another, by the Interpoſition of ſome other Word, as in this of *Terrence*.

Quæ meo cunque animo lubitum eſt facere.

Where *Quæ* and *cunque*, are divided by putting *meo* between them.

TOISON *d'Or*, (French) the Term in Heraldry for a golden Fleece, which is ſometimes born in a Coat of Arms.

TOIL, or *Tholl*, in common Law, hath two Significations. Firſt, It is uſed for a Liberty, to buy, and ſell within the Precincts of a Mannor. Secondly, For a Tribute, or Cuſtom paid for paſſage, &c. Some Interpret it to be a Liberty, as well to take, as to be free from *Toll*; for they who are Enfeoffed with *Toll* are Cuſtom-free.

TOLT, is a Writ, whereby a Cauſe depending in a Court-Baron, is removed to the County-court; and is ſo called, becauſe it does *Tollere loquelam*, from the one Court, to another.

TOMENTUM, properly ſignifies *Flocks*, or *Locks* of Wool; but by Botaniſts 'tis uſed for that ſoft Downy Matter which grows on the Tops of ſome Plants; which therefore are denominated from hence; as *Gramen Tomentoſum*, *Carduus Tomentoſus*, &c.

TOMETICA, the ſame with *Attenuantia*.

TOMOTOCIA, the ſame with *Hyſterotomia*. *Blanchard*.

TONDINO, a Term in Architecture. See *Aſtragal*.

TONE, a Term in Muſick, ſignifying a certain Degree of Elevation, or Depreſſion of the Voice, or ſome other Sound. *Muſicians* commonly determine it to be the ſixth Part of an *Octave*, in which Sence, the *Octave* is ſaid to be compoſed of Five *Tones*, and two *Semi-tones*; and the *Tone* to be the

Difference between the fourth and fifth. A *Tone*, or whole Note is divided into nine Particles call'd *Comma's*, five of which are aſſigned to the greater *Semi-tone*, and four to the leſſer.

TONICA, are thoſe things which being externally applied to, and rubb'd into the Limbs; ſtrengthen the Nerves, and Tendon. *Blanchard.*

TONNAGE, is a Cuſtom or Impoſt paid to the King, for Merchandiſe carried out, or brought in Ships, and ſuch like Veſſels, according to a certain Rate upon every Tun.

TONSILLÆ, the Almonds of the Ears, as they are vulgarly call'd, are two Glands ſeated at the Root of the Tongue, on each ſide of the *Uvula*, and at the Top of the *Larynx*, covered with the common Membrane that inveſts all the Mouth.

Dr. *Wharton* ſays, That tho' they ſeem two, yet they are really but one, being continued to one another by a thin and broad Production, which is of the ſame glandulous ſubſtance with themſelves. He ſays, They are of a yellowiſh Colour, and compares their Subſtance to concreted Honey, only they are of a more firm Conſiſtency, but they look ſandy like it: They have ſmall Veſſels from the *Jugular Veins* and *Arteries*, and *Nerves* from the fifth Pair.

They have each a large oval common Duct, or *Sinus* that opens into the Mouth ſo wide in an Ox, that one may put the tip of the little Finger into it. Into this many leſſer open, and by a diſcharge into the Mouth, *&c.* the Liquor that is ſeparated in the Gland.

Fallopius hath obſerv'd this Aperture or *Sinus*, to look like a ſmall Ulcer when the Gland has been ſwelled, and ſometimes by unskilful Perſons, to have been treated as ſuch, when it has only been forced to gap a little too much through the too plentiful Defluxion of Humours upon the Gland.

The *Uſe* of theſe Glands was by the Ancients ſuppoſed to be only to ſeparate a certain mucous, or pituitous Matter from the Blood, for the moiſtening, and lubricating of the *Larynx*, Tongue, Fauces, and Gullet: But Dr. *Wharton*, and as many as attribute a fermentative Quality to the *Saliva*, aſcribe a more noble Uſe to them; *viz.* to make a Ferment to further the Concoction of the Stomach: Yea, Dr. *Wharton* (but I think miſtakingly) thinks that they are the chief Inſtrument of Taſt.

TOP (of a Ship) is a round Frame of Boards lying upon the Croſs-trees near the head of the Maſt: Here they furle or looſe the Top-ſail, *&c.*

TOP-ARMOURS, are a kind of Cloths hung about the Round-tops of the Maſts for ſhow; and alſo to hide the Men which are in the top in a Fight, who lie there to fling Stink-pots, *&c.* or to fire ſmall Shot down on the Enemy in caſe of Boarding.

TOP-GALLANT-*Maſts* of a Ship are two, *viz.* *Maintop-gallant-Maſt*, and *Foretop-gallant-Maſt*: And theſe two are ſmall round Pieces of Timber, ſet on to their reſpective *Top-Maſts*; on the Top of which Maſts are ſet the Flag-ſtaffs, on which the Colours, as Flags, Pendants, *&c.* hang.

TOP-MASTS of a Ship are 4; which are made faſt, and ſettled unto the Heads of the *Main-Maſt*, *Fore-Maſt*, *Miſſen-Maſt*, and *Boltſprit* reſpectively.

TOP-ROPES, are thoſe with which the *Top-Maſts* are ſet, or ſtruck. They are reeved thro' a great Block, which is ſeized on one ſide under the Cap, and then they are reeved thro' the *Heel* of the *Top-Maſt*, where is a Braſs *Shiver* placed athwart Ships; after this they are brought up and faſten'd on either ſide the Cap with a Ring: The other part of them comes down by the *Ties*, and ſo is reeved into the *Knight-head*; and when it is to be heaved, is brought to the *Capſtan*: Theſe *Top-Ropes* belong only to the *Main*, and *Fore-Maſt*.

TOPHUS, is a ſtony Concretion in any Part of an Animal Body; which is alſo frequently called a *Tophaceous* Matter.

TOPICK in Medicine, ſignifies what is outwardly applied to the Patient's Body, to cure him of his Diſtemper.

TOPICK in *Logick*, is a *Ground*, or *Subject* on which to found, or from whence to draw an Argument in Diſputation.

TOPINARIA, is the ſame with *Talpa*. *Blanchard.*

TOPOGRAPHY, is a particular Deſcription of ſome ſmall quantity of Land, ſuch as that of a Mannor, or particular Eſtate, *&c.* or ſuch as Surveyors ſet out in their Plots, or make a Draught of, for the Satisfaction, and Information of the Proprietors.

TOPPING *the Lifts*, is the ſame as haling the Top-ſail Lifts; and therefore they ſay *Top a Starboard*, or *Top a Port*; that is, hale upon the Starbard or Larboard Lift. See *Lifts*.

TORCE, a Term in Heraldry for a Wreath; which ſee.

TORCULAR *Herophili* in Anatomy, is that Place where the four Cavities of the *Dura Mater*, or thick Skin of the Brain are joined.

TORE, or *Torus* in Architecture, or as 'tis ſometimes ſpelt *Thore*, is that round Ring which encompaſſes in the Column, between the *Plinth* and the *Liſt*. This is the third Member of the Baſe of a Column; it ſeems like a round Cuſhion, ſwelling out with the Weight of the Incumbent Pillar.

TORICELLIAN *Experiment*, ſo called from its Author, and Inventor *Torricellius* an *Italian*; is when a Glaſs Tube of about 3 Foot in Length, and $\frac{1}{4}$ of an Inch Bore being ſealed (or cloſed in the Fire) at one end, is at the other quite filled with Quick-ſilver; and then being ſtopt with the Finger, hath its unſealed end thruſt down under the Surface of ſome Quick-ſilver, contained in a Veſſel; and then the Finger being removed from the Orifice, and the Tube put into an erect Poſture, the Mercury will deſcend, or run out till it remain in the Tube, to the height of between 28 and 31 Inches, leaving in the top of the Tube an apparent empty Space.

This Quick-ſilver thus ſuſpended, hath been found to encreaſe or leſſen its height in the Tube, according as the Weather alters for dry or wet; and therefore when hung in a Frame with a Plate of Diviſions for this purpoſe, 'tis called the Quick-ſilver Weather-glaſs, the *Mercurial Barometer*, or *Baroſcope*; which Words ſee.

That the Cauſe of the Suſpenſion of the Mercury in this Tube, is occaſion'd by the Weight of the Atmoſphere incumbent on the Orifice of the Tube, and the ſtagnant Mercury in the Baſon over it; is the received Opinion, and ſeems proved by theſe Experiments and Reaſons.

Firſt, That when a Tube, in which this *Torricellian Experiment* is duly made, is placed (Ciſtern and all) in the Receiver of the Air-pump; after one Suction the Mercury will deſcend, and ſo ſtill will it go lower and lower at every Suction of the Air

Air out, 'till at laſt the Surface of the Mercury within the Tube, will be a very little higher, than that which is in the Baſon: But as ſoon as the external Air is let into the Receiver again, it will by its Spring (which is always equal to the Gravity of the Atmoſphere) ſo preſs on the Surface of the Mercury in the Ciſtern, as to force it up again into the Tube with ſuch Violence as will endanger breaking it, and it will (when quiet) regain near its former height in the Tube.

2. It hath been found by repeated Trials, that the included Mercury will ſink if the Tube be carried up to the top of an high Hill, or up but to the Top of an high Tower, Steeple, *&c.* the reaſon of which appears to be, that the Column of incumbent Air which preſſed upon it before, being now leſſen'd in length by the Altitude of the Hill, muſt needs gravitate leſs than at the Bottom, and conſequently cannot bear the Mercury up ſo high in the Tube. And this Mr. *Boyle* takes to be a kind of *Experimentum Crucis*, determining plainly the Cauſe of the Mercury Suſpenſion.

3. If after the Experiment is made and the Mercury ſettled, you lift the Tube out of the ſtagnant Mercury, the external Air will preſs in with that Violence, and drive the Mercury up to the Top of the Tube ſo forcibly, as will endanger the breaking out of the ſealed end.

TORID *Zone*. See *Zone*.

TORRIFIED, *i. e.* Roaſted, it was formerly the uſual way to *Torrifie* Opium, or roaſt it againſt the Fire, before any Medicinal Preparation was made with it, in order to get out ſome malignant Parts that they tanſied were in it before: But by this Means its volatile Spirits and Sulphur in which its great Vertue conſiſts were evaporated and deſtroyed. And indeed 'tis found by Experience, that in moſt Caſes *Crude Opium* is better than any other Preparation of it whatſoever.

TORTEAUXES, a bearing in Heraldry. See *Balls*.

TORUS, in Architecture, is a round, thick Circle running round the Baſe of a Pillar, reſembling the form of a great Ring.

TOTTED, a good Debt to the King, is by the *foreign Oppoſer*, or other Officer noted for ſuch, by writing this Word *Tot* to it.

TOUT *temps priſt & uncore eſt*, is a kind of a Plea in way of Excuſe, or Defence for him that is ſued for any Debt, or Duty belonging to the Plaintiff.

TOW, whatever is drawn after a Ship, or Boat with a Rope, *&c.* is ſaid to be *Towed* after a Ship, or to be in her *Tow*.

TOXICA, are poiſonous Medicaments, wherewith *Barbarians* uſe to anoint their Arrows. *Blanchard*.

TRABEATION, in Architecture, is the ſame with *Entablature*, *viz.* the Projecture on the Top of the Walls of Edifices which ſupports the Timber Work of the Roof. *Trabeation*; or *Entablature*, is different according to the ſeveral Orders and comprehends the Architrave, Frize, and Cornice.

TRACHEA, the ſame with *aſpera Arteria*; which ſee.

TRACHOMA, is a Scab, or Aſperity of the inner Part of the Eye-lid. *Blanchard*.

TRAGEÆ, a Term in Pharmacy; the *Tragæ* differ not from Powders, but that the Ingredients whereof they are prepared, are not beat ſo ſmall: And they are applied either in Fumigations, or externally to the Body, by being put into a Linen Bag, and then into Wine or other Liquor, that they may communicate their Strength, and Qualities to it: Sometimes alſo they are compounded of ſome ſorts of Antidotes, or Counter-poiſons, and other odoriferous things, and of ſimple Medicines reduced into a Powder, with an Addition of Sugar, in order to be taken inwardly. *Blanchard*.

TRAGUS, as *Hircus* (becauſe 'tis ſometimes Hairy) is one of the Protuberances of the *Auricula*, being that next the Temple, as that which is oppoſite to it, and to which the ſoft Lobe of the Ear is annexed, is called Antitragus.

TRAJECTORY, *of a Comet*, is the Line which by its Motion it deſcribes; which *Hevelius* in his *Cometagraphia*, will have to be nearly a Right one; but it ſeems rather to be a very Excentrical Ellipſis.

The Excellent Sir *Iſaac Newton*, in *Prop.* 41. of his third Book, ſhews how to determine the Trajectory of a Comet from three Obſervations; and in his next and laſt Propoſition, how to correct a Trajectory graphically deſcribed. See *Comets*.

TRAILE-BOARD, in a Ship, is a carved Board on each ſide of her Beak, reaching from her Main Stem to the Figure, or to the Brackets.

TRAIN, is the Number of Beats which the Watch maketh in an Hour or any other certain time.

TRANCHE, a Word uſed by the *French* Armoriſts, to expreſs a manner of *Counterchanging* in an Eſcutcheon of this Form.

But our *Engliſh* Heralds Blazon it thus, he beareth, *Per Pale Argent and Azure, per Bend Counterchanged.*

TRANSCENDENTAL *Curves* are ſuch, as when their Nature, or Property comes to be expreſſed by an *Equation*, one of the variable, or flowing Quantities there, denotes a *Curve Line*; and when ſuch *Curve Line* is a *Geometrick* one, or one of the *firſt Degree*, or *Kind*; then the Tranſcendental *Curve* is ſaid to be of the ſecond *Degree* or *Kind*, &c.

TRANCENDENTAL *Quantity*. See *Quantity*.

TRANSCRIPTO *pedis finis levati mittendo in Cancellarium*, is a Writ for the certifying the Foot of a Fine, levied before *Juſtice in Eyre*, &c. into the *Chaneery*.

TRANSCRIPTO *Recognitionis factæ coram Juſticiariis itinerantibus*, &c. Is a Writ for the certifying of a Recognizance, taken before *Juſtices in Eyre*, &c. into the *Chancery*.

TRANSFUSION *of the Blood*, out of one Animal into another, is thus perform'd: Bind and lay them both down on a Table, and then making ſtrong Ligatures round each of their Necks, open the *Right Jugular Vein* and *Cartoid Artery*, of the Man, (if you can get one to try) and the *Left* of the Sheep, *&c.* (or *vice verſa*:) Then dextrouſly fitting two ſmall Quils, or Pipes, croſs-ways from Vein to Artery, ſo that the Arterious Blood of the Sheep, may run into the Veins of the Man, and the Venal Blood into his Arteries, the Sheep receiving his after the ſame manner: And when the rational and ſagacious Looks of the Sheep, and the

the Sheepiſh ones of the Man begin to appear plainly diſtinguiſhable, the Operation is well over; ſeparate them and bind up their Wounds, and 'tis done.

Of this *Transfuſion*, (if any one hath a fancy to try it) he may find a more large Account in *Philoſoph. Tranſact. N.* 20.

'Twas firſt (as is ſaid) practiſed by Dr. *Lower*; and by the Honourable Mr. *Boyle* communicated to the *Royal Society*.

And in *N.* 26. *P.*479. of *Philoſoph. Tranſact.* there is an account, that one Mr. *Gayant* of *Paris*, by Transfuſing the Blood of a Young Dog into an Old one that was exceedingly Decrepid, and bare his Age very poorly, made the Old Curr ſo Lively and Brisk, that in two Hours after the Operation was over, he leapt and friskt about with very Youthful Agility.

So that, Transfuſion of the Blood,
Which makes Fools Cattle, did him Good.
Hudibr.

TRANSGRESSIONE, is a Writ commonly called, a Writ or Action of Treſpaſs, of which *Fitz-Herbert* reckons two ſorts. One *Viſcountiel* ſo called, becauſe it is directed to the Sheriff, and is not returnable, but to be determined in the County; the form whereof, differs from the other, becauſe it hath theſe Words, *Quare vi & armis*, &c. The other is term'd a Writ of *Treſpaſs* upon the Caſe, which is to be ſued in the King's Bench, or Common Pleas, in which are always uſed theſe Wotds, *vi & armis*, See *Treſpaſs*.

TRANSIT, in *Aſtronomy*, ſignifies the paſſing of any Planet juſt by or under any Fixt Star; or of the Moon in particular, covering or moving cloſe by any other Planet.

TRANSITION, in Muſick, is when a greater Note is broken into a leſſer, to make ſmooth, or ſweeten the roughneſs of a Leap, by a gradual *Tranſition*, or paſſing to the Note next following: whence it is commonly called, *the breaking of a Note*, being ſometimes very neceſſary in muſical Compoſitions.

TRANSLATION, in Law, ſignifies the ſetting from one Place to another, as to remove a Biſhop from one Dioceſs to another, is called Tranſlation, and ſuch a Biſhop Writes not *Anno Conſecrationis*, but *Anno Tranſlationis noſtræ*.

TRANSMUTATION, in Geometry, is to reduce, or change one Figure or Body, into another of the ſame Area, or Solidity, but of a different Form, as a Triangle into a Square; a Pyramid into a Parallelopiped, &c.

TRANSMUTATION *of Metals*, is what the Alchymiſts call the *grand Operation*, or finding the *Philoſophers Stone*; which is ſuch a curious univerſal Seed of all Metals, that if you melt any Metal in a Crucible, and then put in but a little of this *Stone* or *Powder of Projection*, (as they often call it) into the melted Metal, it will immediately, (as they tell you) turn it into Gold, or Silver, according as they uſe it.

The Famous Dr. *Dickinſon* in his Book *de Quinteſſentia Philoſophorum*, tells the World he was twice ſhewed this mighty Feat, by *an Adept* that went by the name of *Mundanus*: To which I ſhall only ſay, as Mr. *Boyle* uſed to do in ſuch Caſes, *he that hath ſeen it, hath more reaſon to believe it, than he that hath not.*

You have in *Lemery*, Dr. *Dickinſon*, and others, long Accounts of the Impoſtures, and Cheats of ſeveral pretended *Adepti*: How they fix *Mercury* with *Verdegreaſe*, and then Colour it deeper (for the Verdegreaſe will give it a yellow Colour) with Turmerick Cadmia, &c. and then they would paſs it thus off for true Gold: But if you ſhould go about to try it by the *Copple*, it will all fly away in Fumes. And indeed nothing produced this way ought to be adjudged true Gold, (unleſs it have all the Properties of true Gold, for all is not ſo that Glifters, and looks yellow) that is, it muſt be able to endure *Coppelling*, *Cementation*, *Purification* with *Antimony*, and the *Depart*. It muſt have the *Malleability*, and great *Ductility* of that Metal; and eſpecially its *true Specifick Gravity*, *i. e.* it muſt be to Water, as 19, or 18 and $\frac{1}{2}$ is to 1, or elſe 'tis ſome way falſe and Counterfeit. And this laſt Teſt of Specifick Gravity, would, if not attainable, argue an apparent Impoſſibility of Tranſmutation of Metals. Nor indeed can I ſee how any one can propoſe to increaſe the Relative, or Specifick Gravity of any Body whatſoever by a certain and determinate Way; and till this is done, all other Pretences are vain; for let it look how it will, if it have leſs Specifick Gravity than 18 and a half to 1, it cannot be true Gold; and therefore muſt either be a mixture of ſome Gold and other Metals together; or elſe ſome of them under the Diſguiſe of Gold.

The trick of turning Cinnabar into Silver, is pretty enough, and ought to be known.

They bruiſe the Cinnabar groſly, and then *ſtratifie* it in a Crucible with granulated Silver: The Crucible is placed in a great Fire, and after due time for its Calcination, they take it off; and pouring the Matter out, they ſhew the Cinnabar turn'd into real Silver, tho' the Silver Grains appear in the Number and Form they were put into the Crucible. But the Miſchief of all is, when you come to handle the Grains of Silver, you find them nothing but light fraible Bladders which will crumble to pieces between your Fingers: The Silver is almoſt of it got in and incorporated with the *Cinnabar*, and the whole weighs no more, nor indeed ſo much, as it did when it was firſt put into the Crucible.

But to give you ſomething on the behalf of *Tranſmutation*, Mr. *Boyle* talks of his own ſeparating from common Mercury, near a fourth part of its weight in clear Liquor, *Sep. Chym. Pag.* 134. and tells us alſo, that two Friends of his did, by preſſing Mercury in a skilfully managed Fire, turn it almoſt Weight for Weight into Water; but they tell us not in either Experiment, the Specifick Gravity of the produced Water, nor of the remaining untranſmuted Maſs of Mercury; which unleſs one knew, there is no judging of the Reality of the *Tranſmutation*.

In his Second Eſſay on the ſucceeding Experiments he tells us, that Dr. *K.* a Perſon far both from the Temptation and Cuſtom of Lying, aſſured him he did once light on a kind of *Aqua fortis* with which he did divers times draw a *Volatile Tincture*, which could and did turn Silver into Gold; and that out of an Ounce of Gold he drew as much of this Tincture, as did Tranſmute an Ounce and a half

half Silver into that Noble Metal: But withal, that deſigning afterwards to proſecute this ſurprizing Experiment further, he could never again make ſuch an *Aqua fortis* as would draw any ſuch Tincture from Gold. Tho' Mr. *Boyle* ſeems enclined to believe the Thing poſſible, becauſe he himſelf more than once was able to deprive Gold of its yellow Colour, and to communicate it to a *Menſtruum*.

He tells us alſo in his Origin of Forms, *P.* 235, That by putting to a Calx of Gold, a good Portion of his *Menſtruum Peracutum*, with a little Spirit of Salt, it did ſlowly, and quietly diſſolve it, only at the bottom remained a white Powder which the Menſtruum would not touch, and which was Indiſſoluble in *Aqua Regalis*. This white Powder being with Borax, or ſome ſuch flux Powder melted into a Metal, was found to be white like Silver, yielding to the Hammer, Diſſoluble in *Aqua Fortis*, or Spirit of Nitre; and would there leave a true Silver Calx, odiouſly Bitter. This is a ſtrange Experiment, which had Mr. *Boyle* made any more than once, as I cannot find that he had; and had he tried the Specifick Gravity of this apparent Silver, and found it to be leſs than that of Gold, it had been no ſmall Proof of the Poſſibility. of a Tranſmutation of Metal.

But what that noble Author relates in another Place of the ſame Book, about the Tranſmutation of Water into Earth; I judge the more conſiderable, becauſe he made uſe of Hydroſtaticks, to examine his Tranſmuted Matter, *viz.*

That rain Water being diſtilled, or re-diſtilled (by a Friend of his) many times over again (near 200 Times) did after each Diſtillation, leave at the Bottom of the Glaſs Body, a *white Earth* in a conſiderable Quantity; and this was afforded (ſaith Mr. *Boyle*) more plentifully in the *latter* Diſtillation, than in the *firſt*.

This he believed to be a certain Quantity of Water, actually turned into Earth, and it was above twice as heavy (ſpecifically) as common Water, and was of ſo fixt a Nature, that it lay in a red hot Crucible for a conſiderable Time, without being diminiſhed in Weight, or emitting any manner of Smoak.

He takes notice alſo, that an Ounce of Water yielded ſix Drams of Powder, a conſiderable Quantity of Water ſtill remaining behind; and that the Glaſs in which it was diſtilled, was not in the leaſt ſenſibly Damaged thereby. Yet this great Chymiſt was not without ſome Scruples about the Experiment. For,

Firſt, He was not ſatisfied that the remaining Water, was not Lighter than before the Diſtillation.

Secondly, He was not aſſured that no Parts of the Glaſs Veſſel were Diſſolved, or incorporated with it.

Thirdly, Nor whether Water be truly an Homogeneal Body; for if it be, he thinks it Difficult, if not impoſſible to conceive that it can be Tranſmuted: For how can (ſaith he) the bare Convention of the Parts of a Fluid into a Concrete, alter the Specifick Gravity.

TRANSNOMINATIO. See *Metonymia*.

TRANSOM, is the Term which ſome give to the Vane of a *Croſs-ſtaff*, which is made to ſlide along upon the *Croſs-ſtaff*, by means of a Square Socket; and may be ſet to any of the Graduations on the Staff, in an Obſervation.

TRANSOM of a Ship, is that main Piece of Timber which lieth acroſs her Stern at her Buttock, directly under the Gun-room Port; as when a Ship is built broad or narrow at her Tranſom, ſhe is ſaid to have a broad or narrow Buttock.

TRANSPARENT, or Diaphanous Bodies are ſuch whoſe Pores probably are all right and nearly Perpendicular to the Plain of their Surface, and ſo conſequently do let the Rays of Light paſs freely thro' them, without being refracted: Whereas the Pores of *Opacous Bodies* are in crooked oblique Poſition, by which means the Beams of Light cannot paſs freely thro' them, but are variouſly refracted and loſt.

TRANSPIRATION, a Breathing through, as of Vapours through the Pores of the Skin. *Blanchard*.

TRANSPOSITION *of Equations*. See *Equation*.

TRANSVERSALIS *Colli*, is a Muſcle of the Neck, which ariſeth Fleſhy from all the Tranſverſe Proceſſes of the *Vertebræ* of the Neck, except the firſt and ſecond, and is inſerted after an oblique aſcending Progreſs to their Superior Spines; it being a Continuation of the ſame Series of Muſcular *Fibres* that compoſe the *Sacer* and *Seme-ſpinatus*: If either of thoſe *Muſcles* act, the *Vertebræ* of the Neck are moved obliquely backwards, as when we look over one Shoulder.

TRANSVERSALIS *Muſculus*, one of the Muſcles of the Abdomen, ſo called, becauſe its Fibres run acroſs the Belly: Its uſe is to compreſs the Abdomen exactly inwards, in *Expiration*.

TRANSVERSALIS *Pedis*, is a Muſcle of the Foot ſo called from its Tranſverſe ſituation; it ariſeth Tendinous from the Internal *Os Seſamoides* of the Great Toe, and becoming a Fleſhy Belly in its Progreſs over the firſt internodes of the two next Toes, it is leſſened at its Inſertion to the Inferior part of that *Metatarſal* Bone, which ſupports that Toe next the leſſer. Its uſe is to bring the leſſer Toe towards the greater.

TRANSVERSALIS *Penis* is a Pair of Muſcles ariſing near the *Erectores Penis*, and thence paſs tranſverſely to their Inſertions at the upper part of the Bulb of the Cavernous Body of the *Urethra*: They have this Name for their Situation. They are mentioned by *Lindanus* after *Aquapendens*, as *Bartholin* obſerves, *Lib.* 1. *cap.* 24.

TRANSVERSALIS *Sutura*, is a Suture which runs acroſs the Face; it paſſes from one Temple to another tranſverſely, over the Root of the Noſe, joyning the *Os Frontis*, and the *Synciput*: 'Tis the firſt of the true Sutures, and is uſually called, *Coronalis*.

TRANSVERSE *Axis*, or *Diameter*. See *Latus Tranſverſum*.

TRAPEZIUM, ſee under *Quadrilateral Figures*. For its Superficial Content. See *Area*.

TRAPEZIUS, is a Muſcle of the Shoulder-blade, which ſerves to move it upwards, backwards, and downwards.

TRAPEZOID, is a ſolid irregular Figure, having four Sides not parallel to one another.

TRAVAILING-BAROSCOPE, the ſame with *Portable Barometer*.

TRAVERSE,

TRAVERSE, a Term in *Gunnery*, ſignifying to turn a Piece of *Ordnance* which way one pleaſes upon her *Platform*.

TRAVERSE, a Sea Word uſed in theſe Senſes; they call the Way of a Ship when ſhe makes Angles in and out, and cannot keep directly to her true Courſe, a *Traverſe*.

Alſo the laying and removing a Piece of Ordnance, or great Gun, in order to bring it to bear, or lie level with the Mark, is called *Traverſing* the Piece.

TRAVERSE, in Navigation, is the Variation or Alteration of the Ship's Courſe, upon the ſhifting of Winds, *&c.*

Note, That in Sailing in reſpect of the Wind, is either *before a Wind, by a Wind, or Larging*.

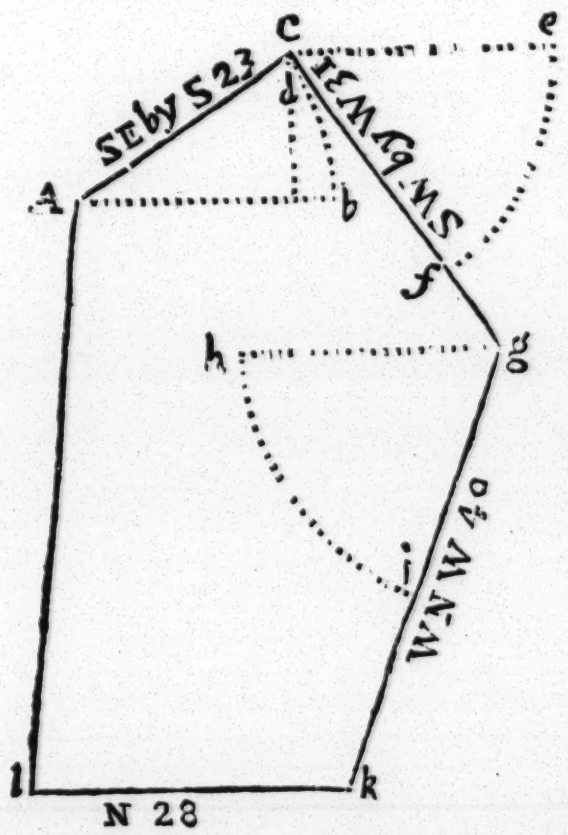
If a Ship Sail by or againſt a Wind, there ought to be an allowance for her Lee-way, and that more or leſs, according to the Growth, and Suage of the Sea, Mould of the Ship, and Sail ſhe bears, *&c.*

EXAMPLE.

Of a Traverſe.

A Ship from Latitude 47 Degrees, 00 Minutes N. Sails S. E. by S. 23 Miles, and then Sails S. W. by W. 31 Miles, and afterwards W. N. W. 40. Miles; laſtly, N. 28 Miles.

I demand the Courſe and Diſtance ſailed from the firſt Place of Departure, and the Latitude ſhe is now in.



Geometrically.

Firſt, Draw the Meridian A *b*, with 60 Degrees from the Chords, deſcribe the Arch *b c*; which make equal to 33 Degrees 45 Minutes = 3 Points; draw A *c*, and make A *d*, or A *c* equal to 23 Miles.

Secondly, Draw *d e* parallel to A *b*; from *d*, with 60 Degrees of the Chords, deſcribe *e f*, which make equal to 5 Points, draw *g f*, ſet 31 Miles from *d* to *g*.

Thirdly, Draw *g b* parallel to A *b*; with 60 Degrees of the Chords deſcribe *b i*, which make equal to 6 Points; draw *g i*, ſet 40 Miles from *g* to *k*.

Fourthly, Draw *k l* parallel to A *b*, make *k l* equal to 28 Miles; draw *l* A, that meaſured on the *Equal Parts*, gives 50, 4 Miles, and the Angle A *l k* meaſured on the Chords, gives 82 Degrees, or 7 ¼ *Points* from the *Meridian*; ſo that if ſhe had ſail'd on a ſtraight Line, and ſingle Courſe from A to *l*, that Courſe had been W. by N. ¼ Weſterly, and the Diſtance 50, 4 Miles.

By the Logarithms.

As the Radius	1 0,00000
Is to the Diſt. of the firſt Courſe 23 Mil.	1,36172
So is the S. Compl. of the Co. S. 56° 15′ -	9,91984
To the Diff. Lat. in the firſt Cou. 19, 1 M.	1,28156
Then, as the Radius	10,00000
Is to the Diſtance A *d* 23 Miles	1,36172
So is the S. 33° 45′ = ∠ *d* A *b* the firſt C.	9,74473
To the Departure in the firſt Courſe 12, 8, 1,	10646

Thus proceeding with the ſeveral Courſes, and Diſtances given, find the Departures, and Difference of Latitude to them all.

If the Courſe be between the North and Eaſt, then the Difference of Latitude is called Nothing, and the Departure Eaſting; if the Courſe be in the North-weſt Quarter, then the Difference of Latitude is called Nothing, and Departure Weſting. If the Courſe be between the South, and Eaſt, the Difference of Latitude is called Southing, and the Departure Eaſting, *&c.*

Now place all the ſaid Differences of Latitude, and Departures in a Table, the Northings all under one another, under the Title *Northing*, and the Southings, under the *Southing*; the *Eaſtings* in the *Eaſt* Column, and the *Weſtings* in the *Weſt* Column.

Then add up all the Northings, as likewiſe the Southings, and ſo the Eaſtings, and alſo the Weſtings: Laſtly, Take the Sum of the Northings, from that of the Southings, if the Southings make moſt; or the Sum of the Southings from the Northings, that you may have their Third Difference, which is the Difference of Latitude; as alſo, the Difference of the Totals, of Eaſting, and Weſting for the Departure; by which Difference of Latitude, and Departure, according to *Caſe* 5 of Right-angled Triangles, you will find the Direct Courſe and Diſtance.

Course.	Points.	Distance.	North.	South.	East.	West.
S E by S	3	23		19,12	12,78	
S W by W	5	31		17,22		25,78
W N W	6	40	15,31			36,96
North.	0	28	28,00			
From Sum			43,31	36,43	12,78	62,74
take			36,34			12,78
Rests.			6,57			49 96 Dep. West.

Departed
Difference of } Latitude { 47° 00′ North.
Present { 00° 07
47° 07′ North.

As the Difference of Latitude 7 Miles— 0,845098
Is to the Radius — 10,000000
So is the Departure 49,9 — 1,698100
To the Tan. of the Course 82,1 — 10,853002

And,

As the S. of the Course 82° 1′ — 9,995770
Is to the Departure 49,9 Miles — 1,698100
So is the Radius — 10,00000
To the Distance 50, 4 Miles — 1,702330

Example 2.

A Ship being bound to the Eastward, and finding the Wind variable, a small Gale, and smooth Water, plies upon these several Courses, with the Distances on each Course; as followeth.

The Lar-board Tack on Board, Wind from S S W *to* S, *and so to* S S E *and* E.

	Miles
South-East by East half Easterly	5
East South-East	4
East by South	7
East half Northerly	3

The Star-board Tack on Board, the Wind S E, E S E, E, *&c.*

South South-West	5
South by West	6
South	4
South South-East	7
South-East by South	3

The Direct Course and Distance from the first place of Departure is requir'd.

The Work by the Transverse Table.

Course.	Points	Dist.	North.	South.	East.	West.

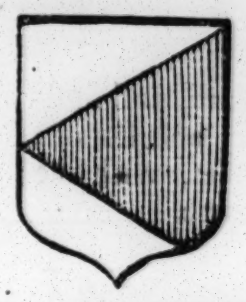
Sum				0 29	3 08	
				28 43	18 62	

Having set down the several Courses, and Distances, then in the *Traverse Table* find the Course on the Head of the Table, if under four Points, but at the bottom, if above four Points; and look the Distance in the Left Hand Column, and in the Square meeting will be the difference of Latitude and Departure under the respective Titles.

Thus, above 5 ½ Points, and right against 5 *m*, I find over Title Diff. Lat. 2 36 *m*, the *Difference of Latitude*, and over *Dep.* 4. 14, the *Departure*, in

the firſt Courſe, which being placed in their proper Columns, according as they are Northing or Southing, &c. Proceed in like manner with all the other Courſes or Diſtances entring and correſponding Differences of Latitude and Departures in their Columns: Then add up the Columns of Diff. of Lat. and Departure, Subſtracting the leſſer Difference of Latitude from the greater, and the leſſer Departure from the greater, and the Remainders are the whole Difference of Latitude and Departure ſhe hath made from the Place of her Departure; ſo in this Example, ſhe's 28, 43 *m* to the South of the Place of her Departure; and 18, 62 *m* Eaſt, with which by Caſe 5th I find her Courſe S E by S 2 Southerly, and Diſtancc 34 5 *m*.



TRAVERSE. There is alſo a Partition of an Eſcutcheon us'd in Heraldry of this Figure, which they call *Parted per Pale Traverſe*.

Argent and *Gules*.

TRAVERSE, is alſo a Word much uſed in Anſwer to Bills in *Chancery*; or it is that which the Defendant pleadeth or ſaith in Bar, to avoid the Plaintiff's Bill, either by confeſſing or avoiding, or by denying and *traverſing* the material parts thereof.

To traverſe an Office, is nothing elſe but to prove, That an Inquiſition made of Lands or Goods by the Eſcheator, is defective, and untruly made. And *to traverſe an Indictment*, is to take Iſſue upon the chief Matter, and to contradict or deny ſome Point of it.

TRAVERSE, in Fortification, is a little *Trench* bordered with two *Parapets*, *viz*. One on the right Side, and another on the left, which the Beſiegers make quite thwart the *Moat* of the Place, to paſs ſecure from *Flank*-ſhot, and to bring the Miners to the Baſtions.

This *Traverſe* is uſually covered on top with *Hurdles* or *Bavins* laden with Earth, for Security from the Fire-works, and differs from a *Coffer* only in this reſpect, That it is made by the *Beſiegers*, and the other by the *Beſieged*.

This Word is now often us'd for any Retrenchment or Line Fortify'd with Faſcines, Gabions Barrels, Bags of Earth, &c.

TRAVERSE-*Board*, is a little round Board hanging up in the Steerage of a Ship, and bored full of Holes upon Lines ſhowing the Points of the Compaſs; upon it, by moving of a little Peg from Hole to Hole, the Steers-man keeps an account how many Glaſſes (that is, half Hours) the Ship Steers upon any Point.

TRAUMATICKS, are thoſe things which being taking in Decoctions and Potions, fetch the ſerous and ſharp Humours out of the Body, and ſo attenuate the Blood, that it may be conveniently driven to the wounded, broken, or bruiſed Parts. *Blanchard*.

TREASON, is of two ſorts, *viz*. *High* and *Petty Treaſon*. *High Treaſon* is defined to be an Offence committed againſt the Security of the King or Kingdom, whether it be by Imagination, Word or Deed; as to compaſs or imagine the Death of the King, Queen, or Prince; or to Deflower the King's Wife, or his eldeſt Daughter unmarried, or his eldeſt Son's Wife; or levy War againſt the King in his Realm, adhere to his Enemies, counterfeit his Great Seal, Privy Seal, or Money: To Kill the King's Chancellor, Treaſurer, Juſtices of either Bench, Juſtices in Eyre, of Aſſize, or of Oyer and Terminer, being in their Place, doing their Office; diminiſhing or impairing current Money, and many others, as may be ſeen in divers Statutes particularly expreſs'd. In caſe of this *Treaſon*, a Man ſhall be Hang'd, Drawn and Quartered, and forfeit his Lands and Goods to the King. It is ſometime called *Treaſon Paramount*, *Petty Treaſon*. See the Word it ſelf in its proper place.

There is alſo mention of *Accumulative Treaſon*, and *Conſtructive Treaſon*, in the Statute 14 *Car*. 2. *cap*. 29. And here Note, That in *Majori proditione omnes ſunt principales*, there are no Acceſſaries in *Treaſon*, all are Principals. And *Voluntas non reputabitur pro facto niſi in cauſa Proditionis*, for *Petty Treaſon*.

TREASURE-TROVE, is when any Money, Gold, Silver, Plate, or Bullion is found in any Place, and none knows to whom it belongs; then the Property thereof belongs to the King, but the Civil Law gives it to the Finder, according to the Law of Nature. The Puniſhment for concealing *Treaſure found*, is Impriſonment and Fine. But if any Mine or Metal be found in any Ground, that always pertains to the Lord of the Soil, except it be a Mine of Gold or Silver, which uſed to be always to the King, in whoſe Ground ſoever it be found; But by a late Act of Parliament, the King hath only the *Præemption*.

TREBLE, is the laſt or higheſt of the four Parts in *Muſical Proportion*.

TREENELS, in a Ship, are long Pins or Nails of Wood, whence they are called Tree-nells, or Tree-nails, made out of the Heart of Oak, to faſten the Planks to the Timber; and theſe have always Oakam, driven into them to prevent any Leak.

TREES and *Shrubs*, of our Native Growth in *England*, are thus diſtinguiſhed by our moſt Judicious Botaniſt, Mr. *John Ray*.

I. *Such as have their Flower disjoined and remote from the Fruit; and theſe are.*

1. *Nuciferous ones*, or ſuch as bear Nuts, as the Walnut Tree, the Hazel Nut-tree, the Beach, the Cheſnut, and the common Oak.

2. *Coniferous ones*, or ſuch as bear a ſquammoſe or ſcaly Fruit, of a kind of Conical Figure, and of a woody or hard Subſtance, in which are many Seeds, which when they are Ripe, the Cone opens or gapes, in all its ſeveral Cells and Partitions, and ſo they drop out. Of this kind are the *Scotch* Firs, Male and Female; the Pine, which in our Gardens is called the *Scotch* Firr; the common Alder Tree, and the Birch Tree.

3. *Bacciferous ones*, or ſuch as bear Berries; as Juniper, and the Yew Tree.

4. *Lanigerous ones*, or ſuch as bear a woolly downy Subſtance; as the black, white, and trembling Poplar, Willows, and Oſiers of all kinds.

5. Such

5. Such as bear their Seeds (having an imperfect Flower) in Leafy Membranes or Caſes; as the *Horn-beam* of *Hardbeam*, called in ſome places the *Hornbeech*.

II. *Such as have their Fruits and Flowers Contiguous*; and theſe are either with *the Flower placed on the Top of the Fruit, or elſe have it adhering to the Baſe or Bottom of the Fruit.*

1. Trees and Shrubs with the Flower placed on the Top or Upper-part of the Fruit: Of theſe, ſome are *Pomiferous*, as Apples and Pears; and ſome *Bacciferous*, as the Sorb or Serviſe Tree; the White or Haw Thorn, the wild Roſe, Sweet-brier, Currants, the great Bilbery Buſh, Honey Suckle, Ivy, *&c.*

2. Trees whoſe Flower adheres to the Baſe or Bottom of the Fruit, are either ſuch as have their Fruit moiſt and ſoft when Ripe, as

1. *Pruniferous ones*, whoſe Fruit is pretty large and ſoft, with a Stone in the middle; as the black Thorn or Slow-Tree, the black and white Bullace Tree, the common wild Cherry-Tree, the Black Cherry, *&c.*

2. *Bacciferous ones*; as the Strawberry Tree, in the Weſt of *Ireland*, Miſſeltoe, Water Elder, the Dwarf a large Lawrel, the Viburnum or way-faring Tree, the Dog-berry Tree, the Sea black Thorn, the Berry-bearing Elder, the Privet Barberry, common Elder, the Holly, the Buck Thorn, the Berry-bearing Heath, the Bramble and the Spindle Tree, or Prick-wood.

Such as have their Fruit dry when 'tis Ripe; as, the Bladder Nut-Tree, the Box-Tree, the common Elm and Aſh, the Maple, the *Gaule* or *Sweet-Willow*, common Heath, Broom, Diers Weed, Furze or Gorſe, the Lime-Tree, *&c.*

TREMOR, is a voluntary Motion depraved, by which the Member is ſometimes raiſed up, and ſometimes depreſſed through the mutal Contraction between the Faculty and the Part affected.

TRENCHES, in Fortification, are certain Moats or Ditches, which the Beſiegers cut to approach more ſecurely to the Place Attack'd, and are of ſeveral ſorts, according to the different nature of the Soil; for if the adjacent Territory be Rocky, the Trench is only an Elevation of *Bayins*, *Gabions*, *Wool-packs*, or Shouldrings of Earth caſt up round about the Place: But where the Ground may be eaſily open'd, the Trench is dug therein, and border'd with a Parapet on the Side of the Beſieged. The Breadth of it ought to be from 8 to 10 Foot, and the Depth from 6 to 7.

Theſe *Trenches* are to be carried on with winding Lines, in ſome manner parallel to the Works of the Fortreſs, ſo as not to be in view of the Enemy, nor to expoſe its Length to their Shot, which they call *Enfilading*; for then it will be in danger of being *Enfiladed*, or ſcoured by the Enemies Cannon: And this carrying of the Trenches obliquely, they call, carrying the Trenches by *Coudees* or *Traverſes*.

They call it *Opening the Trenches*, when the Beſiegers begin to Work upon the Line of Approaches; and this is uſually done in the Night, and ſometimes within Musket-ſhot, and ſometimes within half or whole Cannon-ſhot of the Place, if there be no riſing Ground about it, the Garriſon Strong, and their Cannon well ſerved. The Workmen that open the Trenches, are always Supported by Bodies of Men againſt the Sallys of the Beſieged; and ſometimes thoſe bodies lie between them and the Place, as alſo on their Right and Left. The Pioneers ſometimes Work on their Knees, and the Men that are to ſupport them, lie flat on their Faces, in order to avoid the Enemies ſhot: And the Pioneers are alſo uſually covered with *Mantelets* or *Sauciſſons*. They alſo ſay, *Mount the Trenches*; that is, go upon Duty in them: And to *Relieve the Trenches*, is to Relieve ſuch as have been upon Duty there. To *Carry on the Trenches*, is to advance them towards any Place.

TREPANUM, the ſame with *Mediolus*; which ſee.

TRESPASS, ſignifies any Tranſgreſſion of the Law under Treaſon, Felony, or Miſpriſion of either; for a Lord of the Parliament to depart from thence without the King's Licence, is neither Treaſon nor Felony, but *Treſpaſs*.

But this Word is moſt commonly uſed for that Wrong or Damage which is done either to the King in his Foreſt, or by one private Man to another; and according to this Signification, it is of two ſorts; *Treſpaſs General*, otherwiſe called *Treſpaſs vi & armis*; and *Treſpaſs Special*, otherwiſe called *Treſpaſs upon the Caſe*; and this ſeemeth to be without Force, howbeit they are ſometimes confounded. How to diſtinguiſh the Forms of theſe Writs or Actions, ſee F. N. B. *Fol.* 86, 87. In an Action of *Treſpaſs*, the Plaintiff always Sues for Damages, or the Value of the Hurt done him by the Defendant. There is alſo *Treſpaſs local*, and *Treſpaſs tranſitory*. *Treſpaſs local*, is that which is ſo annexed to the Place certain, that if the Defendant joyn iſſue upon a Place, and traverſe the Place only by ſaying *abſque hoc*, That he did the *Treſpaſs* in the Place mentioned in the Declaration, and aver it, it is enough to defeat the Action. *Treſpaſs Tranſitory*, is that which cannot be defeated by the Defendant's traverſe of the Peace, becauſe the Place is not material: But the Action of *Treſpaſs quære clauſum fregit*, ought to be *Local*.

TRESSEL-TREES, in a Ship, are thoſe Timbers of the Croſs Trees that ſtand along Ships, or Fore and aft at the tops of the Maſts. See *Croſs Trees*.

TRESSURE, a term in Heraldry for an *Orle* when it is flowered; and if there be two of them, it is called a double Treſſure. See *Orle*.

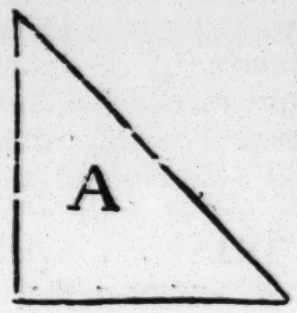
TRIA *Prima*, are Salt, Sulphur, and Mercury, the Three Hypoſtatical Principles of the Chymiſts, out of which they pretend that all mix'd Bodies are compounded, and into which they are ultimately reſolvable by Fire; but the latter is falſe, and the firſt impoſſible to be proved.

TRIAL, in Law, is uſed for the Examination of all Cauſes, Civil and Criminal, according to the Laws of the Realm, before a proper Judge: Of which there are divers kinds; as Matters of Fact ſhall be tried by the Jurors; Matters of Law, by the Juſtices; Matters of Record, by the Record it ſelf. A Lord of Parliament, upon an Indictment of Treaſon or Felony, ſhall be Tried without any Oath by his Peers, upon their Ho-

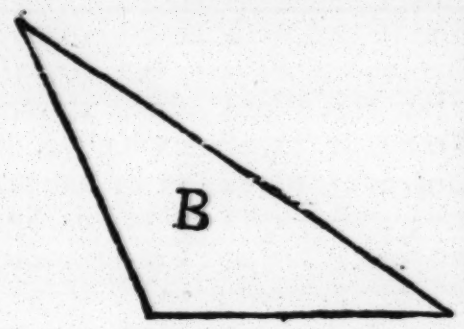
nours and Allegiance; but in Appeal at the Suit of any Subject, they ſhall be Tried *per bonos & legales homines*. If ancient Demeſne be pleaded of a Mannor, and denied, this ſhall be Tried by the Record of *Doomsday*. Baſtardy, *Excommengement*, Lawfulneſs of Marriage, and other Eccleſiaſtical Matters ſhall be Tried by the Biſhop's Certificate.

TRIANGLE, is a Figure having three Angles and three Sides only, and is either *Spherical*, (which ſee) or *Plane*; whoſe Sides are Right Lines. Every *Plane Triangle* may be conſider'd with relation either to its Angles, or its Sides. As to its Angles 'tis either,

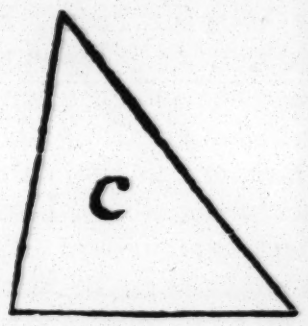
1. *Right Angled Triangle*, is that which hath one *Right Angle*, as A.



2. *Obtuſe Angled Triangle*, is ſuch as hath one Obtuſe Angle, as B.



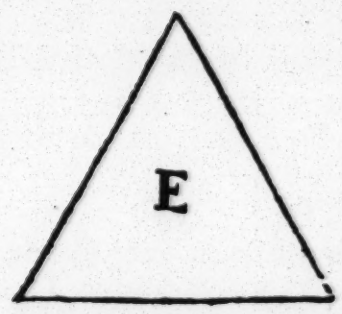
3. *Acute Angled Triangle*, is that which hath all its Angles *Acute*, as C.



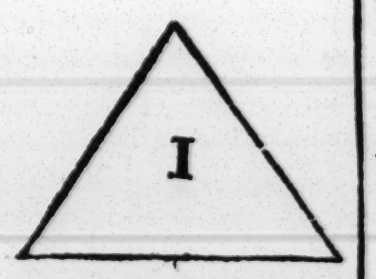
N. B. Any Triangle that is not Right Angled is called *Oblique Angled*, or *Amblygonial*.

A Triangle, as to its Sides, is either,

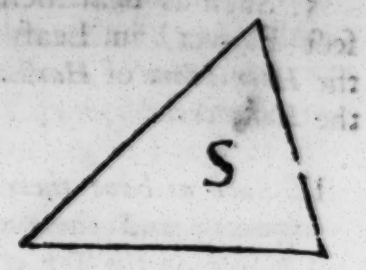
1. *Equilateral Triangle*, is that which hath all its Sides equal to one another, as E.



2. *Iſoſceles*, or an *Equilegg'd Triangle*, is that which hath only two Sides equal, as I.



3. *Scalenous Triangle*, is that which has no two Sides equal, as S.



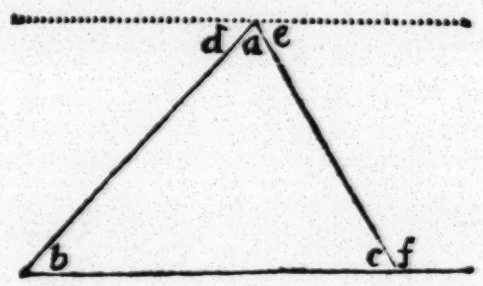
To find the *Area* of all Triangles, ſee *Area*.

Of the Properties of Plane Triangles.

PROPOSITION I.

In every Triangle, the ſum of all the three Angles is equal to two Right ones; and the external Angle made by any Side produced, is equal to the ſum of the internal and its oppoſite.

I ſay, 1. $a + b + c = 2 \sqrt{\ }$
2. $f = b + a$. $\sqrt{\ }$.



Draw the prick'd Line through the Vertex parallel to the Baſe: Then will the Angles *d* and *e* be ſeverally equal to the alternate ones *b* and *c*. (29 *è*. 1. *Eucl.*) But $d + a + e = \angle$ (by Cor. 2. 13 *è*. 1. *Eucl.*) Wherefore $b + a + c = 2 \angle$. *Q. E. D.*

And ſince $c + f$ are alſo equal to $2 \angle$ (13. *è*. 1. *Eucl.*) if *c* be taken from both, there muſt remain $f = b + a$. *Q. E. D.*

COROLLARY I.

Hence no $\triangle$ can have 2 obtuſe or 2 $\angle$.

COROL. II.

In a Right-angled $\triangle$, the 2 oblique Angles muſt make a right one between them.

COROL. III.

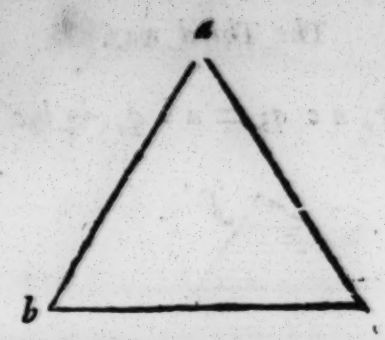
If 2 Angles in one $\triangle$ be $=$ to 2 in another, the remaining Angles muſt alſo be equal.

PROP. II.

In the ſame Triangle, equal Sides ſubtend, and are ſubtended by equal Angles.

I ſay, if $a = b$, then $a c = c b$.

Becauſe

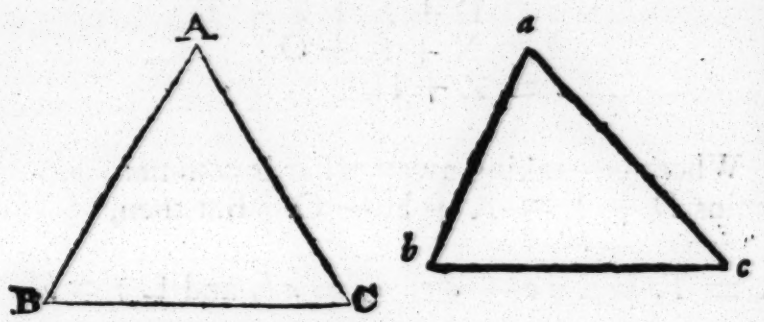


Becauſe the Angles *a* and *b* are equal, the Lines *a c* and *c b* muſt be equally inclined to the Baſe *a b*; and conſequently, be ſo at the Point *c* where they meet, and therefore *c* muſt be equidiſtant from *a* and *b*; for if *c* be nearer to, or farther from *b* than *a*, it muſt be becauſe the Angle *a* is leſſer or greater than *b*, which is contrary to the Suppoſition.

And on the other hand, if the ſides are equal, the Angles muſt; for being equal, they muſt needs be equally inclined to the Baſe *a b*, in the Point *c*, where they meet.

PROP. III.

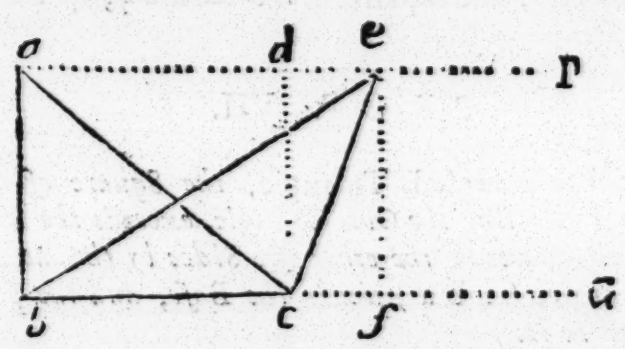
In two Triangles A B C, *and* a b c, *if all the three Sides, or two Sides and one Angle, or two Angles and one Side be reſpectively equal one to another, the whole Triangles are equal.*



For being laid one on another, they will concur.

PROP. IV.

Triangles on the ſame Baſe, and having the ſame Height, (that is, being between the ſame parallel Lines) are equal.



I ſay the Triangles *a b c*, and *e b c*, having the ſame Baſe *b c*, and between the ſame parallel Lines *a* P and *b* C, are equal.

Draw *d c* and *e f* parallel to *a b*.

1. The *Triangles d c e* and *e c f* are equal, becauſe each equal to half the Parallelogram *d f*.

2. The *Triangles a b e* and *e b f* are alſo equal, being each equal to half the Parallelogram *a f*.

3. But $\triangle a b c + \triangle c e f =$ half the $\square a f$.

4. And $\triangle e b c + \triangle c e f =$ half the $\square a f$.

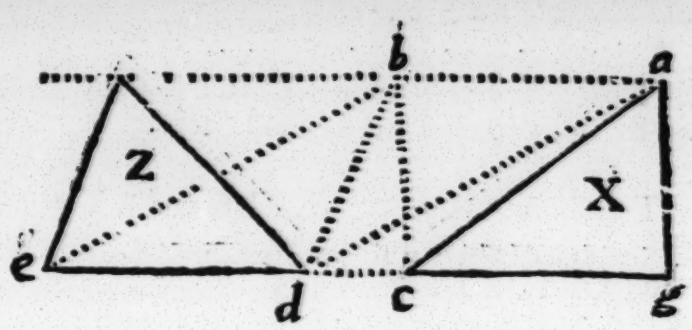
Therefore, if the $\triangle c e f$ be taken away from both Sides, the $\triangle e b c$ muſt remain $=$ to the *Triangles a b c*. *Q. E. D.*

PROP. V.

Triangles on equal Baſes, and between the ſame Parallel Lines, are equal.

I ſay $\triangle Z = \triangle X$.

Draw *b c* parallel to *a g* join'd *d a*, *d b*, and *b e*.



1. $\triangle Z = e b d$. (*per preced.*) $= a b d$, becauſe 'tis half the $\square a b e d$.

2. $\triangle a b d = a b c$ (*per preced.*) $= \triangle X$, becauſe 'tis half the $\square a b c g$.

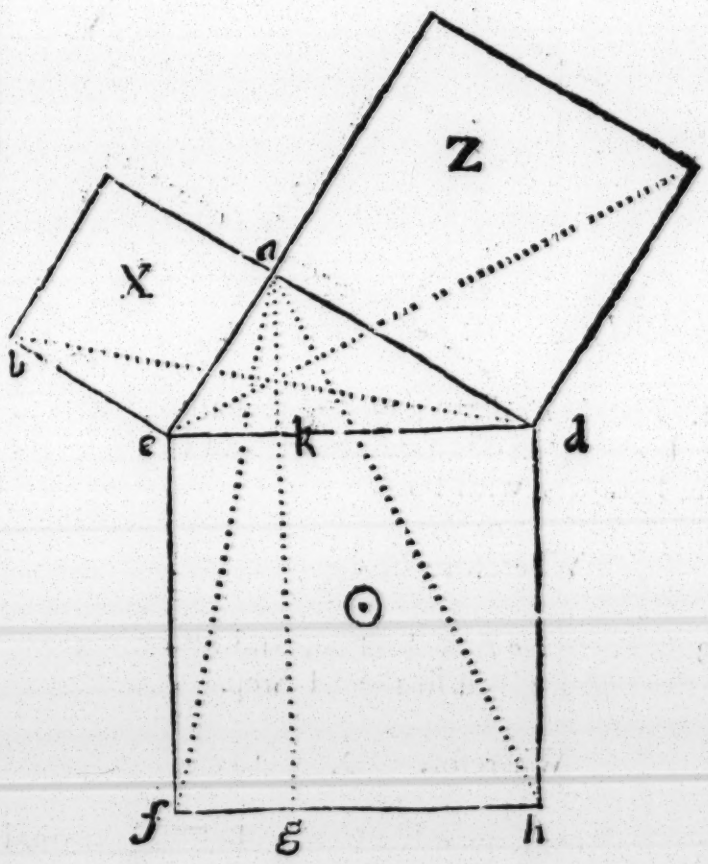
Wherefore $\triangle Z$ muſt be equal to $\triangle X$. *Q. E. D.*

COROL.

Hence follows, that if two Lines have between them equal *Triangles* on the ſame or equal Baſes, theſe Lines muſt be Parallel to each other.

PROP. VI.

I ſay the Square of the Hypothenuſe (e d) *of a Rectangled* $\triangle$ (e a d) *is equal to both the Squares of the 2 other Sides* (a e) *and* (a d.)



That is,

$$\boxed{\square q; = Z = q; + X q;}$$

1. O q; = □ kf + □ kb.

2. ½ □ kf = △ fae, and ½ □ kb = △ adb; becauſe □s on the ſame Baſes, are double to △s that have the ſame perpendicular height, or are between the ſame parallel Lines.

3. But △ fae = △ bed, and the △ hda = △ ecd, as having ſeverally two Sides and one Angle in one equal to thoſe in the other. The two equal Sides, are the Sides of the Square, and the obtuſe Angle $bed = edc$.

4. Now ½X q; = △ bed, and ½Z q; = △ dce, (by the Proof in the Second Step.)

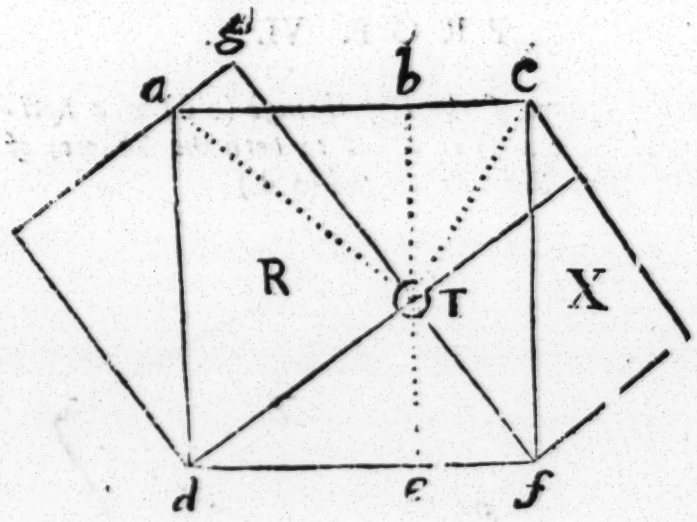
5. Therefore ½X q; = ½ □ kf, and ½Z q; = ¾ □ kb (by comparing together the 2d, 3d and 4th Steps.)

6. And conſequently, X q; = □ kf, and Z q; = □ kb, (for if the halves are equal, the wholes muſt.)

Wherefore X q; + Z q; = O q; (by the firſt Step.) *Q. E. D.*

The Second way.

I ſay the Square of df = Sum of the Squares of do and of



1. □ df = □ ae + □ ec.

2. The △ aod = ½ □ dg, and alſo = to ½ □ ae, becauſe on the ſame Baſe, and between the ſame Parallels with both.

Wherefore □ dg = □ ae.

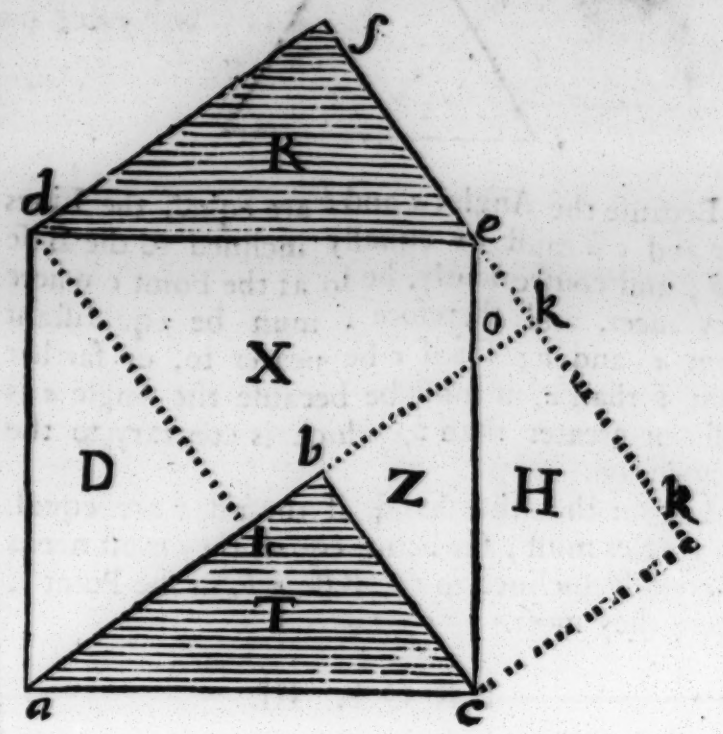
3. The △ cof = ½ □ X, and alſo to ½ □ ec for the reaſon given in the 2d Step.

Wherefore □ X = □ ec.

4. And conſequently, □ dg + □ X is equal to □ df, (by Step 1.) *Q. E. D.*

The Third way.

I ſay, $ac\ q; = ab\ q; + bc\ q;$



Make bk = to ab, and compleat all the Squares.

Then will,

□ ac = D + X + Z + T.
□ ab = X + R + O.
□ bc = Z + H.

Wherefore taking away what is common, Remains D + T = R + H + O. But then,

R = T, bec. $ae = de$, $df = ab$, and ∟ $f = b$.

Remains to be proved, that

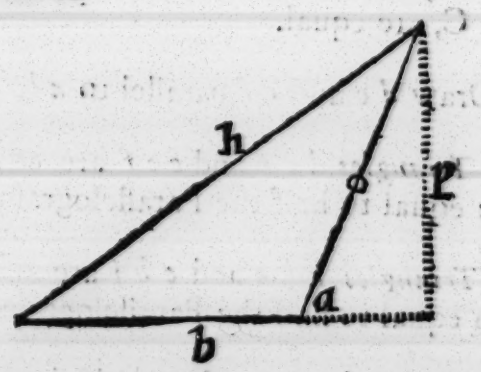
D = H + O. Which it is, becauſe D = R (as having 2 = Sides and one ∟) and R was proved = T, and T = O + H, becauſe $ac = ce$, the Angle at b = k, and the Angle $acb = eck$ (becauſe each with bce makes a ∟.)

Wherefore, the Square of ac = $ab\ q; + bc\ q;$ *Q. E. D.*

PROP. VII.

In an Obtuſe-angled Triangle, *the Square of the Side ſubtending the Obtuſe Angle, exceeds the Sum of the Squares of the other two Sides by the double Rectangle,* (2 b a) *under the Baſe, and the part added to it.*

Let fall the Perpendicular p, and produce b, till it meet with it.



Demon.

Demonſtration.

1. $b\,b$ = $b\,b + 2\,b\,a + a\,a + p\,p$.

2. And $o\,o = p\,p + a\,a$.

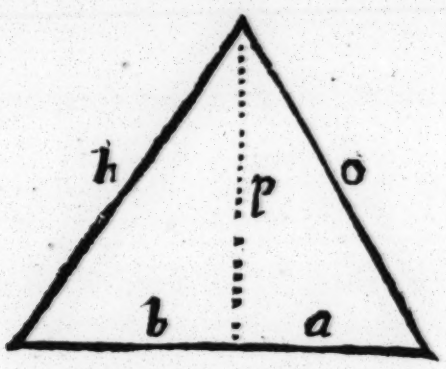
3. But $b\,b + o\,o = b\,b + a\,a + p\,p$.

Wherefore $b\,b$ exceeds the laſt Step by $2\,b\,a$. *Q. E. D.*

PROP. VIII.

In an Acute-angled Triangle, *the Square of the Side* (h) *ſubtending an* Acute, *is leſs than the Sum of the Squares of the other two Sides, by double the Rectangle under the whole Baſe,* (b + a) *and the Segment of the Baſe* (a) *which is next to the* Acute-angle.

Let fall the Perpendicular *p*.



Demonſtration.

1. $h\,h = b\,b + p\,p$.

2. $o\,o = p\,p + a\,a$.

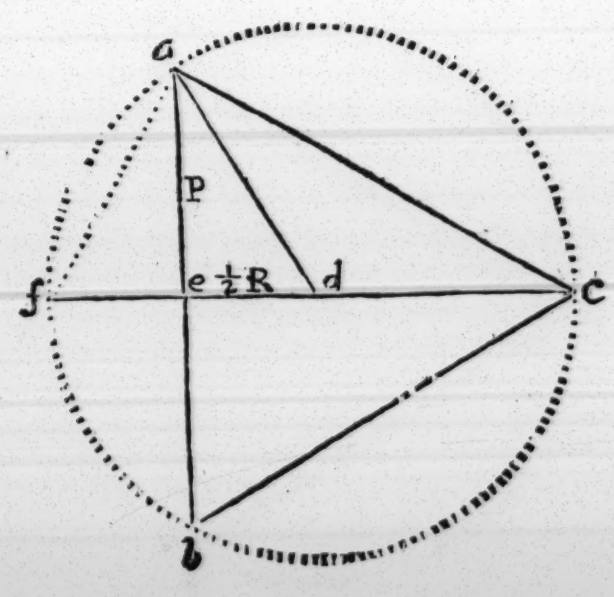
3 Q. $\overline{b + a} = b\,b + 2\,b\,a + a\,a$.

4. $b\,b + p\,p + 2\,a\,a + 2\,a\,b$, is the Sum of the Squares of the Legs.

Wherefore $h\,h$ is leſs than that by $2\,a\,a + 2\,a\,b$, which is plainly equal to the Double Rectangle under the whole Baſe, and the part *a*.

PROP. IX.

The Side a b *of an* Equilateral Triangle, a b c, *inſcribed in a Circle, is in Power Triple of the Radius; or its Square is equal to thrice the Square of the Radius,* a d.



Let the Radius be called R, and conſequently its Square R R.

I ſay, then $d\,e = \frac{1}{2}$ R, for the two Triangles *f e a*, and *e a d*, are equal, as having two Angles and one Side Equal, in both. Wherefore the Square of $e\,d = \frac{1}{4}$ R R; which being ſubtracted from R R, leaves P P = $\frac{3}{4}$ R R. Wherefore P = $\sqrt{:\frac{3}{4}}$ RR; and conſequently its double $a\,b$ = $2\sqrt{:\frac{3}{4}}$ R R; *i. e.* to the $\sqrt{:\frac{12}{4}}\sqrt{}$ R R, or to $\sqrt{:}$ 3 R R. Wherefore 3 R R = □ of $a\,b$; or $a\,b\,p$ = 3 R R. *Q. E. D.*

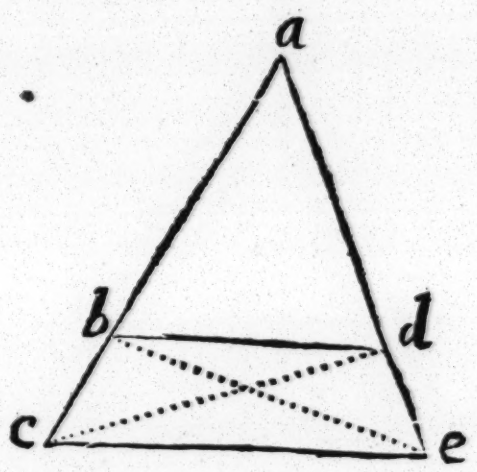
N. B. Herein is founded *Euclid*'s way of generating a *Tetrahedrum*, and inſcribing it in a given Sphere. See *Prop.* 13 & 13.

PROP. X.

The Sides of a Triangle *are cut Proportionably by a Line drawn Parallel to the Baſe.*

That is, it makes, $a\,b : b\,c :: a\,d : d\,e$.

Draw the Lines $b\,e$ and $c\,d$.



Demonſtration.

1. The *Triangles bdc*, and *bde*, are equal, becauſe on the ſame Baſe, and between the ſame Parallels. Therefore the Triangle *a b d*, will have the ſame Proportion to them both, *i. e.* $a\,b\,d : b\,d\,c :: a\,b\,d : b\,d\,e$. But the Triangle *a b d*, having the ſame height with the two equal *Triangles b d c*, and *b d e*, will be to them as its two Sides *a b* and *a d*, are to their Baſes *b c* and *d e*.

Therefore $a\,b : c\,b :: a\,d : e$.

Which *Proportionals*, may be conſidered and varied according to the ſeveral Species of *Proportion*.

As by *Inverſion*, $c\,b : a\,b :: d\,c$: the Parts of the Legs below the Parallel, are Proportional to thoſe above it.

Alſo *Alternately*, $a\,b : a\,d :: e\,b : d\,e$. The Part of one Leg above the Parallel, is to the Part of the other Leg above the Parallel, as the Parts below are to one another.

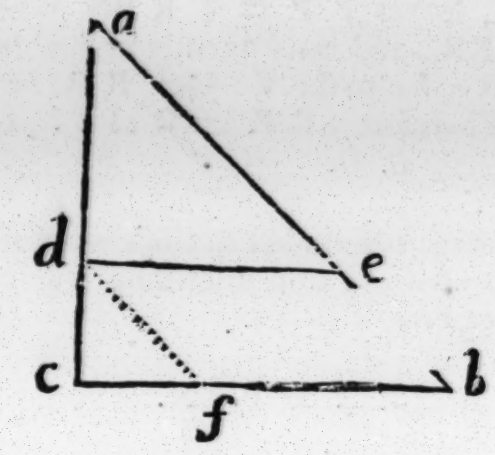
The ſame thing may be done by *Compoſition* and *Diviſion*, &c.

PROP.

PROP. XI

In a Triangle, *a Parallel to the Baſe, is to the Baſe, as the Parts above the Parallel are to the whole Legs.*

That is, $de : cb :: ad : ae :: ae : ab$.



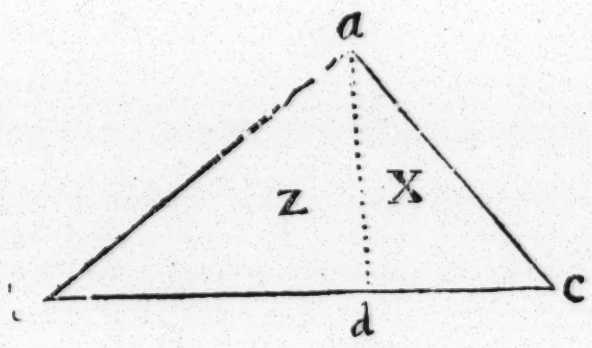
Draw df parallel to eb.

Then will $fb = de$: Therefore 'twill be $bf : fc :: da : dc$: And by *Inverſion*, $fc : bf :: dc : da$. And then by *Compoſition*, $fc + bf$ (i. e. bc) : bf (i. e. de.) $:: dc + da$ (i. e. ac:) da; or as $cb : de :: ac : da$.

Which *Inverted*, gives $de : cb :: ad : ac$. *Q. E. D.*

PROP. XII.

In a Right-angled Triangle (a b c) *a Line* (a d) *drawn from the Right-angle at the Top, Perpendicular to the Hypothenuſe* (b c) *divides the Triangle* (a b c) *into two other* Right-angled Triangles, *which are ſimilar to the firſt Triangle, and to one another.*



1. For all three Triangles have one Right-angle. And the Triangles abc, and abd, have the Angle b (common to both) and conſequently the third Angle bad, muſt be equal to c. Wherefore theſe two Triangles are ſimilar.

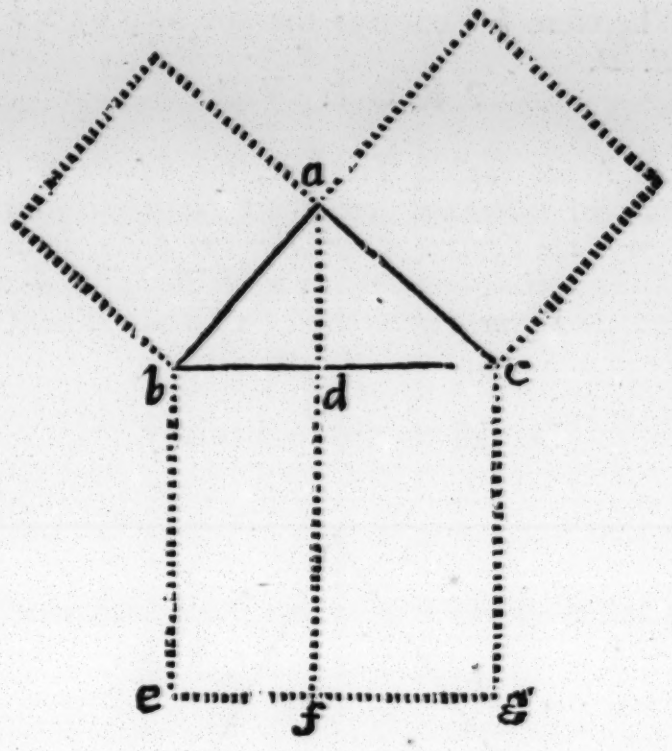
2. The Caſe is the ſame, as to the Triangles abc and adc: But the Triangles abd and adc, being ſimilar to the great one abc, muſt be alſo ſimilar to one another. *Q. E. D.*

From the Similarity of which three Triangles, it will follow, that the Sides about the Equal Angles are proportional (by 4. & 6. *Eucl.*) and thence ariſes the Proof of the next Famous Propoſition, by this means proved a fourth way.

PROP. XIII.

In every Right-angled Triangle, *the Square of the* Hypothenuſe *is equal to the Sum of the Squares of the other two Sides.*

I ſay, $\square bc = \square ba + \square ac$.



Demonſtration.

1. For the Square bg is made up of the two Rectangles bf and dg.

But $\square bf = \square ba$, *for* $cb : ba :: ba : bd$. That is, $\square ba = cb \times bd = \square bf$.

And $\square dg = \square ac$. for $bc : ac :: ac : cd$. That is, $\square ac = bc \times cd = \square dg$.

Wherefore $\square bc$ ($= \square bf + \square dg$) $= \square ba + \square ac$. *Q. E. D.*

COROLLARY.

Hence 'tis plain, That any Figure made on the *Hypothenuſe* of any *Right-angled Triangle*, ſhall be equal to two other ſimilar Figures made on the Sides. Becauſe all ſuch Figures are to one another, as the Squares of their Homologous Sides.

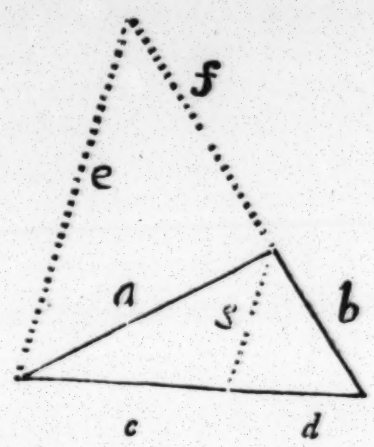
You have above three other ways of demonſtrating this admirable Propoſition, without the Doctrine of Proportion being firſt learnt.

PROP. XIV.

If any Angle of a Triangle be biſſected, the Biſſecting Line will divide the oppoſite Side in the ſame Proportion as the Legs of the Angle are to one another.

Let the Sides of the Triangle be *a*, *b*, and *c* + *d*, and the Biſſecting Line *s*,

I ſay, *a* : *b* :: *c* : *d*.



Produce the Leg *b*, till *f* = *a* the other Leg of the Angle, and draw the Line *e*. Then will the Triangle *e f a* be an *Iſoſceles*; and conſequently the Angles at the Baſe *e*, will be equal: And therefore each will be equal to half the biſſected Angle, (becauſe that is external and equal to them both:) Therefore in the firſt Triangle, the Biſſecting Line *s* is parellel to the Baſe *e*; and conſequently, *f* : *b* :: *c* : *d*.

That is, *a* : *b* :: *c* : *d*? Q. E. D.

TRIANGULAR *Compaſſes*, are ſuch as have three Legs or Feet to take off any Triangle at once; they are uſed in Maps, Globes, &c.

TRIANGULAR *Quadrant*, is a *Sector*, with a looſe Piece to make it an *Equilateral Triangle*; the Calendar is graduated on it, with the Sun's Place, Declination, and many other uſeful Lines, and by the help of a String and a Plummet, and the Diviſions graduated on the looſe Piece, it may be made to ſerve for a Quadrant.

TRIANGULARE *Oſſiculum*, the Triangular little Bone, is that which is placed betwixt the Lambdoidal Suture of the Scull, and the *Sagittalis*. *Blanchard*.

TRIANGULARIS, a Muſcle of the *Thorax*, which with its Partner, lies on each Side the *Cartilago Enſiformis*, within the Cavity of the *Thorax*, under the *Sternum*; ſometimes this appears to be three, at other times four diſtinct Muſcles on each Side. It ariſes from the inferior Part of the *Os Pectoris*, whence its upper Part aſcends, and lower deſcends to its Implantations at the Bony Endings of the fourth, fifth, ſixth, and ſometimes ſeventh and eighth Ribs, near their Conjunction with their Cartilages. Its reputed Uſe by moſt (if not all) Anatomiſts, is to contract the Breaſt.

TRIANGULUS *Septentrionalis*, or *Deltoton*, the *Triangle*, a Northern Conſtellation conſiſting of 6 Stars.

TRIBRACHYS, is the Foot of a *Latin* Verſe, conſiſting of three Syllables, and thoſe all ſhort, as *Priamus*.

TRIBRACHUS, the ſame with *Tribrachys*.

TRICEPS, is a Muſcle of the Thigh, ſo called from its three Heads or Beginnings, the firſt and largeſt of which, ariſeth broad and fleſhy from the Inferior Edges, and External Parts of the *Os Iſchium*, and *Pubis*, where they are joined to each other lying between the *Semi-tendinoſus*, and *Semi-membranoſus*, and that of the *Gracilis*, and deſcending with an Oblique Order of fleſhy Fibres, is inſerted partly Tendinous and Fleſhy, near an Hand's Length in Breadth to the *Linea Aſpera*, of the Thigh-bone, that is immediately below the Inſertion of the *Quadratus Femoris*; its inferior Part making a ſtrong round Tendon, inſerted into the ſuperior Part of the Internal and Lower *Appendix* of the Thigh-bone.

The ſecond Head, or Beginning of this Muſcle, ariſeth Tendinous from the *Os Pubis*, but in its deſcent ſoon becomes Fleſhy, and joins with the former, near to its Inſertion to the middle Part of the *Linea Aſpera* of the Thigh-bone.

The third and laſt Beginning of this Muſcle, ſpringeth from the inferior Part of the *Os Pubis*, between the Origination of its laſt deſcribed Head, and that of the *Pectineus*; and deſcending obliquely, joins with the Firſt near its Inſertion to the *Linea Aſpera* of the Thigh-bone, immediately above the Termination of the ſecond Head of this Muſcle. This moves the Thigh variouſly according to the Diverſity of its Beginnings; ſo the firſt deſcribed Part pulls the Thigh-bone upwards, inwards, and ſomewhat backwards: The ſecond and third Beginnings of it, pull it more inwards, and turn it ſomewhat outwards, as when we put our Legs acroſs each other.

TRICUSPIDES are three Valves of a Triangular Form, placed at the Mouth of the Right Ventricle of the Heart; they are made of a thin Membrane, and their Baſes are fixed to the Mouth of the ſaid Ventricle, and their Points tied by ſmall Fibres to the Fleſhy Productions; ſo that when the Heart contracts, its Point approaches its Baſis, and the Fleſhy Productions move upwards; therefore the Fibres of theſe Valves are relaxed, and the Valves lifted up by the Blood which gets underneath them, becauſe the Furrows and Fleſhy Productions keeping the Valves at a little Diſtance from the Sides of the Ventricle, give way to the Blood to paſs under them, and ſo to thruſt up the Valves, which ſhut ſo cloſely the Entry into the Ventricle, that the Blood cannot return the Way it came in, but when the Ventricle is dilated, the Fibres are pulled down, and the Paſſage made open for the Blood to enter.

TRIE, a Sea Term: See *Try*.

TRIEMIMERIS, is a Branch of the *Cæſura* of a *Latin* Verſe, when after the firſt Foot of the Verſe there remains an odd Syllable, which helps to make the next Foot; as in this Verſe.

Ille Latus Niveum molli fultus Hyacintho.

TRIGEMINUM: See *Complexus*.

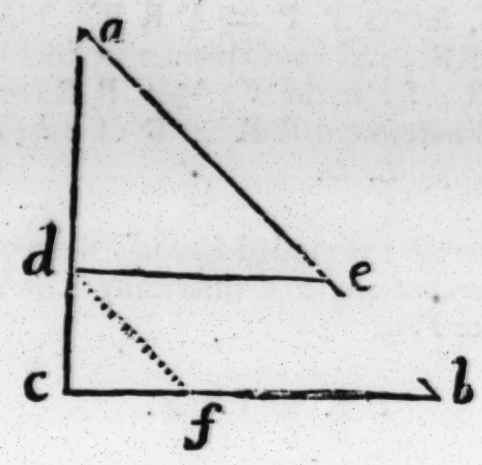
TRIGILD: See *Argild*.

TRIGLYPH, in Architecture, is a Member of the *Frize* of the *Dorick Order*, ſet directly over every Pillar, and in certain Spaces in the Inter-columniations. By their Tringular Gutters (for they

PROP. XI

In a Triangle, *a Parallel to the Baſe, is to the Baſe, as the Parts above the Parallel are to the whole Legs.*

That is, $de : cb :: ad : ae :: ae : ab$.



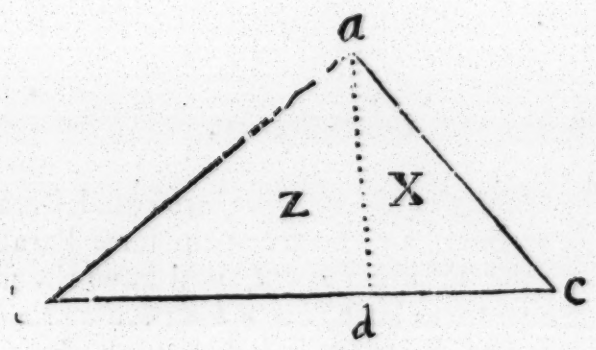
Draw df parallel to eb.

Then will $fb = de$: Therefore 'twill be $bf : fc :: da : dc$: And by *Inverſion*, $fc : bf :: dc : da$. And then by *Compoſition*, $fc + bf$ (i. e. bc) : bf (i. e. de.) :: $dc + da$ (i. e. ac:) da; or as $cb : de :: ac : da$.

Which *Inverted*, gives $de : cb :: ad : ac$. *Q. E. D.*

PROP. XII.

In a Right-angled Triangle (a b c) *a Line* (a d) *drawn from the Right-angle at the Top, Perpendicular to the Hypothenuſe* (b c) *divides the Triangle* (a b c) *into two other* Right-angled Triangles, *which are ſimilar to the firſt Triangle, and to one another.*



1. For all three Triangles have one Right-angle. And the Triangles abc, and abd, have the Angle b (common to both) and conſequently the third Angle bad, muſt be equal to c. Wherefore theſe two Triangles are ſimilar.

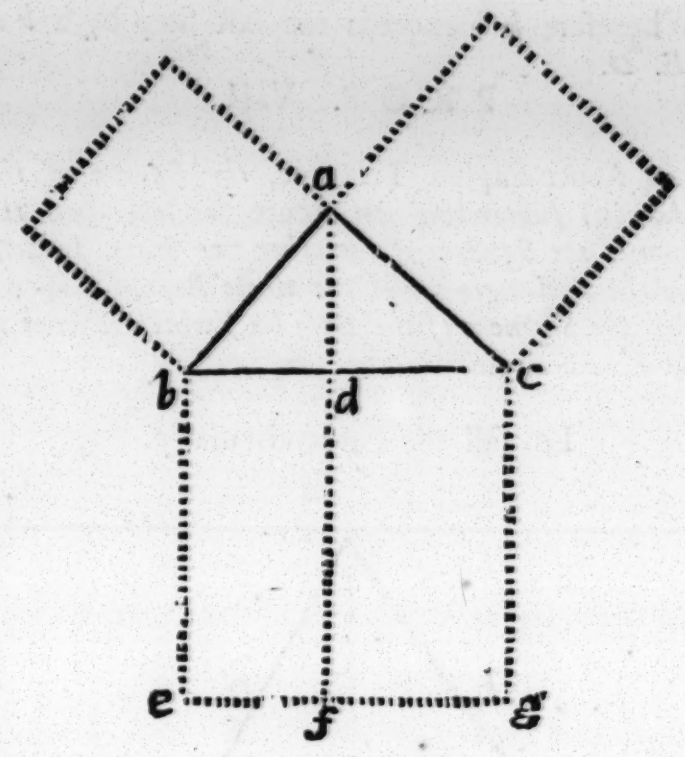
2. The Caſe is the ſame, as to the Triangles abc and adc: But the Triangles abd and adc, being ſimilar to the great one abc, muſt be alſo ſimilar to one another. *Q. E. D.*

From the Similarity of which three Triangles, it will follow, that the Sides about the Equal Angles are proportional (by 4. & 6. *Eucl.*) and thence ariſes the Proof of the next Famous Propoſition, by this means proved a fourth way.

PROP. XIII.

In every Right-angled Triangle, *the Square of the* Hypothenuſe *is equal to the Sum of the Squares of the other two Sides.*

I ſay, $\square bc = \square ba + \square ac$.



Demonſtration.

1. For the Square bg is made up of the two Rectangles bf and dg.

But $\square bf = \square ba$, *for* $cb : ba :: ba : bd$. That is, $\square ba = cb \times bd = \square bf$.

And $\square dg = \square ac$. for $bc : ac :: ac : cd$. That is, $\square ac = bc \times cd = \square dg$.

Wherefore $\square bc$ ($= \square bf + \square dg$) $= \square ba + \square ac$. *Q. E. D.*

COROLLARY.

Hence 'tis plain, That any Figure made on the *Hypothenuſe* of any *Right-angled Triangle*, ſhall be equal to two other ſimilar Figures made on the Sides. Becauſe all ſuch Figures are to one another, as the Squares of their Homologous Sides.

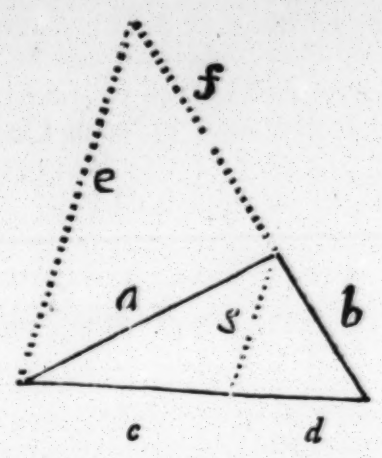
You have above three other ways of demonſtrating this admirable Propoſition, without the Doctrine of Proportion being firſt learnt.

PROP. XIV.

If any Angle of a Triangle be biſſected, the Biſſecting Line will divide the oppoſite Side in the ſame Proportion as the Legs of the Angle are to one another.

Let the Sides of the Triangle be *a*, *b*, and *c* + *d*, and the Biſſecting Line *s*,

I ſay, *a* : *b* :: *c* : *d*.



Produce the Leg *b*, till *f* = *a* the other Leg of the Angle, and draw the Line *e*. Then will the Triangle *e f a* be an *Iſoſceles*; and conſequently the Angles at the Baſe *e*, will be equal: And therefore each will be equal to half the biſſected Angle, (becauſe that is external and equal to them both:) Therefore in the firſt Triangle, the Biſſecting Line *s* is parellel to the Baſe *e*; and conſequently, *f* : *b* :: *c* : *d*.

That is, *a* : *b* :: *c* : *d*? Q. E. D.

TRIANGULAR *Compaſſes*, are ſuch as have three Legs or Feet to take off any Triangle at once; they are uſed in Maps, Globes, &c.

TRIANGULAR *Quadrant*, is a *Sector*, with a looſe Piece to make it an *Equilateral Triangle*; the Calendar is graduated on it, with the Sun's Place, Declination, and many other uſeful Lines, and by the help of a String and a Plummet, and the Diviſions graduated on the looſe Piece, it may be made to ſerve for a Quadrant.

TRIANGULARE *Officulum*, the Triangular little Bone, is that which is placed betwixt the Lambdoidal Suture of the Scull, and the *Sagittalis*. *Blanchard*.

TRIANGULARIS, a Muſcle of the *Thorax*, which with its Partner, lies on each Side the *Cartilago Enſiformis*, within the Cavity of the *Thorax*, under the *Sternum*; ſometimes this appears to be three, at other times four diſtinct Muſcles on each Side. It ariſes from the inferior Part of the *Os Pectoris*, whence its upper Part aſcends, and lower deſcends to its Implantations at the Bony Endings of the fourth, fifth, ſixth, and ſometimes ſeventh and eighth Ribs, near their Conjunction with their Cartilages. Its reputed Uſe by moſt (if not all) Anatomiſts, is to contract the Breaſt.

TRIANGULUS *Septentrionalis*, or *Deltoton*, the *Triangle*, a Northern Conſtellation conſiſting of 6 Stars.

TRIBRACHYS, is the Foot of a *Latin* Verſe, conſiſting of three Syllables, and thoſe all ſhort, as *Priamus*.

TRIBRACHUS, the ſame with *Tribrachys*.

TRICEPS, is a Muſcle of the Thigh, ſo called from its three Heads or Beginnings, the firſt and largeſt of which, ariſeth broad and fleſhy from the Inferior Edges, and External Parts of the *Os Iſchium*, and *Pubis*, where they are joined to each other lying between the *Semi-tendinoſus*, and *Semi-membranoſus*, and that of the *Gracilis*, and deſcending with an Oblique Order of fleſhy Fibres, is inſerted partly Tendinous and Fleſhy, near an Hand's Length in Breadth to the *Linea Aſpera*, of the Thigh-bone, that is immediately below the Inſertion of the *Quadratus Femoris*; its inferior Part making a ſtrong round Tendon, inſerted into the ſuperior Part of the Internal and Lower *Appendix* of the Thigh-bone.

The ſecond Head, or Beginning of this Muſcle, ariſeth Tendinous from the *Os Pubis*, but in its deſcent ſoon becomes Fleſhy, and joins with the former, near to its Inſertion to the middle Part of the *Linea Aſpera* of the Thigh-bone.

The third and laſt Beginning of this Muſcle, ſpringeth from the inferior Part of the *Os Pubis*, between the Origination of its laſt deſcribed Head, and that of the *Pectineus*; and deſcending obliquely, joins with the Firſt near its Inſertion to the *Linea Aſpera* of the Thigh-bone, immediately above the Termination of the ſecond Head of this Muſcle. This moves the Thigh variouſly according to the Diverſity of its Beginnings; ſo the firſt deſcribed Part pulls the Thigh-bone upwards, inwards, and ſomewhat backwards: The ſecond and third Beginnings of it, pull it more inwards, and turn it ſomewhat outwards, as when we put our Legs acroſs each other.

TRICUSPIDES are three Valves of a Triangular Form, placed at the Mouth of the Right Ventricle of the Heart; they are made of a thin Membrane, and their Baſes are fixed to the Mouth of the ſaid Ventricle, and their Points tied by ſmall Fibres to the Fleſhy Productions; ſo that when the Heart contracts, its Point approaches its Baſis, and the Fleſhy Productions move upwards; therefore the Fibres of theſe Valves are relaxed, and the Valves lifted up by the Blood which gets underneath them, becauſe the Furrows and Fleſhy Productions keeping the Valves at a little Diſtance from the Sides of the Ventricle, give way to the Blood to paſs under them, and ſo to thruſt up the Valves, which ſhut ſo cloſely the Entry into the Ventricle, that the Blood cannot return the Way it came in, but when the Ventricle is dilated, the Fibres are pulled down, and the Paſſage made open for the Blood to enter.

TRIE, a Sea Term: See *Try*.

TRIEMIMERIS, is a Branch of the *Cæſura* of a *Latin* Verſe, when after the firſt Foot of the Verſe there remains an odd Syllable, which helps to make the next Foot; as in this Verſe.

Ille Latus Niveum molli fultus Hyacintho.

TRIGEMINUM: See *Complexus*.

TRIGILD: See *Argild*.

TRIGLYPH, in Architecture, is a Member of the *Frize* of the *Dorick Order*, ſet directly over every Pillar, and in certain Spaces in the Inter-columniations. By their Tringular Gutters (for they

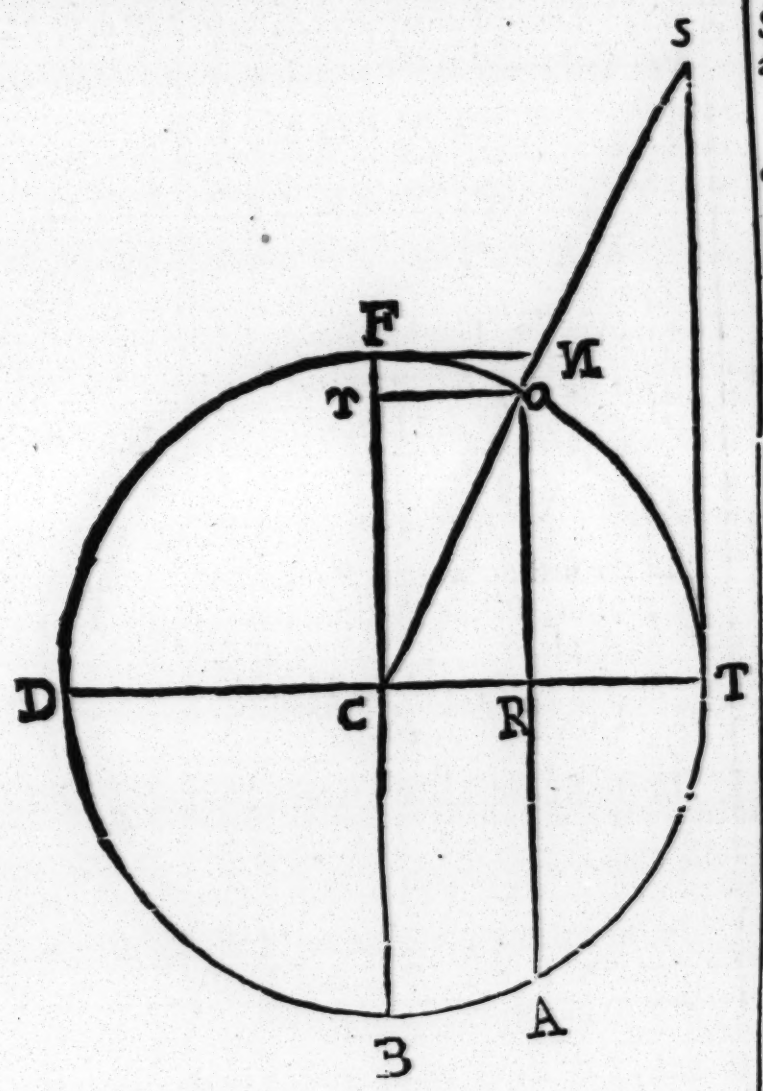
are always made with three *Glyphæ*, whence the Name;) they ſeem to have been deſign'd to convey the *Guttæ*, or Drops which hang a little under them: Some think they repreſent *Apollo*'s Lyre.

TRIGON, is a Word variouſly uſed in Mathematicks, and ſignifies a Figure with three Angles: By ſome addicted to Aſtrological Vanities, 'tis us'd for the ſame with what they as fillily call a Triplicity.

In Dialling there is ſometimes uſed an Inſtrument of a Triangular Form, which is called a *Trigon*.

TRIGONOMETRY is the Art of Meaſuring Triangles, or of Calculating the Sides of any Triangle ſought; and this is either *Plain* or *Spherical*: Of which I ſhall ſpeak diſtinctly; beginning firſt with the *Plain*.

The Art of *Trigonometry* doth much depend on the Knowledge of the following Lines in and about a Circle.



DEFINITIONS.

1. The Line D T in a Circle, is called the Diameter; one half of which, C T, as alſo C O, and C F, is called the Radius; and by ſome the whole Sine, becauſe all other Sines are taken out of it.

2. Any Right-line, as O A, joining the two Extremities of an Ark, is called the Chord, or Subtenſe, either of the Ark O T A, or of its Complement to a whole Circle O D A.

3. The Line O R, which is Perpendicular to the Radius C T, or which is juſt half the Chord O A, is called the Right-ſine, or moſt uſually the Sine of the Ark O T, or of the Ark O D, ſo that a Right-ſine is half the Chord of double the Ark.

4. The Difference of any Ark from a Quadrant, be it more leſs, is called its Complement. Thus O F is the Complement of the Ark O T, being what it wants of being a Quadrant; and O F is alſo the Exceſs by which the Ark O D exceeds a Quadrant; the Line *r o* is the Right Sign of the Complement, and therefore 'tis called the Co-Sine or Sine-Complement of the Ark O T; as O R is the Co-Sine of the Ark F O.

5. A Line, as T S, touching the Circle in the Point T, and Perpendicular to the Radius C T, is called a Tangent: And if a Right Line be drawn through O from the Centre of the Circle C, meeting with the Tangent in S, that Line S C is called a Secant, and they both limit one another, ſo as to be the Tangent and Secant of the Ark O T: F N is the Co-Tangent, and C N the Co-Secant of the ſame Ark; but they are the Tangent and Secant of the Complemental Ark O F.

6. The Line R T intercepted between the Right Sine and the Tangent, is called the Verſed Sine, and by ſome *Sagitta*.

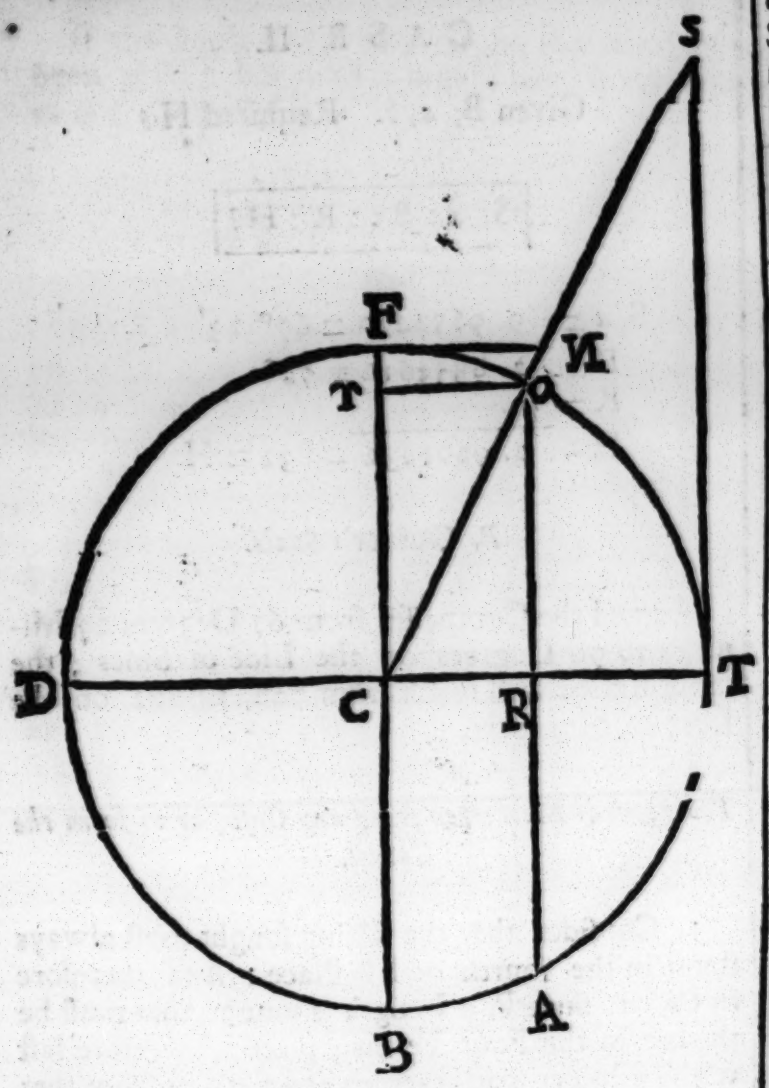
7. Whatever Number of Degrees an Ark wants of a Semi-circle, is called its Supplement.

8. The Line C R, which is the Part of the Radius C T lying between the Centre and the Right Sine, is always equal to, and may be taken for the Co-Sine *r* O; and C *r* is equal to the Right Sine O R.

9. If any Ark be leſs than a Quadrant, as T O, the Difference between the Radius and the Co-Sine, is the Verſed Sine R T; but if it exceed a Quadrant, as the Ark D F O doth then the Sum of the Radius and Co-Sine, is the Verſed Sine: Thus D C + C R = D R the Verſed Sine of the Ark D F O.

10. The Radius with the Sine and Co-Sine of any Ark (as T O) do make a Right-angle Triangle, as O C R, which is ſimilar to the Triangle C S T, made by the Radius, the Tangent, and the Secant. Alſo the Radius, the Co-Tangent, and the Co-Secant, make another Triangle ſimilar to the two former.

Hence



Hence 'tis plain,

1. That as the Co-Sine Is to the Sine : : So is the Radius To the Tangent. That is, C R : R O : : C T : T S.

2. As Radius Is to the Sine : : So is the Secant To the Tangent. That is, C O : O R : : C S : S T.

3. As the Sine Is to the Radius : : So is the Radius To the Co-Secant. That is, O R : O C : : F C : C N.

4. As the Tangent Is to the Radius : : So is Radius To the Co-Tangent; As S T : T C : : F N.

Therefore the Rectangle between the Tangent and Co-Tangent of any Ark is equal to the Square of the Radius.

11. Every Triangle has six Parts, of which three are Sides, and three Angles; and of these if we have three given, we can find the rest, (except in the Case where the three Angles only of a plain Triangle are given.)

For from thence the Sides cannot be found, because two Triangles may be Equiangular, and yet have the Sides by no means of the same length. We can find the rest, I say, if supposing the Radius divided into any Number of equal Parts, we can but discover how many of such parts any Sine, Tangent, or Secant of any Ark or Angle doth contain. Now this is ready done to our Hands, in the Table of Sines, Tangents, and Secants, which we have, with prodigious Industry, in Books ready calculated for this purpose.

12. When therefore any Triangle is given to be resolved, the first thing we have to do, is to consider, That there is in the Table of Logarithms, Sines, Tangents, and Secants, a Triangle exactly similar, and equal to that which we are required to solve, and whose Sides are to one another in the very same Proportion of those of the Triangles proposed.

12. We must understand whatever *Ratio* one Side of the Triangle given, hath to the other Side about the same Angle, considered as Lengths estimated or numbered by any known Measure, as suppose Inches, Yards, Miles, Leagues, *&c.* the very same hath the two Sides about the same Angle in the Triangles in the Tables, or in the Tabular Parts: Which two things well understood, do lead us into the whole Mystery of Trigonometrical Calculations.

13. *Trigonometry*, is either *Plain* or *Spherical*; and both may be resolved by the means of four *Propositions*, which because of their excellent Use, are called *Axioms*.

14. The first of which relates to *Rectangle Plain Triangles*; and is this:

AXIOM I.

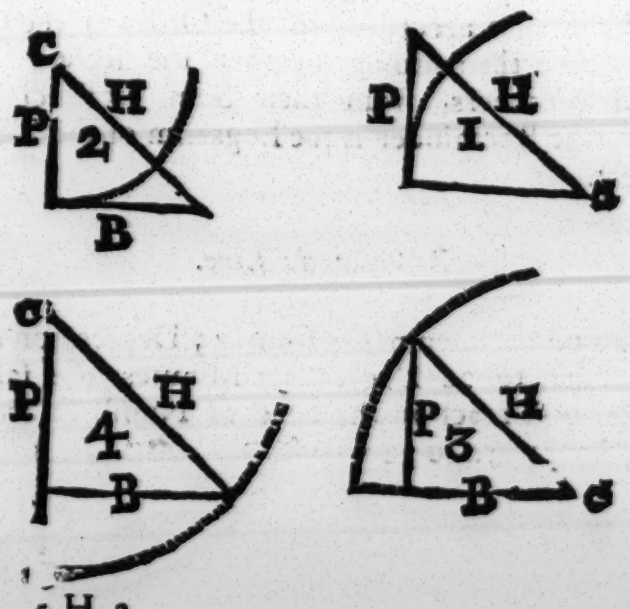
In a Right-angle Triangle, *if either of the Legs be supposed to be the Radius of a Circle, the other Leg will be the Tangent of the opposite Angle, or of the Angle at the Centre; and the Hypothenuse will be the Secant of that Angle: But if you imagine the Hypothenuse to be the Radius of a Circle, then each Leg will be the Sine of its opposite Angle, or of the Angle at the Centre; as is plain from the adjoining Figures.*

In the first of which, B (the Base) being made the Radius, P (the Perpendicular) is the Tangent of the Angle at *a*, the Centre of the Circle, which is opposite to P, and the Hypothenuse is the Secant of the same Angle.

In the second Figure, where P is made the Radius, B is the Tangent of the opposite Angle at the Centre *c*.

In the third Figure, where H the Hypothenuse is made the Radius, P is the right Sine of the opposite Angle at the Centre. And,

In the fourth Figure, H being also made Radius, but C the Centre of the Circle, B will be the Sine of its opposite Angle *c*.



5 H 2 Th

The Seven Caſes of Plain Triangles.

	Given	Required.	Proportions.	Given	Required.
1	B, *a*, *b*	P	R : B :: Tan. *b* : P	*c* : √ √	*c*
2	B, *a*, *b*	H	S, *a*, B :: R : H	*c* : √ √	*b*

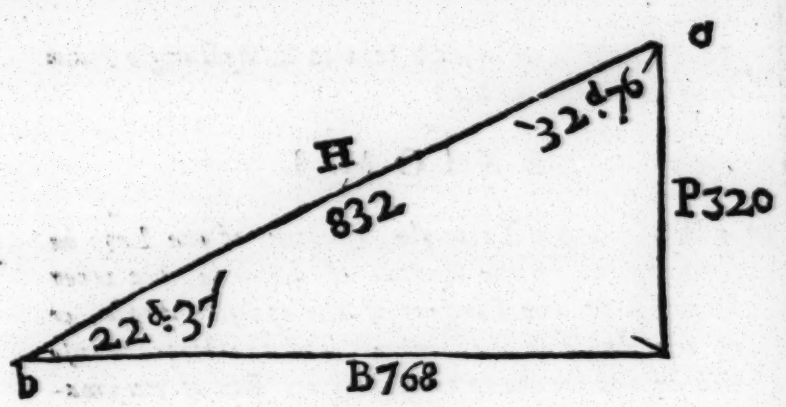
7	H √ √	B	R : H :: S, *a* : B	*b* √ √	*c* √



The Calculation of the Seven Caſes of Right-angle Plain Triangles.

CASE I.

Given B, *a*, *b*. Required P?

Canon | R : B :: T : *b* : P? |

R = 10.
B = 2. 8853612 = 768
T, *b* = 9. 6197205 = 22° 37′
P = 2. 5050817 = 320 = P?

The General Rule for all Operations in Trigonometry, is, to write down the Numbers found in the Tables according to the Order of the Canon: And then adding together the ſecond and third Numbers, from their Sum ſubſtract the Firſt, the Remainder is the Logariſm of the Term ſought.

By Gunter's *Line.*

Extend the Compaſſes from 45 Degrees on the Tangents, to 22 Degrees 37 Minutes, the ſame Extent will reach in the Line of Numbers from 768, backward to 320.

CASE II.

Given B, *a*, *b*. Required H?

| S, *a* : B :: R : H? |

S, *a* = 9. 9652480 = 67° 23′
B = 2. 8853612 = 768
R = 10.
H = 2. 9201132 = 832 = H.

By Gunter's *Scale:*

Extend the Compaſſes from 67 Degrees 23 Minutes to 90 Degrees on the Line of Sines; the ſame Extent will reach from 768, to 832 on the Line of Numbers.

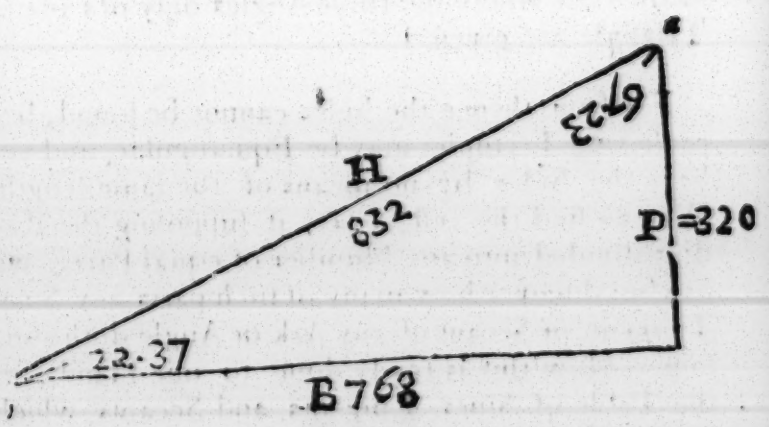
The general Method to ſtate any Caſe, or to form the Canon.

1. Conſider that the Thing ſought muſt always ſtand in the fourth or laſt Place: And therefore *in Caſ.* 1. ſince P, a Length is ſought, that muſt be the laſt of the Four Terms; place it therefore laſt with an Interrogation-point after it, to ſhew that it is required or ſought.

2. In the Golden-Rule the ſecond and fourth Terms being always of the ſame Nature or Kind, and P being a Length ſought, and B the only Length given; B is neceſſarily determined to be in the ſecond Place: Write it down therefore in that Place with four Points after it thus : : to ſhew that the Proportion disjoins or breaks off there.

3. Conſider that the Hypothenuſe not being either given or ſought, the firſt Axiom determines you to work by Tangents: And the Side given B being ſuppoſed Radius, the Proportion muſt be; As B conſider'd as Radius, Is to its ſelf conſidered as a Length given : : So will P conſidered as the Tangent of the Angle *b*, be To its ſelf conſidered as a Length ſought. That is,

| R : B :: T, *b* : P? |



If

If the Angle *b* had been ſought, that muſt have been placed laſt, and it would have ſtood thus; as in *Caſe* the Fifth.

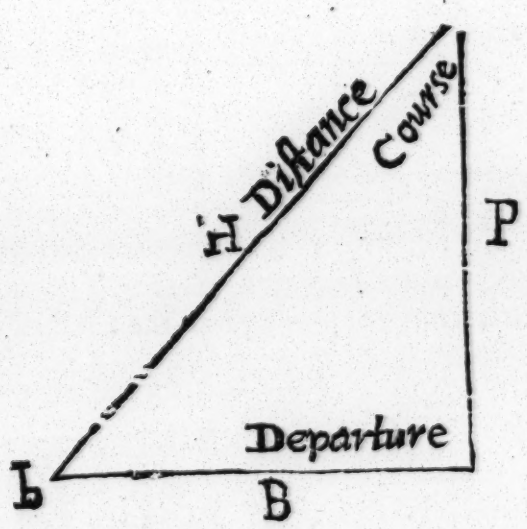
B : R : : P : T, *b*?

But if the Hypothenuſe had been in the Queſtion, either given or required, you muſt have worked by Sines, and the Hypothenuſe will be always Radius; as in *Caſe* 2. where H is ſought.

For H being required, it muſt ſtand in the laſt Place; and ſince B a Length is given of the ſame Nature with H, that muſt be in the ſecond Place: And then ſay by *Axiom* 1, As B conſidered as the Sine of the given Angle *a*, Is to its ſelf conſidered as a Length: : So is H conſidered as Radius, To its ſelf as a Length ſought: That is,

S, *a* : B : : R : H?

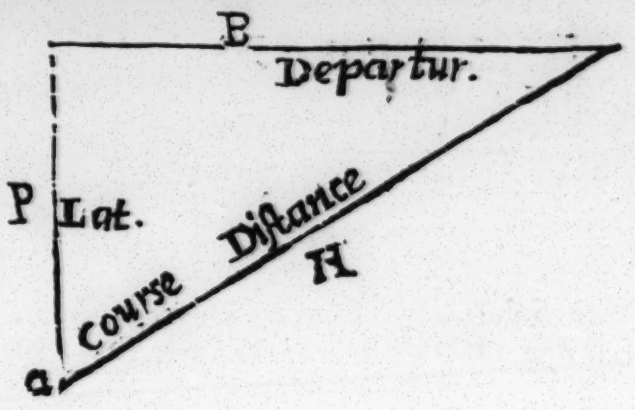
And to ſhew the extenſive Uſe of this Doctrine of *Plain Trigonometry*, the General Triangle above deſcribed and numbred, may either firſt relate to the Sea, and then theſe 7 Caſes will be all the Caſes of *Plain Sailing*; and alſo of Mr. *Wright*'s, or, as 'tis commonly, tho' falſly call'd, *Mercator*'s too; Regard being firſt had to the Way of Working by Meridional Parts, &c.



For, in this Triangle the Angle *a*, is the Angle of the Rhumb, or the Angle which the Line of the Ship's Courſe makes with the Meridian, and therefore uſually by the Sailors called, *The Courſe*; and the Side P repreſents the Meridian of any Place, a-croſs which the Ship is ſuppoſed to ſail; and conſequently on it muſt be accounted the Difference of Latitude between the two Places *a* and *b*. The Angle *b* is the Complement of the Courſe, or what that Angle wants of 90 Degrees, and conſequently known when the Courſe is ſo. The Baſe repreſents the Difference of Longitude, or the Departure Weſt, or the Weſting of the Ship in Compariſon of the Place at *a* that ſhe is ſuppoſed to have parted from: And the Hypothenuſe H, repreſents the Diſtance ſailed, or *run* (as the Seamen call it) or how many Leagues or Miles the Ship hath ſailed from the Place *a* to the Place *b*.

This being underſtood, if this firſt Caſe be made a Caſe of *Plain Sailing*, there will be given Courſe and Departure; required Difference of Latitude, and the Canon is;

As Radius is to the Departure in Miles: : So is the Co-Tangent of the Courſe, To the Difference of Latitude in Miles.



N. B. Here the Ship being at *a*, is ſuppoſed to ſail South-Weſtward (or to ſpeak exactly, W. S. W.) and therefore her Difference of Latitude is reckoned to the South, and her Departure to the Weſt: But by inverting the ſame Triangle, you may ſuppoſe the Difference of Latitude North, and the Departure Eaſt; for the North is accounted to lie right before you, and conſequently the Eaſt to the Right-hand, and the Weſt to the Left; wherefore the Courſe now is E. N. E.

2. If you would apply the Doctrine of *Trigonometry*, to the Calculation of Heights, Depths, Diſtances, the ſame Triangle and Numbers will do; regard being had to the Nature of the Terms required and ſought.

For the Perpendicular P, will repreſent any Altitude; and B will repreſent a Diſtance from the Foot of it meaſured on the Ground: The Angle at *b* is found by the Quadrant, or ſome ſuch Inſtrument; and conſequently you may find P by *Caſe* 1. For,

As Radius is to the Diſtance, from the Foot of the Object: : So is the Tangent of the Angle of Altitude, To the Height of the Place, *i. e.*

R : B : : T, *b* : P?

Or, ſuppoſe the Diſtance B were required from above, by taking the Angle *a*, and finding the Length of P, by a String and Plummet. Then will

R : P : : T, *b* : P?

This being premiſed as to the general Uſe of *Trigonometry*, let us proceed to

CASE

CASE III.

Given B, H. Required the Angles *a*, *b*,

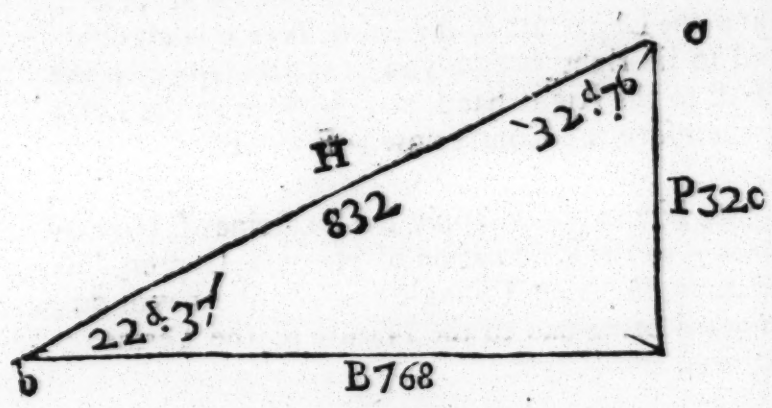
H : R :: B : S, *a*?

H = 2. 9201233 = 832
R = 10. 0000000
B = 2. 8853612 = 768
S, *a* = 9. 9652379 = 67° 23′
= Angle *a*

Which Subſtracted from 90 Degrees, gives the Angle *b* = 22 Degrees, 37 Minutes.

By Gunter's *Scale.*

The Extent from 832, back to 768, in the Line of Numbers will reach from 90 Degrees to 67 Degrees 30 Minutes in the Line of the Sines.



CASE IV.

Given B, H. Required P?

Having found *a* by the foregoing Caſe, this will be the Theorem :

R : B :: T : *b* : P?

Or,

R : T, *b* :: B : P?

R = 10.
T, *b*, = 9. 6197205 = 22° 37′
B = 2. 8853612 = 768
P = 2. 5050817 = 320.

By Gunter's *Scale.*

The Extent from 45 Degrees in the Tangent-line, back to 22 Degrees 37 Minutes, will reach in the Line of Numbers from 768, back to 320.

CASE V.

Given B, P. Required √ √?

B : R :: P : T, *b*?

B = 2. 8853612 = 768
R = 10.
P = 2. 5051500 = 320
T, *b* = 9. 6197888 = 22° 37′ = *b*.

Which 22 Degrees 37 Minutes ſubſtracted from 90 Degrees, leaves *a* = 67 Degrees 23 Minutes.

By Gunter's *Scale.*

The Extent from 768 back to 320, in the Line, will reach from 45 back to 22 Degrees 37 Minutes in the Tangents.

CASE VI.

Given B, P. Required H?

Having found *b* by the foregoing Caſe, this will be the Theorem :

S, *b* : P :: R : H?

S, *b* = 9. 5849685 = 22° 37′
P = 2. 5051500 = 320
R = 10.
H = 2. 9201815 = 832 = H?

By Gunter's *Scale.*

The Extent from 22 Degrees 37 Minutes, forwards, to 90 Degrees in the Line of Sines, will reach from 320, to 832 in the Line of Numbers.

CASE VII.

Given H and √ √. Required H?

R : H :: S, *a* : B?

R = 10.
H = 2. 9201233 = 832
S, *a* = 9. 9652480 = 67° 23′
B = 2. 8853719 = 768 = B.

By Gunter's *Scale.*

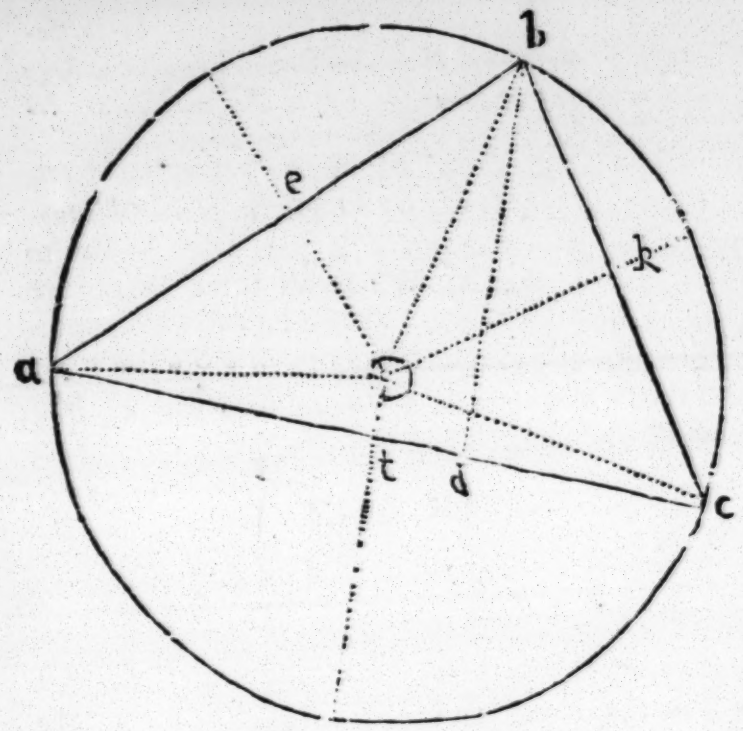
The Extent from 90 Degrees in Line of Sines back to 67 Degrees 23 Minutes, will reach in the Line of Numbers from 832 backwards to 768.

The

The Resolution of Oblique Plain Triangles.

AXIOM II.

In every Triangle, a, b, c, *the Sides are in Proportion to one another, as the Sines of their opposite Angles.*



Let fall from the Angle *b*, a Perpendicular to the Base *a c*: For then the whole will be resolved into 2 Right-angle Triangles, and consequently by Axiom the First *a b* : R :: *b d* : S, *a*; also *b c* : R :: *b d*: S, *c*; wherefore *a b*: *b c* :: S *c* : S, *a*: by Reciprocallity of Proportion.

Otherwise thus:

Draw a Circle about the Triangle, from whose Centre O, let the Prependiculars O *e*, O *k*, and O *t*, be let fall to the three Sides of the Triangle, and the Lines *o a*, *o b*, and *o c*, be drawn to the three Angles.

The Sides of the Triangle will be bisected by the Perpendiculars, and consequently *a e* will be = *e b*, *b k* = *k c* and *c t* = *t a*; wherefore as the whole Line *a b*, Is to *b c* : : So will the half Side *a c* be, To the half *k c*; but *a e* and *k c*, are the Sines of the Angles at the Centre *a o e* and *k o c*, which Angles at the Centre are severally equal to the Angles of the Triangle *c* and *a*, because they stand on half the Arks that the Angles of the Triangle do; wherefore *a b* : *b c* : : S, *c* : S, *a*.

Let H, B, and O, be the Sides of an Oblique Plain Triangle; *a*, *b* and *c*, its three Angles; here because there is no Right-angle, three Things must be always given, that is, either two Sides and one Angle, one Side and two Angles, or else all the three Sides.

From whence will arise the three former of the six following Cases.

	Given.	Requir'd.	Proportions.
1	H. O. *c*	*b*.	O, S *c* : : H : S, *b*. Note, that the Angle *b* is ambiguous, and you must collect from the Circumstances of the Triangle, whether it be Obtuse or Acute.
2	H. O. *c*.	B.	Here first find the Angle *b* by *Case* 1. thence *a* will be known by taking the Sum of *b* + *c* from 180°. Then S, *c* : O : : S, *a* : B. Or S, *b* : H : : S, *a* : B.
3	*c*, *b*, O.	H.	S, *c* : O : : S, *b* : H.
4	H. *a*. O	*c*, *b*.	A + O : H — O : : T ½ Z of the opposite Angles, To T ½ X of the opposite Angles, and ½ Z + ½ X = *b*, and ½ Z — ½ X = *c*.
5	H. *a*, O.	B.	Find the Angles by the former Case, and then S, *b* : H : : S, *a* : B; or S, *c* : O : : S, *a* : *b*.
6	H. O. B 3 Sides.	3 Angl.	B . H+O : : H — O : X. And then ½ B + ½ X = C B and ½ B — ½ X = B *b*. Then will H : R :: C B : Co-sine Angle C; and O : R : : *b* B : Co-sine Angle *b*; Axiom 1.

And the three last are solved by the Help of the two following Axioms.

AXIOM III.

As the Sum of the Legs about the Angle given, Is to their Difference : : *So is the Tangent of half the Sum of the other two Angles, To the Tangent of half their Difference.*

Now the Sum of the other two Angles is known, being what the given Angle wants of 180 Degrees, and their Difference is now found; add therefore their half Sum, and half Difference together, and it gives you the *greater of the two Angles sought*; and half the Difference subtracted from the half Sum, leaves the lesser Angle sought. And thus having found the Angles; if the Side opposite to the former given Angle be sought, it will be found easily by *Pardie's Axiom*, That the Sides are as the Sines of the Angles.

The Demonstration of the *Third Axiom*, is briefly thus.

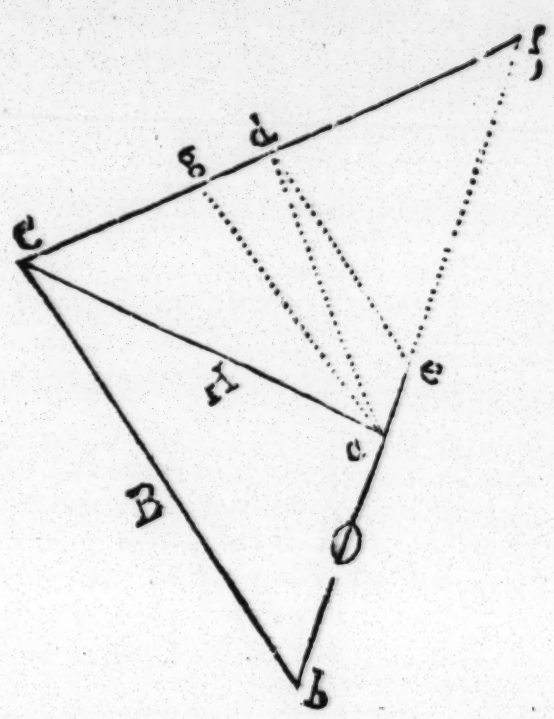
Demonstration.

I say the Sum of the Legs of any Angle *a*, Is to their Difference : : As the Tangent of half the Sum of their opposite Angles, Is to the Tangent of half their Difference.

Produce

Produce O, one of the given Legs of the Angle given, till *a f* become equal to H or C *a*, and then biſect *b f* in *e*, join *c f*, and biſect it alſo in *d*: Draw *a d*, which will be perpendicular to *c f* (2. 16.) and draw *d e*, which will be parallel to *c b*. (6. 92.) Then will the Angle *c a d* = *d a f*; i. e. to the half of *c a f*, which external Angle *c a f* = *c* + *b*: That is, to the Sum of the oppoſite Angles required.

Draw then *g a* parallel to *c b*; ſo will the Angle *g a c*, be equal to the alternate one *c*. And if from half the Sum of the oppoſite Angles, you take the leſſer Angle; *i. e.* If from *c a d*, you take *g a c*, there will remain the Angle *g a d*, equal to half the Difference of the oppoſite Angles.



And ſo alſo, if from *b e*, half the Sum of the Legs, you take O the leſſer Leg, there will remain *a e* equal to half the Difference of the Legs. And then ſince the Triangle *c a d* is Right-angled, if *a d* be made Radius, *c d* will be the Tangent of the Angle *c a d*; (*i. e.* the Tangent of half the Sum of oppoſite Angles;) and in the little Triangle *g a d*, *g d* will be the Tangent of the Angle *g a d*; (*i. e.* The Tangent of half the Difference of oppoſite Angles.) But the Segments of the Legs of any Triangle cut by Lines parallel to the Baſe, being proportionable, *e b* : *e a* :: *c d* : *d g*; That is, in Words, *Half the Sum of the Legs, Is to half their Difference* :: *As the Tangent of half the Sum of the oppoſite Angle, Is to the Tangent of half their Difference*; but Wholes are as their Halves: Wherefore the Sum of the Legs, Is to their Difference:: As the Tangent of half the Sum of the oppoſite Angles, Is to the Tangent of half their Difference. *Q. E. D.*

Whence the two following *Caſes* will eaſily be ſolved.

CASE I.

Given H, O and *a*. Required *c*, *b*?

For H + O : H — O :: as T, half Z oppoſite Angles, Is to T, half X oppoſite Angles; and then half Z + half X = *b*, and half Z — half X = *c*.

CASE II.

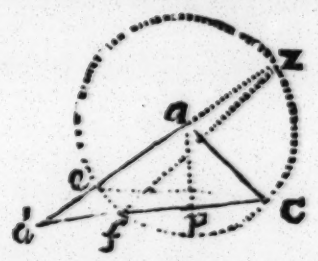
Given H O, and *a*. Required B?

Firſt find the Angles by the former *Caſe*, and then S, *b* : H :: S, *a* : B; or S, *c* : O :: S, *a* : B; by the *Second Axiom*.

AXIOM IV.

The Baſe, Is to the Sum of the Legs :: *As the Difference of the Legs, Is to the Difference of the Segments of the Baſe made by a Perpendicular let fall from the Angle oppoſite to the Baſe.*

For there is alſo another Caſe, in *plain Oblique-Triangles*, which requires a particular Axiom to ſolve it; and that is, Where all three Sides are given to find the Angles. Here let fall a Perpendicular from any Angle to its oppoſite Side as *a p*;



and then ſay, As the Side *d c*, Is to *d a* + *a c*, the Sum of the other two Sides :: So is the Difference of thoſe two Sides *d a* — *a c*, To a fourth Number. Half of which added to half *d c*, gives you the Segment of the Baſe *d p*; and if ſubtracted from half *d c*, it will leave the other Segment *p c*. And when thoſe Segments are thus found, the Angles are eaſily had thus; *d a* : *Radius* :: *d p* : Co-ſine of the Angle *d*, And *a c* : *Radius* :: *p c* : Co-ſine of the Angle C.

The Demonſtration of which laſt Axiom, is thus.

Demonſtration.

On the Centre *a*, with the Diſtance *a c*, deſcribe a Circle, which will interſect both the other Sides of the Triangle, and then *z d* will repreſent the Sum of the Legs *d a* and *a c*; *d e* will repreſent their Difference, and *d f* will repreſent the Difference of the Segments of the Baſe made by the Fall of the Perpendicular *a* P.

Then I ſay, *d c* : *d z* :: *d e* : *d f*; That is, *The Baſe, Is to the Sum of the Legs* : : *As the Difference between the two Sides, Is to the Difference of Segments of the Baſe*; as is apparent from *Prop.* 67. of *Pardie's* Sixth Book, after drawing the prick'd Lines *e c* and *f z*.

And then the Caſe will ſtand thus.

CASE III.

Given H, O, B, all three Sides. Required the Angles? See the Figures before.

I ſay, by this *Axiom*, B : H + O :: H — O : X, which expreſſes the Difference of the Segments of the Baſe, = *e f* in the Figure.

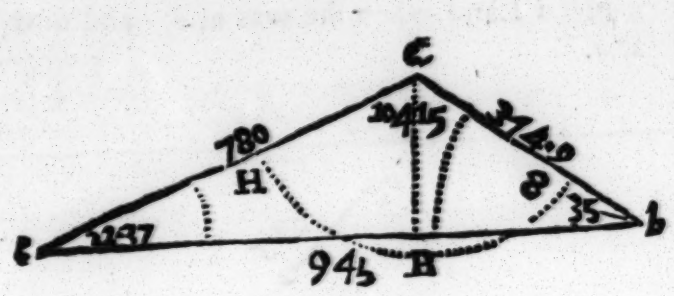
And

And then having found X; half B + half X = *d p* the greater Segment, and half B — half X = *p c*, the leſſer, by which means the two Right-angled Triangles *a d p*, and *a p c*, will be ſolved eaſily: For *d a*: *Radius*:: *d p*: Co-ſine of the Angle *d*; And *a c*: *Radius*:: *p c*: To the Co-ſine of the Angle *c*.

The Operation of the Six Caſes of Oblique-angled Triangles.

CASE I.

Given H, O, *c*. Required *b*?



O : S, *c* :: H : S, *b*?

The Numbers of the Triangles, are as follows.

√ *c* = 22° 37′
√ *b* = 53 08
√ *a* = 104 15 Or, its Suppl. = 75° 45′

H = 780
O = 374·9
B = 945
O = 2.5739154 = 347·9

S, *c* = 9.5849685 = 22° 37′
H = 2.8920946 = 780

Sum = 12.4770631

S, *b* = 9.9031477 = 53° 8′

CASE II.

Find firſt the Angle *b*, by *Caſe* 1. then will *a* be known.

Given H, O, *c*. Required B?

S, *c* : O :: S, *a* : B?

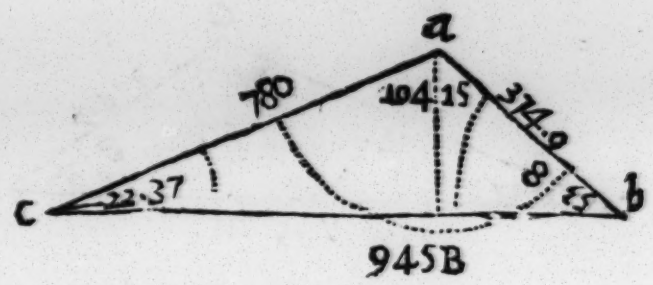
S, *c* = 9.5849685 = 22° 37′
O = 2.5739154 = 374 9
S, *a* = 9.9864273 = 104 15

Sum = 12.5603427

B = 2.9753742 = 945

CASE III.

Given *c*, *b*, O. Required H?



S, *c* = 9.5849685 = 22° 37′
O = 2.5739154 = 374 9
S, *b* = 9.9031084 = 53 8

Sum = 12.4770238

H = 2.8920553 = 780

CASE IV.

Given H, *a*, O. Required *b*, *c*?

H + O : H — O :: T, ½ Z. op. √ √ : T, ½ X op. √ √

H + O = 11540 9
H — O = 405 1
Half Z oppoſite Angles = 37 52

H + O = 3.0625820 = 1154 9
H — O = 2.6074550 = 405 1
T half Z = 9.8907254 = 37 52

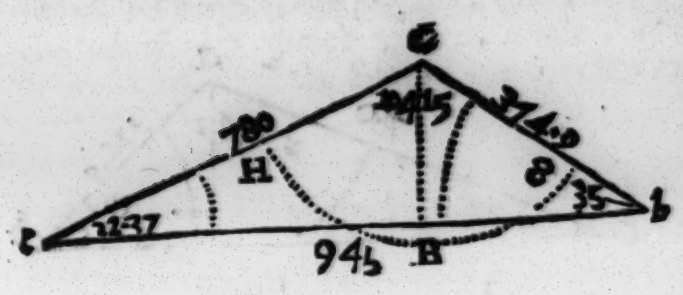
Sum = 12.4981804

T, half X. 9.4355984 = 15° 15′

Then will half Z + half X = 53 Degrees 7 Minutes = *b*; And half Z — half X = 22 Degrees 37 Minutes = *c*.

CASE V.

Given H, *a* O. Required B ?



Find the Angles *b* and *c*, by *Case* 4. then,

S, *b* : H :: S, *a* : B?

S, *b* = 9.9031084 = 53° 8′

H = 2.8920946 = 780
S, *a* = 9.9864273 = 104° 15′*

Sum = 12.8785219
B = 2.9754135 = 945

* This is the Sine of 74.45, the Supplement of 104.15, to a Semi-circle.

CASE VI.

Given H, O, B. Required Three Angles ?

B : H+O :: H−O : X.
½ B + ½ X = C B and ½ B − ½ X = B *b*.
H : R :: B *c* : Σ *c*; and O : R :: B *b* : Σ *b*.

B = 2.9754318 = 945

H+O = 3.0622058 = 1154.9
H−O = 2.6074540 = 405.1

½ B = 472 ½ 5.6696058 =
½ X = 247 ½
2.6942280 = 495

H = 2.8920453 = 780′

½ B + ½ X = 750
½ X − ½ = X225 R = 10.
B C = 2.8573225 = 720

Σ *c* = 9.9652672 = 23° 37′

O = 2.5739154

R = 10.
B *b* = 2.3521825

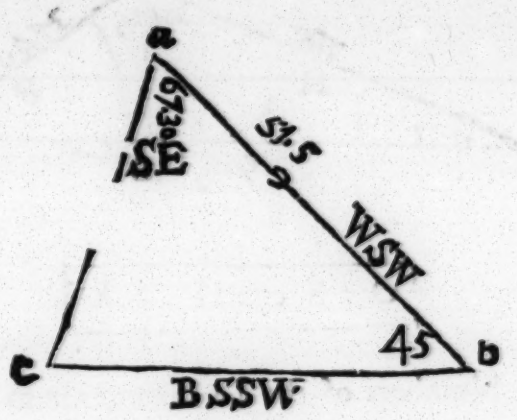
Σ *b* = 9.7782671 = 53° 08′

And when thus the Nature, Reaſon, and Method of Operation in the Calculating of the Sides and Angles of Oblique Triangles, is fully underſtood; its Application, Uſe, and Practice, will be very eaſie and plain, tho' its Extent be very large and ample. For,

Firſt, If you have a Mind to apply it to what they call *Oblique Sailing*, or the Doctrine of *Oblique Plain Trigonometry*, applied to *Sailing*; your former Triangle and Caſes will reach all that you can deſire.

As ſuppoſe a Ship Coaſting along by the Shore from the Place *b*, ſets an Head Land by her Compaſs, (as *c*) and finds it to bear from her S. S. W. then ſhe ſails on, W. S. W. 51. 5 Miles or Minutes to *a*; and then finds that the Head Land bears from her full S. E.

'Tis required to determine her Diſtance from this Head Land when ſhe was at *b*, and now ſhe is at *a*.



First, To Plot the Triangle.

Draw a ſtreight Line, as B, repreſenting the firſt bearing of the Head Land, which was S. S. W. Then from 6 Points take 2, and there remains 4 = 45°; becauſe the Ship ſailed Weſt South Weſt, make the Angle *b* equal to 45°, and ſo will the Line O repreſent the Diſtance ſailed, and *b* will be the Courſe. Prick off the Diſtance run, *viz.* 51. 5 Miles from *b* to *a* Then becauſe the Ship ſailed W. S. W. the contrary Rhumb from *a* to *b*, muſt be E. N. E. And ſince the South-Eaſt Rhumb makes with that an Angle of 67° 30′, you muſt make the Angle at *a*, juſt 67° 30′. So with the Line H, when drawn, interſect the Line B in the Point of the Situation of the Head Land *c*; and by that means will the Triangle be compleated.

This being done, if you pleaſe, (tho' Plotting the Triangle is not of abſolute Neceſſity, but very uſeful and inſtructive) then conſider, that it muſt be a Caſe of *Oblique Plain Triangles*, where is given the Angle *a* and *b*, and the Side O. Required H and B ?

To find H, ſay, (becauſe *c* is alſo known if *a* and *b* are)

S, *c* : O :: S, *b* : H?

Operation.

S, c = 9.9656153 = 67° 30′
O = 1.7118072 = 51. 5 Miles.
S, b = 9.8494850 = 45°.
Sum = 11.5612922
H = 1.5956769 = 39. 4 Miles.

And to find B, you may ſay,

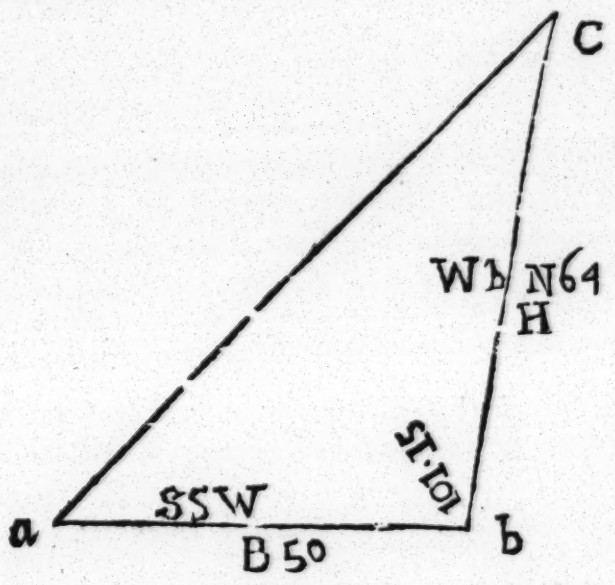
As S, b : H :: S, a : B?

Or,

As S, c : O :: S, a : B?

I ſhall give but one Inſtance more in this Matter, which is this.

Suppoſe a Ship ſail S. S. W. 50 Leagues, and then W. by N. 64 Leagues: What was her direct Courſe, and what is her Diſtance from the Place ſhe went from?



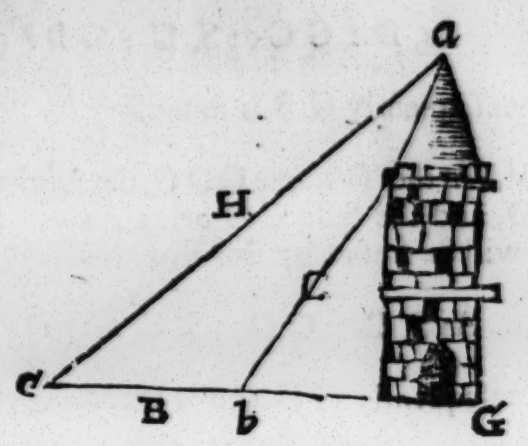
To Plot the Caſe.

Let b be the Place from whence the Ship ſailed, and let B repreſent the S. S. W. Rhumb, and the Diſtance thereon run = 50 Leagues, from b to a.

Then, ſince the firſt Courſe was two Points, and the Second ſeven Points from the Meridian, make an obtuſe Angle at b, equal to 9 Points, 101° 15′: And on the Leg H. ſet 64 Leagues, then drawing the Side a c, the Triangle will be formed.

In which you have two Legs, H and B forming the Angle a, and that Angle given. And this is *Caſe* 4. of *Plain Oblique Triangles*.

Secondly, If you would apply this Part of *Trigonometry* to the Meaſuring of inacceſſible Diſtances, Heights, &c. at Land; the Practice will be very eaſie.



Suppoſe a Tower, Steeple, &c. as a G, whoſe Height you would take, but can meaſure no nearer than from c to b, but know the Length B, is = 100 Yards.

Here you can take the Angle a b G, with your Quadrant, and conſequently the Obtuſe Contiguous one, c b a, is known.

The Angle c is known after the ſame way by the Inſtrument: Wherefore having in the Obtuſe Angled Triangle H O B, the Baſe B, and the Angles c and b, you muſt find O by *Caſe* 3. of *Oblique Plain Triangles*: For ſince c and b are known their Sum ſubſtracted from 180, will leave c a b, known. Therefore ſay,

As S, a : B :: S, c : O?

And when it is thus known or found, having in the Right-angled Triangle, b a, G, the Hypothenuſe O, and the Angle b.

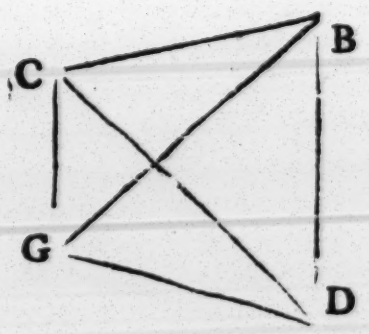
By *Caſe* the 7th of Right-angled Triangles.

As R : O :: S, b : a G?

The Altitude of the Tower ſought.

Thirdly, Suppoſe an inacceſſible Diſtance, as B D, which imagine to be the Diſtance between two Forts, Baſtions, &c. on the Wall or Line of an Enemies City or Camp; and that becauſe of the Cannon, &c. you can go no nearer than the Line G C, but can meaſure from G to C, and at each Station take Angles with an Inſtrument.

Having taken then by the Theodolite, &c. the Angles G C D, and C G D, and meaſured G C: And alſo having taken the Angles C G D, and B C G. This premiſed, which is eaſily done by the Inſtrument.



You have in the Triangle C B G, the Side C G, and the two Angles G, and G C B: Wherefore, alſo the Angle C B G. Say therefore,

As, B : G C :: S, C : G B?

And consequently G B is found.

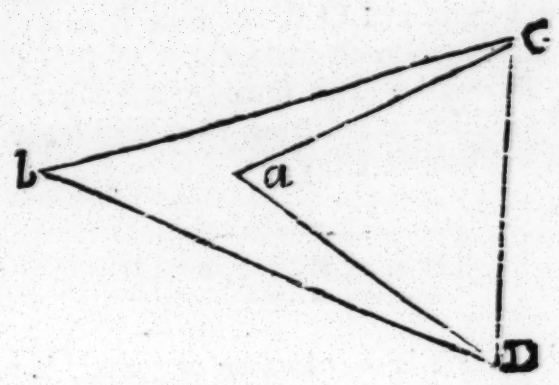
Again, in the Triangle C D G, the Angles G C D, C G D, and the Side C G being given, the Side, G D, will be found by this Proportion.

As S, D : C G :: S, C : G D?

And consequently G D also is found.

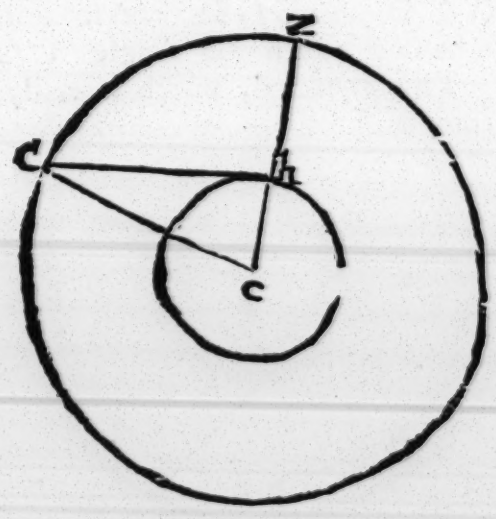
And now having in the Triangle G B D, the two Sides G B and G D, and the included Angle G; you can first find the remaining Angles severally by *Axiom* 3. and then the Side B D by *Axiom* 2.

Or, If not being able to get nearer than the Point *a*, you could not measure sideways as before, but only backward to *b*, or forward from *b* to *a*: You may then easily gain the Length from D to C.



For placing the Instrument at *a*, you can take the two Angles *b a* D and *b a* C, and take also C *a* D; measure then from *a* to *b*, and at *b* take also the two Angles *a b* D, and *a b* C. Then can you easily gain the Sides *a* C, and *a* D, in the two Triangles *b a* C, and *b a* D; and having before taken by the Instrument the Angle C *a* D, you may find the Side C D in that last Triangle *a* C D, by the second and third *Axioms* of *Plain Oblique Trigonometry*. Also,

Fourthly, On the Application of this Part of *Trigonometry*, to the Doctrine of *Astronomy*, depends the Method for finding the Parallax and Distance of a Planet, or Star.



Let *c* be the Centre of our Earth, and *h* a Point on its Surface; at which, an Observer at *h* takes with an Instrument the Angle ☾ *h z*, or the Distance of the Meridian Moon ☾, from her Zenith at *z*.

Her true Distance from the Zenith, is known by the Astronomical Tables; which is the Angle ☾ *c z*: But the observed Angle ☾ *h z*, being external to the Triangle, ☾ *h z*, will be = to ☾ + *c*.

Where take *c* from it, and the Remainder is the Angle *h* ☾ *c* = to the Moon's Parallax, whose Subtense is *h c* = to the Earth's Semidiameter.

Suppose that *h c* be 4000 Miles; then in the Triangle ☾ *h c*, there are all the Angles, and the Side *h c* known.

Wherefore,

As S, ☾ : *h c* :: S, *h* : ☾ *c*?

Which is the Moon's Distance from the Centre of our Globe.

And also, as

S, ☾ : *h c* :: S, *c* : ☾ *h*?

The Moon's Distance from the Place of Observation.

TRIGONOMETRY *Spherical.*

Definition 1.

A *Spherical Triangle* is made by, or contained under the Arks of three great Circles of the *Sphere*.

Definition 2.

A *Spherical Angle*, is the mutual Inclination or Aperture of the Planes of two great Circles.

Properties of Spherick Triangles.

1. When one Circumference of a Circle cuts, crosses, or falls on another, the Sum of the Angle made thereby is equal to two right ones.

2. When two Circumferences of Circles cros each other, tho' opposite or vertical Angles are always equal.

3. In every *Spherical Triangle*, the greater Angle is opposite to the greater Side.

4. An *Isosceles Spherical Triangle*, hath its Angles at the Base equal to each other; the *Converse* of which also is true, That if the Angles at the Base are equal, the Triangle is an *Isosceles*.

5. If two *Spherical Triangles* are mutually *Equilateral*, they are also *Equiangular* and *Similar* one to another.

6. If two *Spherick Triangles* have in each one Angle and two Sides including it; or if they have one Side and two Angles adjacent respectively equal, the whole Triangles are equal.

7. Any two Sides of a *Spherick Triangle*, are longer than the Third; because the Ark of a great Circle is the nearest Distance between any two Points on the Sphere.

8. All

8. All great Circles muſt cut each other into two equal Parts, becauſe their common Interſection is a Diameter of the Sphere; and conſequently, the two Points of Interſection are at the Diſtance of a Semicircle from each other.

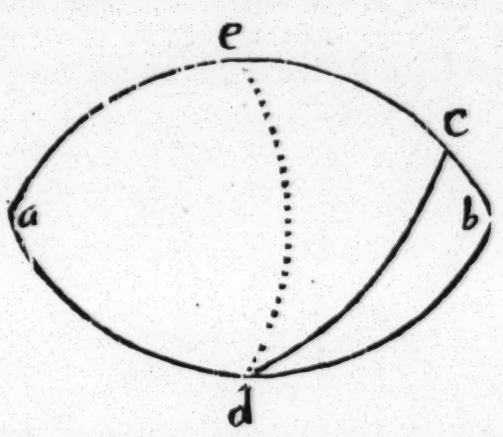
COROLLARY.

Hence 'tis plain, That every Side of a Spherick Triangle muſt be leſs than a Semicircle.

9. The oppoſite Angles at the Interſection of two Circles are always equal, becauſe the ſame Planes conſtitute both Angles; that is, the Angle *a* is equal to the Angle *b*: See Figure below.

10. In a *Spherical Triangle*, if the Sum of the Legs of any Angle be greater, equal, or leſs than a Semicircle; the internal Angle at the Baſe is accordingly greater, equal, or leſs than the outward and oppoſite one; and conſequently, the Sum of the two internal Angles at the Baſe is greater, equal or leſs than two Right Angles.

DEMONSTRATION.



If *a c* + *c d* be greater than *a b*, *d c* muſt be longer than *c b*, and conſequently, the Angle *b* (= *a*) will be bigger than the Angle *c d b*. *Property* 3. But if *a c* + *c d* be equal to a Semicircle, then *d c* will be equal to *c b*, and the Angle be = Angle *c d b*. And in the Triangle *d c b*, becauſe *d c* + *c d* is leſs than *a b*; therefore *a c* is greater than *c d*, and conſequently the external Angle *a d c* is greater than the Angle *a*; that is, than the Angle *b*, the internal Angle at the Baſe.

Alſo, ſince the Angle *a d c* + the Angle C *d b* = two Right Angles, therefore the Angle *a d c* + the Angle *a* is great than two Right Angles, *&c.*

11. In an Iſoſceles Sph. Triangle, if one of the equal Legs is greater, equal, or leſs than a Quadrant, the Angle is accordingly greater, equal, or leſs than a Right one.

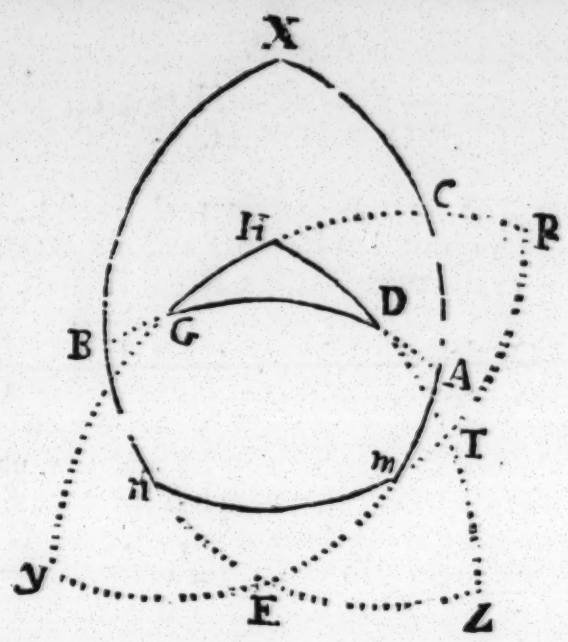
12. The Sum of the three Sides of every Sph. Triangle, is leſs than a Circle.

For *c d* is leſs than *c b* + *b d*, wherefore *a c* + *d c* + *d a*, muſt be leſs than the Sides *a c b* + *a d b*: See the Figure above.

13. The Meaſure of any *Spherick Angle*, is an Ark of a great Circle deſcribed from the Angular Point, and preciſely 90 Deg. diſtant from it; that is, making the Angular Point the *Pole* of that Circle.

14. The Poles of the Sides of any Triangle G H D, do on the Surface of the Globe, conſtitute another Triangle *n x m*, which may be called Supplemental to the Triangle G H D; for the Supplements of the Angles and Sides of the Triangle *n x m*, are equal to the Sides and Angles of the Triangle G D H.

DEMONSTRATION.



From the Points G H D, as Poles deſcribe three great Circles *x* A *y*, R T *m n*, *x* B *n z*, then is *y m* = Quadrant = A *x*; becauſe *m* is the Pole of H G *y*, and *x* or E the Pole of G A, therefore *m x* = A *y* = Supplement of C A = Angle H G D, and *z n* is Quadrant = B *x*, therefore *n x* = B *x* = Supplement of Angle G H D, and *n* T = Quadrant = *m* R, therefore *n m* = T R = Supplement of the Angle D H G.

Note, That the Triangle *n* E *m* conſtituted between the three next Poles, has its three Sides and Angles equal to the Angles and Sides of the Triangle G H D, ſave that the greateſt Side *n m* is the Supplement of the greateſt Angle H, and the Angle E the Supplement of the Side G D.

15. Any Angle of a Triangle, with the Difference of the other two, is leſs than two Right Angles. For, *x n* is leſs than *x m* + *m n*:

That is,

$$2\angle - D < 2\angle - G + 2\angle - H.$$

Therefore,

$$G + H - D < 2\angle.$$

For ſince $2\angle - D < 2\angle - G + 2\angle - H$:

That is,

$$2\angle - D < 4\angle - G - H,$$

By transfering D, G, and H, 'twill be $2\angle + G + H < 4\angle + D$; then by taking away $2\angle$ from both Sides, and transfering D, you'll have $G + H - D < 2\angle$. *Q. E. D.*

16. If

16. If two Triangles are mutually Equiangular, they are alſo mutually Equilateral; for becauſe they are Equiangular, their Supplimental Triangles are Equilateral, (by 14th) and therefore Equiangular (by 15th) and therefore the propoſed Triangles are Equilateral (by 14th.)

17. *Firſt*, The 3 Angles of every Triangle are greater than 2 Right Angles, and leſs than 6 Right ones.

For $nx + mx + mn < 4\ \angle$ (by 12.)

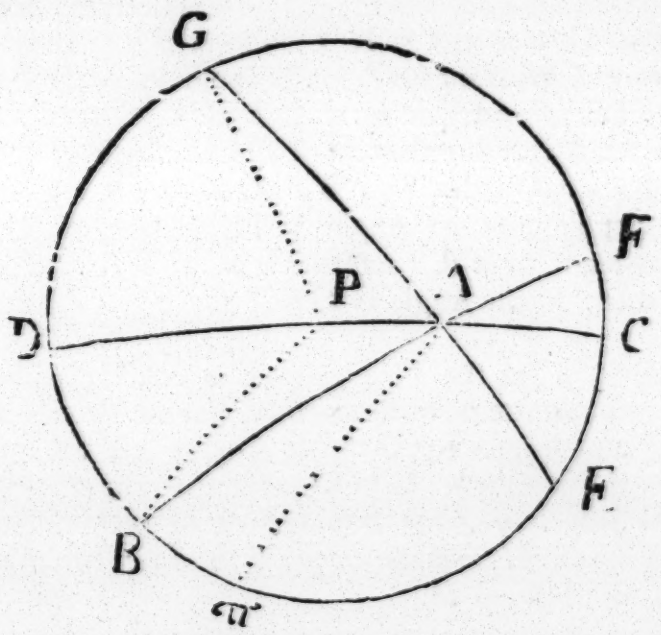
That is,

$$6\ \angle - D - G - H < 4\ \angle,$$
$$i.e.\ 2\ \angle < D + G + H.$$

2*dly*, The Sum of the internal Angles, is leſs than the Sum of the Internal and External, both which, in all, make but ſix Right Angles.

18. Of ſeveral Arks of great Circles falling from the ſame Point of the Sphere's Surface on another Circle, the greateſt is that which paſſes through the Pole of the Circle, and the next to this, is greater than that which is farther off.

For ſuppoſe P the Pole of the Circle C ϖ D, and ϖ the Pole of D P C; then is A D > A B > A E > A C; and the Arch B ϖ C > B P > B D.



19. A great Circle paſſing through the Poles of another great Circle, cuts it at Right-angles; and on the contrary, if it cuts it at Right-angles, it paſſes through its Poles. Thus the Angle P B D = ∠ = P G D = P D B, alſo = to ϖ A C.

20. In an oblique angled Triangle, if the Angles at the Baſe are *like*, or of the ſame kind, *i.e.* both Acute, or both Obtuſe; the Perpendicular falls within the Triangle, and the Quadrantal Ark without: But if they be *unlike*, the Perpendicular falls without, and the Quadrant within. For the Triangle E A F has the Angles E and F Acute, and the Perpendicular A C falls within, and the Quadrant A ϖ without. Alſo the Triangle B A G hath B and G obtuſe; and the Perpendicular A D within, and the Quadrant A ϖ without: But the Triangle B A E has the Angle B, E of different kinds, and the Perpendicular A C without, and the Quadrant A ϖ within.

Alſo, by the ſame Figure is manifeſt, how the *Ambiguities* of Right-angled Triangles may be ſolved, *viz.*

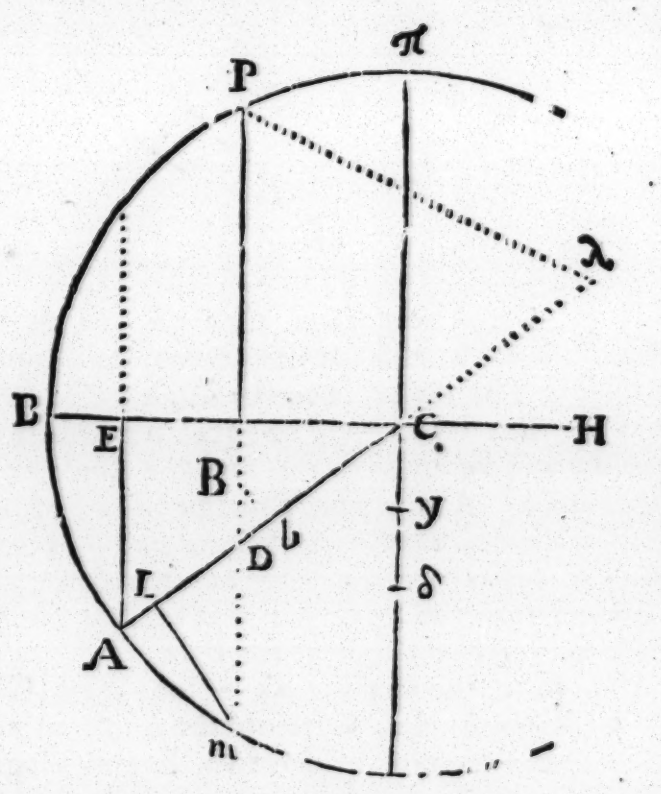
SOLUTIONS.

1. The Legs of the Right-angle are of the ſame kind with the oppoſite Angles. So in the Triangle B D A, becauſe D A is greater than a Quadrant D P, the Angle D B A is greater than the Right-angle D B P: And in the Triangle B C A, becauſe A C is leſſer than the Quadrant P C, the Angle C B A is leſſer than the Right-angle C B P.

2. If the Legs (and conſequently the Angles) are of the ſame or different kinds; the Hypothenuſe is accordingly leſſer or greater than a Quadrant: So in the Triangles E D A, E C A, the Hypothenuſe A E is leſſer than a Quadrant; but in the Triangle B D A, the Hypothenuſe A B, is greater than the Quadrant B P.

3. If the Hypothenuſe is leſs or greater than a Quadrant, either Leg, with its adjacent Angle, is accordingly of the ſame or different kind, as follows from the two laſt.

For the viewing the Sines, Co-ſines, and other Right-Lines of Arks, which are not viſible in a common Sphere; Let the Arks of three great Circles of Card Paſte-board be put together, as in an Armillar Sphere.

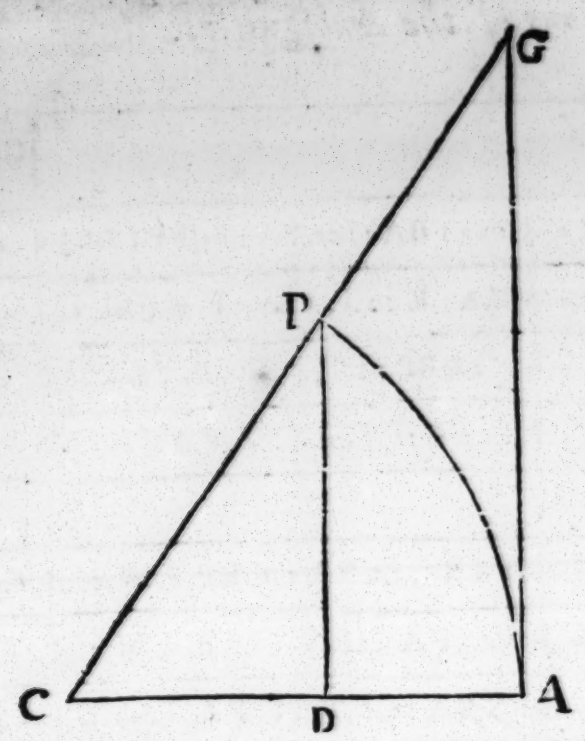


As ſuppoſe the two Arks B P, B A, and that B P H, the Plane of the greater Ark were turn'd round B H, till that a Right-Line falling from P perpendicular to the Plane B A H, may fall on the ſame Point of the Line C A, ſuppoſe on D; for in that Poſition P A B will be a Spherick Triangle Right-angled at A, and B P the Hypothenuſe, B A the Baſe, P A the perpendicular Arch.

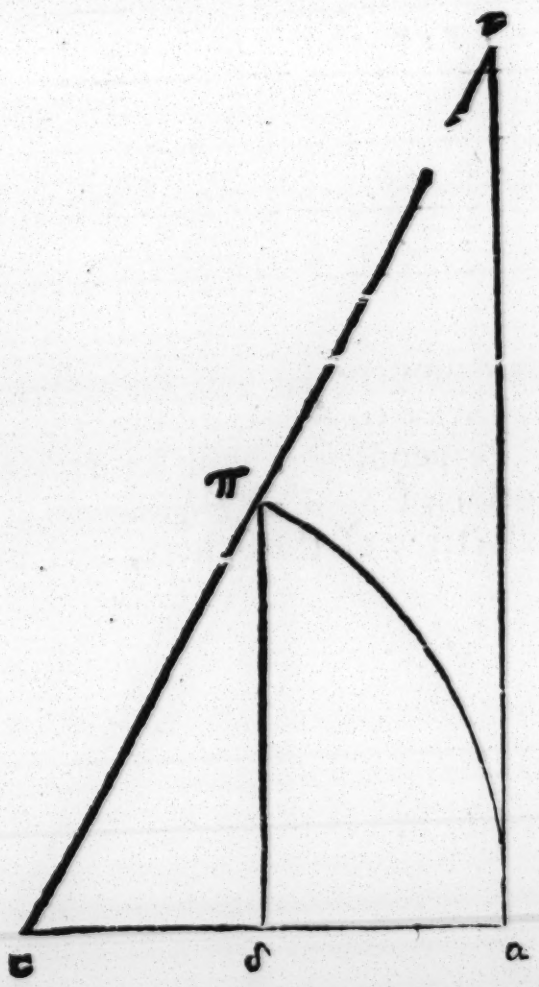
And ſuppoſe P A (in the next Figure) be equal P A of the Triangle, and fitted according to its Letters therein, and draw A E, P F Perpendicular to B C; ſo A E, P E, P D, will be Sines of the Arks B A, B P, P A, and their Co-ſines will be E C, F C, D C.

Theſe

Theſe things being done and conceived, the two firſt Axioms of *Sperick Trigonometry* will preſently appear, and alſo the Demonſtration of the 16 Caſes of Right-angled Triangles, without any other Figure or Production of Sides, as is uſual.



To that End, let the Ark $\varpi\alpha$ (*Fig.* 3.) be alſo fitted in the Solid, according to its Letters; (*as you will find it very well done in Mr.* Heynes's *Trigonom.*) Then in the two Right-angled Spherick Triangles. P B A, ϖ B α, having the ſame Acute Angle B, at the Baſe.



AXIOM I.

The Sines of the Hypothenuſes are proportional to the Sines of the Prependiculars.

P F : P D :: ϖ C : $\varpi\delta$.

AXIOM II.

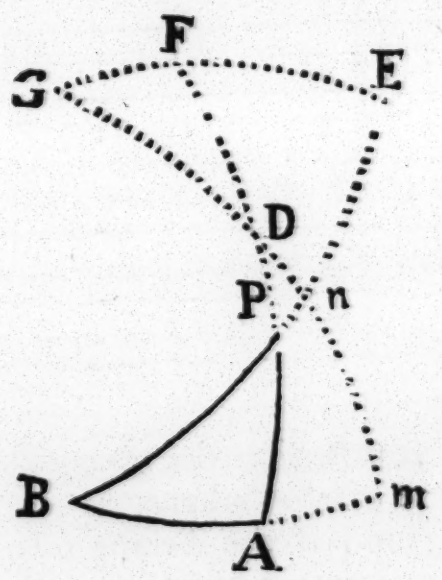
The Sines of the Baſes are proportional to the Tangents of the Perpendiculars.

A E : A G :: α C, $\alpha\gamma$.

For the two Right-angled Triangles F P D, C $\varpi\delta$, are ſimilar; as alſo E A G, and C $\alpha\gamma$.

And for the Solution of the following *Caſes*, I ſuppoſe B A P (in this Figure) a Right-angled Triangle, and its Sides produced to Quadrants B N, B M, A D.

Suppoſe alſo, P E, P F, N G, and E G, Quadrants. Then is N E equal to B P, and the Complement of B A equal to A M, equal to *b* A D M, and F E equal to Angle F P E, equal to Angle B P A, and G D equal to N M, equal to Angle B, and the Angles at A, M, N, E, and F, right.



N. B. The Reaſon of producing the Sides of the Triangle B A P to Quadrants, is, becauſe by this Means the Angles may be turned into Sides, and the Hypothenuſes into Saſes and Perpendiculars *& è contra*: And from hence it comes to paſs, that the Parts of the Triangle given, do ſometimes fall in Co-ſines and Co-Tangents, inſtead of Sines and Tangents.

Here follow the Proportions for *Right-angled Triangles.*

The Propoſitions for the Solution of the Sixteen Caſes of Right-angled Spherick Triangles, *with their Solutions of the Ambiguities.*

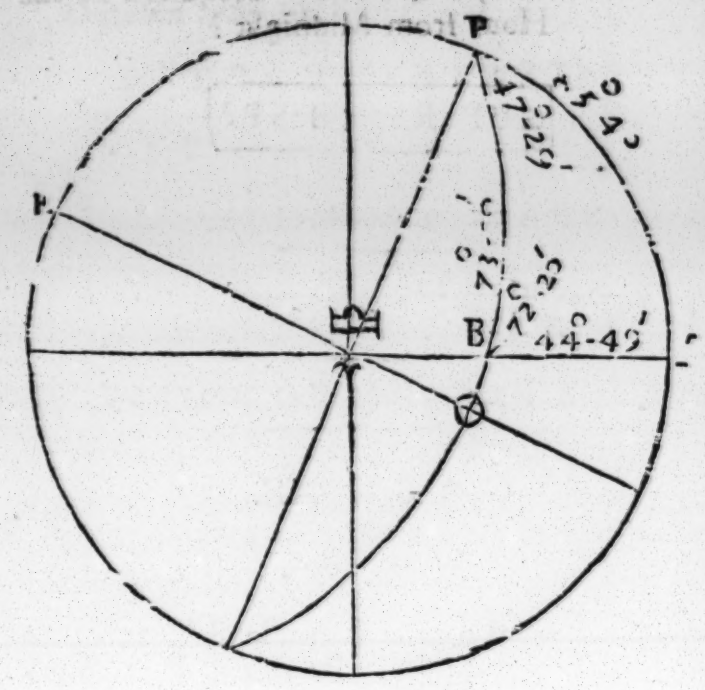
N. B. If you Project the given Triangle within a Primitive Circle, according to the Doctrine of the Sphere, as was ſhewed under *Spherick Geometry*, all Ambiguities will vaniſh ; and if the Triangle be Oblique, the Perpendicular will be drawn alſo: And this is a very good Way to gain a clear Notion of *Spherical Trigonometry* ; which cannot be underſtood throughly, without the Doctrine of the Sphere, and its ſeveral Projections be firſt learn'd.

Examples,

Examples of the Sixteen Cases of Right-angled Spherical Triangles.



For the Sun's Declination.

CASE I.

Given the Compliment of the Sun's Amplitude B A, and the Latitude P A: Required the Suns Diſtance from the Pole P B, which is the Compliment of his Declination?

R : Σ B A :: Σ P A : Σ B P?

R. = 10. 0000000

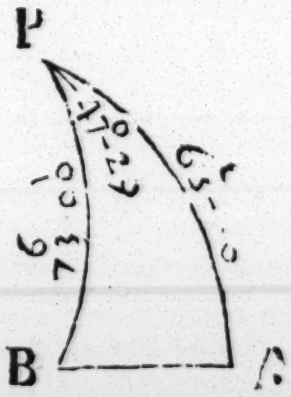
Σ B A = 9. 8508702 = 44° 49'
Σ P A = 9. 6149441 = 65 40

Σ P B = 9. 4658143 = 73

Wherefore the Sun's Declination is 77 Deegrees, = ⊙ B.

CASE II.

Given as before B A and P A. Required B, the Angle of the Suns Poſition?



S, B A : R :: T. P A : T, B?

S, B A = 9. 8480909

Radius = 10.
T, P A = 10. 3446523
T, B = 10. 4965614 = 72° 20'

CASE III.

Given B P, equal to the Sun's Diſtance from the Pole, and P the Sun's Hour from Midnight. Required B, the Angle of the Sun's Poſition?

R : Cos. B P :: T, P : *t*, B?

Radius = 10.

Σ B P = 9. 4659353
T, P = 10. 0376939

t, B. = 72° 20' = 9. 5036292

CASE IV.

For the Latitude.

Given B P equal to the Sun's Diſtance from the Pole, and P the Hour from Midnight. Required P A the Latitude?

R. Σ P :: T, B P : T, P A?

Radius = 10.

Σ P = 9. 8298212
T, B P = 10. 5146610

T, P A = 10. 3444822 = 65° 40'

CASE V.

For the Sun's Amplitude.

Given as before B P and P. Required B A, equal to the Sun's Amplitude?

R : S, B P :: S, P : S, B A.

Radius = 10.

S, B P = 9. 9805963
S, P = 9. 8675151

S, B A = 9. 8481114 = Co-Amplitude

Wherefore, the Sun's Amplitude will be 45° 11'.

CASE VI.

For the Sun's Declination.

Given P A equal to the Latitude, and P the Hour from Midnight. Required B P equal to the Diſtance from the Pole, or the Sun's Co-Declination?

Σ B : R :: T, P A : T, B P?

Σ P = 9. 8298212

Radius = 10.
T, P A = 10. 3446523

T, B P = 10. 5148311 = 73°

CASE VII.

For the Angle of the Sun's Position.

Given as before P A, and P. Required B?

R. Σ P A :: S, P : Σ, B?

R. = 10.

Σ P A = 9. 6149441
S, P = 9. 8675151

Σ B = 9. 4824592 = 72° 20'

CASE VIII.

For the Latitude.

Given B A equal to the Sun's Amplitude, B equal to the Sun's Position. Required P A the Latitude?

R : S, B A :: T, B : T, P A?

Radius = 10.

S, B A = 9. 8480909
T, B = 10. 4968908

T, P A = 10. 3449817 = 65° 40'

CASE IX.

Given P A equal to the Latitude, and B the Angle of Position. Required B A equal to the Amplitude?

T, B : R :: T, P A : S, B A?

T, B = 10. 4968908

Radius = 10.
T, P A = 10. 3446523

S, B A = 9. 8477615 = 40° 49'

CASE X.

For the Sun's Distance from the Pole.

Given P A and B, as before. Required B P, the Sun's Distance from the Pole?

S, B : R :: S, P A : S, B P?

S B = 9. 9790192

Radius = 10.
S, P A = 9. 9595964

S, B P = 73° 0' = 9. 9805772 = Co-Declin.

Wherefore the Declination is 17 Degrees.

CASE XI.

For the Hour from Midnight.

Given, as before, P A and B. Required P, the Hour from Midnight?

Σ P P : R :: Σ B : S P?

Σ P A = 9. 6149441

Radius = 10.
Σ B = 9. 4821283

S, P = 9. 8671842 = 47° 29'

CASE XII.

For the Hour.

Given P A, equal to the Latitude B P, equal to the Sun's Amplitude. Required P = Sun's Hour from Midnight?

T, B P : R :: T, P A : Σ P?

T, B P = 10. 5146610

Radius = 10.
T, P A = 10. 3446523

Σ P = 9. 8299913 = 47° 21'

The Hour from Midnight 47° 29' = 3 H. 10'.

CASE XIII.

For the Angle of Position.

Given, as before, P A : P B. Required B, and the Angle of the Sun's Position?

S, B P : R :: S, P A : S, B?

S, B P = 9. 9805963

Radius = 10.
S, P A = 9. 9595964

S, B = 9. 9790001 = 72° 20'

CASE XIV.

Given Latitude and Declination. Required the Sun's Amplitude?

Given, as before, P A and P B. Required B A = Sun's Amplitude?

P A : R :: Σ B P : Σ B A.

Σ P A = 9. 6149441

Radius = 10.
Σ B P = 9. 4659353

Σ B A = 9. 8509912 = 44° 49'

Equal to the Co-Amplitude, wherefore the Sun's Amplitude = 45° 11'.

CASE

CASE XV.

Given B the Angle of the Sun's Poſition, and P the Hour from Midnight. Required B P the Sun's Diſtance from the Pole?

T, P : R :: *s*, B : Σ BP?

T, P = 10. 0376939

Radius = 10.
s, : B = 9. 5031092

s, : BP = 9. 4654053 = 73°

CASE XVI.

Given as before B, the Angle of Poſition, and P the Hour from Midnight. Required P A = the Latitude of any Place?

S, P : R :: Σ B : Σ PA?

S, P = 9. 8675151

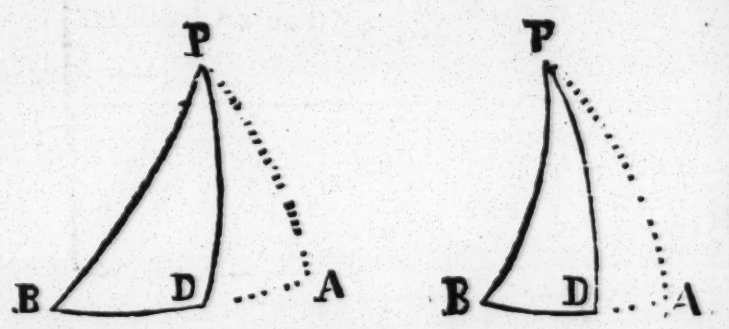
Radius 10.
Σ, B = 9. 4821283 = 72° 20′

Σ, PA = 9. 6146132 = 24° 19′

Oblique Spherical Triangles, may be reduced to two Right-angled Spherical ones, by letting fall a Perpendicular, which either divides the Oblique Triangle propoſed into two Right ones, or makes two Right ones, by adding a Right-angle Triangle to it.

In *Oblique Triangles* there are 12 *Caſes*, 10 of which (by this Preparation) may be ſolved by the two firſt *Axioms*, or by Rules deduced from them.

RULE I.



The Co-ſines of the Angles at the Baſe, are proportional to the Sines of the Angles at the Vertex. For by *Caſe* 7. of *Right-angled Spherick Triangles*.

R : *cs*, PA :: S, BPA : *cs*, B?
R : *cs*, PA :: S, DPA :: *cs*, D?
Therefore *cs*, B : S, BPA :: *cs*, D : S, DPA?

RULE II.

The Co-ſine of the Sides are proportional to the Co-ſines of the Baſes. For by *Caſe* 1. of *Right-angled Spherick Triangles*.

R : *cs*, PA :: *cs*, BA : *cs*, BP?
R : *cs*, PA :: *cs*, CA : *cs*, DP?
Therefore, *cs*, BA : *cs*, BP :: *cs*, DA : *cs*, DP?

RULE III.

The Sines of the Baſes are reciprocally proportional to the Tangents of the Angles at the Baſes. For by *Axiom* 2.

S, BA : R :: T, PA : T, B?
S, DA : R :: T, PA : T, D?
Therefore S, BA × T, B = R × T, A = S, DA × T, D?
Conſequently S, BA : S, DA :: T, D : T, B?

RULE IV.

The Tangent of the Sides, are reciprocally proportional to the Co-ſines of the Angles at the Vertex. For by *Caſe* 4.

T, BP : R :: T, PA : *cs*, DPA?
T, DP : R :: TPA : *cs*, DPA?
Therefore T, BP : T, DP :: *cs*, DPA : *cs*, BPA?

AXIOM III.

In any Triangle the Sines of the Sides are proportional to the Sines of the oppoſite Angles. For by *Axiom* 1.

S, BP : R :: S, PA : S, B?
S, DP : R :: S, PA : S, D?
Therefore S, BP : S, DP :: S, D : S, B?

In letting fall your Perdendicular, obſerve this Rule.

Let it fall from the End of a given Side, and oppoſite to a given Angle.

For by ſo doing, you have enough given in one of the Right-angled Triangles to dertermine any of its unknown Parts.

The two firſt Caſes are ſolved each by one Operation by the third Axiom; the other eight Caſes are ſolved each by two Operations.

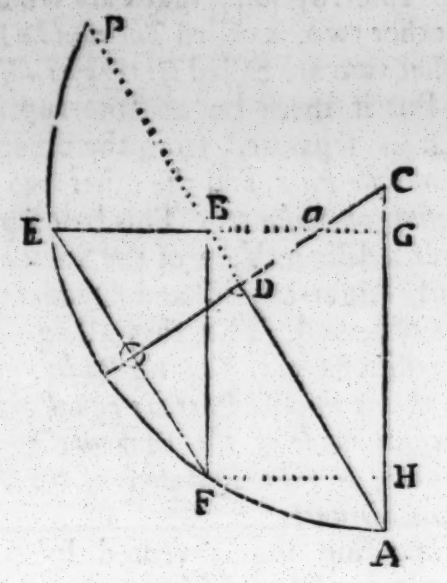
Obſerve alſo, the Addition or Subſtraction both of the Segments of the Baſe, and Angles at the Vertex, according as the Perpendicular falls within or without the Triangle.

Proportions for the Solving the first Ten Caſes of Oblique Spherick Triangles.

Caſe.	Given.	Req.	Proportion.
1	BP. PD. B.	D.	S, PD : S, B :: S, BP : S, D. *Ambiguous.*
2	BP. B. D.	PD.	S, D : S, BP : S, B : S, PD. *Ambiguous.*
3	BP. PD B.	BD.	R : *cs*, B :: T, BP : T, BA, by Caſe 4th of Right-angled Spherick Triangles. Then *cs*, BP : *cs*, BA :: *cs*, DP : *cs*, DA, by *Rule* 2d. Then BA ± DA = BD, according as the Perpendicular falls within or without the Triangles; which is doubtful, unleſs the Kind of the Angle D is known.
4	BP. PD. B.	P.	R : *cs*, BP :: TB : *ct*, BPA, by *Caſe* 3d. And then, T, DP : T, BP :: *cs*, BPA : *cs*, DPA, by *Rule* 4th. Then BPA ± DPA : = PBD. Here alſo, the falling of PA is doubtful, unleſs you know the Kind of the Angle D.
5	BP, B, D.	P.	*cs*, BP : R :: *ct*, B : T, BPA, by *Caſe* 3d. Then, *cs*, B : S, BPA :: *cs*, D : S, DPA, by *Rule* 1. then, if B and D are {alike / unlike} BA ± DPA = BD.
6	BP, B, D.	BD.	*cs*, B : R :: *ct*, BP : *ct*, BA, by *Caſe* 4th. Then T, D : T, B :: S, BA : S, DA, by *Rule* 3d. And then, if B and D are {alike / unlike} BPA ± DA = BPD.
7	B, P. BP.	D.	*cs*, BP : R :: *ct*, B : T, BPA, by *Caſe* 3d. Then *s*, BPA : *s*, DPA :: *cs*, B : *cs*, D, by *Rule* 1. If BPA > BPD, and B {acute / obtuſe}, D is {obtuſe / acute} But if BPA > BPD, and B {acute / obtuſe}, D is {acute. / obtuſe.}
8	B, P. BP.	DP.	*cs*, BP : R :: *ct*, B : T, BPA, by *Caſe* 3d. Then *cs*, DPA : *cs*, BPA :: T, BP : DP, by *Rule* 4th. Then, if DPA is {like to / unlike} B, DP is {< / >} than a Quadrant.
9	BP. BD. B.	DP.	*cs*, B : R :: T, BP : T, BA, by *Caſe* 4th. Then *cs*, BA : *cs*, BP :: *cs*, DA : *cs*, DP, by *Rule* 2d. Then, if DA is {like / unlike} (PA) > B, BD is {< / >} than a Quadrant.
10	BP. BD. B.	D.	*cs*, B : R :: T, BP : T, BA, by *Caſe* 4th. Then S, DA : S, BA :: T, B : T, D, by *Rule* 3d. Then if BA is {< / >} BD, D is {like / unlike} B.

LEMMA.

The Difference of the verſed Sines of two Arks multiplied by half the Radius, is equal to the Sine of half the Sum of thoſe Arks multiplied by the Sine of half the Difference of the Arks.



Suppoſe, A F, A E, the two Arks; the Difference of the verſed Sines is A G — A H = G H = B F, and the Sine of half the Sum of the Arks is A D, for E P = F A, the Sine of half the Difference of the Arks is F O. Now the Triangles A C D, E F B are Similar, (for the Triangles *a* C G, E *o a* are Similar, therefore the Angle C equal to the Angle E) therefore, as A C : A D : : F E : F B, or $\frac{1}{2}$ A C : A D : : $\frac{1}{2}$ F E (*i. e.* F *o*) : F B; therefore $\frac{1}{2}$ A C × F B = F O × A D. For ſince A C : A D : : F E : F B; therefore A C × F B = A D × F E; and conſequently $\frac{1}{2}$ A C × F B = $\frac{1}{2}$ A D × F E: that is = A D × $\frac{1}{2}$ E F : = A D × O F. *Q. E. D.*

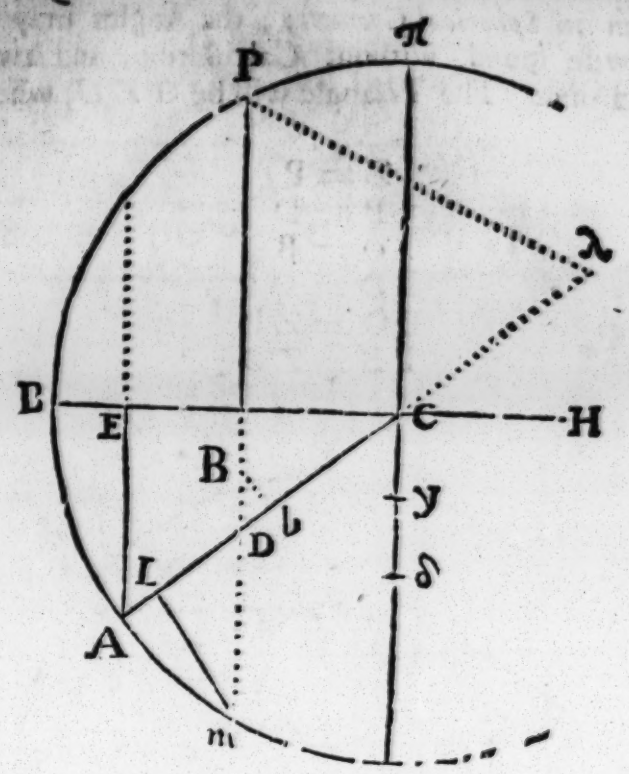
AXIOM IV.

The Rectangle, or Product of the Sines of the Legs, Is to the Square of the Radius : : As the Difference of the verſed Sines of the Baſe, and of the Difference of the Legs, To the verſed Sine of the Vertical Angle.

Demonſtration.

Reſume the foreſaid Circles of Paſteboard, and ſuppoſe there B the Angle required, B A, B P, (equal B M) its Legs, P A the Baſe to be any way oblique to the Plane B A, and not perpendicular as before. Then will B P A be an oblique Triangle.

Let fall P B perpendicular to B *m*, and π *y* perpendicular to C *a*, and B *b* to *b* A, and *m* L perpendicular to *c* A; therefore B *b* is perpendicular to *c* A, and *b* L equal *b* A — L A equal to the verſed Sine of the Baſe, leſs the verſed Sine of the Difference of the Legs.



But A E : A C : : *b* L : B *m*.

And *m* F : *a c* : : B *m* : *y a*.

Therefore multiplying the Correſpondent Terms of both Proportions,

A E × *m* F : A C × *a* C : : (*b* L × B *m* : B *m* × *y a*
b L : *y a*.

CASE XI.

The Three Sides of any Spherick Triangle being given, to find an Angle.

The Rectangle of the Sines of the Legs, Is to the Square of the Radius : : As the Sine of $\frac{1}{2}$ *Baſe more* $\frac{1}{2}$ *diff. of the Legs multiplied by the Sine of* $\frac{1}{2}$ *Baſe leſs* $\frac{1}{2}$ *diff. of the Legs, Is to the Square of the Sine of* $\frac{1}{2}$ *the Angle required.*

Demonſtration.

A E × *m* F : Rq : : (by *Ax.* 4. *b* L : *y a*) *b* L × $\frac{1}{2}$ R : *y* R × $\frac{1}{2}$ R; (*i. e.* by the foregoing *Lemma*, and the firſt in Mr. *Caſwell*'s Trigonometry.)

A E × *m* F : R *q* : : S, $\frac{1}{2}$ Baſe × $\frac{1}{2}$ diff. *c r* × S, $\frac{1}{2}$ Baſe — $\frac{1}{2}$ diff. *c r* to S *q* $\frac{1}{2}$ Angle.

Example in Numbers.

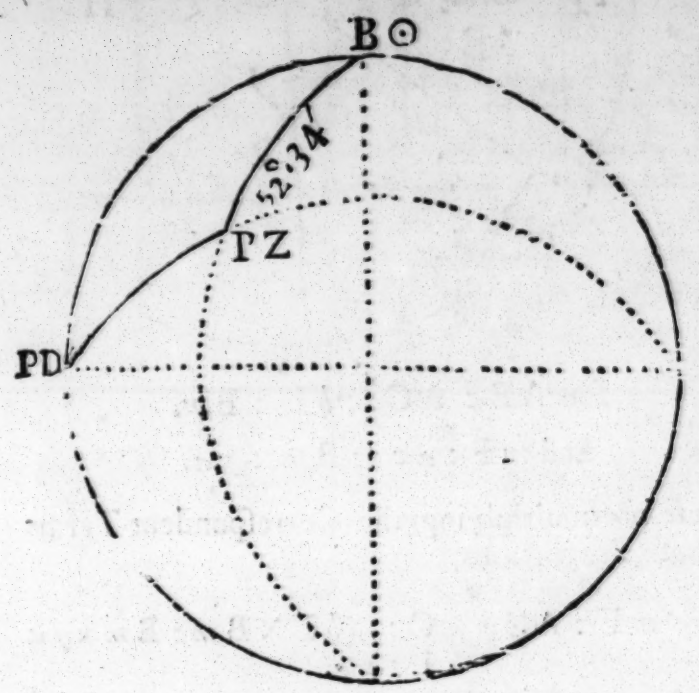
Suppoſe B P equal 60°. 10′, D P equal 46°. 42′, B D equal 87°. 30′ were given, and the Angle P required?

$\frac{1}{2}$ the Baſe is	43°. 45′
$\frac{1}{2}$ the Diff. of the Sides is	6. 44
$\frac{1}{2}$ the Baſe + $\frac{1}{2}$ Diff. of the Sides is	50. 29
$\frac{1}{2}$ the Baſe — $\frac{1}{2}$ Diff. of the Sides is	37. 01
Rad. Sq.	20.0000000
S, $\frac{1}{2}$ Baſe + $\frac{1}{2}$ diff. *c r* × S, $\frac{1}{2}$ Baſe — $\frac{1}{2}$ diff.	19.6669325
Sum	39.6669325
Subſtract the □ of the Sine of the Legs	19.8002534
Remainder = Sq. of the Sine of $\frac{1}{2}$ ∠ P	19.8666791
The $\frac{1}{2}$ of which is the Sine of 59°. 03′	9.9333395
That is $\frac{1}{2}$ the Angle required.	
Therefore being doubled is	118°. 06′ = P.

If

If these Data's were projected by the Directions given in *Spherical Geometry*; the Angles may be likewise found, without Calculation, and 'twill stand thus. The Triangle will be ⊙ Z D, where

Z = P
P = D
⊙ = B
BD = ⊙P
PD = ZP
PB = Z⊙



CASE XII.

The three Angles being given, to find a Side.

The Angles adjacent to the Side requir'd, call Legs; and the Angle oppoſite, call Baſe: Then work as in the 11th *Caſe*.

For, ſuch is the Operation in the Supplemental Triangle, whoſe Angles and Sides are equal to the Supplements of the Sides and Angles of the Triangle propoſed: But Arks and their Supplements, have the ſame Sines and Tangents.

Example in Numbers.

In the Triangle B D P, there is given the

Angle { P = 143.0, *the Sun's Azimuth from the North.*
B = 15.04, *the Angle of the Sun's Poſition.*
D = 30.00, *the Hour from Noon.*

Required the Side P D, which is the *Complement of the Latitude?*

Com. *Angle* P =	37° 00′	*Ar. co.* of the Sines.		0.220537
Angle D =	30 00			0.301030
Angle B =	15 04	= *Angle op.*		
Sum =	82 04			
½ Sum =	41 02	Sines		9.817233
½ Sum — *Angle op.*	25 58	Sines		9.641323
The Sum of the 4 Logarithms equal				19.980113
Its half is the Co-ſine of 12° 13′				9.990056

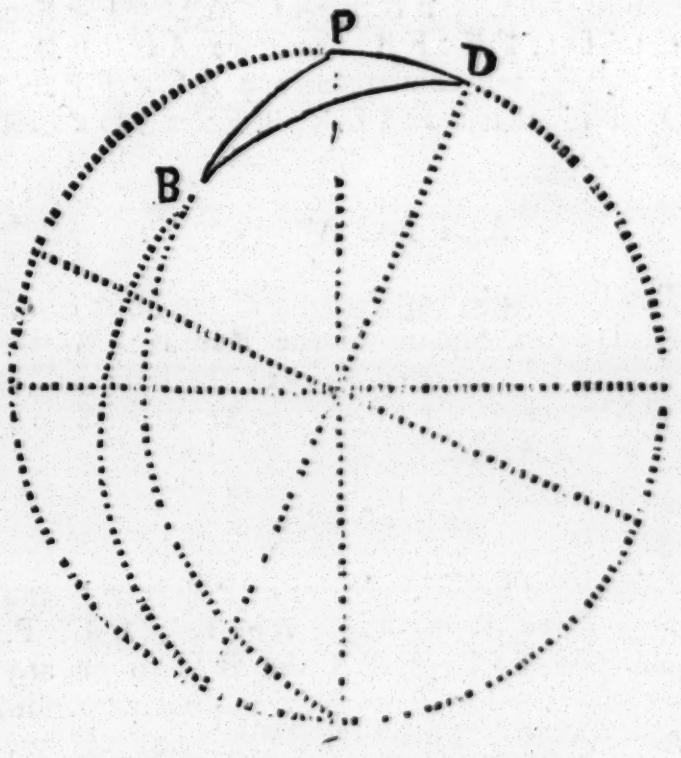
Which doubled, gives 24° 26′ equal P D equal *Complement of Latitude*: Wherefore the Latitude muſt be 65°. 34′.

In a Spherick Triangle, that is Right-angled or Quadrantal, the two Parts which are adjacent to the Right-angle or Quadrant, together with the Complements of the other three, are called, by my Lord *Napier*, *The Five Circular Parts*. And if the three Parts which enter the Queſtion, (*viz.* 2 given, and 1 required) have no Interruption, (now tho' a Right-angle or Quadrant come between, 'tis not counted an Interruption) that Part which is between the other two, is called *The middle Part*, and then the other two are called *Extreams adjacent*, or *conjunct*. But if there be an Interruption, that Part which is ſeparated from the other two, is called *The middle Part*, and the other two, are *Extreams oppoſite*, or *disjunct*. This being premiſed, *Napier*, after a diligent View of the Solutions of all the Caſes of Right-angled and Quadrantal Triangles, has obſerved, That they all agree in one or two Propoſitions, *viz.* *That the Radius multiplied by the Sine of the middle Part, is equal to the Rectangle or Product made of the Tangents of the Extreams conjunct, or to the Rectangle of the Co-ſines of the Extreams disjunct.*

This Propoſition was invented by the Lord *Napier*, purely for Eaſe of Memory, and has been applied in all its Caſes by moſt Authors; as particularly, by Sir *Iſaac Newton*, *Norwood*, Sir *J. Moor*, *Ward*, &c.

Some more Examples of Oblique Spherick Triangles in Numbers.

In the Oblique Triangle B P D, (See the Figure following.)



Suppoſe there be given the Sides.

P D = 24°. 20′, { *the Complement of the Sun's Latitude.*

B D = 73°. 00′, { *the Complement of the Sun's Declination, or his Diſtance from the North Pole.*

P B = 52°. 34′, { *the Complement of the Sun's Altitude.*

'Tis required to find the Angle.

B P D, { *the Sun's Azimuth from the North Part of the Meridian.*

½ the

½ the Base is	36°	30′
½ the Diff. of the Side is	14	07
½ the Base + ½ the Diff. of the Sides is	50	37
	22	23
The Radius Square.	24.	000000
S, ½ Base + ½ Diff. *cr* × S, ½ base— ½ diff. *cr*.	19	469525
Sum	39	469525
From which Subtr. the □ of the Sines of the Legs.	19	514701
Rem.=Sq. of the Sine of ½ the Angle P.	19	954824
Its ½ is the Sine of 71° 40′ = ½ the Angle required	9.	977412

Therefore being doubled, is 143° 20′ = Angle P.

For practical Operations in this Case, nothing is more easy and expeditious than the following Method, of which I shall give two useful Examples: One for the *Azimuth*, as above; the other for the *Hour of the Day*.

1. In the Triangle D P B, let the same things be given, and the Angle P, or *Azimuth* requir'd.

P D = 24° 20′	*Ar. co. of the Sines.*	0	385056
B P = 52 04		0	103146
B D = 73 00 = Base.			
Sum = 149 54.			
Sum = 74 57	*their Sines*	8	984842
½ S — Base = 1 57		9	531822
Sum =		19	001872
Its half is the Co-sine of 71° 32′		9	500936

Which being doubled, gives 143° 04′ for the Angle P, or the Azimuth from the North.

2. In the Triangle D P B, the Sides being given, and the Angle D, which is the Hour from Noon requir'd.

P D = 24° 20′	*Ar. co. of the Sines*	0	385056
B D = 73 00		0	019404
B P = 52 34 Base.			
Sum = 149 55			
½ Sum = 74 57	*their Sines*	9	984842
½ Sum — Base = 22 23		9	580698
The Sum of the four Logarithms =		19	970000
Its half is the Co-sine of 14° 58′		9	985000

Which doubled, is 29° 56′ = Angle D; and being reduced into Time, gives 1 Hour and above 59 Minutes from Noon, which was requir'd.

TRILATERAL, in Geometry, is the same with a three-sided Figure.

TRIMM *of a Ship*, is her best Posture, Proportion of Ballast, and hanging of her Masts, &c. for sailing; and therefore, to find the best way of making any Ship to sail swiftly, is called finding her *Trimm*. And this depends very much on Experience and Judgment, and several Trials and Observations which the Commander may make Aboard.

TRINE, is an Aspect of the Planets, when at the Distance of 120 Degrees or 4 Signs from each other, and noted thus △.

TRINGLE, in Architecture, is a little Member fix'd exactly upon every *Triglyph*, under the Plat-band of the Architrave, from whence hang down the *Guttæ* or Pendant-Drops in the *Dorick Order*.

TRINOMIAL-*Root*, in Mathematicks, is a Root consisting of three Parts connected together by the Sign +; as $a + b + c$: See *Binomial*.

TRIP: The Seamen say a Ship goes with her *Top sails a-Trip*, when she carries them hoisted up to the highest, and when the Wind blows not too hard, but a gentle, or *Loom-gale*.

TRIPARTITION, is Division by 3, or a taking the third Part of any Number or Quantity.

TRIPLICATE *Ratio*, must be well distinguish'd from *Triple*, and is the Ratio of Cubes one to another.

Thus in these Geometrical Proportionals 2, 4, 8, 16, 32, as the Ratio of the first Term (2) is to the third (8) Duplicate of the first to the second, or as 4 the Square of 2, to 16 the Square of 4; so the Ratio of 2 to 16 the fourth Term, is *Triplicate*; or as 8 which is the Cube of 2, to 64 the Cube of 4. And this *Triplicate Ratio* is compounded of all the preceding Ratio's.

TRIPPING; a Term in Heraldry: See *Passant*.

TRIPTOTES, in Grammar, are such defective Nouns as have but three Cases, as *Sordem*, *Sordis*, *Sorde*, and *Tantundem*, &c.

TRIS-DIAPASON, or *Triple-diapason*, a Chord in Musick, otherwise called a Triple, Eighth, or Fifteenth.

TRISE; the Sea Word for hailing up any thing by a dead Rope, or one that doth not run in a Block, but 'tis done by Hand or by main Strength: Thus if any Cask, Chest, or other Goods hath only a Rope fastned to it, and so without a Tackle is pulled up into the Ship by Hand, they say it is *Trised up*.

TRISMUS, is the grinding of the Teeth, or a Convulsion of the Muscles of the Temples, whereby the Teeth gnash whether one will or no. *Blanchard*.

TRISYLLABLE, is a Word consisting of but three Syllables.

TRITÆOPHYES, is an Ague that comes every third Day. *Blanchard*.

TRITÆUS, is the same with *Febris Tertiana intermittens*. *Blanchard*.

TRITONE, a Term in Musick, which signifies a greater Fourth.

TRITURATION, is a pounding in a Mortar, &c. whereby Medicines are reduced to Powder, that they may be the better mixed.

TROCANTER, the same that *Rotator*.

TROCHILE, in Architecture, is that hollow Ring or Cavity which runs round a *Column* next to the *Tore*; vulgarly 'tis call'd the *Casement*: 'Tis frequently bordered or rather shut in with *Lists*. 'Tis often called *Scotia*, from its shady dark Appearance.

TROCHISCI, *Trochisks*, are round or other figur'd Medicinal things, made of Powders, mix'd with viscous Extracts, and made up into Paste, and then into round, triangular, &c. little Bodies, which are to be dried up in the Shade. They are much the same with Tablets and Lozenges.

TROCHLEA, a Term in Anatomy, the same with *Bathmis*.

TROCHLEA, is alſo one of the Mechanick Powers, and is what we uſually call the *Pulley*.

TROCHLEARIS, is the upper or greater oblique Muſcle of the Eye: See *Obliquus Superior*.

TROCHOID, the ſame with *Cycloid*; which ſee.

TROCHOLICKS, is by ſome taken for that Part of the Mechanicks which ſhews the Properties of all circular Motions.

TROMA, is a Wound from an external Cauſe.

TROMBOSIS, is a Trembling, or a Depravation of the voluntary Motion of the Members. *Blanchard.*

TROPES, are when Words are changed from their proper Signification, and applied to other things than what they naturally mean.

TROPICAL *Year*: See *Year*.

TROPHY, in Architecture, is an Ornament which repreſents the Trunk of a Tree charged or encompaſſed all round about with *Arms* or *Military* Weapons, both *Offenſive* and *Defenſive*.

TROPICKS, are Circles ſuppoſed to be drawn parallel to the *Equinoctial* at 23° 30′ diſtance from it, one towards the North, called the *Tropick of Cancer*; and the other towards the South, call'd the *Tropick of Capricorn*, becauſe they lie under theſe Signs.

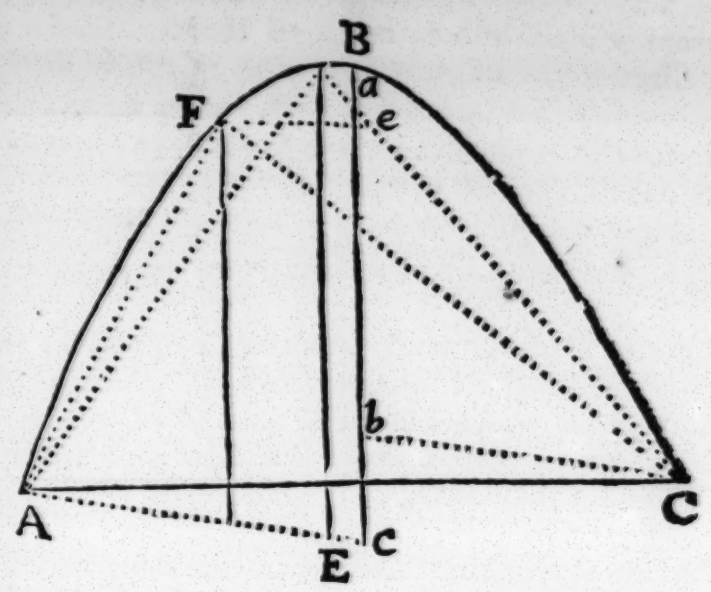
Mr. *Halley*, in *Philoſ. Tranſ.* N° 215. by three ſubſequent Obſervations made near the Tropick at proper Intervals of Time, ſhews a Method to find the Moment of the Sun's Ingreſs into the Tropical Signs, capable of all the Exactneſs the moſt Accurate can deſire; and that without any Conſideration of the Parallax of the Sum, of the Refractions of the Air, of the greateſt Obliquity of the Ecliptick, or Latitude of the Place, premiſing the following *Lemmata*, *viz.*

1. That the Motion of the Sun in the Ecliptick, about the time of the Tropicks, is ſo nearly equable, that the Difference from Equality is not ſenſible, from five Days before the Tropicks, to five Days after; and the Difference ariſing from the little Inequality that there is, never amounts to above $\frac{1}{4}$ of a ſingle Second in the Declination, and this by reaſon of the Nearneſs of the *Apogæon* of the Sun to the *Tropick of Cancer*.

2. That for five Degrees before and after the Tropicks, the Differences whereby the Sun falls ſhort of the Tropicks, are as the verſed Sines of the Sun's Diſtance in Longitude from the Tropicks; which verſed Sines in Arches under five Degrees, are beyond the utmoſt Nicety of Senſe, as the Squares of thoſe Arches. From theſe two follows,

3. That for five Days before and after the Tropicks, the Declination of the Sun falls ſhort of the utmoſt Tropical Declination, by Spaces which are in duplicate Proportion, or as the Squares of the Times by which the Sun is wanting of, or paſt the Moment of the Tropick.

Hence 'tis evident, that if the Shadows of the Sun, either in the Meridian, or any other Azimuth, be carefully obſerved about the time of the Tropick, the Spaces whereby the Tropical Shade falls ſhort of, or exceeds thoſe at other times, are always proportionable to the Squares of the Intervals of Time between thoſe Obſervations and the true time of the Tropick; and conſequently, if the Line, on which the Limits of the Shade is taken, be made the Axis, and the correſpondent Times from the Tropick, expounded by Lines, be erected on their reſpective Points in the Axis as Ordinates, the Extremities of thoſe Lines ſhall touch the Curve of a Parabola, as in the following Figure, where *a*, *b*, *c*, *e*, being ſuppoſed Points obſerved, the Lines *a* B, *b* C, *c* A, *e* F, are reſpectively proportional to the times of each Obſervation, before or after the Tropical Moment in *Cancer*.



This being premiſed, the true time of the Tropick by three Obſervations, is found from this Geometrical Problem.

Having three Points in a Parabola, A, B, C, or A, F, C, given, together with the Direction of the Axis, To find the Diſtance of thoſe Points from the Axis.

Of this there are two Caſes; the one when the time of the ſecond Obſervation B is preciſely in the Middle-time between A and C: In this caſe, putting *t* for the whole time between A and C, then A *c* the Interval of the remoteſt Obſervation A from the Tropick is found by the following Analogy:

$$2ac - bc : 2ac - \tfrac{1}{2}bc :: \tfrac{1}{2}t \text{ (or AE)} : Ac,$$

the time of the remoteſt Obſervation A from the Tropick.

But the other Caſe, when the middle Obſervation is not exactly in the Middle between the other two times, as at F, is ſomething more operoſe, and the whole Time from A to C being put $= t$, and from A to F $= S$, $ce = c$, and $bc = b$, the Theorem will ſtand thus $\frac{ttc - bSS}{2tc - 2bS} = Ac$, the Time ſought.

To illuſtrate this Method of Calculation, he gives the two following Examples.

Anno 1500, *Bernard Walther*, in the Month of *June*, at *Nuremberg*, obſerved the Chord of the Diſtance of the Sun from the *Zenith*, by a large Parallactick Inſtrument of *Ptolemy*, as follows.

$$June \left\{ \begin{matrix} 2.\ 45467 \\ 9.\ 44934 \\ 16.\ 44990 \end{matrix} \right\} \text{ and } June \left\{ \begin{matrix} 8.\ 44975 \\ 12.\ 44883 \\ 16.\ 44990 \end{matrix} \right.$$

In both which Caſes, the middle Time is exactly in the Middle between the Extreams, and therefore in the former three, $ac = 533$, $bc = 477$ and *t*, the Time between being 14 Days; by the firſt Rule, the Time of the Tropick will be found by this Proportion. As

As 589 : 827 $\frac{1}{2}$ :: $\frac{1}{2}$ *t* (or 7 Days) : 9 d. 2 h. 2′. Whence the Tropick *Anno* 1500, is concluded to have fallen *June* 11 d. 20 h. 2′.

In the latter three, *a e* equal 107, *b c* equal 15, and the whole Interval of Time is 8 Days equal *t*; whence,

As 199 : 206 $\frac{1}{2}$ :: 4 Days : 4 d. 3 h. 37′, which taken from the 16 Day at Noon, leaves 11 d. 20 h. 23′ for the Time of the Tropick agreeing with the former to the third Part of an Hour.

Anno 1636, *Gaſſendus* at *Marſeilles* obſerved the Summer Solſtice by a *Gnomon* of 55 Foot high, in order to determine the Proportion of the *Gnomon* to the Solſtitial Shade; and he left theſe Obſervations, ſerving for the ſecond Rule.

June 19	Shadow	31766	Parts whereof the *Gnomon* was 89428.
June 20		31753	
June 21	Sh. N.	31751	
June 21		31759	

Theſe being divided into two Sets of three Obſervations each, *viz.* The 19th, 20th, and 22d; and the 19th, 21ſt, and 22d, there will be in the firſt three, *c* equal 13, *b* equal 7, *t* equal 3 Days, S equal 1; and in the ſecond, *c* equal 15, *b* equal 7, *t* equal 3, and S equal 2. Whence, according to the Rule, the 19th Day at Noon, the Sun wanted of the Tropick a Time proportionate to one Day, as *t t c*—S S *b* to 2 *t c*—2 *b* S; that is, as 110 to 64 in the firſt Sett, or 107 to 62 in the ſecond Sett, that is, 1 d. 17 h. 15′ in the firſt, or 1 d. 17 h. 25′, in the ſecond Sett; whence it may be concluded, that the Moment of the Tropick was on *June* 10 d. 17 h. 20′ in the Meridian of *Marſeilles*.

The great Advantage of this Method is, That any very high Buildings ſerves for an Inſtrument, or the top of a high Tower or Steeple, or even any high Wall whatſoever, that may be ſufficient to intercept the Sun, and caſt a true Shade. Nor is the Poſition of the Plane on which you take the Shade, or that of the Line thereon, on which you meaſure the Receſs of the Sun from the Tropick, very material; but in what way ſoever you diſcover it, the ſaid Receſs will be always in the ſame Proportion, by reaſon of the ſmallneſs of the Angle, which is not 6 Minutes in the firſt five Days: Nor need you enquire the Hight or Diſtance of your Building, provided it be very great, ſo as to make the Spaces you meaſure, large and fair. But it is convenient, that the Plane on which you take the Shade, be not far from perpendicular to the Sun, at leaſt not very oblique; and that the Wall which caſts the Shade, be ſtrait and ſmooth at top, and its Direction nearly Eaſt and Weſt. And it will be requiſite to take the Extream greateſt or leaſt Deviation of the Shadow of the Wall, becauſe the Shade continues for a good time at a ſtand without Alteration, which will give the Obſerver leiſure to be aſſured of what he does, and not be ſurprized by the quick tranſient Motion of the Shade of a ſingle Point at ſuch a Diſtance.

The principal Objection is, That the *Penumbra* or Partile Shade of the Sun, is in its Extreams very difficult to diſtinguiſh from the true Shade, which will render this Obſervation hard to determine nicely.

But if the Sun be tranſmitted through a *Teleſcope*, after the manner uſed to take his *Species* in a *Solar Eclipſe*, and the upper half of the Object-glaſs be cut off by a Paper paſted thereon, and the exact upper Limb of the Sun be ſeen juſt emerging out of, or rather contiging the Species of the Wall, (the Poſition of the Teleſcope being regulatd by a fine Hair extended in the *Focus* of the Eye-glaſs) then by this Means the Limit of the Shade may be obtained to the utmoſt Exactneſs.

TROVER, in Law, is an Action which a Man hath againſt one, that having found any of his Goods, refuſes to deliver them upon Demand. Of late, Actions of Detinue are much turn'd into Actions upon the Caſe, *Sur* Trover & *Converſion*.

TROUGH *of the Sea*, is the Hollow or Cavity made between any two Waves or Billows in a rowling Sea; and when a Ship lies down there, they ſay, *She lies in the Trough of the Sea*.

TRUCKS, belonging to the Carriage of a Piece of Ordnance, are the Wheels which are on the Axletree to move the Piece.

TRUE *Conjunction*: See *Conjunction True*.

TRUE *Place* of a Planet or Star, is a Point of the Heavens ſhewn by a right Line drawn from the *Centre of the Earth* through the *Centre of the Planet* or *Star*; whereas its *apparent Place*, is that which is found by a right Line drawn from the *Obſerver's Eye* through the Centre of the Planet or Star. And this Point in the Heavens is referred to the Ecliptick or Zodiack, by the Planet or Star's Circle of Longitude.

TRUNCATED *Pyramid* or *Cone*, is one whoſe Top is cut off by a Plane parallel to its Baſe; and therefore the Figure of the truncated Top muſt always be ſimilar to the Baſe.

How to find its *Solidity*, ſee in the Word *Fruſtrum*.

A Truncated Cone, or the *Fruſtrum* of that Body, is called ſometimes a *Curti-Cone*.

TRUNK *Roots* of a Plant, are little Roots which break or grow out of the Trunks of Plants; and are of two kinds.

1*ſt*, Such as Vegetate by a direct Deſcent, the Place of their Eruption being ſometimes all along the Trunk, as in *Mints*, *&c.* and ſometimes only in the utmoſt Point, as in *Brambles*.

2*dly*, Such as neither aſcend nor deſcend, but ſhoot forth at Right-angles with the Trunk; which therefore, tho' as to their Office they are true Roots, yet as to their Nature they are a middle Thing between a Trunk and a Root. Dr. *Grew Anat. of Plants*, p. 27.

TRUNNIONS of a Piece of Ordnance, are thoſe Nobs or Bunches of the Guns Metal which bear her up upon the Cheeks of the Carriages.

TRUSSES, are Ropes faſtned to the Parrels of a Yard in a Ship, ſerving either to bind faſt the Yards to the Maſts, when the Ship rowls, lying either *a Hull*, or an Anchor; or to hale down the Yards in a Storm or Guſt of Wind: They belong to the Main-yard, Fore-yard, and Miſſen, and are all brought to upon occaſion.

TRY; a Ship is ſaid to *Try*, when ſhe hath no more Sails abroad but her Main-ſail: When her *Tacks* are cloſe aboard, the *Bowlings* ſet up, and the *Sheats* haled cloſe aft; when alſo the Helm is tied cloſe down to the Board, and ſo ſhe is let lie in the Sea. And ſometimes when it blows ſo hard, that they cannot maintain the Main-ſail, as they ſay; that is, cannot bear it out, they make her *lie a Try* under a *Miſſen-ſail* only.

TUBÆ *Fallopianæ*, are two ſlender Paſſages, proceeding from the Womb, which when they are a little removed from it, grow gradually wider: They have large Holes or Orifices, which almoſt lie ſhut, the extream Edges falling flat; yet if they be diligently opened and dilated, they repreſent the extream Orifice of a Trumpet. Their Uſe is to receive the Eggs from the Teſticles, and carry them into the Womb, according to the Excellent *R. de Graef*; the Truth whereof is evident from the Inſpection of Rabbets diſſected.

TUBER, properly, is a ſubterraneous Muſh-room, or a *Truffle*; but by Botanick Writers, is often uſed to ſignifie the round turgid Roots of ſome Plants: Which therefore they call *Turberoſe Roots*, or *Knobby Roots*, as Mr. *Ray* Engliſhes it.

TUBEROUS: See *Tuber*.

TUBULI *Lactiferi*, certain Lactiferous or Milk-carrying Pipes, which are as it were the Store-houſe wherein the Milk is kept, and thro' which, as by Conduits, it flows to the Nipples of the Breaſts of Females when they give Suck.

TUBULI *Vermiculares*, are certain ſmall winding Cavities formed on the outſides of the Shells of Marine Shell-Fiſhes, in which ſome ſmall Worms inhabit and breed.

Theſe are very frequently found on ſuch *Foſſil Shells* as are dug up almoſt every where out of the Earth; and therefore help to demonſtrate, that they are real Shells, and not *formed Stones*, as ſome will have it.

TUCK *of a Ship*, is the truſſing or gathering up of her Quarter under Water; which if ſhe lie deep, makes her have a Broad, or as they call it, *Fat Quarter*, and hinders her Steering, by keeping the Water from paſſing ſwiftly to her Rudder; and if this Truſſing lie too high above the Water, ſhe will want bearing for her Works behind, unleſs her Quarter be very well laid out.

TUMOR; by this Word, which in general ſignifies any Swelling, the Chirurgeons underſtand a *Diſeaſe* or morbid Affection, incident moſt uſually to the Organical Parts of the Body, increaſing their Quantity preternaturally by Means of ſome ſuperfluous Humours coming thither from other Parts.

TUNICLE, in Anatomy, ſignifies a Membranous Coat.

TUNNAGE: See *Tonnage*.

TURBITH *Mineral*, or Yellow Precipitate of Mercury, is thus made. Put any Quantity of good Quickſilver into a Glaſs Retort, and pour on it four times its Weight of Oil of Vitriol. Set the Retort in Sand, and when the Mercury is diſſolv'd, which 'twill hardly be in ten Hours time, diſtil off the Humidity gently at firſt, but make a ſtrong Fire at laſt, to drive out all the Spirits. When you break the Retort, you will find in it a white Maſs, which powder in a Glaſs Mortar, and then pouring warm Water upon it, it will preſently turn *Yellow*; it muſt be waſhed ſeveral times, and dried in the Shade, and then 'twill Vomit and Purge ſtrongly.

TURIONES; amongſt Botanick Writers, are the firſt young tender Shoots or Tops which any Plants do annually put forth of the Ground.

TURN, a Term belonging to the Movement of a Watch, and ſignifies the entire Revolution of any Wheel or Pinion.

The number of *Turns*, which the *Pinion* hath in one *Turn* of the *Wheel*, is commonly ſet down as a *Quotient* in common Arithmetick, thus, 5) 60 (12 where the *Pinion* 5 playing in a *Wheel* of 60, moveth round 12 times in one *Turn* of the *Wheel*.

Now, by knowing the Number of *Turns*, which any *Pinion* hath in one *Turn* of the *Wheel* it worketh in, you may alſo find how many *Turns* a *Wheel* or *Pinion* hath, at a greater Diſtance: as the *Contrate-wheel*, *Crown-wheel*, &c.

For, 'tis but Multiplying together the *Quotients*, and the Number produced, is the Number of *Turns*, as in this Example.

5) 55 (11
5) 45 (9
5) 40 (8

The firſt of theſe three Numbers hath 11 *Turns*, the next 9, and the laſt 8. If you multiply 11 by 9, it produceth 99; that is, in one *Turn* of the Wheel 55, there are 99 *Turns* of the ſecond *Pinion* 5, or the *Wheel* 40, which runs concentrical, or on the ſame *Arbor* with the ſecond *Pinion* 5. If you multiply 99 by the laſt Quotient 8, it produces 792, which is the Number of *Turns* the third *Pinion* 5 hath.

TURN, is the Sheriff's Court, kept twice every Year, *viz.* within a Month after *Eaſter*, and within a Month after *Michaelmas*. *Magna Charta*, *cap.* 35. From this Court are exempted only Archbiſhops, Biſhops, Earls, Barons, all religious Men and Women, and all ſuch as have Hundreds of their own to be kept. It is a Court of Record, in all things that pertain to it: It is alſo the King's Leet through all the Country, and the Sheriff is Judge; and this Court is incident to his Office.

TURN-*Pikes*, in the Art of War, are Spars of Wood of 12 or 14 Foot long, and about 6 Inches Diameter in a ſexangular Form: They are bored with Holes, one right under another, about an Inch Diameter; the Axis of each Hole muſt be ſix Inches one from another, but to go by Turns from each ſide, the Pickets that are driven into the Hole, are 6 or 5 Foot long, pointed with Iron, and with Wedges or Nails faſten'd hard into the Holes.

Two of theſe faſten'd together with an Iron Chain and Staple, ſome 6 Inches long, will be of great Uſe to ſtop the Enemies in the Breaches, or elſewhere. But thoſe that are intended to be thrown in Breaches, muſt be made of Oak, and need not be ſo big, or the Pickets ſo long.

TURNO *Vicecomitum*, is a Writ that lies for thoſe that are called to the *Sheriff's Turn* out of their own Hundred.

TUSCAN *Order* of Architecture; ſo called, becauſe invented in *Tuſcany*, an eminent Part of *Italy*. 'Tis the moſt plain of all the 5, and is ſeldom us'd but in ſome Country Building, where there is no need of any *Order* but one; or elſe in ſome very great Building, ſuch as an *Amphitheatre*, or the like, where all the Orders are deſign'd to be uſed.

The Columns here, together with Baſe and Capital, are to be 7 Modules in Length, and to have their Thickneſs diminiſh'd by degrees to a quarter Part. When theſe Columns ſtand alone, the Spaces between them, or the *Inter-columns*, ought to be very large.

Their *Pedeſtals* ought to be one Module high; and the *Baſe* of the *Column* ought to be of the Height of half its Thickneſs; and that Height divided into two equal Parts, makes the *Orle* or *Plinth*,

Plinth, which is made with a kind of Compass; the other is divided into 4 Parts, of which, one is for the *List*, the other for the *Tore*, or thick round Circle of the Pillar.

The *Base* hath a *Saille* or Bearing out, which is the 16th Part of the Diameter of the Column.

The *Capital* is an Height half the Thickness of the Column at the *Base*; and is divided into three equal Parts (according to *Ozanam*), of which, one is for the *Abacus*, the other for the *Oeuf*, as they call it in *French*, *i. e.* the *Ornament*; and the third Part being divided into 7 Divisions, the first makes the *List* under the *Ornament*; and the other six serve for the *Gorgerin Collier*, or *Frise*. The *Astragal* is the Height of the *List* below the *Ornament*.

TUSCAN *Work*, in Architecture, is the most simple and rude of the Five ancient Orders of Pillars: See *Column* and *Order*.

TWIGILD: See *Angild*.

TWILIGHT, is that dubious half Light which we perceive before the Sun-rising, and after Sun-setting. 'Tis occasion'd by the Earth's Atmosphere and the Splendor of the Æther which environs the Sun. The Ethereal accended Atmosphere of the Sun, not setting so soon as, and rising before the Sun; and the Sun's Rays also illuminating the Earth's Atmosphere, before the Body of the Sun it self can appear, occasions a Light always preceding at the Rise, and subsequent to the Setting of that Planet. Which, tho' because of many accidental Variations in both the Sun's and Earth's Atmosphere, it cannot be always of the same Degree of Duration or Brightness; yet it usually holds in the Evenings, 'till the Sun is about 18 Degr. below the Horizon, and appears so long before his Rise in the Morning: And therefore will be least under the Equator, where the Sun rises and sets at Right-Angles to the Horizon; and so will increase more and more, according as the Position of the Sphere grows more oblique: For, in our Latitude, for a good Part of the Year, the Sun is never above 18 Degrees below the Earth; and consequently, all that Time we have no Night, but continual Twilight.

TYMPAN, in Architecture, is that Part of the Bottom of the *Frontons*, which is enclosed between the *Cornices*, and answers the Naked of the *Frise*.

TYMPAN *of an Arch*, is a Triangular Table placed in its Corners.

The most simple of these *Tympans* have only a Table hollow'd, sometimes with the Branches of Lawrel, Olive-Tree, or Oak, or with Trophies, and are conformable to the *Dorick* and *Ionick* Orders. But the richest are adorn'd with flying Figures, as *Fame*; or sitting Figures, as those of the *Cardinal Virtues*, and are proper for the *Corinthian* and *Composit* Orders.

Tympan, is also attributed to the Pannels of Doors in Joyners Work, and to the *Dye* or Square of Pedestals.

TYMPANITES, *Tympanias*; the Disease call'd the *Tympany* is a fix'd, constant, equal, hard, resisting Tumour of the *Abdomen*, which being beat or struck, yields a Sound. It proceeds from a stretching Inflation of the Parts, and of the Membranaceous Bowels, whose Fibres are too much swoln with Animal Spirits, and hindred from receding by the Nervous Juice, which obstructs the Passage; to which Distemper there is consequently added, as the Complement of all, an abundance of flatulent Matter in the Places that are empty. *Blanchard.*

TYMPANUM, or rather *Tympani Membrana*, the Drum, or the Skin of the Drum of the Ear, is a small, thin, orbicular, transparent, nervous and dry Membrane, of most exquisite Sense, stretched over the Cavity of the inner Part of the Ear, and dividing between the inward and outward Ear. Some will have it spring from the *Pericranium*, others from the *Dura-mater*, others from the *Pia-mater*, and others from the softer Process of the auditory Nerve there expanded; and there are some Anatomists, which believe it hath a Substance proper to its self, made in the first Formation of the Parts, and springing from nothing else. It is very *dry*, that it may give the better Sound; and *strong* to bear external Injuries the better. It is enchased in a Channel made in the circumference of the outer End of the Bone that joins to the Cartilage which forms the largest Part of the *Meatus Auditorius*; and it hath a Cord which runs a-cross it behind, which some take for a Ligament to strengthen it; but *Verney* saith, 'tis a Branch of the 7th Pair of Nerves which supplies Twigs to the Muscles that move the *Tympanum*, which are two in Number. When this *Membrana Tympani* is taken away, there appears a Cavity on the inside of it, which is properly the *Tympanum*; but *Verney* will call it the *Barrel*. It's about a Quarter of an Inch long, and half an Inch wide; 'tis compassed round with Bone, and clad within with a Membrane, which is interwoven with a great Number of Vessels. How Sounds are distinguish'd by means of this *Membrana Tympani*, and the four Bones, *Malleolus*, *Incus*, *Stapes*, and the *Os Orbiculare*, you will find at large under the Word *Ear*.

TYMPANUM, in Mechanicks, is a Cylinder, but larger and shorter than the common Axis or Cylinder, which is the *Axis in Peritrochio*, and 'tis usually placed upon that Axis, and is much the same with the *Peritrochium*, which is a kind of Wheel placed on the Axis, in whose Circumference are Staves or Levers to turn the Axis easily about, in order to raise the Weight required.

TYPHODES, is a Symptomatical, continued burning Fever; as it were from the Inflammation of the Bowels. *Blanchard.*

TYPHOMANIA, is a *Delirium* with a Phrensy and a Lethargy. *Blanchard.*

TYPUS, or *Periodus* and *Circuitus*, is the Order that intermitting Fevers observe, consisting of Intension and Remission, of Encreasing and Decreasing, according to some kind of Regularity; and accordingly denominating the kind of the Fever by its *Type*. *Blanchard.*

TYROSIS, is when Milk which is eaten, curdles in the Stomach into a Substance like Cheese. *Blanchard.*

VACATION, by the Lawyers, is all the reſpective Time betwixt the End of one Term, and the Beginning of another.

It ſignifies alſo the time from the Death of a Biſhop, or other Spiritual Perſon, 'till the Biſhoprick, or other Dignity, be ſupplied with another.

VACUUM, is by Phyſiologiſts, ſuppoſed to be a Space devoid of all Body: And this they diſtinguiſh into a *Vacuum Diſſeminatum*, or *Interſperſum*; *i. e.* ſmall void Spaces interſperſed about between the Particles of Bodies:

Or, a *Vacuum Coacervatum*, which is a larger void Space made by the meeting together of the ſeveral Interſperſed or Diſſeminate Vacuities before mentioned.

That there is a *Vacuum*, at leaſt a *Diſſeminate* one, ſeems clear from the following Arguments.

1. That without ſuppoſing ſome Interſperſed Vacuities among Bodies, 'tis very hard to account for Motion: For, if there be an abſolute *Plenum*, the leaſt Body in Nature cannot move, but all Bodies that are, muſt move with it; and yet into what Places they ſhould move, when all Things are already full, is as hard to conceive, as the former.

2. Without allowing a *Vacuum*, how can there be any ſuch thing as either *Rarefaction*, or *Condenſation*? For, if all Space is adequately full of Body, nothing can poſſibly ever take up a greater or leſſer Room than it had at firſt; and yet we find by evident Experience, that Air is capable of a very great Degree of Compreſſion, and that Water can be rarified into Air, or Vapour, and then take up vaſtly larger Room, than it did before.

3. Sir *Iſaac Newton* found, that the Weight of Bodies doth by no means depend on their Forms or Textures, but that all Bodies at equal Diſtances from the Earth, do equally gravitate towards it in Proportion to the Quantity of Matter in them, which is every where as their Weight: Wherefore, *there muſt of Neceſſity be a Vacuum*: For, if all Places were full, there could be no Difference in the Specifick Gravity of Bodies, but Air would be intenſively as heavy as Gold; and ſo Gold could not deſcend in Air, and much leſs any lighter Body than it, which would contradict all the received Laws of Hydroſtaticks, though confirm'd by Ten thouſand Experiments.

In VADO *exponere*, is to Pawn, or leave any equivalent as a Pledge, or Surety of returning Money borrowed or owing.

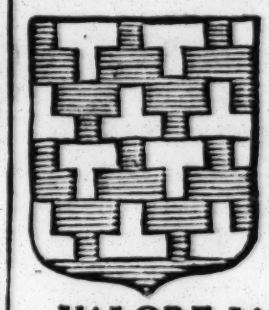
VADIUM *Mortuum*, a Term in Law, ſignifying a Mortgage, Lands or immoveable Goods ſo pawn'd, or engaged to the Creditor, that he has a Right to the mean Profits for the Uſe of his Loan or Debt.

Per VADIUM *ponere*, in Law, ſignifies to take Security, Bail, or Pledges, for the Appearance of a Delinquent in ſome Court of Juſtice.

VAGINALIS *Gulæ*, the perforated Muſcle of the *Gula*, as *Willis* calls it; who ſays, The whole *Oeſophagus* ſeems to conſiſt of two Muſcles; which make four Parallelograms with their oppoſite Fibres decuſſating each other: But in Men it is far otherwiſe; in whom the Fibres of this Muſcle are Longitudinal, and Oblique; the former ſeem to take their Original at the Arytenoidal Cartilages, and paſſing ſomewhat Obliquely to the back Part of the *Oeſophagus*, deſcend to the Stomach: The latter ſeems to be a Continuation of the *Pterigopharyngæus*, and the *Oeſophagus*, deſcending obliquely in a Spiral manner, not unlike thoſe of the Inteſtines deſcribed by the learned Dr. *Cole*.

VAGINALIS *Tunica*: See *Elythroïdes*.

VAIRY, or VERRY, is when the Field of a Coat of Arms is checquered into 2 Colours by the Figures of little Bells; and if theſe Colours are Argent and Azure, 'tis *Vairy Proper*, and you need ſay no more but *Vairy*: But if the Colours are any other, they muſt be expreſly named in Blazoning the Coat: See the Form of it under *Verry*.



VAIRY *Coppy*, or *Potent Counter-Potent*, is a Bearing in Heraldry of this Figure, and in Blazon, the Colours muſt be expreſſed; as *Azure and Argent*, &c.

VALORE *Maritagii*, is a Writ: See *Value of Marriage*.

VALUE *of Marriages*, or *Valore Maritagii*, is a Writ that lies for the Lord, having proffered covenable *Marriage* to the Infant, without Diſparagement, if he refuſe to take the Lord's Offer, to recover the *Value of the Maritage*: See *Stat.* 12 *Car.* 2. *cap.* 24.

VALVULA *Major*, is the upper Part or Cover of the *Iſthmus*, which is betwixt the *Teſtes*, and the foremoſt Vermicular Proceſs of the *Cerebellum*, to which two it is tied at its two Ends, and to the Proceſſes that come from the *Cerebellum* to the *Teſtes*, at its Sides. 'Tis of a Medullary Subſtance; its Uſe is to keep the *Lympha* from falling out above the Nerves in the Baſis of the Skull.

VALVES, are little thin Membranes in Veſſels, or Fibres, like Folding-doors as it were; they have received different Names, according to the Diverſity of their Figuration, as *Sigmoides*, like the *Greek* Letter *Sigma*; *Semilunares*, like an Half-Moon, *&c.* They are found in Veins, Arteries, and in the Lymphatick and Lacteal Veſſels; nay, as ſome ſay, even in the Muſculous Fibres. There are

VALVES alſo found in the Inteſtines, in the ſmall and great Guts, eſpecially in the *Jejunum*, and about the Beginning of the *Ilium*, which are called Semi-circular from their Figure. Theſe Valves, or Folds, grow more and more Oblique, by little and little, the nearer you come to the *Ilium*, and at the Beginning of the *Ilium*, they are leſs Oblique than further on.

In like manner, near the End of the *Jejunum*, they are gradually more and more diſtant from one another, and ſo in the *Ilium* too.

At

At the Beginning, and in the Middle of the *Jejunum*, they are ſcarce diſtant half a Thumb's breadth; in the *Ilium* a whole Thumb's breadth, and more.

They yield a little if thruſt with your Finger, and move here and there: At the Beginning of the *Colon* there is a Fleſhy and Circular Valve, beſides ſeveral others in that Gut.

The Uſe of them is to ſtop the Meat a little, that it may be the better fermented, the Chyle diſtributed, adjacent Parts be cheriſhed with Heat; and laſtly, That it aſcends or returns not again.

VALVULÆ *Conniventes*: See *Conniventes*.

VANE. Thoſe *Sights* which are made to move and ſlide upon *Croſs-ſtaves*, *Foreſtaves*, *Davis's Quadrants*, &c. the Seamen call *Vanes*.

VAN-GUARD, a Military Term, ſignifying the firſt Line of an Army drawn up in Battalia. This is the ſame with the Front of an Army, and gives the firſt Charge upon the Enemy.

VAPORARIUM, is when the Patient ſits ſo as that he receives the Vapours through an Hole, under which there is placed a Pot full of oppoſite and boiling hot Ingredients, which cooling, freſh Matter is added.

VAPOROSUM *Balneum*: See *Balneum Vaporis*.

VAPOURS, in a Medical Senſe, is now a-days uſed for the Diſeaſe called otherwiſe *Hyſterick*, or *Hypocondriack Fits*, or *Melancholy*: But the moſt common Senſe of the Word, is for Watry Exhalations raiſed up either by the Heat of the Sun, the Subterraneal, or any other accidental Heat, Fire, &c.

Mr. *Halley*, in *Philoſophical Tranſactions*, N° 189. gives an Eſtimate of the Quantity of Vapours raiſed out of the Sea, by the Warmth of the Sun, by an Experiment as follows.

We took a Pan (ſaith he) about 4 Inches deep, and 7 or 9 Inches in Diameter, in which we placed a Thermometer, and by means of a Pan of Coals, we brought the Water to the ſame Degree of Heat which is obſerved to be that of our Air in the hotteſt Summers; the Thermometer nicely ſhewing it.

Then we affixed the Pan of Water with the Thermometer in it, to one end of the Beam of the Scales, and exactly counterpoiſed it with Weights in the other Scale: And by the Application or Removal of the Pan of Coals, we found it very eaſy to maintain the Water in the ſame preciſe Degree of Heat.

Doing thus, we found the Weight of the Water ſenſibly to decreaſe; and at the end of 2 Hours we obſerved, That there wanted half an Ounce of *Troy*, all but 7 Grains, or 233 Grains of Water, which in that Time had gone off in Vapour, tho' one could hardly perceive it to ſmoak, and the Water was not ſenſibly warm.

This Quantity in ſo ſhort a Time, ſeemed very conſiderable, being little leſs than 6 Ounces in 24 Hours, from ſo ſmall a Surface as a Circle of 8 Inches Diameter.

To reduce therefore this Experiment to an exact *Calculus*, and to determine the Thickneſs of that Skin of Water, which had ſo evaporated, I aſſume the Experiment alledged by Dr. *Edward Bernard*, to have been made in the *Oxford Society*, *viz.* That a Cube-Foot (*Engliſh*) of Water, weighs exactly 76 Pounds *Troy*. This divided by 1728 the Number of Inches in a Foot, will give $253\frac{4}{7}$ Grains, or half an Ounce, $13\frac{1}{3}$ Grains for the Weight of a Cube-Inch of Water; wherefore the Weight of 233 Grains is $\frac{233}{253\frac{4}{7}}$, or 35 Parts of 38 of a Cube-Inch of Water.

Now the Area of the Circle, whoſe Diameter is 72 Inches, is 49 Square Inches; by which dividing the Quantity of Water evaporated, *viz.* $\frac{35}{38}$ of an Inch, the Quote $\frac{35}{1862}$, or $\frac{1}{53}$, ſhews, that the Thickneſs of the Water evaporated, was the Fifty-third Part of an Inch; but we will ſuppoſe it only the Sixtieth Part, for the Facility of Calculation.

If therefore Water as warm as the Air in Summer, exhales the Thickneſs of a ſixtieth Part of an Inch in two Hours, from its whole Surface, in 12 Hours it will exhale the $\frac{1}{10}$ of an Inch; which Quantity will be found abundantly ſufficient to ſerve for all the Rains, Springs and Dews, and account for the *Caſpian* Seas being always at a ſtand, neither waſting nor overflowing; as likewiſe for the Current ſaid to ſet always in at the Streights of *Gibraltar*, though thoſe *Mediterranean* Seas receive ſo many, and ſo conſiderable Rivers.

To eſtimate the Quantity of Water ariſing in Vapour out of the Sea, I think I ought to conſider it only for the Time the Sun is up; for that the Dews return in the Night, as much if not more Vapours than are then emitted; and in Summer, the Days being longer than twelve Hours, this Exceſs is ballanced by the weaker Action of the Sun, eſpecially, when ariſing before the Water be warmed: So that if I allow $\frac{1}{10}$ of an Inch of the Surface of the Sea, to be raiſed *per Diem* in Vapours, it may not be an improbable Conjecture.

Upon this Suppoſition, every ten Square Inches of the Surface of the Water, yields in Vapour *per Diem*, a Cube-Inch of Water; and each Square Foot half a Wine-pint; every Space of four Foot Square, a Gallon; a Mile Square, 6914 Tons; a Square Degree, ſuppos'd of 69 *Engliſh* Miles, will evaporate 33 Millions of Tons: And if the *Mediterranean* be eſtimated at 40 Degrees long, and four broad, Allowances being made for the Places where it is broader, by thoſe where it is narrower, (and I am ſure, I gueſs at the leaſt) there will be 160 Square Degrees at Sea; and conſequently the whole *Mediterranean* muſt loſe in Vapour, in a Summer's Day at leaſt 5280 Millions of Tons, and this Quantity of Vapour, though very great, is as little as the Remains of another Cauſe, which cannot be reduced to Rule, I mean the Winds, whereby the Surface of the Water is lick'd up ſometimes faſter than it exhales by the Heat of the Sun; as is well known to thoſe that have conſidered thoſe Drying Winds which blow ſometimes.

To eſtimate the Quantity of Water the *Mediterranean* Sea receives from the Rivers that fall into it, is a very hard Task, unleſs one had the Opportunity to meaſure their Channels and Velocity; and therefore we can only do it by allowing more than enough: That is, by preſuming theſe Rivers greater than in all Probability they be, and then comparing the Quantity of Water voided by the *Thames*, with that of thoſe Rivers whoſe Waters we deſire to compute.

The *Mediterranean* receives theſe conſiderable Rivers; The *Iberus*, the *Rhone*, the *Tiber*, the *Po*, the *Danube*, the *Neiſter*, the *Boryſthenes*, the *Tanais* and the *Nile*; all the reſt being of no great Note, and their Quantity of Water inconſiderable.

Theſe nine Rivers, we will ſuppoſe each of them to bring down ten times as much Water as the River of *Thames*; not that any of them are ſo great in Reality, but to comprehend with them all the ſmall Rivulets that fall into the Sea, which otherwiſe I know not how to allow for.

To calculate the Water of the *Thames*, I aſſume that at *Kingſton-Bridge*, where the Flood never reaches, and the Water always runs down, the Breadth of the Channel is 100 Yards, and its Depth three, it being reduced to an Equality; (in in both which Suppoſitions I am ſure I take with the moſt.)

Hence the Profile of the Water in this Place, is 300 Square Yards: This multiplied by 48 Miles, (which I allow the Water to run in 24 Hours, at two Miles an Hour) or 84480 Yards, gives 25344000 Cubick-Yards of Water to be evacuated every Day: That is 20300000 Tons *per Diem*: And I doubt not but in the Exceſs of my Meaſures of the Channel of the River, I have made more than ſufficient Allowance for the Waters of the *Brent*, the *Wandel*, the *Lea*, and *Darwent*, which are all worth Notice, that fall into the *Thames* below *Kingſton*.

Now, if each of the aforeſaid nine Rivers yield ten Times as much Water as the *Thames* doth, 'twill follow, that each of them yield but 203 Millions of Tons *per Diem*, and the whole nine but 1827 Millions of Tons in a Day; which is but little more than one third of what is proved to be raiſed in Vapour out of the *Mediterranean* in Twelve Hours Time.

Now what becomes of this Vapour when rais'd, and how it comes to paſs that the Current always ſets in at the Mouth of the Streights of *Gibraltar*, is intended, with Leave, for a farther Entertainment of this Honourable Company.

In the mean Time, it is needful to advertiſe the Reader, That in making the Experiment herein mentioned, the Water uſed, had been ſalted to the ſame Degree, as is the common Sea-Water, by the Solution of about a fortieth Part of Salt.

The Quantity of Vapours drawn by any determinate Heat from any Quantity of Water in a determinate Time is always proportionable to the Surface of that Water: So that from a double Surface there will be raiſed a double Quantity of Vapour, from a triple Surface, a triple Quantity, *&c.*

For the Manner how, and the Reaſon why Vapours are raiſed by Heat, Mr. *Halley* gives the following Account.

He hath ſhewed, That if an Atom of Water be expanded into a Shell or Bubble, whoſe Diameter ſhall be Ten times as great as before, ſuch an Atom will be ſpecifically lighter than Air, and will riſe ſo long as that Flatus or warm Spirit which firſt ſeparated it from the Maſs of Water, ſhall continue to diſtend it to the ſame Degree: But then that Warmth declining, and the Air growing cooler, and with all ſpecifically lighter, theſe Vapours will ſtop at a certain Region of the Air, or elſe deſcend.

If therefore it ſhould be ſuppoſed, That the whole Earth were covered with Water, and that the Sun as now ſhould make his Diurnal Courſe round it, this Learned Perſon thinks, That the Air would be impregnated with a certain Quantity of Aqueous Vapours, which it would retain it in like Salts diſſolved in Water; and that the Sun in the Day time warming this Air, that part of the Atmoſphere would ſuſtain a greater Proportion of Vapours; (as warm Water will hold more Salt diſſolved in it than cold;) which on the Abſence of the Vapours at Night, would be diſcharged in Dews.

And in this Caſe he concludes, there could be no Diverſity of Weather, other than Periodically every Year alike, the Mixture of all Terreſtrious, Saline, and Heterogeneous Vapours being here excluded; which he judges to be when variouſly compounded and driven by Winds, the Cauſes of thoſe various Seaſons and Changes of Weather which we now find.

But if inſtead of an Earth covered all over with Water, you ſuppoſe the Sea interſperſed about wide and ſpacious Tracts of Land, and alſo divided by high Ridges of Mountains, ſuch as the *Pyrenean*, the *Alps*, and the *Appenine* in *Europe*: *Taurus*, *Caucaſus*, *Imaus*, &c. in *Aſia*; Mount *Atlas*, and the *Mountains of the Moon* in *Africa*: And the *Andes* and *Apalatean* Mountains in *America*; each of which far ſurpaſs the uſual Height to which the Aqueous Vapours of themſelves aſcend, and on the Tops of which, the Air is ſo cold, and rarified, as to retain but a ſmall Part of thoſe Vapours which are brought thither by the Winds.

The Vapours therefore thus rais'd from the Sea, and by the Winds carried over the Low-Lands to thoſe Ridges of Mountains, are there compelled by the Stream of the Air, to mount with it up to their Tops, where the Water preſently precipitates, gleeting down by the Crannies of the Stones; and part of the Vapour entring into the Caverns of the Hills, the Water thereof gathers as in an Alembick in the Baſons of Stone which it finds; and theſe being once full, the Overplus of the Water runs down at the loweſt Place of the Baſon, and breaking out by the Sides of the Hills, forms *Single Springs*:

Many of which running down by the Valleys, or Guts, between the Ridges of the Hills, and after uniting, form *little Rivulets*, or *Brooks*; and many of theſe meeting again in a common Channel from *large Rivers*.

And in this Theory, the Author ſaith, he was confirmed by Experience at *St. Helena*; where reſiding to make Celeſtial Obſervations, the Place being about 800 Yards above the Surface of the Sea, there was every Night ſuch a Condenſation, or rather Precipitation of the Vapours, as that, tho' the Sky was clear, they would cover every half Quarter of an Hour the Object-Glaſſes of his Teleſcopes, and wet his Paper ſo that it would hardly bear Ink to write his Obſervations. *Philoſophical Tranſactions*, N° 192.

The Learned Dr. *Woodward* ſuppoſes the great Abyſs of Water in the Bowels of the Earth to be the Promptuary from whence the Water of Springs and Rivers is chiefly deduced: See *Springs*.

Mr. *Homberg*,

Mr. *Homberg*, in ſome Experiments which he hath publiſhed in the *Memoires de Mathematique & de Phyſique*, for the Month of *May*, 1693. ſays, That the moſt probable Cauſe of the Elevation of Vapors in general, is that the Fiery or Æthereal Matter firſt puts the ſmall Particles of the Water into an Agitation, and then mingles it ſelf with it; which *Mixture* is what we call *Vapors*; this being ſpecifically lighter than Air, will riſe in it, 'till it come to ſuch an height, as that the Air is there of the ſame relative Gravity with it ſelf, and there it will ſwim about, 'till by the Motion of Winds, or other Cauſes, its Conſtitution is broken, and ſo the watry Parts uniting together in greater Drops, it deſcends in Dew, or Rain: Which Notion differs very little from Mr. *Halley*'s. Only *Homberg*, by an Experiment which he made of Evaporation *in Vacuo*, concludes, That Air is not neceſſary to the firſt riſing of Vapors, but only to the making of them mount up on high, after they once are brought or raiſed into it.

VARIATION is, according to *Tycho*, the third Inequality in the Motion of the Moon; and ariſes from her *Apogæum*, being changed as her Syſtem is carried round the Sun by the Earth. *Bullialdus* calls this the Moon's *Reflection*, expreſſing it, That her *Apogæon* reflects backwards contrary to the Order or Succeſſion of the Signs, by reaſon of which the Angle of her *Evection* is ſometimes more, and ſometimes leſs, than it would appear to be, by conſidering only the two other Inequalities. But *Tycho* aſſerts this *Variation* to be never leſs than 40 Minutes, 30 Seconds.

Sir *Iſaac Newton* thinks the *Variation* is cauſed partly by the Elliptick Form of the Moon's Orbit, and partly by the Inequality of the Moments of the Area which the Moon deſcribes by a Radius drawn to the Earth. This, *Prop.* 29. *Book* 3. of his *Principia*, he ſhews how to find; and ſets it at a middle Rate, to be 35 Minutes, 9 Seconds.

VARIATION *of the Needle, or Compaſs*, is the Deviation, or Turning of the *Magnetical Needle* in the *Mariners Compaſs*, from the true *North-point*; which happens more or leſs in moſt Places; and is commonly called by Sea-men the *North-Eaſting*, or *North-Weſting of the Needle.*

To find the Variation at Sea.

About three Hours before or after Noon, having the *Sun's Declination*, his *Altitude*, and the Latitude of the Place, find his true *Azimuth*, (as is directed under that Word) obſerve alſo the *Sun's Magnetical Azimuth*, and then the Differences of thoſe two Diſtances from the *Meridian*, is the *Variation of the Compaſs.*

The ſame is alſo found by having the *Sun's True* and *Magnetical Amplitude.*

For if the Amplitudes be of one kind; that is, both North, or both South, their Difference is the *Variation*: But if of different kinds; that is, one North, the other South, their Sum is the Variation.

In the Practice of obſerving the Variation, it is uſual to take it by the Amplitude of the Riſing and Setting of the Sun, *when his Centre appears in the Viſible Horizon*; whereas he ought to be obſerved when his under Limb is ſtill above the *Horizon* about two Thirds of his Diameter, or 20 Minutes, becauſe of the Refraction, and the Height of the Obſerver's Eye above the Surface of the Water; or elſe to work the *Amplitudes*, as the *Azimuths*, by reckoning the Sun's Diſtance from the *Zenith*, 90 Degrees 36 Minutes. This, tho' it be of little Conſequence near the Equinoctial, will make a great Error in high Latitudes, where the Sun Riſes and Sets Obliquely.

A Table of the Variation of the Compaſs, as it hath been obſerved in divers Places, and at divers Times.

From the foregoing Table 'tis obſerv'd by the Learned Capt. Halley.

1. That in all *Europe*, the *Variation* at this Time is *Weſt*, and more in the Eaſtern Parts thereof than the Weſtern, increaſing that way.

2. That on the Coaſt of *America*, about *Virginia*, *New-England*, and *Newfoundland*, the *Variation* is *Weſterly*, increaſing all the way as you go Northerly along the Coaſt, ſo as to be above 20 Degrees at *Newfoundland*, nearly 30 Degrees in *Hudſon's Streights*, and not leſs than 57 Degrees in *Baffin's Bay*: And that as you ſail Eaſtward from this Coaſt, the Variation diminiſhes.

Whence it is, That ſomewhere between *Europe* and the North part of *America*, there muſt be an Eaſterly Variation, or at leaſt no Variation.

3. That on the Coaſt of *Brazil*, there is Eaſt Variation, increaſing as you go to the Southward, ſo as to be 12 Degrees at *Cape Frio*, and 20 Degr. and half over-againſt *R. Plata*; and thence ſailing South-weſterly, to the Streights of *Magellan*, it decreaſes 17 Degrees, and at the Weſt Entrance about 14 Degrees.

4. That the Eaſtward of *Brazil*, this Eaſterly Variation decreaſes, ſo as to be very little at *St. Helena* and *Aſcenſion*, and to be quite gone, and the Compaſs Point true about 18 Degrees of Longitude Weſt from the *Cape of Good Hope*.

5. That to the Eaſtward of the aforeſaid Places, a Weſtward Variation begins, and governs in all the *Indian Sea*, ariſing to 18 Degrees under the Equator, about the Meridian of the Northern part of *Madagaſcar*; and 27 Degrees and a half in 39 Degrees South Latitude, near the ſame Meridian: Eaſterly from thence, the Weſt Variation decreaſes, ſo as to be not much above 8 Degrees at *Cape Comorin*, and about 3 Degrees upon the Coaſt of *Java*; and about the *Molucca Iſlands* to be quite gone; as alſo a little to the Weſtward of *Van Diemen's Land*.

6. That to the Eaſtward of the *Molucca's* and *Van Diemen's Land*, in South Latitude, there ariſes another Eaſterly Variation, which ſeems not ſo great as the former, nor of ſo large Extent; for that at the Iſland *Rotterdam*, it is ſenſibly leſs than upon the Eaſt Coaſt of *New Guinea*; and at the rate it decreaſes, it may well be ſuppoſed, that about 20 Degrees further Eaſtward, or 225 Degrees Eaſt Longitude from *London*, in the Latitude of 20 Degrees South, a Weſterly Variation begins.

7. That the Variation taken at *Baldivia*, and at the Weſt Entrance of the *Streights of Megellan*, ſhews, That the Eaſt Variation noted in the third Obſervation, is decreaſing apace; and that it cannot well extend many Degrees into the *South Sea*, from the Coaſt of *Peru* and *Chili*, leaving room for a ſmall Weſterly Variation in that Tract of the unknown World that lies in the mid-way between *Chili* and *New Zealand*, and between *Hounds Iſland* and *Peru*.

8. That in ſailing North-weſt from *St. Helena*, by *Aſcenſion*, as far as the Equator, the Variation continues very ſmall Eaſt, and as it were, conſtantly the ſame; ſo that in this part of the World, the Courſe, wherein there is no Variation, is evidently no Meridian, but rather North-weſt.

9. That the Entrance of *Hudſon's Streights*, and the Mouth of *R. Plata*, being nearly under the ſame Meridian, at the one place the Needle varies 29 Degrees and a half Weſt; at the other 20 Degrees and a half Eaſt.

Whence 'tis concluded,

That the whole Globe of the Earth is one great Magnet, having four Magnetical Poles, or Points of Attraction, near each Pole of the Equator two; and that in thoſe Parts of the World which lie near adjacent to any one of thoſe Magnetical Poles, the Needle is govern'd thereby, the neareſt Pole being always predominant over the more remote.

And he conjectures, That the Pole, which is at preſent neareſt to us, lies in or near the Meridian of the *Lands-End* of *England*, and not above 7 Degrees from the *Arctick Pole*; by this Pole the Variation in all *Europe* and *Tartary*, and the *North Sea*, are principally govern'd; tho' with regard to the other *Northern Poles*, whoſe Situation is in the Meridian paſſing about the middle of *California*, and about 15 Degrees from the North Pole of the World; to this the Needle has chiefly reſpect in all the *North America*, and in the two Oceans on either ſide thereof, from the *Azores* Weſtwards to *Japan*, and farther.

The two Southern Poles are rather farther diſtant from the South Pole of the World: The one about 16 Degrees therefrom, in a Meridian ſome 20 Degr. to the Weſtward of *Magellan's Streights*, or 95 Degrees Weſt from *London*; this commands the Needle in all *South America*, in the *Pacifick Sea*, and the greateſt Part of the *Ethiopick Ocean*.

The fourth and laſt Pole ſeems to have the greateſt Power, and largeſt Dominions of all, as it is the moſt remote from the Pole of the World, being little leſs than 20 Degrees diſtant therefrom, in the Meridian which paſſes through *New Holland* and the Iſland *Celebes* about 120 Degrees Eaſt from *London*; this Pole is predominant in the South part of *Africa*, in *Arabia*, and the *Red Sea*, in *Perſia*, *India*, and its Iſlands; and all over the *Indian Sea*, from the *Cape of Good Hope* Eaſtwards, to the middle of the great South Sea that divides *Aſia* from *America*.

This ſeems to be the preſent Diſpoſition of the Magnetical Vertue throughout the whole Globe of the Earth: It remains to ſhew how this Hypotheſis makes out all the Variations that have been obſerv'd of late; and how it anſwers to the ſeveral Remarks drawn from the Table.

And firſt, it is plain, that (our *European North Pole* being in the Meridian of the *Lands-end* of *England*) all places more Eaſterly than that, will have it on the Weſt ſide of their Meridian; and conſequently the Needle reſpecting it with its Northern Point, will have a Wetterly Variation, which will ſtill be greater as you go to the Eaſtwards, till you come to ſome Meridian of *Ruſſia*, where 'twill be greateſt, and from thence decreaſe again. Thus at *Breſt* the Variation being but 1 Degree and

3 Quarters at *London* 4 Degrees and a half; but at *Dantzick* 7 Degrees Weſt. To the Weſtward of the Meridian of the *Lands-End* the Needle ought to have an Eaſterly Variation; were it not that (by approaching the *American Northern Pole*, which lies on the Weſt ſide of the Meridian, and ſeems to be of greater force than this other) the Needle is drawn thereby Weſtward, ſo as to counter-ballance the Direction given by the *European Pole*, and to make a ſmall Weſt Variation in the Meridian of the *Lands-End* it ſelf. Yet about the Meridian of the Iſle *Tercera*, 'tis ſuppoſed our neareſt Pole may ſo far prevail, as to give the Needle a little Turn to the Eaſt; tho' but for a very little ſpace; the Counter-ballance of thoſe two Poles permitting no conſiderable Variation in all the Eaſtern part of the *Atlantick Ocean*; nor upon the Weſt Coaſt of *England* and *Ireland*, *France*, *Spain* and *Barbary*: But to the Weſtward of the *Azores*, the Power of the *American* Pole, overcoming that of the *European*, the Needle has chiefly reſpect thereto; and turns ſtill more and more towards it, as you approach it. Whence it comes to paſs, that on the Coaſt of *Virginia*, *New-England*, *Newfoundland*, and in *Hudſon's-Streights*, the Variation is Weſtward; that it increaſes as you go from thence towards *Europe*, and that it is leſs in *Virginia* and *New-England*, than in *Newfoundland* and *Hudſon's-Streights*.

This Weſterly Variation again decreaſes, as you paſs over the *North America*, and about the Meridian of the middle of *California*, the Needle again points due North; and from thence Weſtwards to *Yedzo* and *Japan*, 'tis ſuppoſed the Variation is Eaſterly; and half Sea over, not leſs than 15 Degrees: And that this Eaſt Variation extends over *Japan Yedzo*, *Eaſt-Tartary*, and part of *China*, till it meet with the Weſterly, which is govern'd by the *European* North Pole, and which is the greateſt ſomewhere in *Ruſſia*.

Towards the South Pole the Effect is much the ſame, only that here the South Point of the Needle is attracted.

Hence it will follow, That the Variation on the Coaſt of *Brazil*, at the River of *Plate*, and ſo on to the *Streights* of *Magellan*, ſhould be Eaſterly, if we ſuppoſe a Magnetical Pole ſituated about 20 Degrees more Weſterly than the *Streights* of *Magellan*. And this Eaſterly Variation doth extend Eaſtward over the greateſt part of the *Ethiopick* Sea, till it be counterpoiz'd by the Vertue of the other Southern Pole; as it is about mid-way between the *Cape of Good Hope*, and the Iſles of *Triſtan d' Acuntia*.

From thence Eaſtwards the *Aſian* South Pole becoming prevalent, and the South Point of the Needle being attracted thereby, there ariſes a Weſt Variation very great in Quantity and Extent, becauſe of the great Diſtance of this Magnetical Pole of the World.

Hence it is, That all the *Indian Sea*, as far as *Hollandia Nova*, and farther, there is conſtantly Weſt Variation; and that under the Equator it ſelf, it ariſes to no leſs than 18 Degrees, where 'tis moſt.

About the Meridian of the Iſland of *Celebes*, being likewiſe that of this Pole, this Weſterly Variation ceaſes, and an Eaſterly begins, which reaches to the middle of the South Sea, between the middle of *Zelandia Nova* and *Chili*, leaving room for a ſmall Weſt Variation govern'd by the *American* South Pole.

From all this it appears, That the Direction of the Needle in the Temperate and Frigid Zone, depends chiefly upon the Counterpoiſe of the Forces of two Magnetical Poles of the ſame Nature: As alſo how it is, that under the ſame Meridian, the Variation ſhould be in one place 29 Degrees and a half Weſt, and in another 20 Degrees and a half Eaſt.

In the *Torrid Zone*, and particularly under the Equinoctial, reſpect muſt be had to all four Poles, and their Poſitions well conſider'd; otherwiſe it will not be eaſie to determine what Variations ſhall be; the neareſt Pole being always ſtrongeſt; yet not ſo, as not to be counter-ballanc'd ſometimes by the united Forces of two more remote; as is noted in the Eighth Obſervation, that in ſailing from *St. Helena*, by the Iſle of *Aſcenſion*, to the Equator, on the North-weſt Courſe, the Variation is very little Eaſterly, and in that whole Tract unalterable, becauſe that the *South American* Pole (which is conſiderably the neareſt in the aforeſaid Places) requiring a great Eaſterly Variation, is counterpoiz'd by the contrary Attraction of the *North American*, and the *Aſian South* Pole; each whereof ſingly are, in theſe Parts, weaker than the *American South* Pole; and upon the North-weſt Courſe, the Diſtance from this latter is very little varied; and as you recede from the *Aſian South* Pole, the Ballance is ſtill preſerv'd by acceſs towards the *North American* Pole. In this Caſe no notice is taken of the *European North* Pole; its Meridian being little remov'd from thoſe of theſe Places, and of it ſelf requiring the ſame Variations we here find.

After the ſame manner you may proceed to determine the Variations in other places, under and near the Equator.

All this ſeems very much to confirm the aforeſaid *Hypotheſis*, *That there are in the Earth four ſuch Magnetical Points, or Poles, which occaſion the great Variety, and ſeeming Irregularity, which is obſerved in the Variation of the Compaſs.*

But to calculate exactly what it is, in any Place aſſign'd, is not as yet done, nor is it determin'd in what Proportion the attractive Power decreaſes, as you remove from the Pole of the Magnet; as alſo the Change of the Variation, and at what rate, is not yet perfectly diſcovered.

From the foregoing Table, it ſhould ſeem, that all the Magnetical Poles had a Motion Weſtward; but if it be ſo, 'tis evident, That it is not a Rotation about the Axis of the Earth; for then the Variations would continue the ſame, in the ſame Parallel of Latitude (the Longitude only changed) as much as the Motion of the Magnetical Poles: But the contrary is found by Experience; for there is no where in the Latitude of 51 and an half North, between *England* and *America*, a Variation of 11 Degrees Eaſt, at this time; as it was once here at *London*. Wherefore it ſeems that our *European* Pole is grown nearer the Pole *Arctick* than it was heretofore; or elſe that it has loſt part of its Virtue.

But whether theſe Magnetick Poles move altogether with one Motion, or with ſeveral, whether equally, or unequally; whether circular, or libratory: If circular, about what Centre; if libratory, after what manner, things yet unknown.

In

In *Philoſ. Tranſ.* N. 195. Capt. *Halley* brings the following *Hypotheſis*, accounting for this *Variation*, and ſolving all its *Phænomina's*; which is thus:

He reckons the external Parts of the Globe as the Shell, and the internal as a *Nucleus*, or inner Globe, included within ours, with a fluid Medium between, which having the ſame common Centre and Axis of Diurnal Rotation, may turn about with our Earth each 24 Hours; only this outer Sphere having its turbinating Motion, ſome ſmall matter either ſwifter or ſlower than the internal Ball. And a very minute Difference in Length of Time, by many Repetitions, becomes ſenſible; the internal Parts will by degrees recede from the external; and not keeping pace with one another, will appear gradually to move, either Eaſtward or Weſtward, by the Difference of their Motions.

Now ſuppoſing ſuch an internal Sphere having ſuch a Motion, the two great Difficulties in the former Hypotheſis is eaſily ſolv'd: For if this exterior Shell of Earth be a Magnet, having its Poles at a diſtance from the Poles of Diurnal Rotation; and if the internal *Nucleus* be likewiſe a Magnet, having its Poles in two other places diſtant alſo from the Axis; and theſe latter, by a gradual and ſlow Motion, change their Place in reſpect of the External: We may then give a reaſonable Account of the four Magnetical Poles aforemention'd, as likewiſe of the Changes of the Needle's Variations.

The Period of this Motion being wonderful great, and there being hardly an hundred Years ſince theſe Variations have been duly obſerv'd, it will be very hard to bring this *Hypotheſis* to a *Calculus*, eſpecially ſince tho' the Variations do increaſe and decreaſe regularly in the ſame place, yet in differing places, at no great diſtance, there are found ſuch caſual Changes thereof, as can no ways be accounted for by a regular Hypotheſis, as depending upon the unequal and irregular Diſtribution of the Magnetical Matter within the Subſtance of the external Shell or Coat of the Earth, which deflect the Needle from the Poſition it would acquire from the Effect of the general Magnetiſm of the whole.

Of this, the *Variations* at *London* and *Paris* give a notable Inſtance; for the Needle has been conſtantly about $1\frac{1}{2}$ more Eaſterly at *Paris* than at *London*: Tho' it be certain, that according to the general Effect, the Difference ought to be contrary way; notwithſtanding which, the Variations in both places do change alike.

Hence, and from ſome other things of like nature, it ſeems plain, that the two Poles of the external Globe are fix'd in the Earth, and that if the Needle were wholly govern'd by them, the *Variations* thereof would be always the ſame, with ſome Irregularities upon the Account but juſt now mention'd. But the internal Sphere having ſuch a gradual Tranſlation of its Poles, does influence the Needle, and direct it variouſly, according to the Reſult of the attractive or directive Power of each Pole; and conſequently, there muſt be a Period of the Revolution of this internal Ball; after which, the Variations will return again, as before. But if it ſhall in future Ages be obſerved otherwiſe, we muſt then conclude, that there are more of theſe internal Spheres, and more Magnetical Poles than Four, which, at preſent, we have not a ſufficient number of Obſervations to determine, and particularly in that vaſt *Mer del Zur*, which occupies ſo great a part of the whole Surface of the Earth.

If then, two of the Poles be fix'd, and two moveable, it remains to aſcertain, which they are that keep their Place. And it were to be wiſh'd we had the Experience of another Century of Years to found our Concluſions upon: Yet he thinks it may be ſafely determined, that our *European North Pole* (which is ſuppoſed to be near the Meridian of the *Lands-End* of *England*, and about 7 Deg. therefrom) is that that is moveable of the two Northern Poles, and that that has chiefly influenced the Variations in theſe Parts of the World: For in *Hudſon's-Bay*, which is under the Direction of the *American Pole*, the Change is not obſerv'd to be near ſo faſt, as in theſe Parts of *Europe*, tho' that Pole be much farther removed from the Axis.

As to the *South Poles*, he takes the *Aſian Pole* which he places about the Meridian of the Iſland *Celebes* to be fixed, and conſequently the *American Pole* to move, from the like Obſervation of the ſlow decreaſe of the Variation on the Coaſt of *Java*, and near the Meridian of the *Aſian Pole*; tho' he owns to have no Account of the Effects of the other beyond *Magellan Straights*.

This being granted, 'tis plain, That the fixed Poles, are the Poles of this external Shell or *Cortex* of the Earth; and the other two, the Poles of the Magnetical *Nucleus*, included and moveable within the other. It likewiſe follows, that this Motion is Weſtwards; and, by conſequence, that the aforeſaid *Nucleus* has not preciſely attain'd the ſame Degree of Velocity with the exterior Parts in their diurnal Revolutions; but ſo very nearly equals it, that in 365 Revolves, the Difference is ſcarce ſenſible.

This is ſuppoſed to ariſe from the Impulſe whereby this diurnal Motion was impreſs'd on the Earth, being given to the external Parts, and from thence, in time, communicated to the internal; but not ſo, as perfectly to equal the Velocity of the firſt Motion impreſs'd on, and ſtill conſerv'd by the ſuperficial Parts of the Globe.

As to the Quantity of this Motion, it is impoſſible to define it, both from the Nature of this kind of Obſervation, which cannot be very accurately perform'd; as alſo, from the ſmall Time theſe Variations have been obſerv'd, and their Change diſcover'd. It appears by all Circumſtances, that its Period is of many Centuries of Years, and as far as may be, collected from the Change of the Place, where there was no Variation by reaſon of the *Equilibrium* of the two Southern Magnetical Poles, *viz.* from *Cape d' Agulhas*, to the Meridian of *St. Helena* (which is about 23 Deg. in about 90 Years) and of the Place where the Weſterly Variation is in its greateſt Deflection, being about half ſo much, *viz.* from the Iſle of *Diego Roiz*, to the South-weſt Parts of *Madagaſcar*; we may with ſome reaſon conjecture, that the *American* Pole has moved Weſtward 46 Degr. in that Time, and that the whole Period thereof is perform'd in 700 Years, or thereabouts: So that, the nice Determination of this, and of ſeveral other Particulars in the Magnetick Syſtem, is reſerv'd for Poſterity; all that we can hope to do, is to leave behind us Obſervations that may be confided in, and to propoſe Hy-

potheſes which after Ages may examine, amend, and refute.

Thus, in order to explain the Change of the *Variations*, we have adventured to make the Earth hollow, and to place another Globe within it; not but that there may be ſeveral Objections againſt it; as,

That there is no Inſtance in Nature of the like thing.

That, if there was ſuch a middle Globe, it would not keep its Place in the Centre, but be apt to deviate therefrom, and might poſſibly chock againſt the concave Shell, to the Ruin, or at leaſt Endamaging thereof.

That the Water of the Sea would perpetually leak through, unleſs we ſuppoſe the Cavity to be full of Water.

That were it poſſible, yet it does not appear what Uſe ſuch an inward Sphere can be of, being ſhut up in eternal Darkneſs, and therefore unfit for the Production of Animals, or Plants; with many more Objections, according to the Fate of all ſuch new Propoſitions.

To theſe it may be briefly anſwer'd, That the Ring environing of the Globe of *Saturn*, is a notable Inſtance of this kind, as having the ſame common Centre, and moving along with the Planet, without ſenſibly approaching him on one ſide more than on the other. And if this Ring were turned on one of its Diameters, it would then deſcribe ſuch a concave Sphere as this external one is ſuppoſed to be. And ſince the Ring in any Poſition given, would in the ſame manner keep the Centre of *Saturn* in its own, it follows, That ſuch a concave Sphere may move with another included in it, having the ſame common Centre: Nor can it well be ſuppoſed otherwiſe, conſidering the Nature of Gravity; for ſhould theſe Globes be adjuſted once to the ſame common Centre, the Gravity of the Parts of the Concave, would preſs equally towards the Centre of the inner Ball; which Equality muſt neceſſarily continue till ſome external Force diſturb it, which is not eaſie to imagine in this Caſe. And, perhaps, this might be more intelligibly expreſs'd, by ſaying, That the inner Globe being poſited in the Centre of the Exterior, muſt neceſſarily aſcend which way ſoever it moves; that is, it muſt overcome the Force of Gravity preſſing towards the common Centre, by an Impulſe it muſt receive from ſome outward Agent. But all outward Efforts being ſufficiently fenced againſt, by the Shell that ſurrounds it, it follows, That this *Nucleus* being once fix'd in the common Centre, muſt always there remain.

As to the Leaking of the Water through this Shell, when once a Paſſage ſhall be found for it to run through, is confeſs'd to be an Objection ſeemingly of weight; but by conſidering how rightly great Beds of Chalk or Clay, and much more Stone, do hold Water, and even Caves arch'd with Sand, no Man can doubt but the Wiſdom of the Creator has provided for the Microcoſm, by many more Ways than can be either imagin'd or expreſs'd; eſpecially ſince we ſee the admirable and innumerable Contrivances wherewith each worthleſs Individual is furniſh'd, both to defend it ſelf, and propagate its Species. What Curioſity in the Structure; what Accuracy in the Mixture and Compoſition of the Parts ought not we to expect in the Fabrick of this Globe, made to be the laſting Habitation of ſo many various Species of Animals, in each of which, there want not many Inſtances that manifeſt the boundleſs Power and Goodneſs of their Divine Author; and can we then think it a hard Suppoſition, that the internal Parts of this Bubble of Earth ſhould be replete with ſuch *Saline* and *Vitriolick* Particles, as may contribute to Petrefaction, and diſpoſe the tranſuding Water to ſhoot and coagulate into Stone, ſo as continually to fortify, and, if need were, to conſolidate any Breach or Flaw in the concave Surface of the Shell.

And perhaps this may not without reaſon be ſuppoſed to be the final Cauſe of the Admixture of the magnetical Matter in the Maſs of the terreſtrial Parts of our Globe, *viz.* To make good and maintain the concave Arch of this Shell: For, by what the Excellent Sir *Iſ. Newton* has ſhewn in his *Principia Philoſophiæ*, it will follow, that according to the general Principle of Gravity, viſible throughout the whole Univerſe, of thoſe Particles that by Length of Time, or otherwiſe, ſhall moulder away, or become looſe on the concave Surface of the external Sphere, would fall in, and with great Force deſcend on the internal, unleſs thoſe Particles were of another ſort of Matter, capable by their ſtronger Tendency to each other, to ſuſpend the Force of Gravity; but no other Subſtance is known capable of ſupporting each other by their mutual Attraction, but the Magnetical; and theſe we ſee miraculouſly to perform that Office, even where the Power of Gravity has its full Effect; much more within the Globe, where it is weaker. Why then may we not ſuppoſe theſe ſaid Arches to be lined throughout with a magnetical Matter, or rather, to be one great concave Magnet, whoſe two Poles are the Poles we have before obſerv'd to be fix'd in the Surface of our Globe.

Another Argument favouring this Hypotheſis, is drawn from a Propoſition of the ſame Sir *Iſaac Newton*, where he determines the Force wherewith the *Moon* moves the *Sea* in producing the *Tides*; his Words are, *Denſitas Lunæ eſt ad denſitatem Terræ ut* 680 *ad* 387, *ſeu* 9 *ad* 5 *quem proxime. Eſt igitur corpus Lunæ denſius ac magis terreſtre quam Terra noſtra*, p. 466.

Now if the *Moon* be more ſolid than the Earth, as 9 to 5, why may we not reaſonably ſuppoſe the *Moon*, being a ſmall Body, and a ſecondary Planet, to be ſolid Earth, Water and Stone, and this Globe to conſiſt of the ſame Materials, only $\frac{4}{5}$ thereof to be Cavity, within and between the internal Spheres; which might be rendred not improbable.

And one of the Uſes of the Cavity of the Earth ſeems to be, To diminiſh the Specifick Gravity thereof, in reſpect of the *Moon*; for it may be demonſtrated, that the Oppoſition of the *Æther* to the Motions of the Planets, in a long time, becomes ſenſible; and conſequently, the greater Bodies muſt receive a leſs Oppoſition than the ſmaller, unleſs the Specifick Gravity of the ſmaller do proportionably exceed that of the greater, in which Caſe only they can move together; ſo that the Cavity aſſign'd in the Earth, may ſerve well to adjuſt its Weight to that of the *Moon*: For otherwiſe, the Earth would leave the *Moon* behind it, and ſhe become another primary Planet.

VARI-

VARICOSUM *Corpus*, is that Contexture of Spermatick Veſſels, which enters the Teſticles.

VARIOLÆ, the Small-Pox, conſiſts in a contagious Diſorder of the Blood, contracted from the Air or otherwiſe; accompanied with a continued wandring Fever, which ſometimes increaſes, ſometimes decreaſes, with a Pain in the Head and Loins, Anxiety and Inquietude, and with a breaking forth of Pimples and Wheals, which ſwell and ſuppurate. The Famous *Willis* attributes the Cauſe of this Diſtemper to ſome filthy and fermentative Matter, which is communicated to the *Fœtus*, together with the Nouriſhment from the Womb; but how this can hold in adult Perſons, whoſe Blood has undergone ſo many Alterations, I could never yet underſtand from his Writings. It ſeems rather to conſiſt in a depraved Temperature of Air, with a peculiar Diſpoſition of the Blood and the nervous Juice towards this Diſtemper. This poiſonous Quality of the Air, firſt infects the nervous Juice, (whence proceeds the Pain of the Head and Loins) wherewith the Blood boils and ferments, and parts into little Pieces or Clots, which in the Courſe of Circulation, ſtick to the outward Parts, and to the inner *Viſcera* too; after a while they grow ripe, and ſuppurate. *Blanchard.*

VARIX: See *Cirſus.*

VAS *breve*: See *Breve vas.*

VASA, the Veſſels in an Animal, are Cavities through which the Liquors of the Body paſs, as a Vein, an Artery, Lymphatick Veſſels, the *Ductus* that conveys the Chyle, and thoſe of the Spittle.

VASA *deferentia*, are thoſe Veſſels wherein the Seed is convey'd from the Teſticles to the *Veſiculæ Seminales.*

VASA *Lactea*, the Milky Veſſels in the Meſentery: They which reach from the Guts to the Glandules in the Meſentery, are ſaid to be of the firſt ſort; and they which reach from thoſe Glandules to the Bag that carries the Chyle, are of the ſecond ſort.

Their Uſe is to convey the Chyle from the Guts to the little Bag which holds the Chyle, and thence to the *Ductus*, which conveys it to the *Thorax*. *Aſellius* was the firſt who diſcovered them, and the dexterous *F. Ruiſchius* afterwards diſcover'd Valves in them. *Blanchard.*

VASA *Lymphaticæ*: See *Vena Lymphatica.*

VASCULIFEROUS *Planets*, are, according to the Botaniſts, ſuch as have beſides the common Calyx or Flower-Cup, a peculiar Veſſel or Caſe to contain their Seed, one belonging to each Flower, but ſometimes divided into diſtinct Cells. Theſe have always a monopetalous Flower, either *uniform* or *difform*.

The former of theſe have their Seeds all divided.

1. Into two Partitions; as the *Hyoſcyamus*, *Nicotiana*, *Priapeia*, and the *Gentiana.*

2. Into three Partitions; as the *Convolulus*, *Speculum Veneris*, *Trachelium*, *Repunculus*, *Campanula*, *Repunculus Corniculatus*, &c.

3. Into four Partitions; as the *Stramonium.*

Thoſe of the latter Kind, or which have a *difform monopetalous* Flower, as the *Linaria*, *Pinguicula*, *Antirrhinum*, *Ariſtolchia*, *Scrophularia*, *Digitalis*, *Pedicularis*, *Melampyrum* and *Euphraſia*, &c.

VASTI *Muſculi*, are certain Muſcles that contribute to the extending of the Leg, and are of two ſorts, *viz*. *External* and *Internal.*

VASTO, is a Writ that lies for the Heir againſt the Tenant for Term of Life, or of Years, for making Waſte, or for him in the Reverſion or Remainder.

VASTUM, is a Waſte or Common, lying open to the Cattle of all Tenants, who have a Right of Commoning.

VASTUS *Externus*, is a Muſcle of the Leg, ſo called, from its Magnitude and Situation. It ariſes outwardly tendinous, inwardly fleſhy from the external Part of the great *Trochanter*, and *Linea Aſpera* of the Thigh-bone, from whence its Fibres deſcend obliquely forwards; and on the contrary, become outwardly fleſhy, and tendinous internally; and ſo ſoon as they meet with the Tendon of the *Rectus Femoris*, grow perfectly tendinous. It helps to extend the *Tibia.*

VASTUS *Internus*, is a Muſcle of the Leg, which hath its Denomination from its Situation and Magnitude. Its Beginning is large, partly tendinous, and partly fleſhy; its being continued from the *Linea Aſpera*, on the Back part of the Thigh-bone, from immediately below the leſſer *Trochanter*, till within three Fingers breadth above the inferior *Appendix* of the ſaid Bone internally and laterally; from hence its fleſhy Fibres deſcend obliquely outwards, and an almoſt ſemicircular manner, and on a ſudden ceaſing to be fleſhy, its Tendon is united with that of the *Rectus*, together with the *Vaſtus Internus* and *Crureus*, and is inſerted with them. It helps to extend the *Tibia.*

VECTIS, or the *Lever*, is the firſt of the Mechanick Powers, as they are uſually call'd. This Dr. *Wallis*, in his Mechanicks, rightly conſiders as a *Right Line* perfectly inflexible, of no weight it ſelf, or at leaſt, of an equable one throughout, accommodated to the raiſing or ſuſtaining of heavy Bodies. This *Vectis* is always ſupported by a *Fulcrum*, on which it moves as on an immoveable Centre.

VECTOR, a Line ſuppoſed to be drawn from any Planet moving round a Centre, as the Focus of an Ellipſis, to that Centre or Focus, is by ſome Writers of the New Aſtronomy, call'd the *Vector*; becauſe 'tis that Line by which the Planet ſeems to be carried round its Centre, and with which it deſcribes proportional Area's in proportional Time.

VEDETTE, a Military Term, ſignifying a Centinel on Horſe-back detach'd from the Main Body of the Army, to diſcover and give notice of the Enemies Deſigns.

VEER: The Seamen call *Veering* out a Rope, letting it go by Hand, or letting it run out of it ſelf. Thus they ſay, *Veer more Cable*; that is, let more Cable run out. But they don't uſe this Word for the letting out of any running Rope, except the *Sheat*, but of that, they ſay, *Veer more Sheat*; that is, let more of it run out.

The Word *Veer* is alſo uſed in reference to the Wind; for when it changeth often and ſuddenly, they ſay, the Wind *veereth*; alſo when a Ship being under Sail, hath her *Sheat veered out*, they ſay, ſhe goes *Veering*; that is, at large; neither *by* a Wind, nor directly *before* it, but between both, which they call alſo Quartering.

VEGETABLES, are ſuch Natural Bodies as grow and increaſe from Parts organically form'd, but have no proper Life nor Senſation.

VEGE-

VEGETATION, is the Way of Growth or Increaſe of Bulk, Parts and Dimenſions, proper to all Trees, Shrubs, Plants, and Herbs.

It hath been a general Opinion amongſt almoſt all the Modern Naturaliſts; That the Vegetation of Plants and even Minerals too, was chiefly owing to Water; and that not only as a Vehicle, to convey to them the fine rich Earth, *&c.* proper for their Nouriſhment; but that the Water was tranſmuted into the very Body of the Plant, and afforded the greateſt part of it, if not all the Matter with which they are nouriſh'd, and by which they grow and increaſe in Bigneſs. This Opinion countenanced by very great Names, that Learned and Ingenious Naturaliſt Dr. *John Woodward*, Author of the *Natural Hiſtory of the Earth*, thought very well worth taking into ſerious Examination.

And in the firſt place, he carefully examined all ſorts of Water, and found, that the cleareſt, fineſt Spring-water, which he could any where meet with, exhibited even to the naked Eye, great Numbers of exceeding ſmall terreſtrial Particles, and that all other Craſſer Waters had theſe in yet much greater Quantity; and alſo, that they were of a much larger Bulk.

He found this Terreſtrial Matter, contain'd in all Water, to be of two kinds: The one properly a *Vegetable Matter*, but conſiſting of very different Particles; ſome of which are proper for the Nouriſhment of ſome kinds of Plants; others for different ſorts, *&c.* The other kind of Earthy Matter, he found to be purely of a Mineral Nature; and this alſo was of very various and different kinds.

The former ſort of Vegetable Earthy Matter, abounds plentifully in all Waters; but for the *Mineral*, 'tis found moſtly in Spring-water, next to that, in River-water, and leaſt of all in Rain-water; tho' even there it is alſo to be found plentifully.

This Fact (he ſaith) any one may diſcover, by only keeping Water for a competent Time without ſtirring it, in a clear Glaſs Viol, cloſe ſtopt, to keep out Duſt, *&c.* For then he will obſerve, that theſe very ſmall Terreſtrial Particles, which before were ſcarcely viſible ſingly, will now combine together into larger and more conſpicuous Maſſes, which, by Degrees, will join together, and form Clouds as it were in the Water, which will grow daily more and more opacous and thick, by the continual Acceſſion of new Matter. And if the Earthy Matter in the Water be chiefly of the *Vegetable* kind, it will turn the Water green, the uſual Colour of Vegetables; and this will grow deeper and deeper colour'd, but will not precipitate to the Bottom of the Glaſs, as the *Mineral* Matter will, if there be any conſiderable Quantity, by reaſon of its much greater Specifick Gravity. On the whole therefore he concludes, very juſtly, That there is in all Water a conſiderable Quantity of Earthy Matter: And in order to determine whether the Vegetation of Plants was chiefly owing to bare Water, or not rather to the *Terreſtrial Matter* therein contain'd, he made, with very great Accuracy and Care, the following Experiments, as you will find in a Diſcourſe of his, read before the Royal Society, and publiſh'd in their *Tranſactions*, N. 253.

Which *Experiments*, becauſe they are done with an uncommon Care and Exactneſs, are a ſufficient number of them, and are follow'd by very ingenious *Reflections*, ſerving to explicate many Difficulties in Philoſophy, and to ſet the whole Affair of Vegetation in a very good Light; I ſhall give the Reader as followeth.

A. D. 1691, I choſe (ſaith he) ſeveral *Glaſs Viols*, that were all, as near as poſſible, of the ſame ſhape and bigneſs. After I had put what Water I thought fit into every one of them, and taken an Account of the *Weight* of it, I ſtrain'd and ty'd over the Orifice of each Viol, a piece of Parchment, having an Hole in the Middle of it, large enough to admit the *Stem* of the *Plant* I deſign'd to ſet in the Viol, without confining or ſtraitning it, ſo as to impede its *Growth*. My Intention in this, was to prevent the encloſed Water from evaporating or aſcending any other way, than only through the Plant to be ſet therein.

Then I made choice of ſeveral Sprigs of *Mint*, and other *Plants* that were, as near as I could poſſibly judge, alike freſh, ſound and lively. Having taken the Weight of each, I plac'd it in a Viol order'd as above; and as the Plant imbibed and drew off the Water, I took care to add more of the ſame from time to time, keeping an Account of the Weight of all I added. Each of the Glaſſes were for better Diſtinction, and the more eaſy keeping a Regiſter of all the Circumſtances, noted with a different Mark or Letter, A, B, C, *&c.* and all ſet in a row in the ſame Window, in ſuch manner, that all might partake alike of *Air*, *Light*, and *Sun*. Thus they continued from *July* the 20th to *October* the 5th, which was juſt 77 Days. Then I took them out, weigh'd the Water in each Viol, and the Plant likewiſe, adding to its Weight that of all the Leaves that had fallen off during the Time it ſtood thus. And laſtly, I computed how much each Plant had gain'd, and how much Water was ſpent upon it. The Particulars are as follows.

A. *Common Spear-Mint*, ſet in *Spring-water*.

The Plant weigh'd, when put in *July* 20, juſt 27 Grains; when taken out *October* 5. 42 Gr. So that in this Space of 77 Days, it had gain'd in Weight 15 Grains.

The whole Quantity of Water expended during the 77 Days, amounts to 2558 Gr. Conſequently, the Weight of the Water taken up, was $170\frac{3}{17}$ times as much as the Plant had got in Weight.

Weight of the Plant when firſt put in Water.	Weight of the Plant when taken out of the Water.	Weight gained by the Plant dur- the 77 Days.	Weight of the Water expended upon the Plant.	Proportion of the Increaſe of the Plant to the Expence of the Water.
A. *Common Spear-Mint : Spring-Water.*				
27 Grains.	42 Grains.	15 Grains.	2558 Grains.	As 1 to 170 $\frac{8}{13}$.
B. *Common Spear-Mint : Rain-Water.*				
28 $\frac{1}{4}$ Gr.	45 $\frac{3}{5}$ Gr.	17 $\frac{1}{2}$ Gr.	3004 Gr.	As 1 to 171 $\frac{23}{25}$
C. *Common Spear-Mint : Thames-Water.*				
28 Gr.	54 Gr.	26 Gr.	2493 Gr.	As 1 to 95 $\frac{23}{26}$.
D. *Common Solanum, or Night-Shade: Spring-Water.*				
49 Gr.	106 Gr.	57 Gr.	3708 Gr.	As 1 to 65 $\frac{2}{57}$.
E. *Lathyres* ſeu *Cataputia Gerh. Spring-Water.*				
98 Gr.	101 $\frac{1}{2}$ Gr.	3 $\frac{1}{2}$ Gr.	2501 Gr.	As 1 to 714 $\frac{4}{7}$.

The Specimen *D* had ſeveral *Buds* upon it when firſt ſet in Water; theſe in ſome Days became fair *Flowers*, which were at length ſucceeded by *Berries*. Several other Plants were try'd, that did not thrive in Water, or ſucceed any better than the *Cataputia* foregoing.

The Viols *F* and *G* were filled, the former with *Rain*, and the other with *Spring-Water*, at the ſame time as thoſe above-mention'd were, and ſtood as long as they did; but they had neither of them any Plant; my Deſign in theſe being only to inform my ſelf, whether any Water exhaled out of the Glaſſes, otherwiſe than through the Bodies of the Plants. The Orifices of theſe two Glaſſes were cover'd with *Parchment*; each piece of it being perforated with an Hole of the ſame bigneſs with thoſe of the Viols above: In this I ſuſpended a bit of Stick about the thickneſs of the Stem of one of the aforeſaid Plants, but not reaching down to the Surface of the included Water; I put them in thus, that the Water in theſe might not have more ſcope to evaporate than that in the other Viols.

Thus they ſtood the whole 77 Days in the ſame Window with the reſt; when, upon Examination, I found none of the Water in theſe waſted or gone off: Though I obſerved, both in theſe, and the reſt, eſpecially after hot Weather, ſmall Drops of Water, not unlike Dew, adhering to the inſides of the Glaſſes; that part of them I mean, that was above the Surface of the encloſed Waters.

The Water in theſe two Glaſſes that had no Plants in them, at the End of the Experiment, exhibited a larger Quantity of Terreſtrial Matter than that in any of thoſe that had the Plants in them did. The Sediment in the Bottom of the Viols was greater, and the *Nubeculæ* diffuſed thro' the Body of the Water thicker. And of that which was in the others, ſome of it proceeded from certain ſmall Leaves that had fallen from that part of the Stems of the Plants that was within the Water, wherein they rotted and diſſolved. The Terreſtrial Matter in the *Rain-Water*, was finer than that in the *Spring-Water*.

Experiments, *Anno* 1692.

The Glaſſes made uſe of in this, were of the ſame ſort with thoſe of the former Experiment; and cover'd over with Parchment in like manner.

The Plants here were all *Spear-Mint*; the moſt kindly, freſh, ſprightly Shoots I could chuſe. The Water and the Plants were weigh'd as above, and the Viols ſet in a Line, in a *South Window*, where they ſtood from *June* the 2d, to *July* the 28th, which was juſt 56 Days.

H. *Hyde-Park Conduit Water, alone.*

The Weight of the Plant when firſt ſet in Water.	Weight of the Plant when taken out of the Water.	What gain'd by the Plant during the 56 Days.	What of the Water is expended upon the Plant.	Proportion of the Increaſe of the Plant to the Expence of the Water.
127 Grains.	255 Grains.	128 Grains.	14190 Grains.	As 1 to 110$\frac{11}{12}$.

I. *The ſame Water, alone.*

110 Gr.	249 Gr.	139 Gr.	13140 Gr.	As 1 to 94$\frac{74}{133}$.

K. *The ſame Water, with an Ounce and an half of common Garden Earth diſſolved in it.*

76 Gr.	244 Gr.	168 Gr.	10731 Gr.	As 1 to 63$\frac{147}{168}$.

L. *Hyde-Park Water, with the ſame Quantity of Garden Mould as the former.*

92 Gr.	376 Gr.	284 Gr.	14950 Gr.	As 1 to 52$\frac{182}{384}$

M. *Hyde-Park Water, diſtilled with a gentle Still.*

114 Gr.	155 Gr.	41 Gr.	8803 Gr.	As 1 to 214$\frac{29}{41}$.

N. *The Reſidue of the Water which remain'd in the Still after that in* M *was diſtill'd off.*

81 Gr.	176 Gr.	94 Gr.	4344 Gr.	As 1 to 46$\frac{20}{94}$.

H, was all along a very *kindly Plant*, and had run up above two Foot in height. It had ſhot but one conſiderable collateral Branch; but had ſent forth many and long Roots, from which ſprung very numerous, tho' ſmall and ſhort leſſer *Fibres*. Theſe leſſer Roots came out of the larger on two oppoſite ſides, for the moſt part; ſo that each Root, with its *Fibrilla*, appeareth not unlike a ſmall Feather. To theſe *Fibrillæ* adhered pretty much *Terreſtrial Matter*. In the Water which was at the laſt thick and turbid, was a green Subſtance, reſembling a fine thin *Conferva*.

The *Plant* I, was as kindly as the former, but had ſhot no collateral Branches: Its *Roots*, the *Waters*, and the green Subſtance, all much as in the former.

The *Plant* K, tho' it had the Misfortune to be annoy'd with very ſmall Inſects that happen'd to fix upon it, yet had ſhot very conſiderable collateral Branches; and at leaſt as many Roots, as either in H or I, which had a much greater Quantity of *Terreſtrial Matter* adhering to the Extremities of them. The ſame green Subſtance here that was in the two preceding.

The *Plant* L, was far more flouriſhing than any of the precedent; had ſeveral conſiderable collateral Branches, and very numerous Roots, to which *Terreſtrial Matter* adhered very copiouſly.

The Earth in both theſe Glaſſes was very ſenſibly and conſiderably waſted, and leſs than when firſt put in. The ſame ſort of green Subſtance here, as in thoſe above.

The *Plant* M, was pretty kindly; had two ſmall collateral Branches, and ſeveral Roots, tho' not ſo many as that in H or I; but as much *Terreſtrial Matter* adhering to them, as thoſe had. The Water was pretty thick; having very numerous ſmall Terreſtrial Particles ſwimming in it, and ſome Sediment at the bottom of the Glaſs. This Glaſs had none of the green Matter abovementioned in it.

The *Plant* N, was very lively, and had ſent out ſix collateral Branches, and ſeveral Roots.

The Glaſs O, had alſo *Hyde Park Conduit Water*, in which was diſſolv'd a Dram of *Nitre*. The *Mint* ſet in this, ſuddenly began to wither and decay, and *died* in a few days, as likewiſe did two more Sprigs that were ſet in it ſucceſſively. In another Glaſs I diſſolv'd an Ounce of good Garden Mould, and a Dram of *Nitre*; and in a third, half an Ounce of Wood-aſhes, and a Dram of *Nitre*; but the Plants in theſe ſucceeded no better than in the former. In other Glaſſes I diſſolved ſeveral other ſorts of Earth, Clay, Marls, and variety of Manures, &c. I ſet *Mint* in diſtilled *Mint-Water*; and other Experiments I made of

ſeveral

ſeveral Kinds, in order to get Light and Information what haſtned or retarded, promoted or impeded *Vegetation*.

The *Glaſs* P, *Hyde-Park Conduit Water*: In this I fixed a *Glaſs-Tube* of ten Inches long, the Bore about one ſixth of an Inch in Diameter, filled with very fine and white Sand, which I kept from falling down out of the Tube into the Viol, by tying a thin Piece of Silk over that end of the Tube that was downwards. Upon Immerſion of the lower End of it into the Water; this by little and little aſcended quite to the upper Orifice of the Tube; and yet in all the 56 Days which it ſtood thus, a very inconſiderable Quantity of Water had gone off, *viz.* ſcarcely 20 Grains, tho' the Sand continued moiſt up to the top, 'till the very laſt. The Water had imparted a green Tincture to the Sand, quite to the very top of the Tube: And in the Viol, it hath precipitated a greeniſh Sediment, mix'd with Black. To the Bottom and Sides of the Tube, as far as 'twas immerſed in the Water, adhered pretty much of the green Subſtance deſcribed above. Other-like Tubes I filled with *Cotton*, *Lint*, *Pith of Elder*, and ſeveral other porous *Vegetable Subſtances*; ſetting ſome of them in clear Water, others in Water tinged with *Saffron*, *Cochinele*, *&c.* And ſeveral other Trials were made, in order to give a Mechanical Repreſentation of the Motion and Diſtribution of the Juices in Plants; and of ſome other *Phænomena* obſervable in *Vegetation*.

Several *Plants* being alſo ſet in the Viols Q, R, S, *&c.* ordered in like manner as thoſe above, in *October*, and the following colder Months; theſe throve not near ſo much, nor did the Water aſcend in nigh the Quantity it did in the hotter Seaſons, in which the before cited Trials were made.

Some Reflections upon the foregoing Experiments.

1. *In the Plants of the ſame kind, the leſs they are in Bulk, the ſmaller Quantity of the Fluid Maſs in which they are ſet, is drawn off; the Diſpendium of it where the Maſs is of equal Thickneſs, being pretty nearly proportion'd to the Bulk of the Plant.*

Thus, that in the Glaſs mark'd A, which weigh'd only 27 *Gr.* drew off but 2558 *Gr.* of the Fluid: And that in B, which weigh'd only 28 $\frac{1}{4}$ took up but 3004 *Gr.* Whereas that in H, which weigh'd 127 *Gr.* ſpent 14190 *Gr.* of the *Liquid Maſs*.

The Water ſeems to aſcend up the Veſſels of Plants, in much the ſame manner as up a *Filtre*; and 'tis no great Wonder, that the larger Filtre ſhould draw off more Water, than the leſſer; or that a Plant that has more and larger Veſſels, ſhould take up a greater ſhare of the Fluid in which it is ſet, than one that has fewer and ſmaller ones can. Nor do I note this as a Thing very conſiderable in it ſelf, but chiefly in regard to what I am about next to offer: And that it may be ſeen, that in my other Collations of Things, I made due Allowance for this Difference.

2. *The much greater part of the Fluid Maſs that is thus drawn off, and convey'd into the Plant, does not ſettle or abide there; but paſſes through the Pores of them, and exhales up into the Atmoſphere.*

That the Water in theſe Experiments aſcended only through the Veſſels of theſe Plants, is certain.

The *Glaſſes* F and G, that had no Plants in them, tho' diſpoſed in like manner as the reſt, remain'd at the end of the Experiment, as at firſt, and none of the Water was gone off: And that the greateſt part of it flies off from the Plant into the Atmoſphere, is as certain.

The leaſt Proportion of the Water expended, was to the Augment of the Plant, as 46 or 50 to 1. And in ſome, the Weight of the Water drawn off was 100, 200, nay, in one above 700 times as much as the Plant had received of Addition.

This ſo continual an Emiſſion and Detachment of Water, in ſo great Plenty, from the Parts of the Plants, affords us a manifeſt Reaſon, why Countries that abound with Trees, and the larger Vegetables eſpecially, ſhould be very obnoxious to *Damps*, great Humidity in the Air, and more frequent Rains, than others that are more open and free. The great Moiſture in the Air, was a mighty Inconvenience and Annoyance to thoſe who firſt ſettled in *America*, which at that Time was much overgrown with Woods and Groves. But as theſe were burnt and deſtroy'd, to make way for Habitations and Culture of the Earth, the Air mended and cleared up apace, changing into a Temper much more ſerene and dry than before. Nor does this Humidity go off pure and alone, but uſually bears forth with it many Parts of the ſame Nature with thoſe whereof the *Plant*, through which it paſſes, conſiſts. The *Craſſer* indeed are not ſo eaſily born up into the Atmoſphere; but are uſually depoſited on the Surface of *Leaves*, *Flowers*, and other Parts of the *Plants*. Hence come our *Manna*'s, our *Honies*, and other *Gummous* Exſudations of *Vegetables*.

But the finer and lighter Parts are with greater eaſe ſent up into the *Atmoſphere*.

Thence they are convey'd to our Organs of *Smell*, by the *Air* we draw in *Reſpiration*, and are pleaſant or offenſive, beneficent or injurious to us, acording to the Nature of the Plants from whence they ariſe.

And ſince theſe owe their Riſe to the Water that aſcends out of the Earth through the Bodies of Plants, we cannot be far to ſeek for the Cauſe why they are more numerous in the Air, and we find a greater Quantity of Odours exhaling from Vegetables, in warm, humid Seaſons, than in any others whatſoever.

3. *A great part of the Terreſtrial Matter that is mix'd with Water, aſcends up into the Plant, as well as the Water.*

There was much more Terreſtrial Matter at the end of the Experiment in the Water of the *Glaſſes* F and G, that had no *Plants* in them, than in thoſe that had *Plants*.

The *Garden Mould* diſſolved in the Glaſſes K and L, was conſiderably diminiſhed, and carried off; nay, the *Terreſtrial* and *Vegetable Matter*

w[illegible]born up in the *Tubes* fill'd with *Sand*, *Cotton*, &c. in that Quantity, as to be evident even to Senſe. And the Bodies in the Cavities of the other Tubes, that had their lower Ends immers'd in Water, wherein *Saffron*, *Cochineel*, &c. had been infuſed, were *tinged* with *Yellow*, *Purple*, &c.

If I may be permitted to look abroad a while, towards our *Shores* and *Parts* within the *Verge* of the *Sea*, theſe will preſent us with a large Scene of *Plants*, that along with the Vegetable, take up into them meer *Mineral Matter* alſo in great abundance: Such are our *Sea Purſlain*, the ſeveral ſorts of *Alga's*, of *Samphires*, and other *Marine Plants*. Thoſe contain *common Sea Salts*, which is all one with the *Foſſil*, in ſuch Plenty, as not only to be plainly diſtinguiſh'd on the *Palate*, but may be drawn forth of them in conſiderable Quantity; nay, there want not thoſe, who affirm, There are *Plants* found that will yield *Nitre*, and other *Mineral Salts*; of which, indeed, I am not ſo far ſatisfied, that I can depend on the thing, and therefore give this only as an *Hint* for Enquiry.

To go on with the *Vegetable* Matter, how apt and how much diſpos'd this, being ſo very *fine* and *light*, is to attend Water in all its *Motions*, and follow it into each of its *Receſſes*, its manifeſt, not only from the Inſtances above alledged, but many others. *Percolate* it with all the Care imaginable, *Filter* it with never ſo many *Filtrations*, yet ſome Terreſtrial Matter will remain. 'Tis true, the Fluid will be thinner every time than other, and more diſengaged of the ſaid Matter; but never wholly free and clear. I have filtred Water thro' ſeveral Sheets of thick Paper, and after that thro' very cloſe fine Cloth twelve times doubled; nay, have done this over and over, and yet a conſiderable Quantity of this Matter diſcovered it ſelf in the Water after all. Now, if it thus paſſes *Interſtices* that are ſo very ſmall and fine along with the Water, 'tis the leſs ſtrange it ſhould attend it in its Paſſage through the Ducts and Veſſels of Plants. 'Tis true, filtring and diſtilling of Water, intercepts and makes it quit ſome of the Earthy Matter it was before impregnated withal; but then, that which continues with the Water after this, is fine and light, and ſuch conſequently as is in a peculiar manner fit for the Growth and Nouriſhment of Vegetables. And this is the caſe of Rain-water. The Quantity of Terreſtrial Matter it bears up into the *Atmoſphere* is not great: But that which it does bear up, is mainly of that light kind or Vegetable Matter, and that too perfectly diſſolved, and reduced to ſingle Corpuſcles, all fit to enter the *Tubules* and Veſſels of *Plants*. On which account 'tis, that this Water is ſo very *Fertile* and *Prolifick*.

The Reaſon why in this *Propoſition* I ſay only a great Part of the Terreſtrial Matter that is mix'd with the Water, aſcends up with it into the Plant is, becauſe all of it cannot. The Mineral Matter is a great deal of it, not only groſs and ponderous, but ſcabrous and inflexible; and ſo not diſpoſed to enter the Pores of the Roots. And a great many of the ſimple Vegetable Particles by Degrees unite, and form ſome of them ſmall *Clods* or *Moleculæ*; ſuch as thoſe mention'd in H, K, and L, ſticking to the Extremities of the Roots of thoſe Plants. Others of 'em intangled in a looſer manner, and form the *Nubeculæ*, and green Bodies ſo commonly obſerved in ſtagnant Water. Theſe, when thus conjoin'd, are too big to enter the *Pores*, or aſcend up the Veſſels of Plants, which ſingly they might have done.

They who are converſant in *Agriculture*, will eaſily ſubſcribe to this. They are well aware, that be their *Earth* never ſo rich, ſo good, and ſo fit for the Production of *Corn* or other *Vegetables*, little will come of it, unleſs the Parts of it be ſeparated and looſe. 'Tis on this account they beſtow the Pains they do in *Culture* of it; in *Diging*, *Plowing*, *Harrowing*, and breaking of the *clodded Lumps* of Earth. 'Tis the ſame way that *Sea Salt*, *Nitre*, and other *Salts* promote *Vegetation*.

I am ſorry I cannot ſubſcribe to the Opinion of thoſe Learned *Gentlemen*, who imagine *Nitre* too eſſential to Plants; and that nothing in the *Vegetable* Kingdom is tranſacted without it. By all the Trials I have been able to make, the thing is quite otherwiſe; and when contiguous to the Plant, it rather deſtroys, than nouriſhes it. But this *Nitre* and other *Salts* certainly do; they looſen the Earth and ſeparate the concreted Parts of it, by that means fitting and diſpoſing them to be aſſumed by the Water, and carried up into *Seed* or *Plant*, for its *Formatation* and *Augment*.

There is no Man but muſt obſerve, how apt all ſorts of *Salts* are to be wrought upon by *Moiſture*; how eaſily they liquate and run with it; and when theſe are drawn off, and have deſerted the Lumps wherewith they were incorporated, thoſe muſt moulder immediately, and fall aſunder of courſe. The hardeſt Stone we meet with, if it happen, as frequently it does, to have any ſort of *Salt* intermix'd with the Sand, of which it conſiſts, upon being expos'd to an *humid Air*, in a ſhort time diſſolves and crumbles all to Pieces, and much more will clodded Earth or Clay, which is not of near ſo *compact* and ſo *ſolid* a Conſtitution as Stone is. The ſame way likewiſe is Lime ſerviceable in this Affair. The Husbandman ſays of it, That it does not *fatten*, but only *mellows* Ground. By which they mean, That it does not contain any thing in it ſelf that is of the ſame Nature with the *Vegetable Mould*, or afford any Matter fit for the Formation of *Plants*, but meerly ſoftens and relaxes the Earth, by that means rendring it more capable of entring the *Seeds* and *Vegetables* ſet in it, in order to their Nouriſhment, than otherwiſe it would have been. The Properties of Lime are well known, and how apt 'tis to be put into *Ferment* and *Commotion* by *Water*: Nor can ſuch *Commotion* ever happen when *Lime* is mixed with *Earth*, however hard or clodded that may be, without opening and looſening of it.

4. *The Plant is more or leſs nouriſhed and augmented in Proportion, as the Water in which it ſtands contains a greater or ſmaller Quantity of proper Terreſtrial Matter in it.*

The Truth of this *Propoſition* is ſo evidently diſcernable through the whole Proceſs of theſe Trials, that I think no doubt can be made of it.

The Mint in the Glaſs C, was of much the ſame Bulk and Weight with thoſe in A and B: But the Water in which that was, being *River Water*, which was apparently ſtored more copiouſly with Terreſtrial Matter, than the Spring or Rain Water wherein they ſtood, were; it had thriven at almoſt

almoſt double the Bulk that either of them had, and with a leſs Expence of Water too. So likewiſe, the *Mint* in L, in whoſe Water was diſſolved a ſmall Quantity of good Garden Mould, tho' it had the Diſadvantage to be leſs when firſt ſet, than either of the *Mints* in H or I, whoſe Water was the very ſame with that in L, but had none of that Earth mixed with it, yet in a ſhort time, the Plant not only overtook, but much outſtrip'd thoſe; and at the end of the Experiment, was very conſiderably bigger and heavier than either of them.

In like manner, the *Mint* in N, tho' leſs in the beginning than that in M, being ſet in that *thick, turbid, ferculent Water* that remained behind, after that wherein M was placed was ſtilled off, had in fine more than double its original Weight and Bulk; and received above twice the additional Encreaſe that *that* in M, which ſtood in thinner *diſtilled Water*, had done: And which is not leſs conſiderable, had not drawn off half the Quantity of Water that *that* had.

Why, in the beginning of this Article, I limit the Proportion of the Augment of the *Plant*, to the Quantity of the proper Terreſtrial Matter in the Water, is, Becauſe all, even the *Vegetable Matter*, to ſay nothing of the *Mineral*, is not proper for the Nouriſhment of every *Plant*.

There may be, and doubtleſs are, ſome Parts in different Species of *Plants*, that may be much alike, and ſo owe their Supply to the ſame common Matter: But 'tis plain, all cannot. And there are other *Parts* ſo differing, that 'tis no ways credible they ſhould be formed all out of the ſame ſort of *Corpuſcles*: So far from it, that there want not good Indications, as we ſhall ſee by and by, That every kind of *Vegetable* requires a peculiar and ſpecifick Matter for its *Formation* and Nouriſhment; yea, each part of the ſame *Vegetable* does ſo; and there are very many and different Ingredients go to the Compoſition of the ſame individual Plant.

If therefore the Soil, wherein any Vegetable or Seed is planted, contains all or moſt of theſe Ingredients, and thoſe in due Quantity, 'twill grow and thrive there; otherwiſe 'twill not. If there be not as many ſort of *Corpuſcles*, as are requiſite for the Conſtitution of the main and more eſſential Parts of the Plant, 'twill not proſper at all. If there be theſe, and not in ſufficient Plenty, 'twill ſtarve, and never arrive to its natural Stature. Or if there be any the leſs *neceſſary* and *eſſential* Corpuſcles wanting, there will be ſome Failure in the *Plant*; 'twill be defective in *Taſte*, in *Smell*, in *Colour*, or ſome other way.

But tho' the Tract of Land may happen not to contain proper Nouriſhment for the Conſtitution of ſome one peculiar kind of *Plant*; yet it may for ſeveral *others*, and thoſe much differing amongſt themſelves.

The *Vegetable Particles* are commixt and blended in the Earth, with all the Diverſity and Variety, as well as all the Uncertainty conceivable. (I have given ſome Intimations of this in *Nat. Hiſt. of the Earth*, Page 228, &c. and ſhall not repeat them here.)

It is not impoſſible to imagine, how, *one, uniform, homogeneous Matter*, having its Principles or *original Parts* all of the ſame *Subſtance*, *Conſtitution*, *Magnitude*, *Figure*, and *Gravity*, ſhould ever conſtitute *Bodies* ſo egregiouſly unlike, in all thoſe reſpects, as *Vegetables* of different kinds are; nay, even as the different Parts of the ſame *Vegetable*: That one ſhould carry a *Roſinous*, another a *Milky*, a third a *Yellow*, a fourth a *Red Juice* in its Veins; one afford a *fragrant*, another an *offenſive Smell*; one be *ſweet* to the Taſte, another *bitter*, *acid*, *acerb*, *auſtere*, &c. That one ſhould be *nouriſhing*, another *poiſonous*, one *purging*, another *aſtringent*, That there ſhould be that vaſt difference in them; in their ſeveral *Conſtitutions*, *Makes*, *Properties*, and *Effects*, and yet all ariſe from the very ſame *ſort* of *Matter*, would be very ſtrange. And, to Note that by the Bye, this Argument makes equally ſtrong againſt thoſe who ſuppoſe mere *Water* the *Matter* out of which all *Bodies* are formed.

The *Cataputia*, in the Glaſs E, received but very little Encreaſe, only three Grains and an half all the while it ſtood, tho' 2501 Gr. of *Water* were ſpent upon it. I will not ſay the reaſon was, Becauſe the *Water* did not contain in it *Matter* fit and proper for the Nouriſhment of that peculiar and remarkable *Plant*. No, it may be, the Water was not a proper *Medium* for it to grow in: And we know, there are very many Plants that will not thrive in it.

Too much of that Liquor, in ſome *Plants*, may probably hurry the Terreſtrial Matter thro' their Veſſels too faſt for them to arreſt and lay hold of it. Be that as it will, 'tis moſt certain, There are peculiar Soils that ſuit particular Plants.

In *England*, *Cherries* are obſerv'd to ſucceed beſt in *Kent*; *Apples* in *Herefordſhire*; *Saffron* in *Cambridgeſhire*; *Woad* in two or three of our *Midland Counties*; and *Teazles* in *Somerſetſhire*. This is an Obſervation that hath held in all *Parts*, and indeed in all *Ages* of the *World*. The moſt ancient Writers of Husbandry took Notice of it; and are not wanting in their *Rules*, for making choice of *Soils* ſuited to the *Nature* of each kind of *Vegetable* they thought valuable or worth Propagating.

But, which is a further Proof of what I am here endeavouring to advance, That Soil that is once proper and fit for Production of ſome one ſort of *Vegetable*, does not ever continue to be ſo. No, in Tract of Time, it loſes that Property; but *ſooner* in ſome *Lands*, and *later* in *Others*. This is what all, who are converſant in theſe Things, know very well.

If *Wheat*, for Example, be ſown upon a Tract of Land that is proper for that *Grain*, the *firſt* Crop will ſucceed very well, and perhaps the *ſecond*, and the *third*, as long as the Ground is in *Heart*, as the *Farmers* ſpeak: But in a *few Years* 'twill produce *no more*, if ſowed with that *Corn*. Some other *Grain* indeed it may, as Barley. And after this has been ſown ſo often, that the *Land* can bring forth no more of the ſame, it may afterwards yield ſome good *Oats*, and perhaps *Peaſe* after them: At length it will become barren; the *Vegetative* Matter that at firſt it abounded withal, being reduced forth of it by thoſe ſucceſſive *Crops*, and moſt of it born off. Each ſort of *Grain* takes forth that peculiar *Matter* that is proper for its own Nouriſhment. Firſt the *Wheat* draws off thoſe Particles that ſuit the Body of that *Plant*, the reſt lying all *quiet* and *undiſturb'd* the while. And when the Earth has yielded up all them, thoſe that are proper for *Barley*, a different *Grain*, remain ſtill behind, 'till the ſucceſſive Crops of that *Corn* fetch them forth too: And ſo the *Oats* and *Peaſe* in their *Turn*, 'till in fine all is carried off, and the

Earth in a great Meaſure drained of that ſort of Matter.

After all which, that very Tract of Land may be brought to produce another *Series* of the ſame *Vegetables*, but never till 'tis ſupplied with a new *Fund* of *Matter* of the like ſort with that it at firſt contained. This Supply is made ſeveral ways: By the Ground's lying Fallow for ſome time, till the *Rain* has poured down a freſh Stock upon it: Or by the *Tiller*'s Care, in Manuring of it. And for further Evidence that this Supply is in reality of like ſort, we need only reflect a while upon thoſe *Manures* that are found by conſtant Experience beſt to promote *Vegetation*, and the *Fruitfulneſs* of the *Earth*. Theſe are chiefly either *Parts of Vegetables*, or of *Animals*, which indeed either derive their own Nouriſhment immediately from *Vegetable* Bodies, or from other Animals that do ſo. In particular, the *Blood*, *Urine*, and *Excrements* of *Animals*; *Shaving of Horns*, and of *Hoofs*; *Hair*, *Wooll*, *Feathers*, *calcined Shells*, *Lees of Wine*, and of *Beer*, *Aſhes* of all ſorts of *Vegetable Bodies*, *Leaves*, *Straw*, *Roots*, and *Stubble* turned into *Earth*, by plowing or otherwiſe, to *rot* and *diſſolve* there. Theſe, I ſay, are our beſt *Manures*; and being *Vegetable* Subſtances when refunded back again into the Earth, ſerve for the Formation of other like Bodies.

Not wholly to confine our Thoughts to the *Fields*, let us look a while into our Gardens, where we ſhall meet with ſtill further Confirmations of the ſame thing. The *Trees*, *Shrubs*, and *Herbs*, Cultivated in *theſe*, after they are continued in one *Station*, till they have derived thence the greater Part of the Matter fit for their *Augment*, will *decay* and *degenerate*, unleſs either freſh Earth, or ſome fit *Manure*, be applied unto them. 'Tis true, they may maintain themſelves there for ſome time, by ſending forth Roots further and further, to a great Extent all round, to fetch in more remote Proviſion: But at laſt, all will fail; and they muſt either have a freſh Supply brought to them, or they themſelves be removed and tranſplanted to ſome Place better furniſhed with Matter for their *Subſiſtance*. And accordingly, Gardiners obſerve, That Plants that have ſtood a great while in a Place, have longer Roots than uſual; part of which they cut off when they tranſplant to a freſh Soil, as now not of any further uſe to them.

All theſe Inſtances, to paſs over a great many others that might be alledged, point forth a *particular Terreſtrial Matter*, and not Water, for the Subject, to which Plants owe their Increaſe: Were it Water only, there would be no need of *Manures*, or of Tranſplanting them from place to place. The Rain falls in all places alike, in this *Field* and in that indifferently, in one ſide of an Orchard or Garden as well as another. Nor could there be any reaſon, why a Tract of Land ſhould yield *Wheat* one Year, and not the next, ſince the Rain ſhowers down alike in each. But I am ſenſible I have carried this Article to too great a *length*, which yet on ſo ample and extenſive a Subject, 'twas not eaſie to avoid.

5. *Vegetables are not formed of Water, but of a certain peculiar Terreſtrial Matter.*

It hath been ſhewn, That there is a conſiderable Quantity of this Matter contained both in *Rain*, *Spring*, and *River-water*; that the much greateſt part of the Fluid Maſs that aſcends up into Plants, does not ſettle or abide there, but paſſes through the Pores of them, and Exhales up into the Atmoſphere; that a great part of the Terreſtrial Matter mixed with the Water, paſſes up into the Plant along with it, and that the Plant is *more* or *leſs* augmented in proportion, as the Water contains a *greater* or *ſmaller* Quantity of that Matter. From all which we may very reaſonably infer, That *Earth*, and not *Water*, is the Matter that conſtitutes Vegetables.

The Plant in E drew up into it 2501 Grains of the *Fluid Maſs*, and yet had received but $3\frac{1}{2}$ Gr. of Encreaſe from all that.

The *Mint* in L, tho' it had at firſt the Diſadvantage to be much leſs than that in I, yet being ſet in *Water*, wherewith Earth was plentifully mixed, and that in I only in Water, without any ſuch additional Earth, it had vaſtly outgrown the other, weighing at laſt 145 Gr. more than that did, and ſo having gain'd above twice as much as the other had.

In like manner, that in K, tho' 'twas a great deal *leſs* when put in than that in I, and was alſo impair'd and offended by Inſects, yet being planted in Water wherein Earth was diſſolved, whereas the Water in which (I) ſtood, had none, it not only overtook, but conſiderably ſurpaſſed the other, weighing at laſt 29 Gr. more than that in I, and yet had not expended ſo much Water as that by above 2400 Gr.

The *Plant* in N, tho' at firſt a great deal leſs than that in M, yet being ſet in the *foul craſs Water* that was left in the Still, after that in which M was ſet, was drawn off, in concluſion, had gain'd in Weight above double what that in the finer and thinner Water had.

The Proportion of the Augment of that *Plant* that throve moſt, was to the Fluid Maſs ſpent upon it, but as 1 to 46; in others, 'twas as 1 to 60, 100 to 200; nay, in the *Cataputia*, 'twas but as 1 to 714.

The *Mint* in B took up 39 Gr. of Water a day, one day with another; which was much more than the whole Weight of the Plant originally; and yet withal this, it gained not $\frac{1}{4}$ of a Grain a day, in *Weight*.

Nay, that in H, took up 253 Gr. a day of the Fluid, which was near *twice* as much as its original *Weight*, it weighing, when firſt ſet in the Water, but 127 Gr. And after all, the daily Encreaſe of the Plant was no more than $2\frac{15}{36}$ Gr.

6. *Spring and Rain-water contain pretty near an equal Charge of Vegetable Matter; River-water more than either of them.*

The *Plants* in the Glaſſes A, B, and C, were at firſt of much the ſame Size and Weight. At the end of the Experiment, the Mint in A had gain'd 15 Gr. out of 2558 Gr. of *Spring-water*: That in B, $17\frac{1}{2}$ Gr. out of 3004 Gr. of *Rain-water*; but that in C had got 26 Gr. out of only 2493 Gr. of *River-water*.

I do not found this *Propoſition* ſolely upon thoſe Trials, having made ſome more, which I do not relate here, that agree well enough with theſe: So that the *Proportions* here delivered, will hold for the *main*; but a ſtrict and juſt Compariſon is hardly to be expected; ſo far from it, that I make no doubt, but the Water that falls in *Rain*, at ſometimes,

times, contains a greater Share of *Terreſtrial Matter*, than that which falls at others. A more powerful and intenſe Heat muſt needs hurry up a larger Quantity of that Matter along with the humid *Vapours*, that form *Rain*, than one more *feeble* and *remiſs* ever poſſibly can. The Water of one Spring may flow forth with an higher Charge of this Matter, than that of another; this depending partly upon the quickneſs of the *Ebullition* of the Water; and partly, upon the quantity of that *Matter* latent in the *Strata* through which the Fluid paſſes, and the *greater* or *leſs* Laxity of thoſe *Strata*. For the ſame Reaſon, the Water of one River may abound with it more than that of another; nay, the ſame River, when much agitated and in *Commotion*, muſt bear up more of it, than when it moves with leſs *Rapidity* and *Violence*.

That there is a great quantity of this Matter in Rivers; and that it contributes vaſtly to the ordinary Fertility of the Earth, we have an illuſtrious Inſtance in the *Nile*, the *Ganges*, and other *Rivers*, that yearly overflow the neighbouring *Plains*. Their *Banks* ſhew the faireſt and largeſt *Crops* of any in the whole World: They are even loaded with the multitude of their Productions; and thoſe who have not ſeen them, will hardly be induced to believe the mighty Returns thoſe *Tracts* make, in compariſon of others, that have not the Benefit of like *Inundations*.

7. *Water ſerves only for a Vehicle to the Terreſtrial Matter which forms Vegetables, and does not it ſelf make any Addition unto them.*

Where the proper *Terreſtrial Matter* is wanting, the *Plant* is not augmented, tho' never ſo much Water aſcend into it.

The *Cataputia* in E, took up more Water than the *Mint* in C, and yet had grown but very little, having received only 3½ Gr. of additional Weight, whereas the other had received no leſs than 26 Grains.

The *Mint* in I, was planted in the ſame ſort of Water as that in K was; only the latter had Earth diſſolved in Water, and yet that drew off 13140 Gr. of *Water*, gaining it ſelf no more than 139 Gr. in Weight; whereas the other took up but 10731 Gr. of *Water*, and was augmented 168 Gr. in Weight; conſequently, that ſpent 2409 Gr. more of the Water than *this* in K did, and yet was not ſo much encreaſed in Weight as this, by 29 Grains.

The *Mint* in M ſtood in the very ſame kind of Water, as that in N did. But the Water in M having much leſs Terreſtrial *Matter* in it than that in N had, the Plant bore up 8803 Gr. of it, gaining it ſelf only 41 Gr. the while; whereas that in N drew off no more than 4344 Gr. and yet was augmented 94 Gr. So that it ſpent 4459 Gr. of Water more than that did; and yet was not it ſelf ſo much encreaſed in Weight as that was by 53 Gr.

This is both a very fair and a very concluſive Inſtance; on which account 'tis that I make often uſe of it. Indeed they are all ſo; and to add any thing further on this Head, will not be needful.

'Tis evident therefore, Water is not the Matter that compoſes Vegetable Bodies; 'tis only the Agent that conveys that Matter to them, that introduces and diſtributes it to their ſeveral Parts for their Nouriſhment. That *Matter* is ſluggiſh and inactive, and would lie eternally confined to its Beds of Earth, without ever advancing up into *Plants*, did not Water, or ſome like Inſtrument, fetch it forth, and carry it unto them.

That therefore there is that plentiful Proviſion and vaſt Abundance of it ſupplied to all Parts of the Earth, is a Mark of a *Natural Providence* Super-intending over the Globe we Inhabit, and Ordaining a due Diſpenſation of that Fluid, without the Miniſtry of which the noble Succeſſion of Bodies we behold in *Animals*, *Vegetables*, and *Minerals*, ſhould be all at a ſtand. But to keep to Plants, 'tis manifeſt, Water, as well upon this, as upon the other Hypotheſis, is abſolutely neceſſary in the Affair of *Vegetation*; and it will not ſucceed without it: Which indeed, gave occaſion to the Opinion, That *Water* it ſelf nouriſhed, and was changed into Vegetable Bodies. They ſaw, That tho' theſe were planted in a Soil never ſo Rich, ſo Happy, ſo Advantageous, nothing came of it, unleſs there was *Water* too in conſiderable Quantity.

And it muſt be allow'd, *Vegetables* will not come on or proſper, where that is wanting. But yet what theſe Gentlemen inferred thence, was not, we ſee, well grounded.

This *Fluid*, is capacitated for the Office here aſſigned it, ſeveral ways. By the Figure of its Parts, which, as appears from many Experiments, is Exactly and Mathematically Spherical; their Surfaces being perfectly Polite, and without any the leaſt Inequalities. 'Tis evident, Corpuſcles of ſuch a Figure are eaſily ſuſceptible of Motion, yea, far above any others whatſoever; and conſequently, the moſt capable of moving and conveying other Matter that is not ſo active and voluble. Then the Intervals of Bodies of that Figure are, with reſpect to their Bulk, of all others, the largeſt, and ſo the moſt fitting to receive and entertain foreign Matter in them. Beſides, as far as the Trials hitherto made inform us, the conſtituent Corpuſcles of Water, are each ſingly conſidered abſolutely ſolid, and do not yield to the greateſt external Force. This ſecures their Figure againſt any Alteration; and the Intervals of the Corpuſcles muſt be always alike.

By the latter, 'twill be ever diſpoſed to receive Matter into it: And by the former, when once received, to bear it along with it.

Water is further capacitated to be a Vehicle to this Matter, by the Tenuity and Fineneſs of the Corpuſcles of which it conſiſts. We hardly know any Fluid in all Nature, except Fire, whoſe Conſtituent Parts are ſo exceeding ſubtil and ſmall, as thoſe of Water are. They'll paſs Pores and Interſtices, that neither Air nor any other Fluid will. This enables them to enter the fineſt Tubes and Veſſels of Plants, and to introduce the Terreſtrial Matter, conveying it to all Parts of them; whilſt each, by means of Organs 'tis endow'd with for the Purpoſe, intercepts and aſſumes into it ſelf ſuch Particles as are ſuitable to its own Nature, letting the reſt paſs on through the common Ducts: Nay, we have almoſt every where Mechanical Inſtances of much the ſame Tenor.

'Tis obvious to every one, how eaſily and ſuddenly Humidity, or the Corpuſcles of Water ſuſtained in the Air, pervade and inſinuate themſelves into Cords, however tightly twiſted into Leather, Parchment, Vegetable Bodies, Wood, and the like.

This

This it is that fits them for Hygrometers, and to measure and determine the different Quantities of Moisture in the Air, in different Places and Seasons.

How freely Water passes and carries with it Terrestrial Matter through Filtres, Colatures, Distillations, &c. hath been intimated already.

8. *Water is not capable of performing this Office to Plants, unless assisted by a due Quantity of Heat; and this must concurr, or Vegetation will not succeed.*

The Plants that were set in the Glasses Q, R, S, &c. in *October*, and in the following colder Months, had not near the Quantity of Water sent up into them, or so great an additional Encrease by much as those that were set in *June*, *July*, and the hotter Months. 'Tis plain, Water has no power of moving it self, or rising to the vast Height it does in the more tall and lofty Plants; so far from this, that it does not appear from any Discovery yet made, that even its own Fluidity consists in the intestine Motion of its Parts; whatever some otherwise very learned and knowing Persons may have thought. There is no need of any thing more for solving all the Phænomena of *Fluidity*, than such a Figure and Disposition of Parts, as Water has. Corpuscles of that make, and that are all absolutely *Spherical*, must stand so very tickliſh and nicely upon each other, as to be susceptible of every Impression, and tho' not perpetually in Motion, yet must be always ready and liable to be put into it, by any the slightest Force imaginable. It is true, the Parts of Fire or Heat are not capable of moving themselves any more than those of Water; but they are more subtil, light, and active than those are, and so more easily put into Motion.

In fine, 'tis confident, and Matter of Fact, That Heat does operate upon, and move the Water, in order to its carrying on the Work of *Vegetation*; but how 'tis agitated it self, and when the Motion first begins, this is no fit Place to enquire.

That the Concourse of Heat in this Work, is really necessary, appears not only from the Experiments before us, but from all Nature: From our Fields and Forests, our Gardens and our Orchards, we see in *Autumn*, as the Sun's Power grows gradually less and less, so its effects on Plants is remitted, and their *Vegetation* slackens by little and little.

Its Failure is first discernible in Trees; these are raised highest above the Earth, and require a more intense Heat to elevate the Water charged with its Nourishment, to the Tops and Extremities of them; so that for want of fresh Support and Nutriment, they shed their Leaves, unless secured by a very firm and hardy Constitution indeed, as our *Evergreens* are; next the Shrubs part with theirs, and then the Herbs and lower Tribes; the Heat being at length not sufficient to supply even these, tho' so near the Earth, the Fund of their Nourishment. As the Heat returns the succeeding Spring, they all recruit again, and are furnished with fresh Supplies and Verdure; But first those which are lowest and neareſt the Earth, Herbs, and they that require a lesser Degree of Heat to raise the Water with its Earthy Charge, into them. Then the Shrubs and higher Vegetables in their Turns; and lastly, the Trees. As the Heat encreases, it grows too powerful, and hurries the Matter with too great Rapidity thro' finer, and more tender Plants. These therefore go off and decay; and others that are more hardy and vigorous, and require a greater degree of Heat, succeed in their Order. By which Mechanism, provident Nature furnishes us with a very various and differing Entertainment; and what is best suited to each Season, all the Year round.

As the Heat of the several Seasons affords us a different Face of Things, so the several distant Climates shew different Scenes of Nature, and Productions of the Earth.

The hotter Countries, yield ordinarily the largest and tallest Trees, and those too in a much greater Variety than the colder ever do. Even those Plants which are common to both, attain to a much greater Bulk in the Southern, than in the Northern Climes; nay, there are some Regions so Bleak and Chill, that they raise no *Vegetables* at all, to any considerable Size. This we learn from *Greenland*, from *Ireland*, and other Places of like *cold Site* and *Condition*. In these no Tree ever appears, and the very Shrubs they afford, are few, little, and low.

Again, In the warmer Climates, and such as do furnish forth Trees, and the larger *Vegetables*, if there happen a Remission, or Diminution of the usual Heat, their Productions will be impeded or diminished in Proportion.

Our late colder Summers have given us Proof enough of this. For tho' the Heat we have had, was sufficient to raise the *Vegetative Matter* into the lower *Plants*, into our Corns, our Wheat, Barley, Peaſe, and the like; and we have had Plenty of Strawberries, Rasberries, Currants, Gooseberries, and the Fruits of such other *Vegetables*, as are low and near the Earth: Yea, and a moderate store of Cherries, Mulberries, Plumbs, Filberts, and some others that grow at a somewhat greater height; yet our Apples, our Pears, Walnuts, and the Productions of the taller Trees have been fewer, and those not so kindly, so throughly ripen'd, and brought to that Perfection they were in the former more benign and warm Seasons. The Dwarf-apple and Pear-trees have succeeded better; and indeed in Trees of the same kind, those that keep closest to the Earth, always produce the most and best Fruit. For which reason it is that the Gardiners check and restrain the Growth of their better Fruit-Trees, and prevent their running up too great a Height: Now, even the lower Fruits and Greens have had some share in the common Calamity, and fallen short both in Number and Goodness of what the hotter and kinder Seasons were wont to shew us.

As to our Grapes, Abricots, Peaches, Nectarins, and Figs, being transplanted hither out of hotter Climes, 'tis the less wonder we have of late had so general a Failure of them.

Nor is it the Sun, or the ordinary Emission of the Subterranean Heat only, that promotes *Vegetation*; but any other indifferently, according to its Power and Degree.

This we are taught by our Stoves, Hot-beds, and the like. All Heat is of like kind; and wherever is the same Cause, there will be constantly the same Effect.

There's a *Procedure* in every part of Nature, that is perfect Regularly, and Geometrical, if we can but find it out; and the farther our Searches carry us, the more shall we have Occasion to *admire* this, and the better 'twill compensate our Industry.

VEHICLE, in the General, is that which carries or bears any thing along; as the *Serum*, or watery Humour, they say is the Vehicle which serves to convey the Blood Particles, and to disperse them all

all over the Body: And in Pharmacy, that Liquid in which any Powder, or ſuch like Medicine, is taken, they call a proper Vehicle for it.

VEJOURS, are ſuch as are ſent by the Court to take View of any Place in Queſtion, for the better Deciſion of the Right. It ſignifies alſo ſuch as are ſent to view thoſe that Eſſoin themſelves *de malo Lecti*, whether they be in Truth ſo ſick as they cannot appear, or whether they counterfeit. This Word is alſo uſed for thoſe that are appointed to view an Offence, as a Man murdered, *&c.* See *View*.

VEIN, is a Veſſel in an Animal Body, made to receive and bring the Blood back again from the Arteries.

The Veins conſiſt of four Tunicks, a Nervous, a Glandulous, a Muſcular, and a Membranaceous one. The Branches of the *Vena Cava*, above the Heart, are called *Jugular Veins*, which go towards the Head; they which go towards the Arms, are called *Axillary*; that about the Heart *Coronary*; in the Lungs *Pulmonary*; in the Liver *Hepatick*, or *Liver Vein*; in the *Diaphragma*, *Phrenica*; in the Thighs *Crural*; in the Reins *Emulgents*; and ſo from its various Ramification, it is variouſly denominated. *Blanchard.*

VENA *Cava*: See *Cava Vena.*

VENA *Portæ*, is a notable Vein, ſo called from the two Eminences, called by *Hippocrates* πυλαὶ, between which it enters the Liver. The

VENA *Portæ*, as it enters into the Liver, is inveſted with another Coat, which ſome call *Vagina Portæ*, its Sheath, others *Capſula* or *involucrum*, its Caſe, or Cover, and *Capſula communis*, becauſe the *Porus bilarius* is involved in it as well as the *Porta*.

This outer Coat it has immediately from the Membrane that cloaths the Liver; that is, it is continued from it, though it be of a clear other Subſtance, namely more denſe and carnous; it is inveſted with it in all its Ramifications, and ſo having a double Coat, is in that reſpect an Artery; as alſo in that it brings Blood to its Liver for its Nouriſhment, as well as for other Uſes; and laſtly, into the *Capſula*, it has an obſcure Pulſation (according to Dr. *Gliſſon.*)

When it is enter'd about half an Inch into the Liver, it is carried partly to the Right Hand, partly to the Left, and ſo is ſhap'd into a *Sinus* as it were, and thence is divided into five large Branches, four whereof are diffus'd all over the hollow Side of the Liver, but the fifth aſcends ſtreight to its upper Side, where it diſperſes it ſelf. The ſaid *Sinus* is more conſpicuous in an *Embryo*, becauſe the great Influx of nutritious Juice by the Umbilical Veins enlarge it much. Some make it a ſort of a Heart, obſerving it in an obſcurer kind of *Syſtole* and *Diaſtole*, whereby the Motion of the Blood in the Branches of the *Porta* within the Liver, is promoted in like manner, as it is in the *Arteria pulmonaris*, and *Aorta* by the Right and Left Ventricles of the Heart. Without which Pulſation, they think the Blood would hardly paſs out of the larger Branches of the *Porta* into the narrower, and ſo on into the Roots of the *Cava*.

In an *Embryo* very obſervable is the *Tubulus*, or *Canalis Venoſus*, which paſſes directly out of this *Sinus*, into the *Cava*, almoſt oppoſite to the Mouth of the Umbelical Vein that opens into the *Sinus*.

This *Canalis*, or Pipe, is of the ſame Subſtance and Tincture with a Vein, and enters into the *Cava* juſt as it penetrates the *Diaphragma*; and there alſo two other great Branches out of the Liver are inſerted into the *Cava*; and in the ſame Place this Pipe is alſo knit to the ſuſpenſory Ligament, as it is called, and after the Child is born, grows it ſelf into a Ligament, being in a manner oppoſite to the Umbilical Ligament.

Its Uſe in the *Fœtus*, is for the freer and readier Motion of the Blood and Chyle out of the Umbilical Vein into the *Cava*, ſeeing the Current is hardly ſtrong enough to pervade the *Parenchyma* of the Liver; nor indeed is there any Reaſon why the ſaid Liquors ſhould paſs there-through, ſeeing there is either little or no Bile therein; or however, they are not yet in a Condition to have the ſame ſeparated from them. But to return to the Diviſions of the *Porta*.

The Ancients taught, that they were only ſpread in the ſinous or hollow Part of the Liver; but Dr. *Gliſſon*, in his Accurate Anatomy of it affirms the *Porta* to be diſperſed very equally in all its Parts, upper as well as lower.

And whereas it has been a conſtant Doctrine, That the Branches of the *Porta* open by *Anaſtomoſes*, into thoſe of the *Cava*; the ſame learned Author, and many others ſince him, have obſerved, That there are no ſuch *Anaſtomoſes* at all, but that the Blood doth ouze through the glandulous *Parenchyma* of the Liver, out of the Capillary Veins of the *Porta*, into thoſe of the *Cava*. He that would be fullier informed hereof, may conſult his moſt accurate Book *de Hepate*: But we will now paſs to the Branches of the *Porta*, when it is gone out of the Liver.

This Trunk having paſt a little from the Liver, before it be ſevered into Branches, puts forth two Twigs, out of its upper and fore-part, which are inſerted into the *Cyſtis fellea*, or Gall-Bladder, (and are from thence called *Cyſtice gemellæ*) about the Neck of it, and ſpread by enumerable Twigs through its external Coat.

A third Twig alſo ariſes ſingle from it, which is larger than either of the former, and is inſerted into the Bottom of the right ſide of the Stomach, from whence it aſcends by its hinder ſide up to the *Pylorus*, which gives it the Name of *Pylorica*; it is otherwiſe called, *Gaſtrica dextra.*

Having ſent forth theſe three Twigs, the Trunk paſſeth down, and bending a little towards the left ſide, it is parted into two remarkable Branches; whereof the upper is called *Siniſter*, or the *Left*, and is the leſſer; the lower *Dexter* or the *Right*, which is the larger. The *Left* is beſtowed upon the Stomach, the *Omentum*, a Part of the *Colon*, and the Spleen; the Right is ſpread through the Guts and Meſentery; the Left is called, *Vena Splenica*; but the Right, *Vena Meſenterica.*

The *Vena Splenica*, runs acroſs the Body towards the left ſide, being ſuſtained by the hinder Leaf of the Cawl, and hath two Branches iſſuing out of it, before it comes to the Spleen, *viz.* the *Superior* and the *Inferior.*

The *Superior* is called *Gaſtrica*, or *Ventricularis*, becauſe it is beſtowed upon the Stomach; it aſcends obliquely towards the left part of the Stomach, into the back ſide whereof it is inſerted, and divides it ſelf into three Sprigs, of which the two outmoſt are ſpent on the Body of the Stomach, but the middle aſcends on its back-ſide up to its upper, or left Orifice, which it encompaſſes like a Garland, and is called *Coronaria.* From the *Inferior* Branch two Twigs ſpring; the one is ſmall, and ſends

Twigs

Twigs to the right Side of the inner Leaf of the *Omentum*, and to the *Colon* annexed to it. This is called *Epiplois*, or *Omentalis dextra*. The other is ſpent upon the ſame Leaf of the *Omentum*, with that part of the *Colon* which it ties to the Back, and ts called, *Epipolis*, or *Omentalis poſtica*.

When the *Ramus Splenicus* hath juſt approached to the Spleen, it ſends out two other Twigs, the upper and lower. The *Upper* is called, *Vas breve venoſum*, and is implanted into the left Part of the Bottom of the Stomach. It is ſometimes ſingle, in which caſe it is properly called, *Vas breve* in the ſingular Number; but more often there are two, three, or more of them, and then theſe Veſſeis, be they one or more, do ſometimes ſpring from the *Ramus Splenicus*, after it has entred the Spleen.

This *Vas breve*, was a Veſſel much renowned by the Ancients, who believe it carried an acid Juice from the Spleen to the Stomach, to ſtir up Appetite, and to help the Fermentation of the Meat in it; but it is certain both by Ligature (whereby it filleth toward the Stomach, and emptieth toward the Spleen) and alſo by the general Nature of Veins, whoſe ſmaller Branches and Twigs ſtill receive the ſuperfluous Arterial Blood, from the part whereinto they are inſerted, and conduct it by the larger Channels toward the heart: I ſay, it is certain from hence, that this ſame *Vas breve* carries nothing to the Stomach, but only brings from thence, into the *Ramus Splenicus*, the Remains of the Arterial Blood.

From the *lower* two Twigs iſſue.

The firſt is called, *Gaſtroepiplois ſiniſtra*; this is beſtowed upon the left Part of the Bottom of the Stomach, and the Fore-leaf of the *Omentum*, chiefly on its left Part.

The ſecond ſpringeth moſt commonly indeed from the *Ramus Splenicus*, but ſometimes from the left Meſenterick Vein; and running along the *Inteſtinum Rectum*, is inſerted into the *Anus*, by many Twigs. This is called, *Hæmorrhoidalis interna*, as that which ſpringeth from the *Vena Cava*, is called, *Hæmorrhoidalis externa*.

Now followeth the *Vena Meſenterica*, or the right Branch of the *Vena Portæ*. Before it be divided into Branches, it ſendeth forth two Twigs.

The firſt is called, *Gaſtroepiplois dextra*; this is beſtowed upon the right Part of the Bottom of the Stomach, and the right Side of the upper Leaf of the Cawl.

The ſecond is called, *Inteſtinalis*, or *Duodena*: It is inſerted into the Middle of the *Duodenum*, and the Beginning of the *Jejunum*, and runneth lengthways of them; whence ſome Capillary Twigs go to the *Pancreas*, and the upper Part of the *Omentum*.

After theſe Twigs are paſt from it, it enters by one Trunk into the Meſentery, where preſently it is divided into two Branches, to wit, *Meſenterica dextra*, and *ſiniſtra*.

Meſenterica dextra (placed on the right Side) is double, and ſendeth a great Number of Branches to the *Jejunum*, *Ilium*, *Cæcum*, and the right part of the *Colon*, which aſcendeth up by the right Kidney and runs under the Liver.

It hath fourteen remarkable, though nameleſs Branches; and theſe are afterwards divided into innumerable ſmall Twigs. Theſe are thoſe Veins that are called the *Meſeraicks*, whoſe Branches are ſupported by the Glandules of the Meſentery, but enter not into them; for the Glands open into the *Venæ Lacteæ*.

Meſenterica ſiniſtra, paſſeth thro' the Middle of the Meſentery, to that Part of the *Colon* which deſcendeth from the left Part of the Stomach, and to the *Inteſtinum Rectum*.

The Uſe of the *Porta*, before the Circulation of the Blood, and the *Venæ Lacteæ* were found out, was taught to be for the carrying of Nouriſhment to the Inteſtines and other Parts contained in the *Abdomen*, and alſo to bring back from the Guts the purer Part of the Chyle to the Liver to make Blood of, and a thicker fæculent Part of it to the Spleen, to be excocted by it into an acid Juice, and then carried to the Stomach by the *Vas breve venoſum*, for the exciting of Hunger.

As for this laſt Opinion, it appears by Ligature, That the *Vas breve* carries its Contents from the Stomach to the *Ramus Splenicus*, and it is nothing but the Blood remaining from the Nutrition of the Stomach, (that was brought thither by the Arteries) which is now a conveying back to the Liver, and ſo to the Heart again in its Circulation.

And as for the *Meſeraicks* carrying Nouriſhment to the Guts, or bringing back Chyle, thoſe Errors have been ſufficiently laid open before now. But their true Uſe is only to bring back to the Liver from the Guts, Cawl, and other Entrails, that Blood which remains after their Nutrition, and which was carried to them by their reſpective Arteries.

VENÆ *Lacteæ*, the *Lacteal Veins*, are ſo called, from the white Colour of the Chyle they carry. Theſe were not diſcovered as ſuch 'till about the Year 1622. When *Gaſpar Aſellius* found them out in diſſecting a live Dog fed well. Since whom, many others have made more accurate Diſcoveries of them. They are ſlender pellucid Veſſels, having but a ſingle Coat, and are diſperſed in great Numbers thro' the Meſentery, and appointed for carrying the Chyle. Their Riſe is from the innermoſt Membrane of the Inteſtines, where their Mouths are hid under a kind of ſpongy Cruſt, or *Mucus*, thro' which, by the Preſſion of the Guts the Chyle is ſtrained, and received by the Mouths of thoſe Veſſels. From whence they proceed the neareſt or readieſt way to ſuch Glandules of the Meſentery as are neareſt them; but in their Paſſage many ſmaller ones uniting to another, do commonly grow into one large Trunk, and this a pretty way before they inſinuate themſelves into the Glands they are marching to. But then at their Entrance into the Gland, and ſometimes a little before, this Trunk ſeparates again into new Branches more and ſmaller than the other. And hitherto they bear the Name of *Radicales*, or *Venæ Lacteæ primi generis*. After this, out of the Gland there ſpring again new Capillary ones, which by and by meeting together, make one Trunk again, as before, which keeping its Courſe towards the Centre of the Meſentery, enters as many Glands as lie in its way, being divided into new Branches juſt before its Entrance into each Gland, as before: But whilſt all the Trunk bend one way, they alſo meeting with one another, do in Proceſs ſeveral of them grow into one; and at length all the Trunks arrive at the great or middle Gland of the Meſentery (call'd improperly *Pancreas*) which moſt of them enter into, but ſome of them paſs over its Surface, and by and by they all empty themſelves into the great or common Receptacle of the Chyle that lies behind the ſaid Gland; thoſe that were inſerted into it riſing out of it in like manner, as they did before out of the leſſer Glands. As they run from one Gland

to

to another, they are called *ſecundi generis*, or of the ſecond Kind; and from their having paſs'd all the Glands to their opening into the common Receptacle, &c. they are called *tertii generis*, or of the third Kind.

VENÆ *Lymphaticæ*, the *Lymphatick Veins*, receive the *Lympha* from the conglobated Glandules, and diſcharge themſelves either into the Sanguinary Veins, or into the Receptacle of the Chile.

VENÆ *Preputii*, are Veins ariſing from the Capillary Extremities of the Artery of the *Penis* called *Pudenda*, theſe uniting into larger Branches, paſs into thoſe Veins which ariſe from the *Corpora Cavernoſa Penis*, and paſſing under the common Integuments, do empty themſelves into the upper Vein of that continued from the *Saphena Vein* of the Foot. *Cowper's Myſt. Reformata in Append.*

VENÆ *Sectio*, is the ſame with *Phlebotomy*, or Blood-letting.

VENDITIONI *exponas*, is a Writ Judicial, directed to the Under-Sheriff, commanding him to ſell Goods which he hath formerly by Commandment taken into his Hands, for the ſatisfying a Judgment given in the King's Court.

VENIRE *facias*, is a Writ Judicial directed to the Under-Sheriff, and goeth out of the Record, and lies where two Parties plead and come to Iſſue; for then the Party, Plaintiff, or Defendant, ſhall have this Writ directed to the Sheriff to cauſe Twelve Men of the ſame Country to ſay the Truth upon the Iſſue taken. And if this Inqueſt come not at the Day of the Writ return'd, then ſhall go a *Habeas Corpora*, and after a Diſtreſs, until they come. And it is alſo a Proceſs upon an *Audita Querela*, or upon an Indictment in the King's-Bench, or *Venire facias ad computandum*, againſt Tenant, by *Elegit*.

VENIRE *facias tot Matronas*: See *Ventre inſpiciendo*.

VENT, in Gunnery, ſignifies the Difference between the Diameter of a Bullet, and the Diameter of the Bore of the Piece; and it ought to be $\frac{1}{20}$ of the Diameter of the Bore: See *Ordnance*.

VENTER *Infimus*: See *Hypogaſtrium*.

VENTERS, according to the Definition of Anatomiſts, are the three principal Cavities, or hollow Parts of Animal Bodies, *viz.* thoſe of the *Belly*, *Cheſt* and *Head*; or the *Abdomen*, the *Thorax*, and the *Caput*.

VENTOSE, a *Cupping-Glaſs*: See *Cucurbicula*. The Ingenious Mr. *Hawksbee* hath now found a way of applying Cupping-glaſſes without Fire, by means of a ſmall Air-pump, which do mighty well, and put the Patient to no Pain or Fright.

VENTRE *Inſpiciendo*, is a Writ for the Search of a Woman that ſaith ſhe is with Child, and thereby with-holdeth Land from him that is next Heir at Law.

VENTRES: See *Cavitates*.

VENTRICLE, the Stomach, is a Membranous Bowel in the *Abdomen*, under the *Diaphragma*, betwixt the Liver and the Spleen, conſiſting of four Tunicks; a Nervous, Fibrous, Glandulous, and Membranous one: It hath two Orifices, one on the Right Hand, called *Pylorus* and *Junitor*, whereat the Meat is ſent out into the Guts: Another on the Left Hand, at which the Meat enters. Its Office is to concoct or ferment the Meat: It is alſo called *Stomachus* and *Aqualiculus*.

VENTRICULI *cerebri*, the Ventricles of the Brain, are four; the Uſe of them is to receive the Serous Humours, and to bring them by the *Pelvis* into the *Pituitary Glandule*, or into the *Proceſſus Mamillares*, by the *Os Cribriforme* to the Noſtrils. They are nothing but Complications of the Brain, which happen there as it were by Accident. *Blanchard*.

VENTRICULI *Cordis*, the Ventricles of the Heart, are two: The firſt, or Right Ventricle, receives the Blood from the *Vena Cava*, and ſends it to the Lungs; the Left Ventricle receives the Blood from the Lungs, and ſends it through the whole Body by the *Aorta*, or great Artery, and its Branches: In the *Syſtole*, or Contraction of the Ventricles, the Blood is ſent out: In the *Diaſtole*, or Dilatation, it is let into the Heart.

VENUE, or *Venew*, or *Viſne*, are Terms uſed in Law, ſignifying the Place next to that where any thing that comes to be tried happen'd to be done: And therefore for the better Diſcovery of the Truth of the Matter in Fact upon every Trial, ſome of the Jury muſt be of the ſame Hundred, or ſometimes of the ſame Pariſh, or Neighbourhood, in which the thing is ſuppoſed to be done, who by Intendment may have the beſt Knowledge of the Matter.

VENUS. The time of the Periodical Revolution of this Planet round the Sun, is 224 Days and $\frac{2}{3}$ of a Day, or $7\frac{1}{2}$ of our Months.

According to Mr. *Caſſini*, the greateſt Diſtance of *Venus* from the *Earth* is 38415, the mean Diſtance 22000, and the leaſt Diſtance 5585 Semidiameters of the Earth.

And the Diameter of *Venus* is equal to 7 Semidiameters of the Earth; therefore the Globe of *Venus* muſt be near 43 times greater than that of the Earth. But Dr. *Gregory* ſaith, That to an Eye placed in *Venus*, the Sun's Diameter would appear once and $\frac{1}{2}$ as big again as it doth to us, and therefore his Disk will be more than double of what it appears to us: And the *Light* and *Heat* in this Planet, and its Gravity towards the Sun, will be in the ſame Proportion in reſpect of ours.

The Length of the Day in *Venus*, is but 23 Hours.

The Eye here would behold 4 Planets above it, *viz.* our *Earth*, *Mars*, *Jupiter* and *Saturn*; and one below it, which is *Mercury*: And when our Earth is in Oppoſition to the Sun, it will appear then (in the Night) to ſhine with a full Orb, and be very bright. The Moon will appear always to accompany the Earth, and never to be ſeen from her above $\frac{1}{2}$ a Degree. *Mercury* will never appear to be above 38 Degrees diſtant from the Sun.

Kepler ſaith, The Inclination of the Orbit of *Venus*, is 3 Degrees and 22 Minutes.

October $\frac{14}{24}$ 1666, *Caſſini* obſerved ſeveral Spots in the Body of this Planet, by whoſe Motion he judged (tho' he was not certain) That ſhe moved either by a Circulation, or a kind of Libration round her Axis, in about 23 Hours.

A. D. 1672, and 1686, The ſame Aſtronomer, with a Teleſcope of 34 Foot, believes he ſaw a *Satellite* moving round this Planet, and diſtant from it about $\frac{3}{5}$ of *Venus*'s Diameter. It had the ſame Phaſis with *Venus*, but was without any well defined Form, and its Diameter ſcarce exceeded $\frac{1}{4}$ of that of *Venus*.

Dr. *Gregory* thinks it more than probable, that this was a *Satellite*; and ſuppoſes the Reaſon why it is not uſually ſeen, to be the Unfitneſs of its Surface to reflect the Rays of the Sun's Light; as is the caſe of the Spots in the Moon, of which if the whole Disk of the Moon were compoſed, he thinks

the Planet could not be ſeen in *Venus*. *Aſtron. Phy. & Geom.* p. 472.

Herigone, *Kepler*, and *Rhætenſis*, or *Schyrlæus de Rhæitus*, conjecture that *Venus* moves round her Axis in about 14 Hours; as *Kircher* and *Schottus* pretend to have diſcovered, by Obſervation of certain Spots in her.

VERB, in Grammar, is a variable Part of Speech, expreſſing the Action of the Mind, which affirms that a Thing is ſo, or not ſo: And 'tis either *Perſonal*, which is conjugated or formed thro' all the Three Perſons; or *Impersonal*, which is only found in the Third Perſon Singular.

VERDEGREASE, is the Ruſt of Copper gathered by ſtratifying Plates of Copper with the Husks of preſſed Grapes, and then ſcraping off the Ruſt of the Plates contracted by lying in thoſe Husks for ſome time. But the Painters call *Verdegreaſe*, or *Verdeter*, a kind of Magiſtery of the common Verdegreaſe; which is diſſolved in diſtilled Vinegar, and then Cryſtaliz'd in a cool Place. Theſe are called Cryſtals of *Venus*, made by Vinegar.

VERDEROR, is a Judicial Officer of the King's Foreſt, choſen by the King's Writ in the full County of the ſame Shire where the Foreſt is; and is ſworn to maintain and keep the Aſſizes of the Foreſt; to view, receive and enrol the Attachments and Preſentments of all manner of Treſpaſſes of Vert and Veniſon in the Foreſt.

VERDICT, is the Anſwer of a Jury made upon any Cauſe, Civil or Criminal, committed by the Court to their Examination. And it is either *General*, or *Special*: A *General Verdict*, is that which is given or brought into the Court in like *general* Terms, to the *general Iſſue*, as in Action of Diſſeſin, the Defendant pleadeth, *No Wrong*, *no Diſſeſin*; then the Iſſue is *General*, whether the Fact be wrong, or not; which being committed to the Jury, they, upon Conſideration of their Evidence, come in, and ſay, either for the Plaintiff, That it is a Wrong and Diſſeſin; or for the Defendant, That it is no Wrong, no Diſſeſin. A *Special Verdict* is, when they ſay at large, That ſuch a Thing, and ſuch a Thing, they found to be done by the Defendant or Tenant, ſo declaring the Courſe of the Fact, as in their Opinion it is proved; and as to the Law upon the Fact, they pray the Judgment of the Court. And this *Special Verdict*, if it contain any ample Declaration of the Cauſe from the Beginning to the End, is alſo called, *A Verdict at large*.

VERDOY; the Term in Heraldry for a Bordure of a Coat of Arms, being charged with any Kinds or Parts of Flowers, Fruits, Seeds, Plants, *&c.*

VERGE, is the Compaſs of the King's Court, which bounds the Juriſdiction of the Lord-Steward of the King's Houſhold, and of the Coroner of the King's Houſe; and that ſeems to have been twelve Miles round.

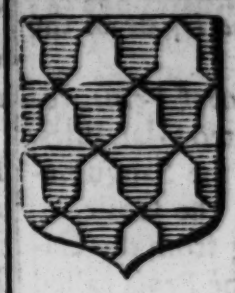
Verge, is alſo uſed for a Stick or Rod, by which One is admitted Tenant, and holding it in his Hand, takes the Oath of Fealty to the Lord of the Mannor, and for that cauſe is called *Tenant by the Verge*. Alſo, the Spindle of the Balance of a Watch is called the *Verge*.

VERMICULARES: See *Lumbricales*.

VERMICULATION, is an Infection of Plants by Worms.

VERMIFORMIS *Proceſſus*, is the Prominence the *Cerebellum*, ſo called from its Shape.

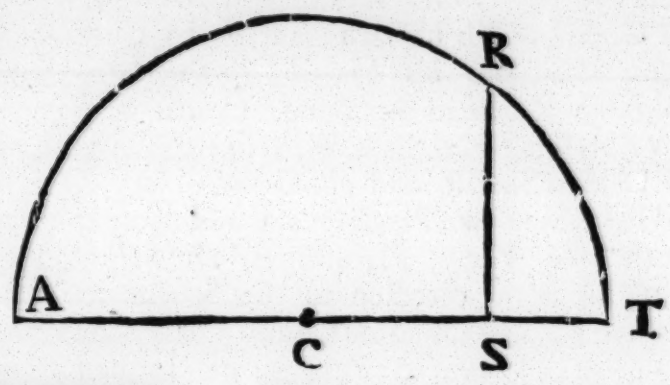
VERMIVOROUS, are ſuch Animals, as feed upon Worms.



VERRY, or *Vairy*, in Heraldry, is of two Sorts. If the Colours (which is a ſort of Chequer-work, of the Shape of little Bells) be Argent and Azure, 'tis enough to ſay *Vairy* alone: But if the Colours are any other, they muſt be named expreſſly. They engrave it thus.

VERSED-*Sine* of an Arch, is a Segment of the Diameter of a Circle, lying between the Foot of the Right Sine, and the lower Extremity of the Ark: See more under the Word *Trigonometry*.

Thus S T is the Verſed Sine of the Ark R T; and A S the Verſed Sine of the Ark A R, which is the Supplement of the former.



VERT; the Heralds Word for a Green Colour; and 'tis called Vert in the Blazon of the Coats of all under the Degree of Noble: But in Coats of Nobles 'tis called *Emerauld*; and in thoſe of King's 'tis called *Venus*. In Engraving 'tis expreſſed by Lines drawn athwart, beginning at the Sinifter Corner of the Eſcutcheon, thus.

VERT, in the Foreſt-Law, ſignifies every thing that grows and bears a *green* Leaf within the Foreſt, that may cover a Deer. And 'tis either *Over-vert* or *Nether-vert*: *Over-vert*, is the great Woods, and in Law-Books are uſually called *Hault-Bois*: *Nether-vert* is the under Woods, otherwiſe call'd *South-Bois*. There is alſo a *Special-vert*; that is, all Trees that grows in the King's Woods within the Foreſt; and thoſe that grow there in other Mens Woods, if they be ſuch Trees as bear Fruit to feed the Deer.

VERTEBRÆ; the *Vertebres* or Joints of the Neck and Back-Bone of any Animal: In a Man they account ſeven in the Neck, 12 in the Back or *Dorſum*, 5 in the Loins, and 5 of the *Os Sacrum*.

VERTEBRALIS, or *Cervicalis*, is a Pair of Muſcles, which extend all the *Vertebræ* of the Body.

VERTEX, is that Point in the Heaven juſt over our Heads, and the ſame with *Zenith*; which ſee.

The Point of any Angle is called alſo its *Vertex*; and that Point of the Curve of a Conick Section, where the Axis cuts it, is called alſo the *Vertex* of that Section.

VERTEX, in Anatomy, is alſo the Crown of the Head, or the middle Part of it, ſeated between the Bounds of the *Sinciput* and *Occiput*.

VERTEX of a Cone, Pyramid, Conick Section, *&c.* is the Point of the upper Extremity of the Axis, or

or the Top of the Figure. So the *Vertex* of an Angle, is the Angular Point; and thoſe Angles which being oppoſite to one another, do touch only in the Angular Point, are called *Vertical* Angles.

VERTEX *of a Glaſs* (in Opticks) is the ſame with its Pole; which ſee.

VERTICAL *Circles*: See *Azimuths*.

VERTICAL *Line*: See *Line Vertical*.

VERTICAL *oppoſite Angles*: See *Angles*.

VERTICAL *Plain* in Perſpective: See *Plain*.

VERTICAL *Point*, the ſame with *Vertex*: So that in Aſtronomy, a Star is ſaid to be *Vertical*, when it happens to be in that Point which is juſt over any Place.

VERTICILLATE *Plants*, are by the Botaniſts ſaid to be ſuch as have their Flowers intermixed with ſmall Leaves, growing in kinds of *Whirls* about the Joints of the Stalk, as *Penny-Royal*, *Hore-hound*, &c. See *Plants*.

The peculiar Characteriſticks of this Genius of Plants, Mr. *Ray* ſaith, are, Their Leaves growing by Pairs, one juſt againſt another on the Stalk. The Flower *Monopetalous*, but uſually hanging down with a kind of Lip, or turn'd ſomething like the Form of an Helmet, four Seeds after each Flower, to which the *Perianthium* of the Flower ſerves inſtead of a *Capſula Seminalis*.

Mr. *Ray* makes two kinds of theſe *Verticillate Plants*.

I. The *Fruticoſæ*, or ſuch whoſe Superficies is Perennial; and theſe have either,

1. A plain Flower, as the *Chamædrys vulgaris*, *Teucrium*, and the *Marum Syriacum*.

2. Such as have a Flower with a Lip, which they call a *Labiated* Flower, or one ſomething in the Form of a Helmet, which they call *Galeated*; as the *Sacria Stæchas*, *Hyſſopus*, *Roſmarinus*, *Satureia*, *Marum vulgare*, *Thymum vulgare*, and the *Polium montanum*.

II. The *Verticillatæ Herbaceæ*, or ſuch whoſe Stalks are not Perennial; and theſe are the *Menthæ*, *Verbena*, *Dictamnus Creticus*, *Origanum*, *Majorana*, *Ocimum*, *Horminum*, *Galeopſis*, *Nepeta*, *Betonica*, *Prunella*, *Stachys*, *Clinopodium vulgare*, *Lamium*, *Moluca Hedera terreſtris*, *Galericulata*, *Calamintha*, *Meliſſa*, *Marrubium Commune*, *Nigrum*, and *Aquaticum*, *Chamæpetys*, *Scarodonia*, *Scordium*, *Bugula*, *Syderitis*, *Cardiaca*.

VERTICITY, the Property of the Loadſtone or a Touch'd-Needle to point *North* and *South*, or towards the Poles of the World: See *Magnet* and *Magnetiſm*.

VERTIGO: See *Scotomia*.

VERY LORD and *Very Tenant*, are Terms in Law, ſignifying thoſe that be immediate *Lord* and *Tenant* one to another.

VESICA: So the Chymiſts call the large Copper Body Tinned within ſide, which is commonly uſed in Diſtillation of Ardent Spirits, becauſe 'tis in Figure ſomething like a blown Bladder. This is called alſo a *Cucurbite*, and commonly, a *Body*: See its Figure in *Cucurbite*.

VESICA *Urinaria*, the Bladder, is a Veſſel appointed to receive the Urine ſeparated in the Kidneys, and brought to it by the Ureters.

It is ſeated in the *Hypogaſtrium*, betwixt the two Coats of the *Peritonæum*, in that Cavity that is formed of the *Os Sacrum*, *Coxæ* and *Pubis*, and is called *Pelvis*. In Men, it lies upon the *Inteſtinum rectum*; in Women, it adheres to the Neck of the Womb, which is placed betwixt the Bladder and the ſtreight Gut: In both, it is knit before to the *Oſſa Pubis*. Moreover, it is knit to the Navel by the *Uracha*.

Its Subſtance is made up of three Membranes.

The firſt and outmoſt is borrowed from the *Peritonæum*. *Riolanus* ſays, This Coat is a Duplicature of the *Peritonæum*, within which, the Bladder lies hid, ſuſpended like a Bottle turned the Mouth downwards. On its outſide, in Man, it is beſmear'd with Fat, but not in Beaſts.

The ſecond is thicker, and endowed with carnous Fibres; yea, *Aquapendens*, *Spigelius*, *Walæus*, and *Bartholin*, will have it to be a true Muſcle, ſerving for the Compreſſion of the Bladder, to ſqueeze out the Urine; as the Sphincter ſerveth for Conſtriction to retain it.

The third and innermoſt, is white and bright, of exquiſite Senſe, as thoſe know too well who are troubled with the Stone.

Within, it is covered with a ſlippery mucous Humour, ſuch as the Gall-bladder has on its inſide, and ſuch as the Inteſtines abound with, which, without Doubt, muſt be ſpued out of ſome Glands in this inmoſt Coat, tho' they be hardly diſcernable. This doth defend it from the Acrimony of the Urine.

Its Membranes have all Sorts of *Fibres*. And when theſe Membranes and Fibres are too long or too far extended with Plenty of Urine, they loſe the Power of contracting themſelves, whence there iſſues a Stoppage of Urine.

It is *perforated* in three Parts, *viz.* in the Sides, where the Ureters are inſerted, to let in the Urine; and before at its Neck, to let it out.

It hath two *Parts*, to wit, the Bottom, and the Neck.

The *Bottom* comprehends the upper, wider and more membranous Part of the Bladder, to which the *Urachus* being tied, reaches the Navel, which together with the bordering Umbelical Arteries, become a ſtrong Ligament in the Adult, hindering the Bladder to preſs upon its Neck. But as for the Arteries, *Riolanus in Animadv. ad Bauch.* affirms, That they contribute nothing to the Suſpenſion of the Bladder, neither reaching to the Navel in the Adult, nor touching the Body of the Bladder of the *Urachus*.

The *Neck* it lower than the Bottom, thicker and ſtraiter. In Men, it is longer and narrower, and being carried to the Riſe of the *Penis*, opens into the *Urethra*; in Women, it is ſhorter and wider, and is implanted into the upper Side of the *Vagina* of the Womb: In both, it is carnous and muſcular, woven of very many Fibres, eſpecially Tranſverſe or Orbicular, which lie hid within the ſtreight Fibres that ſurround the whole Body of

the Bladder, and thele make the Sphincter, which conſtringes the Neck of the Bladder ſo, as no Urine can paſs out againſt ones Will, unleſs when it is affected with the Palſy, Ulcer or other Malady, by which there ſometimes happens an involuntary Piſſing.

The Bladder is oblong and round, in Shape like unto a Pear.

Its *Cavity* is but one ordinarily, yet ſometimes it has been found to have a membranous Partition, that divides it into two, which yet had a Hole in it for the Communication of one Cavity with the other. Such a Partition was obſerved in the Bladder of the Great *Caſaubon*.

It hath *Arteries* and *Veins* from the *Hypogaſtricæ*, which are inſerted into the Sides of its Neck, where they are immediately branched into two, whereof one is ſpent upon the Neck, and the other on the Bottom. *Nerves* it hath (according to Dr. *Willis*) from the loweſt *Plexus* of the Intercoſtals in the *Abdomen*, and from the Marrow of the *Os Sacrum*. For the ſaid *Plexus* ſending two Nerves into the *Pelvis*, they have each of them a vertebral Nerve joined to them, and ſo make two new *Plexus*, from one of which there paſſes a Nerve, that being divided into many Branches, is on each Side diſtributed into the Bladder, and its *Sphincter Muſcle*.

The Uſe of the Bladder is to receive the Urine from the Ureters; and to contain it, like a Chamber-pot, until the Time of Excretion, when it is ſqueezed out of it, by the help partly of its own carnous Membrane, and partly of the Muſcles of the *Abdomen*.

Bartholin quotes ſome Obſervations of *Borrichius*, concerning the Bladder, worthy to be noted, *viz.* " If it be boil'd in Acids, it turns into a Mucilage; " if it be in Salt Liquors, it is thickned; if in Ole- " ous, or in the Liquor of the Alkali Salts of Tar- " tar, or Herbs burnt to Aſhes, it is neither thick- " ned, nor turns into a Mucilage, but is burnt, as " if it were laid on burning Coals, and may al- " moſt be crumbled to Powder. By which (ſays " he) it appears, with what great Danger to the " Bladder, Men inject into it, either acid, ſalt, or " oleous Liquor, for breaking the Stone.

VESICATORIA, are Medicines which act upon, and rarify the Spirits and ſerous Particles, gather themſelves betwixt the Skin and *Cuticula*, and conſequently ſeparate them, and raiſe little Bladders full of ſerous Matter, which are called *Bliſters*.

VESICULA *Fellis*: See *Folliculus Fellis*.

VESICULÆ *Seminales*, the Seed Bladders, are little Cells like thoſe in a Pomgranate, or ſomewhat reſembling a Bunch of Grapes. *De Graef* compares them to the Guts of a little Bird variouſly contorted.

They conſiſt of one thin Membrane, through which ſome ſmall Twigs of both Veins, Arteries, and Nerves run. They are about three Fingers-breadth long, and one broad; but in ſome Places broader, and ſome narrower, as they run in and out. They are two (one for each *Vas deferens*) divided from one another by a little Interſtice; and they do ſeverally, by a peculiar Paſſage, emit the *Semen* contained in them into the *Urethra*.

They are very anfractuous and winding, and (as was ſaid) conſiſt of many little Cells, that they ſhould not pour out all the *Semen* contain'd in them in one Act of Copulation, but might retain it for ſeveral. They have no Communication one with another, not even in their very opening into the *Urethra*; but the *Semen* that is brought to the *Veſiculæ Seminales* on the righe Side, by the right *Vas deferens*, iſſues by its proper Paſſage into the *Urethra*, and that which is brought to the left likewiſe. So that, if by any Accident, the *Veſiculæ* on one Side he burſt or cut (as in Cutting for the Stone they generally are) yet thoſe on the other, being entire, may ſtill ſuffice for Generation. Now when the *Semen* is emitted out of theſe *Veſiculæ* in the Act of Generation, it paſſes out the ſame way it came in, which in this caſe may eaſily be, (tho' otherwiſe it be unuſual there ſhould be a contrary Motion of the ſame Veſſel) for, as it comes in from the *Vaſa doferentia*, it drills along gently, without any Force; but in *Coitu*, when the Muſcles of the *Penis*, and all the bordering Parts, are much Tumified, it is expreſſed or ſquirted out of them with ſome Violence; and paſſing along, their Neck, (which is a Continuation of the *Vaſa deferentia*) ouzes through a Carbuncle (like Quickſilver thro' Leather) into the *Urethra*, or the Duct of the *Penis*, that is common both to the *Semen* and Urine. I ſay, it ouzes from the Necks of the *Veſiculæ* thro' a Carbuncle into the *Urethra*, for there is one placed as a Valve before the Orifice of each of them, partly to hinder the coming of the Urine into them, partly to hinder the involuntary Effuſion of the *Semen*.

Now, though naturally the little Holes through which the *Semen* paſſes out of the Necks of the *Veſiculæ* into the *Urethra*, be almoſt imperceptible, yet if they be either eroded by the Acrimony of the *Semen* (ſuch Acrimony as is contracted by impure Embraces, or in Claps, as we call them) or if of themſelves they be debilitated, and ſo become more Lax (as ſometimes happens) to old or impotent Men, that meddle too much) then there happens a *Gonnorhæa* or continual Efflux of *Semen*: And ſo *Vaſalius* and *Spigelius* have obſerved them much dilated, in diſſecting ſuch as have died with a *Gonnorrhæa* upon them.

VESPERTILIONUM *alæ*, are two broad membranous Ligaments, on each Side one, wherewith the bottom of the Womb is looſely tied to the Bones of the Flank. *Artæus* likens them to Bats-wings, whence the Name. *Blanchard*.

VESPERTINE, in Aſtronomy, when a Planet ſets after the Sun, it is ſaid by ſome to be *Veſpertine*.

VESSELS, in Architecture, are certain Ornaments, uſually ſet over the *Cornices*, and ſo nam'd, becauſe they repreſent divers ſorts of *Veſſels*, which were in uſe among the Ancients.

VESTIBULUM, is a Cavity in the *Os Petroſum*, behind the *Feneſtra Ovalis*, it is covered with a fine Membrane; in it open the ſemicircular Pipes of the Labyrinth. The upper Turning of the *Cochlea*, and the Auditory Nerve pierce into it alſo.

VESTIGIA *of Tendons* are the little Hollows in the Shells of Fiſhes, which are formed on purpoſe for the faſtening or rooting of the Tendons of their Muſcles. Theſe are plainly found on all the Foſſile Shells; and this is a Demonſtration, that once they really belonged to Fiſhes, and are not formed Stones.

VESTURE, in Law, ſignifies a Poſſeſſion or an Admittance to a Poſſeſſion or Seiſin. Thus it is alſo taken by the *Feudiſts*, with whom *Inveſtitura* ſignifies

ſies a Delivery of Poſſeſſion by a Spear or Staff, and *Veſtura* Poſſeſſion it ſelf.

VETERNUS: See *Lethargus.*

VERU, a Comet, according to ſome Writers, reſembling a Spit, being nearly the ſame kind, as the *Lonchites*, only its Head is rounder, and its Train longer and ſharper pointed.

VETITUM *namium. Namium* is a Diſtreſs, and *Vetitum* forbidden: Thus when the Bailiff of a Lord diſtrains Beaſts or Goods, and the Lord forbids his Bailiff to deliver them when the Sheriff comes to replevy them; and to that end, drives them to Places unknown; or when without any Words they are ſo eloined, as they cannot be replevied, divers Lords of Hundreds, and Courts-Barons, have Power to hold Plea *De vitito namio*: See *Naam.*

VI *& armis*, an Expreſſion in a Charge or Indictment, to ſhew the forcible and violent Commiſſion of any Crime.

VI *Laïca amovenda*, when the Biſhop of a Dioceſs has certified into the Court of *Chancery*, that the Rector or Vicar of any Church within his Juridiction, is kept out of his Manſe, or Glebe, or Church, by any Lay-force or intruding Power; then may a Writ be granted to the Sheriff, to remove all ſuch Violence, and ſuch Uſurpation; which Writ is therefore called, *De vi Laïca amovenda.*

VI *Laïca removenda*, is a Writ that lies where Debate is between two Parſons or Proviſors for a Church, and one of them enters into it with a great Number of Lay-men, and holds the other out *Vi & Armis*; he that is holden out, ſhall have this Writ directed to the Sheriff, That he remove the Force. And this Writ is returnable, and ſhall not be granted, until the Biſhop of the Dioceſs, where ſuch Church is, hath certified into the *Chancery*, ſuch Reſiſting and Force.

VIA *Lactea*: See *Milky-way.*

VIBRATION, is the Swing or Motion of a Pendulum; or of a Weight hung by a String on a Pin: See the Proportions of the Vibrations of Pendulums, under *Pendulum.*

VIBRISSÆ, are the Hairs which grow in the Noſtrils: They, with the *Mucus*, which the Glands ſeparate, ſtop any Filth from aſcending too high up into the Noſtrils.

VICARIO *deliberando occaſione cujuſdam Recognitionis*, &c. is a Writ that lies for a Spiritual Perſon impriſoned, upon Forfeiture of a Recognizance, without the King's Writ.

VICENETUM: See *Venue.*

VICIS *& venellis Mundandis*, is a Writ that lies againſt a Mayor or Bailiff of a Town, *&c.* for the clear keeping of their Streets.

VISCOUNTIEL, in Law, ſignifies as much as belonging to the Sheriff; as *Writs Viſcountiel* are ſuch Writs as are Triable in the County or Sheriff's Courts. *Viſcountiel*, ſignifies alſo, certain Farms for which the Sheriff pays a Rent to the King, and makes what Profit he can of them.

VIEW, in Law, ſignifies the Act of Viewers; for when an Action real or perſonal is brought, and the Tenant knows not well what Land it is that the Demandant asks, then he may pray the *View*; which is, that he may *ſee* the Land which is claimed.

VIEW *of Frank-pledge*, is the Office which the Sheriff in his County-Court, or the Bailiff in his Hundred, performs in looking to the King's Peace, and ſeeing that every Man be in ſome *Pledge.*

VILLAIN, is the ſame with Servant or Bondman; and there were formerly in *England* two ſorts of theſe Villains: *Villains in groſs*, who were bound immediately to the Perſons of their Lords, and to their Heirs; and *Villains Regardent to a Mannor*; theſe the Civilians call *Glebæ Aſcriptitios*; and they were bound to their Lord as Members belonging to ſuch a Mannor, of which he was Owner. This latter was a pure *Villain*, of whom the Lord took Redemption to marry his Daughter, and to make him Free; and he might put him out of his Lands and Tenements at his Will; might beat and chaſtize him, but not maim him. We have now no ſuch Slaves as theſe.

VILLENAGE, ſignifies a ſervile kind of Tenure, anciently belonging to Lands or Tenements, whereby the Tenant was bound to do all ſuch Services as the Lord commanded. Of this *Villenage*, there are ſeveral ſorts, but the Slavery of ſuch a Cuſtom is now laid down *in favorem libertatis*, tho' the Statute concerning them be unrepealed.

VILLI, in Botany, are ſmall Hairs like the Grain of *Pluſh* or *Shag*, with which, as with a kind of Excreſcence, ſome Trees do abound. Of this kind is the *Uſnea Officinarum.*

VINDEMIATRIX, a Fixed Star of the third Magnitude, in the Conſtellation *Virgo*, whoſe Longitude is 185 degr. 23 min. Latitude 16 degr. 15 min.

VINUM *Hypocraticum*, is a Wine wherein Sugar and Spices have been infuſed, and is afterwards ſtrained through a Bag, which they call *Manica Hippocratis*; which ſee. *Blanchard.*

VIOL, a kind of Hawſer (in a Ship) made uſe of to purchaſe in the Cable, when the Main-Capſtan cannot do it, becauſe the Ground in which the Anchor is let fall, is too ſtiff, or elſe the Sea runs too high, ſo that they cannot weigh it; then for more help, they take a Hawſer, and opening one Strand thereof, they put therein Nippers, (that is, ſmall Ropes, with a little Truck at one end) and with theſe they bind faſt this Hawſer to the Cable, and then they bring it to the *Jeer-Capſtan*, and ſo heave upon it: And this *Viol* will purchaſe far more than the Main-Capſtan can. This *Viol* is faſtned together with an Eye and a Wale-knot, or elſe with two Eyes ſeized together.

VIRGÆ, is a Meteor, repreſenting a *Bundle of Rods*, and made by the Sun's-beams piercing the more lax and open Parts of a watry Cloud.

VIRGINS *Milk* is made by diſſolving *Saccharum Saturni* in a great deal of Water: It will turn white as Milk; whence the Name. If the Diſſolution be left to ſettle, the white Matter will precipitate, and may be uſed as a *Magiſtery* of *Saturn.*

VIRGO, one of the 12 Signs of the Zodiack, being the 6th according to Order.

VIRGULA *Divinatoria*, is a Hazle Rod ſhaped into two Branches like a Y, which muſt be cut at the time of ſome certain Planetary Aſpect, and by which (as ſome Writers pretend) you may eaſily find out a Vein of rich Metal or valuable Oar in the Earth.

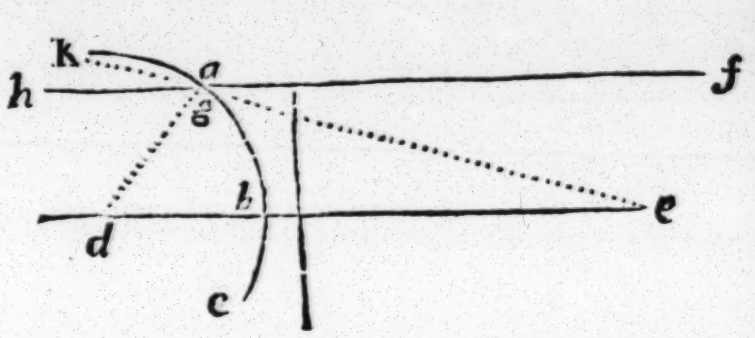
Mr. *Boyle* tells us, That ſome Authors report the Fact: But I judge we may very reaſonably ſuſpect, if not deny the Truth of the Relation, for all this; for he himſelf owns he could never find any thing

thing in it: And ſo ſaith *Kircher*, tho' a Perſon otherwiſe ſubject enough to tell ſtrange Stories.

Some uſe, as is ſaid above, a forked Rod, holding the two Ends in their Hands: Others tie a Hazle-Wand to another ſtreight Stick, and holding it in their Hand, do ſo walk over the Hills and Places where they expect Metals. But they all own the Rod to be very croſs-grain'd, and that it will *work*, as they call it, in ſome Mens Hands only, and at ſome certain Times, and not at others, in the Hands of the ſame Perſons.

VIRIDARIO *eligenda*, is a Writ that lies for the Choice of a *Verderor* in the Foreſt.

VIRTUAL *Focus*, or *Point of Divergence* in a Concave-Glaſs, is the Point *e* in the following Figure.



Let the Concavity of the Claſs be *a b c*, and its Axis *d e*: Let *f g* be a Ray of Light falling on the Glaſs, parallel to the Axis *d e*; and let *d* be the Center of the Ark *a b c*. This Ray *f g*, after it hath paſſed the Glaſs at its Emerſion at *g*, will not proceed directly to *h*, but be refracted from the Perpendicular *d g*, and will become the Ray *g k*. Draw then directly *g k*, ſo as that it may croſs the Axis in *e*. The Point *e* ſo found, Mr. *Molyneux* calls the *Virtual Focus*, or *Point of Divergence*. P. 56. *Dioptr. Nov.*

VIS, or *Force*; as *vi & armis*, by Force of Arms. And this *Vis* is fivefold, *Vis impulſiva*, *ablativa*, *expulſiva*, *turbativa*, and *inquietativa*. *Vis ablativa*, is the taking away of moveable Things: And hence accrues an Action, *Quare vi & armis*, &c. *Vis compulſiva* is, when any one is caſt out of his Poſſeſſion by Force and Arms. *Vis turbativa*, is when any one is diſturbed in his Poſſeſſion, as when two ſtrive to poſſeſs the ſame Thing. *Vis inquietativa*, is when one Man will not ſuffer another quietly to enjoy his Right, or to do any thing in his own Bounds or Limits. And from all theſe ſome ſort of Action will ariſe.

VIS *Centrifuga*, is the Force by which any Body revolving round another, endeavours to fly off from the Axis of the Motion, in a Tangent to that Curve.

The Centrifugal Force is always proportional to the Periphery which any Body deſcribes in its Motion round the Axis of its Motion, by the firſt Theorem of Mr. *Huguen's de vi Centrifuga*.

VIS *Centripeta*, is that by which any Body (from what Cauſe ſoever) tends towards any Point as to its Center.

Of this kind is *Gravity*, by which Bodies tend towards the Center of the Earth: And ſuch is the *Magnetical Force* by which Iron tends towards the Center of the Magnet: And of this kind is that Force or Power wharever it be, by which all the Planets are continually drawn from a Rectilineal Motion, and forced to revolve in Curves.

The Quantity of this Centripetal Force, is of three kinds; *Abſoluta*, *Acceleratrix*, and *Motrix*.

The *Abſolute Quantity* of it, is its Meaſure, greater or leſs, according to the Efficacy of the Cauſe that produces it; and which exerts it ſelf on all Bodies in the Regions round about: As the Magnetical Vertue in ſome Magnets is greater than in others, tho' of the ſame Dimenſions.

Vis Centripetæ Quantitas Acceleratrix, is its Meaſure proportionable to the Velocity which it produces in a given Time. Thus the Power of a Loadſtone is greater at a leſs, and leſſer at a greater Diſtance from the Stone. Gravity is greater in Valleys, and leſs on the Tops of high Mountains, (as is plain from the Experiments of Pendulums) and is yet leſs at remoter Diſtances from the Earth: But at equal Diſtances, 'tis always the ſame, becauſe all Bodies, heavy or light, great or ſmall, abſtracting from the Reſiſtance of the Medium, are equally accelerated in their Deſcent.

Vis Centripetæ Quantitas Motrix, is its Meaſure proportionable to the Motion which it generates in a given time: As the Weight is greater in a greater Body, and leſs in a leſſer; and in the ſame Body, it is greater near the Earth, and leſs in remote Regions. This Force is the *Gravity* or Tendency towards the Center of the whole Body, and is all one with its *Weight*, being always diſcoverable by ſome equal and contrary Force hindering the Deſcent of the heavy Body.

The *Vires Centripetæ*, are always as the Squares of the Velocities divided by the Radii of the Circles deſcribed round the Center.

And alſo reciprocally, as the Squares of the Periodical Revolutions divided by the Radii.

Wherefore if the Perodical Times be equal, both the Centripetal Forces and Velocities, will be as the Radii; *& vice versâ*.

If the Squares of the Times of the Perodical Revolutions are as the Radii, the Centripetal Forces are equal; and the Velocities in half the Ratio of the Radii; *& vice versâ*.

If the Squares of the Periodical Times are as the Squares of the Radii, the Centripetal Forces are reciprocally as the Radii, and the Velocities equal, and *vice versâ*.

If the Squares of the Times of the Periodical Revolutions are as the Cubes of the Radii, or *Diſtances from the Center*, (which is the Caſe of all theſe Planets moving ronnd the Sun, and of the *Moon's* or *Secondary Planets* moving round the Primary) then the Centripetal Forces (or Gravity of Bodies) are as the Squares of the Radii or Diſtances from the Center, (as we find it to be) and the Velocities are in half the Ratio of the Radii, and *vice versâ*: See Sir *Iſaac Newton's Princip. Phli. Mathemat.* p. 39.

If the Centripetal Force of any Body moving round another, be as the Diſtance; that Body moves in an Ellipſis, having its Center in the Center of that Force; or perhaps in a Circle equal to that Ellipſis. *Idem.*

As to which, *Gallilæus* hath this Theorem, That if ſuch an Ellipſis, its Foci becoming infinitely diſtant, ſhould change into a Parabola, the Body would move into the Curve of ſuch a Parabola; and the *Vis Centripeta* reſpecting now a Center infinitely diſtant, would grow *Equable*. To which Sir *Iſaac Newton* adds, That if a Parabolick Section of a Cone, by the Inclination of its Plane to the Side

Side of the Cone, ſhould be turned into an Hyperbola, the Body would continue to move in its Perimeter; and its *Centripetal Force*, would be changed into a *Centrifugal one*.

If any Body freely revolve round a Center, as in the caſe of the Planets round the Sun, its Centripetal and Centrifugal Forces muſt be equal.

VIS *Impreſſa*, is an Impulſe, Force, or Action, communicated to, and exerciſed upon any Body, in order to change its preſent State, either of Reſt or Motion, uniformly forward in a right Line. *Newt. Princip. Mat.* This *Force* conſiſts entirely in Action, and after that ceaſes, cannot remain in any Body: For the Body continues in its new State, whether of Motion or Reſt, by the *vis Inertiæ* only.

VIS *Inſitæ Materiæ*, is the bare Power of Reſiſtance only, by which every Body, as much as it may, endeavours to continue in that State in which it is, either of Reſt, or Motion, uniformly forward in a right Line. This is always proportionable to the Body or Maſs which it is in, and differs nothing from the *Inactivity* of the Matter or Body, but only in the manner of Conceiving it: And therefore, this *Vis Inſitæ*, may moſt properly be call'd, *Vis Inertiæ*. *Newt. Princip. Math.*

VIS *Motrix*, is the Power which produces the Motion of any Body from Place to Place: Thus Gravity is a *Vis Motrix* downwards, or towards the Center of the Earth.

VISCERA, are the Bowels contained in the three great Cavities of the Body, as the Anatomiſts call them. They are called alſo *Exta* and *Interranea*.

VISIBLE *Horizon*: See *Horizon*.

VISIBLE *Place* of a Star: See *Apparent Place*.

VISIBLE *Species*: See *Speciales Viſibiles*.

VISION, is a Senſation in the Brain, proceeding from a due and various Motion of the Optick Nerve, produced in the Bottom of the Eye, by the Rays of Light coming from any Object; by which means the Soul perceives the illuminated Thing, together with its Quantity, Quality, and Modification.

Whether the Picture of the Object be made on the *Tunica Retina*, or on the *Choroides*, there is a great Diſpute between Mr. *Pecquet* and Mr. *Mariotte*, in the *Philoſ. Tranſ.* N° 59, &c.

As to the manner how this noble Senſe of Seeing is produced, there were many Hypotheſes among the Ancients.

1. The *Stoicks* imagined, That certain viſual Rays went from the Brain through the Optick Nerve and Eye, and from thence to the Object; and there (juſt like a Blind Man's Staff) feel out the Figure, Colour, and Dimenſions of the Object.

2. The *Pythagoreans* thought, That there went ſome viſual Species out of the Eye to the Object, which were immediately reflected back again from thence to the Eye, and ſo produced *Viſion*.

3. *Plato* ſuppoſed, That both from the Eye and the Object, there came ſubſtantial Effluvia, which meeting half way, and encountring the Occular Effluvia, the latter were beat back again to the Eye, and there communicated the Impreſſion they had received from thoſe Effluvia which came from the Object; and ſo cauſed the Senſe of Seeing.

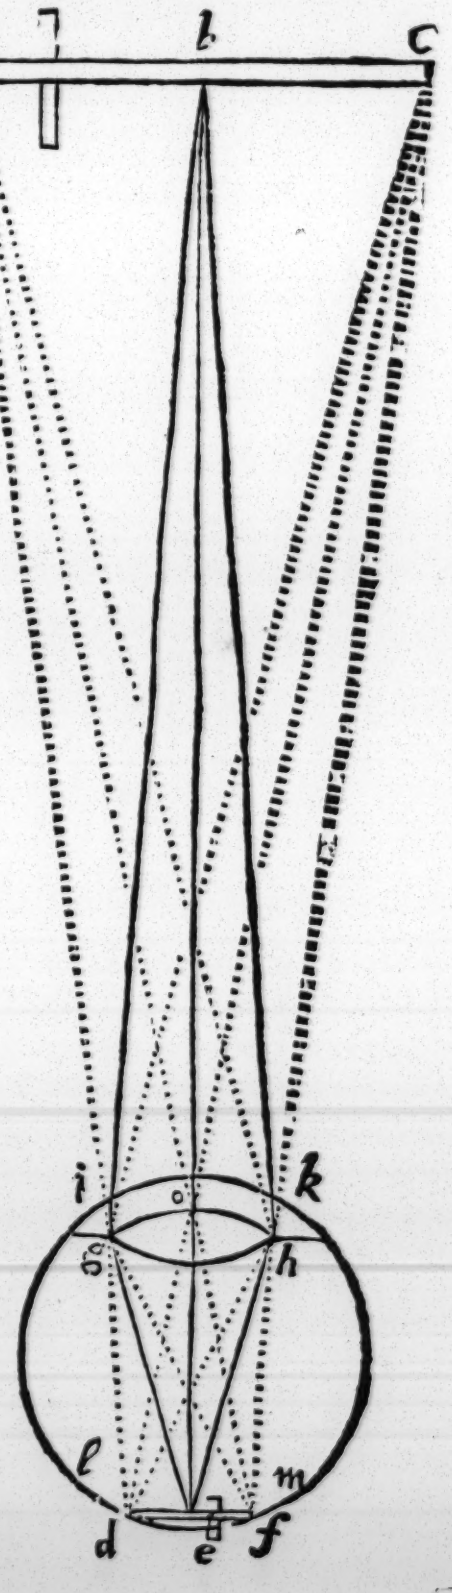
4. *Ariſtotle* aſſerted, That the Colours of all Objects did move the tranſparent Medium, as that did the Eye, and thereby communicate their Images to the Brain, or *commune Senſorium*.

5. *Epicurus*, judiciouſly rejecting the Notion of an Emanation of viſible Species from the Eye; and not thinking the Action of the intermediate Air or Medium ſufficient to account for Viſion, rightly concluded, That the Senſe of Viſion was produced by a ſubſtantial material Efflux from the Object to the Eye.

6. *Cartez* ſuppoſes Viſion performed by bare Motion only, without any material Emanation from the Object; but only that the Light (which with him alſo is not a Body, but the Motion of the finer Parts of the *Medium*) moves the Eye juſt after the ſame manner as the Object is ſuppoſed to have determin'd it; which Motion is continued along the Optick Nerve, up into the Brain, where it moves the *Conarion*, or *Glandula Pinealis*, with him the Seat of the Soul; and, by that means produces internal Senſation, and enables the Soul to judge accordingly.

The Manner of the Viſion with the naked Eye, according to Mr. Molyneux *his Explication of it, in* Diopt. Nov. *p.* 103.

Suppoſe *a b c* an Object, *i k l e m* the Globe of the Eye, furniſhed with all its Coats and Humours; but here the Cryſtalline Humour *g o b* is only expreſs'd, as being principally concern'd in forming the Image on the Fund of the Eye.



1. From

1. From each Point of the Object, we may conceive Rays flowing to the Pupil of the Eye *i k*; as here from the middle Point *b*, there proceed the Rays *b g*, *b o*, *b h*; theſe by means of the Coats and Humours of the Eye, and eſpecially by the Cryſtalline Humour *g h*, are refracted and brought together on the *Retina* or Fund of the Eye in the Point *e*, and there the Point *b* is repreſented. For we may conceive the Chryſtalline Humour *g h*, as it were a Convex-glaſs, in the Hole of a dark Chamber *i l m k*, and that *d e f* is the diſtinct Baſe of this Glaſs.

What is here ſaid of the Point *b*, and its Repreſentation at *e*, may be underſtood of all the other Points in the Object, as of *a* and *e*, and their Repreſentations at *f* and *d*. For, according to Sir *Iſaac Newton*'s beſt Hypotheſis of Light, each Ray has its innate Colour, and ſo will repreſent it where it falls.

2. As in a dark Chamber that has a Hole furniſhed with a Convex-glaſs, if the Paper that is to receive the Image in the diſtinct Baſe, be either nigher to, or farther from the Glaſs, than its due Diſtance, the Repreſentation thereon is confuſed: For then the Radius Pencils do not exactly determine with their Appices on the Paper; but thoſe from one Point are mix'd and confuſed with thoſe from the adjacent Point: So in the Caſe of *Plain Viſion*, 'tis requiſite that the Pencils ſhould exactly determine their Appices at *d e f*, on the *Retina*, or elſe Viſion is not diſtinct.

Therefore, Nature has ſo contriv'd the Eye, That it ſhould have a Power of adapting it ſelf in ſome meaſure to nigh and diſtant Objects, for they require different Conformation of the Eye, becauſe the Rays proceeding from the Luminous Points of nigh Objects, do more diverge than thoſe from more remote Objects: But whether this Variety of Conformation conſiſts in the Cryſtallines approaching nigher to, or removing farther from the *Retina*; or in the Cryſtallines aſſuming a different Convexity, ſometimes greater, ſometimes leſs, according as is requiſite, is left to the Scrutiny of others; and particularly the Curious Anatomiſts. This only may be ſaid, That either of theſe Methods will ſerve to explain the various *Phænomena* of the Eye: And that both theſe may attend each other, *viz.* a leſs Convex-Cryſtalline requires an Elongation of the Eye, and a more Convex-Cryſtalline requires a ſhortning thereof; as a more flat Convex Object-glaſs, or of a larger Sphere, requires a longer Tube; and one protuberant, bulging, or of a ſmaller Sphere, requires a ſhorter Tube.

3. By the former Figure we perceive the Rays from each Point of the Object are all confuſed together on the Pugil in *g h*, ſo that the Eye is placed in the Point of the greateſt Confuſion: But by means of the Humours and Coats thereof, each Cone of Rays is ſeparated, and brought by it ſelf to determine in its proper Point on the *Retina*, there painting diſtinctly the Vivid Repreſentation of the Object, which Repreſentation is there perceived by the *Senſitive Soul*.

4. We are likewiſe to obſerve, That the Repreſentation of the Object *a b c*, on the Fund of the Eye *f e d* is inverted: For ſo likewiſe it is on the Paper in a dark Room; there being no other way for the Radius Cones to enter the Eye, or the dark Chamber, but by their Axis *a o*, *b o*, *c o*, croſſing in the Pole *o* of the Cryſtalline, or Glaſs.

But how comes it to paſs, that the Eye receiving the Repreſentation of a part of an Object on that Part of its Fund which is lowermoſt, or nigheſt the Center of the Earth, perceives that Part of the Object as uppermoſt, or fartheſt from the Center of the Earth? In anſwer to this, let us imagine, that the Eye, in the Point *f*, receives an Impulſe or Stroke by the Protruſion forwards of the Luminous Axis *a o f*, from the Point of the Object *a*; muſt not the viſive Faculty be neceſſarily directed hereby to conſider the Stroke, as coming from the Top *a*, rather than from the Bottom *c*, and conſequently ſhould be directed to conclude *a* the Repreſentation of the Top?

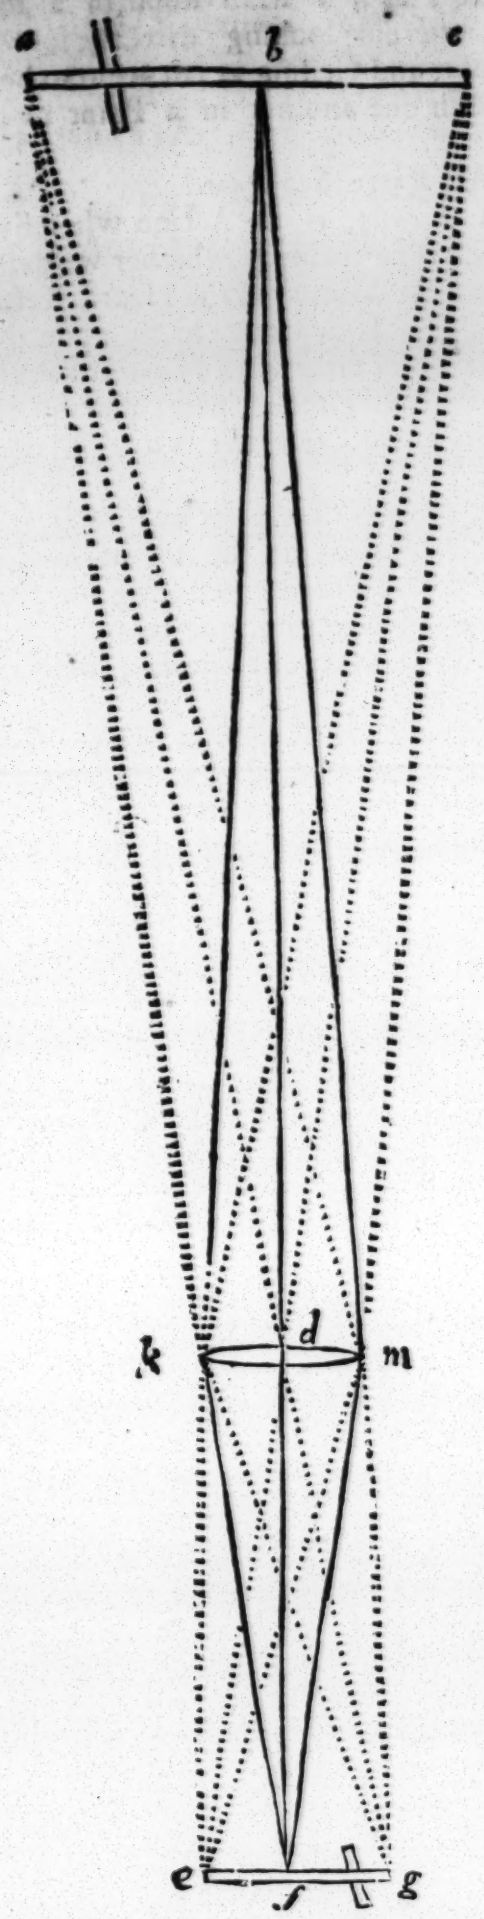
Therefore we may be ſatisfied by ſuppoſing a Man ſtanding on his Head: For here, tho' the upper Parts of Objects are painted on the upper Parts of the Eye, yet the Objects are judged to be erect. And from this Poſture of a Man, the Reaſon appears, why we have uſed the Words *fartheſt from*, and *nigheſt to the Center of the Earth*, rather than *upper* and *lower*: For in this Poſture, becauſe the *upper Parts* of the Objects are painted on that Part of the Eye nigheſt the Earth, (tho' really the *upper Part* of the Eye) they are judged to be fartheſt removed from the Earth.

What is ſaid of *Erect* and *Reverſe*, may be underſtood of *Siniſter* and *Dexter*.

5. The Image of an *Erect Object* being repreſented on the Fund of the Eye *Inverted*, and yet the Senſitive Faculty judging the Object *Erect*, it follows, That when the Image of an *Erect* Object is painted on the Fund of the Eye *Erect*, the Senſe judges that Object to be *Inverted*.

6. The Magnitude of an Object, is eſtimated by the Angle the Object ſubtends before the Eye. Thus, the Length of the Object *a c*, is eſtimated by the Angle *a o c*, *f o d*, and this is called the *Optick Angle*.

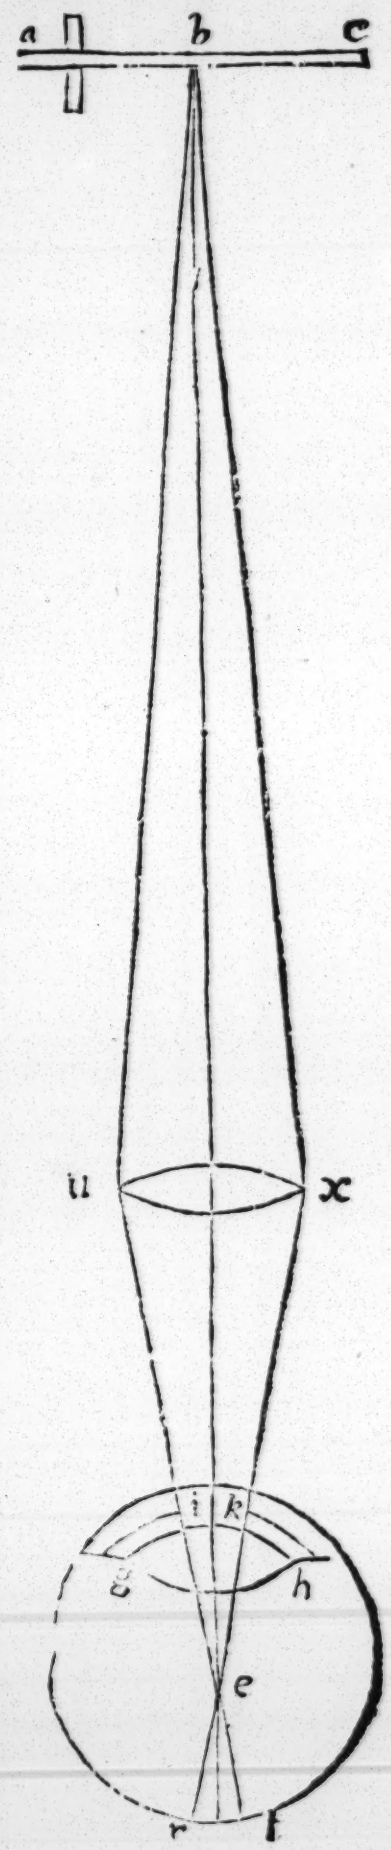
Whence it follows, that if the Eye were placed inſtead of the Glaſs at *d* (*Fig.* 2.) and *a b c*, or *e f g* were Objects, the Eye would perceive them of equal Bigneſs.



The Point *o*, which is the Vertex of the Optick Angle, is variouſly aſſigned by various Authors; ſome placing it in the Centre of the Eye; others in the Vertex of the Cryſtalline; others in the Vertex of the outward Coat or Cerena of the Eye; but 'tis a Matter of no great Conſequence where-ever we place it; for according to the Bigneſs of this Angle *a o c*, the Image on the Fund of the Eye is bigger or leſs.

7. We perceive the Rays that flow from the Point *b*, do proceed to the Eye *Diverging*, as *b g*, *b o*, *b h*: And if the Object *a c* were infinitely diſtant from the Eye, or ſo diſtant from the Eye, that the Breadth of the Pupil *i k* were inſenſible in Compariſon to this Diſtance; then the Rays *b g*, *b o*, *b h*, would proceed as it were parallel, and ſo fall on the Eye: In both which Caſes, by means of the Refractions of the Eye, they are brought together, and Point the Image of the Point *b*, on the Fund of the Eye at *e*.

But if the diverging Rays *b u*, *b x*, (*Fig.* 1.) that flow from the Point *b*, meet the Convex-glaſs *v x*, and are thereby made to converge, as *v i*, *x k*, and ſo fall on the Eye, and there paſſing through the Chryſtalline *g h*, are made to converge yet more, as *i e*, *k e*: Here they croſs in the Point *e*, before they reach the *Retina r t*, and conſequently do point thereon the Image of the Point *b* confuſedly, for 'tis planted on the Space *r t*; whereas to cauſe diſtinct Viſion, it ſhould only be painted on a correſpondent Point on the *Retina*.

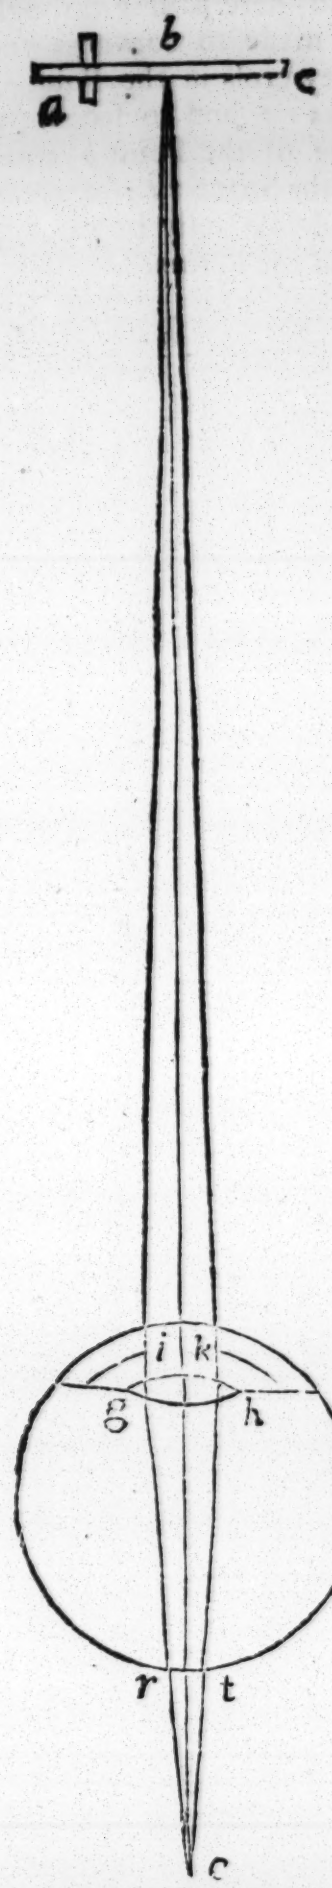


And this is the Fault of their Eyes, who are called *Myopes*, *Purblind*, or *Short-ſighted*: For in them the Cryſtalline is too Convex, (as in *Fig.* 3. both the Convex-glaſs and Cryſtalline joyn'd together, make too great a Convexity) uniting the Rays before they arrive at the *Retina*. And therefore they are help'd by *Concave-glaſſes*, which take off from the too great Convexity of their Cryſtalline, ſome part of its Refractive Power: Or rather theſe Concaves make the Rays diverge ſo, that their Cryſtalline ſhall be ſufficient only to bring them again together, ſo that they be not touched, till they arrive at the Fund of the Eye.

Myopes are alſo helped, by holding the Object very near; for then the Rays that fall on their Eye from any ſingle Point, do more diverge, than when the Eye is farther from the Point, and conſequently their too Convex Cryſtalline doth but ſuffice to bring them together on the *Retina*.

3. On the contrary, the Eyes of Old Men have their Cryſtalline too flat, (as *Fig.* 4.) and cannot correct the Divergence of the Rays *b u*, *b k*, to make them between the *Retina r t*, but beyond the Eye at *e*. Wherefore for their help 'tis requiſite they add the adventitious Convexity of a Glaſs; that both it and the Cryſtalline together, may be ſufficient to unite the Rays juſt at the *Retina*: And from hence it appears, that Spectacles help

Old Men, not by magnifying an Object, but by making its Appearance diſtinct; for Old Men cannot read the largeſt Print without Spectacles, and yet with Spectacles they read the ſmalleſt; tho' theſe with Spectacles do not appear ſo large, as thoſe without Spectacles.



9. What is ſaid of the confuſed or diſtinct Repreſentation of a Point in the Object, may be underſtood of the confuſed or diſtinct Repreſentation of the whole Object; at leaſt, for thoſe Parts that lie pretty nigh adjacent to that Point that is looked at. For here we do not ſee a Point, in the ſtrict Senſe of the Mathematicians, but in a Phyſical Senſe, for the ſmalleſt part imaginable; and the whole Object conſiſting of ſuch Points, what is ſhewn of one Point, may be underſtood of every Point in the Object.

Diſtinct Viſion, is cauſed, when the Pencils of Rays from each Point of an Object, do accurately determine in correſpondent Points of the Image on the *Retina*.

Confuſed Viſion, is cauſed when theſe Pencils do intermix one with another.

Clear Viſion, is cauſed by a great Quantity of Rays in the ſame Pencil illuminating the correſpondent Points of the Image ſtrongly and vigorouſly.

Faint Viſion, is when a few Rays make up one Pencil: And tho' this may be *diſtinct*, yet 'tis *dark* and *obſcure*; at leaſt, not ſo *bright* and *ſtrong*, as if more Rays concurred.

VISITATION, is that Office or Action that is perform'd by a Biſhop in every Dioceſe once every three Years, or by the Arch-deacon once a Year, by viſiting the Churches and their Rectors, *&c.*

VISNE: See *Venue*.

VISORIUS: See *Optick Nerves*.

VISU *Franci plegii*, is a Writ to exempt him from coming to the *View of the Frank Pledge*, who is not Reſident within the Hundred; for Men are bound to this *View*, by reaſon of their Habitation, and not of Lands held where they dwell not.

VISUAL *Point* in a Perſpective, is a Point in the Horizontal Line, wherein all the Ocular Rays unite; as if a Man ſtood in a long ſtrait Gallery, wherein looking directly forward, the Sides, Floor, and Ceiling at laſt ſeem to be united, and to touch one another in a Point or common Centre.

VISUAL *Rays*: See *Rays*.

VITAL *Faculty*, is an Action whereby a Man lives, which is performed, whether we deſign it or no; ſuch are the Motion of the Heart, Reſpiration, Nutrition, *&c.* It depends chiefly upon the *Cerebellum*. It is the ſame with Natural Faculty, tho' the Ancients diſtinguiſhed them, placing the Natural in the Liver, and the Vital in the Heart. *Blanchard*.

VITAL *Flame*: See *Flamma Vitalis*.

VITAL *Indication*, in the Art of Medicine, is ſuch an one as requires the reſtoring and preſerving of the natural Strength of the Body.

VITALIGO, a ſort of Leproſie; there are three kinds of them.

Alphus, where the Colour is White, ſomething rough, and not continued, like ſo many Drops here and there; but ſometimes it ſpreads broader, and with ſome Intermiſſions.

Melas differs in Colour, becauſe it is Black, and like a Shade; in the reſt they agree.

Leuce has ſomething like *Alphus*, but it is whiter, and deſcends deeper, and in it the Hairs are White, and like Down: All theſe ſpread, but in ſome quicker, in others ſlower.

VITRIFICATION, the turning of any Body into Glaſs by the Force of Fire: This (by the Chymiſts) is look'd upon as the Ultimate Action of Fire, and Bodies when once they have gain'd the Form of a Glaſs, do (generally ſpeaking) continue in that Form, and are not capable of putting on any other Shape.

Moſt kinds of *Vitrifications* (as alſo *Calcinations*) are made by Salts uniting and incorporating with the Metalline Particles.

VITRIOL of *Copper* or *Venus*, is *Blue Chryſtals* made by a Solution of Copper in Spirit of Nitre, Evaporation, and Chryſtallization in a cool Place. Theſe are uſed as Cauſticks, but they will diſſolve if expos'd to the Air.

There are other Chryſtals of *Venus* made by diſtilled Vinegar, and they are what is called *Verdegreaſe*; which ſee.

VITRIOL *of Mars*, or *Salt of Steel*, is made by diſſolving Steel in ſome proper *Acid Menſtruum*, then Evaporating and Chryſtallizing to gain the as above in Copper.

VITRIOL *of Silver*, or of the *Moon*: See *Chryſtals of Silver*.

VITRIOLATE *Tartar*: See *Tartar Vitriolate*.

VITRIOUS *Humour*, or *Glaſſie Humour of the Eye*, is the third Humour of the Eye, ſo called from its Reſemblance of the melted Glaſs. 'Tis thicker than the *Aqueous*, but not ſo ſolid as the *Chryſtalline*. 'Tis round or convex behind, and ſomewhat plain before, only hollowed a little in the Middle where it receives the *Chryſtalline*. It exceeds both the other Humours in Quantity.

VITRIOUS *Tunicle*, a thin Film, or Coat, which is ſaid to ſeparate the *Glaſſie Humour* from the *Chryſtalline*; tho' there are ſome who abſolutely deny, That there is any ſuch Coat in the Eye, before the Humours are taken out and expoſed to the Air.

VIVA VOCE: See *Depoſitions.*

VIVIPAROUS *Animals*, are ſuch as bring forth their Young living and perfect; by which they are diſtinguiſhed from *Oviparous* ones, which lay Eggs, which after that, are hatched in living Creatures.

ULNA, or *Focile Majus*, is the greater Bone betwixt the Arm and the Wriſt, which is jointed upward with the Shoulder by *Ginglymus* (which ſee;) and therefore it has there both Proceſſes and Cavities; two oblong Proceſſes, and as it were triangular, and rugged, that the Ligaments may knit it ſtrongly. The foremoſt and uppermoſt is leſs, and goes into the Cavity of the Shoulder: The backward Proceſs is thicker and larger, ends in an obtuſe Angle, and enters the hinder Cavity of the Shoulder; the *Latins* call it *Gibberus:* In the middle of theſe there's a great Cavity like a Semicircle.

It has yet another external lateral Cavity for the Head of the *Radius*, or leſſer Bone of the *Cubit*; it is jointed at the lower End with the Wriſt, both by a Cartilage in the Middle, and by an acute Proceſs, and therefore called *Styloides*, (being like a ſharp-pointed Pen uſed in *Writing-Tables*) whence there ariſes a Ligament, which faſtens the *Cubit*, and the *Joint* of the Wriſt *together.*

UMBELICUS in an *Ellipſis*, &c. is that *Focus* about which *the Motion* of any Revolving Body is made, and which it reſpects as its *Center:* So that either *Focus* may be called by this Name.

UMBELLIFEROUS *Plants*, are by *Botaniſts* accounted, ſuch as have their Tops branched and ſpread out like a Ladies *Umbrella*; on each *little* Sub-diviſion of which there is a ſmall Flower growing; as *Fennel*, *Dill*, *Parſley*, &c.

This Flower is always *Pentapetalous*, and is ſucceeded by two naked Seeds lying joining *together*, which are the true Diſtinctions of *theſe Plants* from *others.*

The *Umbelliferous* are a very large Genus of *Plants*, and by our *Accurate Botaniſt*, Mr. *Ray*, are thus diſtinguiſhed.

Umbelliferous Plants, are either,

I. Such as have a compounded Leaf, of a Triangular and *Pinnate* Form: And the Seeds of theſe are either,

1. Broad, flat, and plain, like Leaves almoſt; as the *Sphondylium*, *Paſtinaca Latifolia*, *Panax Heracleum Tordylium*, *Orcoſelinum*, *Thyſſelinum*, *Apium Cicutæ foliis*, *Daucus Alſaticus Carvifolia*, *Anethum*, *Pucedanum*, *Thapſia*, *Ferula*, &c.

2. With a Seed more tumid, and leſs compreſſed and flat than the former: As the *Cachrys*, *Laſerpitium*, *Cicutaria vulgaris*, *Scandix*, *Cerefolium*, *Myrrhis Sativa Angelica*, *Leviſticum*, *Siler Montanum*, *Bulbocaſtanum*, *Siſarum*, *Oenanthe*, *Sium*, *Pimpinella Apium*, *Cicuta*, *Viſnaga*, *Saxifraga*, *Crithmum*, *Fœniculum*, *Daucus Vulgaris*, *Aniſum*, *Caucalci*, *Coriandrum Paſtinaca Marina*, &c.

II. Such as have a ſimple, or an undivided Leafe, or at leaſt one, only a little jagged: As the *Perfoliata*, *Buplerum*, *Aſtrantia Nigra*, *Sanicula*, and the *Seſeli Æthiopicum.*

UMBELICAL *Region*, is that Part of the *Abdomen* lying round about the Navel.

UMBELICAL *Veſſels*, are the *Veins*, *Arteries*, &c. that belong to the Navel, or rather are enwrapped in the *Navel-ſtring.*

The Navel-ſtring is membranous, wreathed, and unequal, ariſing out of the Middle of the *Abdomen*, (*viz.* the *Navel*) and reaching to the *Placenta Uterina:* 'Tis uſually half an Ell in Length, and as thick as ones Finger. It was convenient to be ſo long and lax, that when the *Fœtus* in the Womb grows ſtrong, it might not break it by its ſprawling and tumbling about; and after it is born, the Secundine, or *After-birth*, might be drawn out the better by it.

The way that it paſſes from the Navel to the *Placenta*, is very unconſtant; for ſometimes it goes upon the Right-hand to the Neck, which having encompaſſed, it deſcends to the *Placenta*, and ſometimes it goes on the Left-hand up to the Neck, &c. Sometimes it comes not to the Neck at all, but goes firſt a little up towards its Breaſt, and then turns round its Back, and from thence paſſes to the *Placenta.*

The Veſſels contain'd in this *String*, (and which are enwrapped to a common Coat, called *Funiculus*, or *Inteſtinulum*) are four, one Vein, two Arteries, and the *Urachus.* For as for the Nerves which *Verheyen* ſuſpects to be contained in it, or the *Lacteal Veſſels* which *Bidloo* thinks he has obſerved, I ſhall not reckon them among theſe Veſſels, becauſe theſe Authors ſpeak but faintly of them.

The *Vein* is larger than the *Arteries*, and ariſes from the Liver of the *Fœtus*, (*viz.* out of its Fiſſure) by the Trunk of the *Vena Portæ* (of which it ſeems to be but a Branch) and from thence paſſing out of the Navel, it runs along the *Funiculus* to the *Placenta*, into which it is implanted by innumerable Roots; but in its Paſſage it ſends ſome little Twigs into the *Arteries.*

The *Ancients*, that thought the *Fœtus* was nouriſhed by the *Mother's Blood* only, taught the ſole *Uſe* of this Vein to be, to carry Blood from the *Placenta* to it: And ſince it has been found out, and believed that it is nouriſhed alſo (if not only) by Chyle, or *Succus Nutritius*, ſome have continued the ſame Office to this Vein, and think that the Chyle is brought by Lacteal Veſſels ariſing out of the *Placenta*, as (they ſay) it was brought thither by the Mother's Lacteals. And indeed if any certain Diſcovery had been made of theſe ſame *Lacteæ*, we ſhould have embraced this Opinion as the moſt probable. But we are not to form *Hypotheſes* out of *Rational Notions* only, but much rather from what appears to the Eyes of the Diſſector.

We do affirm therefore, That the *Umbelical Vein* ſerves for conveying to the *Fœtus* the Nutritious Juice ſeparated in the *Placenta* from the *Mother's Arteries.* How this Separation is made, and how it is firſt of all turned into Blood, we ſhall conſider by and by.

But together with this Juice there returns ſo much of the Arterial Blood (that comes from the *Fœtus*) as is not ſpent upon the Nouriſhment of the *Placenta*, or of the *Chorion* and *Amnios:* Which Liquors thus mixed, though by the *Umbelical Vein*, they are poured into the *Sinus* of the *Porta*, yet are they not diſtributed through the Liver by the uſual Channels thereof only, but by the Venal Duct, is the greateſt Part thereof conveyed in a

direct Course and full Stream into the *Cava* about the Liver.

Besides this Vein, which is common to all Creatures, there have been observ'd in Whelps and Conies, (and may perhaps in others) two small Veins more, that arising from the fourth involving Membrane peculiar to them, pass directly from the *Umbelicus* to the Mesentery of the *Fœtus*, as the other great one does to its Liver; which may strengthen the Opinion, That the Chyle, or *Succus Nutritius* is brought to the *Fœtus* by the *Umbilical Vein* (or *Veins.*) These Veins Dr. *Needham* calls *Omphalo-Mesentericæ*.

In the *Funiculus* are included also two *Arteries*, which are not both of them together so big as the Vein: They spring out of the inner Iliacal Branches of the great Artery: (Dr. *Needham* judges them to be derived immediately from the Extremity of the *Aorta*, before its Division) and passing by the Sides of the Bladder, they rise up to the Navel, out of which they are conducted to the *Placenta*, in the same common Cover with the Vein and *Urachus*, with which they are twined and wreathed not unlike a Rope. I say, they are inserted into the *Placenta*, and with the Vein make a most admirable Neck-like Texture. But there is one Branch of each of them which is manifestly inserted into the *Amnios*. Dr. *Harvey* says, The Vein is conspicuous a pretty while before these Arteries appear.

In the Creatures mention'd in the foregoing Paragraph, there are besides these Arteries, others answering to, and accompanying the Veins called, *Omphalo-Mesentericæ*, abovementioned.

Blood and Vital Spirit are not carried by them from the Mother to the *Fœtus*, as many from *Galen* have taught; but on the contrary. Spirituous Blood is driven from the *Fœtus*, by the beating of its Heart, to the *Placenta* and the Membranes for their Refection and Nourishment; from which what Blood remains, circulates back again in the Umbilical Vein, together with the *Succus Nutritius* afresh inbibed by its Capillaries dispersed in the *Placenta*. But besides Arterial Blood, there flows out of the Navel by them, part of the *Succus Nutritius*, that was imported by the Umbilical Vein; namely, That of it which is more crass and cerrene, which by one Circulation through the Heart, (or it may be many) could not be changed into Blood: This Part, I say, flows out by these Arteries, which by their Branches that are dispersed through the *Amnios*, disimbogue it by their little Mouths into it: For what Use shall be declared presently.

But besides these Uses which are commonly ascribed to these Umbilical Veins and Arteries by Anatomists, *Verheyen* (with some Probability) assigns another.

Says he, "It is worth Inquiry, for what Purpose the Blood of the *Fœtus* is sent in such great "Quantity out of its Body into the *Placenta*: Seeing, without doubt, a far less Quantity of Blood "would suffice for its Nourishment: For no Part "in the whole Body, if you except the Lungs and "Liver, has such abundance of Blood-Vessels as "the *Placenta*. This must needs be for a certain "common Use, which we judge to be a-kin to "the Use of the Lungs, in those who being born, "enjoy a freer Air: Namely, That as these do by "the Help of the Lungs plentifully draw in from "the Air a certain Matter highly necessary for the "feeding the Vital Flame; so in the *Fœtus*, where "the Lungs lie idle, such like Matter being receiv"ed into the Mother's Blood by her Respiration, "is separated therefrom by help of the *Placenta*, "and mixt with the Blood of the *Fœtus* (in the "Umbilical Vein;) and as in the Lungs of Breath"ing Persons, some Heterogenous *Matter* is con"tinually separated from the Blood; so in the "*Placenta* certain *Recrements* of the Blood are de"posited out of the *Umbilical Arteries* into the "Veins of the *Mother*."

And here I shall transcribe a *Material Objection, with the Answer to it*, out of *Diemerbroeck*.

Objection.

How can these Vessels, (Vein and Arteries) when they have grown from the Belly of the Fœtus, *to that Length as to reach the Membranes, penetrate and pass through them to the* Placenta?

Answer.

This is done in the same manner as the Roots of Herbs, Shrubs and Trees penetrate into the hard Ground, yea, often into thick Plants, Walls and Stones, (which Water cannot enter) and root themselves firmly in them. For just so the first sharp-pointed and most fine ends of the *Umbilical Vessels*, insinuate themselves by little and little into the Pores of the Membranes (for the Figuration of those Pores are fitted for their Entrance) and pass through them, and yet the Liquors contained in these Membranes cannot flow out by them: And when those Vessels inhering in the Pores, grow more out into Length, by little and little, the said Pores are more and more widened, (according to the Encrease of the Vessels) and are inseparably united unto, and grow in them.

The fourth *Umbilical Vessel*, is the *Urachus*, or *Urinary Vessel*. This is a small, membranous, round Pipe, endowed with a very strait Cavity arising from the bottom of the Bladder up to the Navel, out of which it passes along within the common Cover, and opens into the *Allantoides*.

It is more apparently pervious in many of the larger Brutes, than it is in Man; in whom some have denied it any Cavity; but that it is hollow in him, is confirmed by many Histories of Persons adult, who having the ordinary Urinary Passage along the *Penis* stopt, the Passage in this Vessel has been unlocked, and they have made Water by the Navel, which could not have been imagined to have happen'd, if it had been originally a Ligament without any *Meatus*.

Bartholin, and others have affirmed, That the *Urachus* in Men reaches no further than the Navel: How then comes that Humour into the *Allantoides*, that has perfectly the same Taste with the Urine in the Bladder? But their Error sprung from hence, That they thought a Humane *Fœtus* had no *Allantoides*, and that Humour that is found in it, they thought had been contained in the *Chorion*. But this is in short refuted above, but more fully and accurately by Dr. *Needham*, *Lib. de formato Fœtu, cap.* 3.

As to the Perviousness of the *Urachus*, I shall add this further, That in Abortions of five or six Months old, the Bladder of the *Embryo* is always full of Urine, out of which, if in the following Months it should not be emptied by the *Urachus*, the Bladder would soon burst, seeing there is daily some

ſome *Serum* ſeparated from the Blood in the Kidnies, and ſent to the Bladder; and the more the *Fœtus* increaſes, the more muſt need be ſeparated. Yea, Dr. *Needham* affirms, That one may either preſs the Liquor contained in the *Allantoides* by the *Urachus* into the Bladder, and with a Pipe blow Wind out of the Bladder by the ſame way into the *Allantoides*.

Its Uſe has been ſufficiently declared in the preceding Paragraph; as alſo above, when we delivered the Uſe of the *Allantoides*, which we ſhall not repeat.

Theſe four Veſſels (as has been ſaid above) have one *common Cover*, which alſo keeps each of them from touching the other: It is called *Inteſtinulum* and *Funiculus*, (by which it with its Veſſels is ſometimes underſtood.) It is membranous, round and hollow, indifferent thick, conſiſting of a double Coat, (the inner from the *Peritonæum*, and the outer from the *Panniculus carnoſus.*) Sometimes it ſelf only is wreathed about like a Rope, the Veſſels included in it running ſtreight along its Cavity; and ſometimes they are wreathed together with it.

It hath ſeveral *Knots* upon it here and there, which Dr. *Wharton* thinks to be *Papillæ*, or little Glands through which the Lacteal (or Nutritious Juice) diſtils out of the Cavity of the *Funiculus*, into the Cavity of the *Amnios*.

I cannot tell whether this be ſo, or no; but the Uſe that doting Midwives make of them to gueſs by their Number how many Children more the Mother ſhall have, and by their Colour, whether thoſe Children ſhall be Male or Female, is more ridiculous than ſuperſtitious.

UMBILICK *Points*, in *Mathematicks*, are the ſame with *Focus's*; which ſee.

UMBILICUS, the Navel, is a Part in the Center of the *Abdomen*, to which the Navel-ſtring in a *Fœtus* is joined, which is cut off after the Delivery.

UNCIÆ, in *Algebra*, ſignifie thoſe Numbers which are prefix'd before the Letters of the Members of any Power produced from a *Binomial*, *Reſidual*, or *Multinomial Root*.

Thus in the fourth Power of $a+b$; that is, $aaaa+4\ aaab+6\ aabb+4\ abbb+bbbb$, the *Unciæ* are 4, 6, 4.

The wonderful Sir *Iſaac Newton* gives this *Theorem* for finding the *Unciæ* of any Power ariſing from a *Binomial Root*.

Let the Index of that Power be called m; then will the *Unciæ* ariſe from ſuch a continual Multiplication as this, *viz.*

$$1\times\frac{m-0}{1}\times\frac{m-1}{2}\times\frac{m-2}{3}\times\frac{m-3}{4}\times\frac{m-4}{5},\ \&c.$$

Thus if the *Unciæ* of the *Biquadrate*, or fourth Power were required; the Rule is,

$$1\times\frac{4-0}{1}(=4)\times\frac{4-1}{2}(=6)\times\frac{4-2}{3}(=4)\times\frac{4-3}{1}(=1)$$

Which ſhews, that the *Unciæ* are 1, 4, 6, 4, 1.

UNCORE *Priſt*, in Law, is a Plea for the Defendant, being ſued for a Debt due at a Day paſt, to ſave the Forfeiture of his Bond, ſaying, That he tendred the Debt at the Time and Place, and that there was none to receive, and that he is ſtill ready to pay the ſame.

UNDIMIA, the ſame with *Oedema*.

UNGUIS, a Nail, is a ſimilar, flexible, white, and hard Part, which defends the Fingers from external Injuries, and in ſome meaſure adorns them. The Root of it is joined to a certain Ligament, and by reaſon of the neighbouring Tendons it becomes ſenſible: They ſeem to be made of a Collection of very little Pipes, which adhere extremely thick to one another, and ſhoot out into length. Where they begin, there you find certain nervous Fibres like ſo many ſmall Nipples lengthen'd, the lengthen'd Parts whereof, are ſeen as far as the Nail: If they be forcibly torn off, they leave divers Holes, ſo that the Horney Subſtance of the Nails looks like a Net. Under the Nails there's a pappy ſort of Body, which has its Veſſels of Excretion.

The *Apices*, or Tops of the Nails, are they which grow beyond the Fleſh; the Parts which are out, are called the *Segmina*, the Paring of the Nails; the Parts under the Nails, are the *κρυπτα*, the hidden Parts; the white Semi-lunar Part next the Root, is the Riſe of the Nail; the very Beginnings that grow into the Skin, are call'd the Roots of the Nail; the Sides, the Clefts; the white Spots, *Nubeculæ*, little Clouds, *&c. Blanchard.*

UNGUIS, the ſame with *Hypopyon*; which ſee.

UNGUIS *Os*, is a little thin Bone, which lies in the great Angle of the Orbit of the Eye, it has a Hole in which the Lachrymal Glands lies.

UNGULA, is a ſort of hooked Inſtrument uſed by Surgeons, to draw a dead *Fœtus* out of the Womb.

UNIFORM *Motions* are the ſame with equal, or rather *Equable ones*; which ſee.

UNIFORM *Flowers* of Plants, the Botaniſts call ſuch as are all round of the ſame Figure; or whoſe fore and back Part, and whoſe right and left Parts are exactly alike; but when they are not ſo, they call them Difform Flowers.

UNION, (a Term among Painters) is the mutual Agreeableneſs and Sympathy of the Colours in a Piece of Painting.

UNION, Dr. *Grew* makes Union in a Phyſical Senſe, to be one of the three Ways of Mixture; and he defines it to be the Union of Atoms, or Particles which touch in a Plain; as in the Chryſtallization of Salts, and other like Bodies.

UNION, in Muſick, is one or the ſame Sound, whether produced by one ſingle Voice, or divers Voices ſounding in the ſame Tone; ſo that an *Uniſon* in this Science, may be conſidered as an Unite in Arithmetick, or as a Point in Geometry, not diviſible into any Parts, in regard that it is the firſt Term to any Interval. When the Ancients divided their *Monochord*, ſo that the Parts were as 1 to 1, they called them *Uniſons*.

UNITE, is the ſame with the Figure 1, being one ſingle individual Part of diſcreet Quantity. If a Number conſiſt of 4 or 5 Places, that which is outermoſt towards the Right-hand, is called the *Place of Unites*.

Number in general, is by *Euclid* defined to be *μονάδων πλῆθος*, a Multitude, or Aggregate of *Unites*; and in this Senſe *Unity* is not a Number. But *Unity*, as it may be taken for an Individual *Unite*,

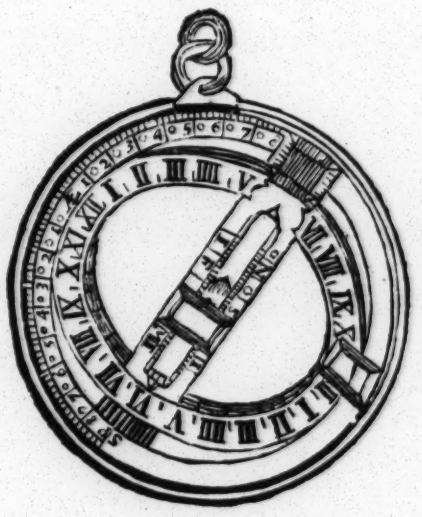
Unite, is certainly as much a Number as 10, 20, 100, &c.

UNITY *of Poſſeſſion*, in the Civil Law, is called, *Conſolidatio fructus & proprietatis*, and ſignifies *Joint Poſſeſſion* of two Rights by ſeveral Titles.

As for Example: If I take a Leaſe of Land from one upon a certain Rent, and afterwards I buy the Fee-ſimple, this is an *Unity of Poſſeſſion*, by which the Leaſe is extinguiſhed, by reaſon that I, which before had the Occupation only for my Rent, am become Lord of the ſame, and am to pay my Rent to none but my ſelf.

UNIVERSAL *Equinoctial Dial*, is made of two Rings of Braſs or Silver, that open and fold together, with a Bridge or Axis, and a Slider, and a little Ring to hang or hold it up by: It is divided on one ſide of the great Ring into 90 Degrees, and ſometimes on the other into two Quadrants, or 180 Degrees, but one is enough: The innermoſt Ring is divided into 24 Hours, ſub-divided on the Face, and on the outſide of the Ring, into every five Minutes. The Axis has the Sun's Declination on one ſide, and the Days of the Month and the Sun's Place on the other.

To uſe it for the Hour, the Perpendicular Line or Stroke which is on the Slider, which moves on the outer Ring, muſt be ſet to the Latitude of the Place, and the Hole in the Slider on the Bridge either to the Sun's Place in the Ecliptick, the Day of the Month, or his Declination; and then the Rings being opened, and ſet ſquare to one another, move the Dial about two and fro, 'till the Sun ſhine through the Hole, and on the inner Edge of the innermoſt Ring, and there it will ſhew the true Hour.



UNIVOCAL Terms in Logick, are ſuch whoſe Name and Nature is the ſame; and 'tis uſed in Oppoſition to Equivocals, whoſe Names are the ſame, but their Natures very different; for a Thing to be predicated *Univocally* of any others, is to be attributed to all of them alike, and in the ſame proper Senſe.

UNLAWFUL *Aſſembly*, is the Meeting of three or more Perſons together, by Force, to commit ſome *unlawful Act*, and ſo abiding together, tho' not endeavouring the Execution of it, as to aſſault, or beat any Perſon, to enter into his Houſe or Land, &c.

UNLIKE Quantities and Signs in *Algebra*: See like *Signs* and *Quantities*.

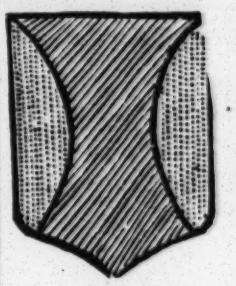
UNLIMITED *Problem (Inordonnè)* according to Mr. *Ozanam*, is ſuch a Problem in *Mathematicks*, as is capable of *Infinite Solutions*: As to divide a Triangle given into two equal Parts, to make a Circle paſs through two Points aſſigned, &c.

UNQUES *Priſt*, in Law, is a Plea whereby a Man profeſſeth himſelf *always* ready to do or perform that which the Defendant requires: As if a Woman ſues the Tenant for her Dower, and he coming in at the Day offers to averr, That he was *always ready*, and ſtill is to perform it In this Caſe, except the Demandant ſhall averr the contrary, he ſhall recover no Damages: When this Plea will ſerve to avoid Charges, and when not: See *Kitchin*, *fol.* 243.

VOCAL *Nerves*, the ſame with *Recurrent*; which ſee.

VOID *Baſtion*: See *Baſtion*.

VOIDED, a Term in Heraldry, when there are Lines drawn within, and parallel to the Out-lines of any Ordinary: This expreſſes an Exemption of ſomething of the Thing voidable, and makes the Field appear tranſparent thro' the Charge.



VOIDER, ſo the Heralds call one of the *Ordinaries*, whoſe Figure is much like that of the *Flaſque* or *Flanch*, only it does not bend or bow in ſo much: This Armour they ſay, is the Reward of a Gentlewoman that has well ſerved her Prince. They are always born by Pairs.

The Field is *Tenn*, two *Voiders*, *Or*.

VOIR *dire*, is when 'tis pray'd upon a Trial at Law, that a Witneſs may be ſworn upon *Voir dire*; the Meaning is, he ſhall upon his Oath ſpeak or declare the Truth, whether he ſhall get or loſe by the Matter in Controverſie; and if he be unconcern'd, his Teſtimony is allowed, otherwiſe not.

VOLATILE *Salt* of *Vegetables* is uſually drawn into a Retort from the Fruits and Seeds fermented, and ſeems to be only the *Eſſential Salt* driven up higher, and Volatilized by the Spirits during *the Fermentation* and *Diſtillation*.

The *Volatile Salt* of *Animals*, is drawn much the ſame way as that of *Vegetables*.

VOLATILE *Spirit of Sal Armoniack*, is made either by mixing Quick-lime, or Salt of Tartar, with *Sal Armoniack*, and then pouring a ſufficient Quantity of Water upon it, the Matter is diſtilled in a Retort when Quick-lime is uſed, otherwiſe in a Glaſs Body, or Cucurbite; by this means the Lime or the Salt of Tartar doth deſtroy the Strength of the Acid Sea Salt, that held bound and fixt the *Volatile Salts* of *Urine* and *Soot* of which *Sal Armoniack* is made; whereby they being at Liberty are driven out by the Fire, and diſſolved in the Water that was poured on the Mixture, and ſo compoſe this *Volatile Salt*.

Spirit of *Sal Armoniack* made with Quick-lime, is an excellent Thing to make Precipitations with; deſtroying all kinds of Acids almoſt, and is uſed to precipitate Solutions of Gold.

If you mix together equal Parts of this Spirit made with Tartar, and of Spirit of Wine, a *Coagulum* will ariſe on their being ſhaken together; but not if you uſe the Spirit of *Sal Armoniack* made with Quick-lime.

If after either of theſe Mixtures to make Spirit of *Sal Armoniack* be put into the Body or Retort, Spirit of Wine be poured on, and then the Spirit drawn off; this is called Spirit of *Sal Armoniack* dulcified.

VOLA-

VOLATILE *Spirit*, is a *Volatile Salt* diſſolved in a ſufficient Quantity of Phlegm or Water.

VOLATILES are (by ſome made) a Species of Animals which fly in the Air, as Birds do.

VOLATILITY, is the Property of ſuch mixt Bodies, whoſe Corpuſcles or Particles, of which they are compoſed, will riſe up by that Degree of Heat, as is proper to ſublime it.

Mr. *Boyle*, in his Notes about the Mechanical Production of this Quality of *Volatility*, ſuppoſes, or rather proves theſe four Attributes, or Qualifications, requiſite to denominate a Body Volatile.

1. That its conſtituent Particles, or Corpuſcles, be very ſmall; for beſides that ſuch Minute Parts are more eaſily put into Motion by the Action of Fire and Heat, and conſequently are more apt to be elevated, than other Parts which are more groſs; theſe can continue their Motion upwards with leſs Reſiſtance, and with a leſs Tendency, to deſcend down by their own Gravity. Wherefore,

2. 'Tis neceſſary that the Corpuſcles of Volatile Bodies, ſhould not only be very ſmall, but they muſt alſo not be too ſolid and heavy; for the great Specifick Weight of ſuch Bodies will hinder them from riſing.

3. 'Tis neceſſary alſo, that they be conveniently *ſhaped* for Motion; for if they be of hooked, branched, or any other irrigular and catching Figure, tho' they may be both very ſmall and light, yet they will be apt to be entangled one in another or to hang or ſtick to other Bodies; and this probably is the Reaſon why Water is more eaſily elevated by Heat, and brought to exhale than Oil, tho' it be ſpecifically heavier than it, and its likely hath its Parts ſmaller too.

4. 'Tis neceſſary that the Parts do not too cloſely adhere to one another, ſo as on that account to be indiſpoſed for the Separation by the Heat of an ordinary Degree of Fire.

And this Honourable Gentleman largely ſhews, that this Quality of *Volatility* is producible by ſuch Mechanical Means as will produce ſome or all of the Qualifications above-mentioned.

VOLITION, is an Act of the Mind, knowingly exerting that Dominion it takes it ſelf to have over any Part of the Man, by employing it in, or with-holding it from any particular Action.

VOLSELIA, or *Vulſella*, is an Inſtrument to pull up Hairs with by their Roots, the ſame with Tweezers, or a Chyrurgeon's little Tongs, which are of different Shape according to the Diverſity of their Uſe.

VOLUMUS, is the firſt Word of a Clauſe in the King's Writs of Protection and Letters-Patents.

Of Protections, ſome are *Cum clauſula Volumus*; and of theſe there are four Kinds, *viz.*

1. *Quia Profecturus.*
2. *Quia Moraturus.*
3. *Quia indebitatus nobis exiſtit.*
5. When any one ſent out into the King's Service beyond Sea in War, is impriſoned.

VOLUNT, a Law Term, is when the Tenant holds at the Will of the Leſſor, or Lord, and that is in two ways.

Firſt, When I make a Leaſe to a Man of Lands to hold at my *Will*, then I may put him out when I pleaſe; but if he ſow the Ground, and I put him out, then he ſhall have his Corn with Egreſs and Regreſs, 'till it be ripe to cut and carry it out of the Ground; and ſuch *Tenant at Will*, is not bound to repair and ſuſtain the Houſe as Tenant for Years is: But if he make wilful Waſt, the Leſſor ſhall have againſt him an Action of *Treſpaſs*.

The other *Tenant at Will, of the Lord*, is by Copy of Court-Roll, according to the Cuſtom of the Mannor; and ſuch a Tenant may ſurrender the Land into the Hands of the Lord, according to the Cuſtom, to the Uſe of another for Life, in Fee, or in Taile; and then he ſhall take the Land of the Lord, or his Steward, by Copy, and ſhall make Fine to the Lord.

VOLUTA, in Architecture, is that Part of the Capitals of the *Ionick*, *Corinthian*, and *Compoſit* Orders, which is ſuppoſed to repreſent the Bark of Trees twiſted, and turned into Spiral Lines; or, as ſome ſay, the Head-dreſſes of Virgins in their long Hair. *Voluta*'s are different in theſe three *Orders:* Thoſe that appear above the Stems in the *Corinthian* Order (according to *Vitruvius*) are 16 in Number in every Capital, whereas there are only 4 in the *Ionick* Order, and 8 in the *Compoſit*. But theſe *Voluta*'s are more eſpecially remarkable in the *Ionick* Capital, repreſenting a kind of Pillow or Cuſhion laid between the *Abacus* and the *Echinus*, as if it were to be fear'd leſt the Weight of the *Abacus*, or of the *Entablature* above it, might break or deface the *Echinus*; whence the ſame Ancient Architect took Occaſion to call the *Voluta*, *Pulvinus*, or Bolſter.

VOLVULUS: See *Ileon* and *Chordapſus*.

VOMER, is a Bone ſituated in the Middle of the lower Part of the Noſe. It has a Cleft in the upper Side, in which Cleft it receives the lower Edge of the *Septum Naſi*. In its further End it receives a ſmall *Apophyſe* of the *Sphœnoides*, and its under Side joins the *Os Palati*.

VOMICA, is a Fault in the Lungs, from Heterogeneous Blood, which lodged perhaps in one of the little Bladders, or Cells there, occaſions neither a Fever nor a Cough; but afterward, when it is encreaſed, it oppreſſes the neighbouring Sanguiferous Veſſels, and impregnates the Blood as it paſſes along with its *Effluviums*; whereupon there ſucceeds a ſmall Fever, accompanied with Inquietude and Leanneſs; at laſt when it is full grown and concocted into Matter, it makes a Neſt as it were, and lodges there. *Blanchard.*

VORTEX, according to the *Carteſian* Philoſophy, is a Syſtem of Particles of Matter moving round like a Whirl-pool, and having no void Interſtices, or Vacuities between the Particles. This Vortex thus moving round, will occaſion any Bodies that ſwim in the Syſtem, to move round as that doth, and that ſwifter or ſlower, according as they are farther off, or nearer to the Centre.

By ſuch *Vortices* as theſe, they endeavour to ſolve the Motion of the Heavenly Bodies round the Sun in the Centre of the Vortex. But the Excellent Sir *Iſaac Newton* had demonſtrated, That the Planets cannot be carried round their Centre by the Motion of any *Corporeal Vortex*: Becauſe if they

they were, the Vortices themſelves muſt be carried round after the ſame manner as Aſtronomers have diſcovered that the Planets perform their Revolutions; which is ſo, that their Periodical Times are always in a *Seſquialteral Ratio* of their Diſtances from their Centres; or that *the Squares of the Times of their Periodical Revolutions are as the Cubes of their middle Diſtances from their Centres.*

But he proves, That the Periodical Times of the Parts of the Vortex will always be only as the Squares of their Diſtances from the Centre of their Motion.

Beſides, the Planets, according to the true *Copernican Hypotheſis*, being carried about the Sun in Ellipſes, and having the Sun in the *Umbilicus* of each Figure, *by Lines drawn from themſelves to the Sun, do always deſcribe Areas proportional to the Times of their Revolutions*, which he ſhews, the Parts of no Vortex can do: See *Scol. Prop. ult. Lib.* 2. *Princip.*

Again, as the Ingenious Mr. *Keil* obſerves in his Examination of Dr. *Burnet*'s *Theory*: If the Earth were carried in a Vortex, it would move faſter, in the Proportion of 3 to 2, when it is in *Virgo*, than when it is in *Piſces*, which all Experience proves to be falſe: See a large Refutation of all the *Carteſian* Doctrine of the Vortices in Dr. *Gregory*'s *Aſtronom. Phyſ. & Geometr. Lib.* 1. *Sect.* 10.

VOUCHER, is a Term in Law, ſignifying when the Tenant calls another into the Court, that is Bound to him to Warranty: And 'tis either to defend the Right againſt the Demandant, or to yield him other Lands, *&c.* in Value, and extend to Lands or Tenements, of Freehold or Inheritance: And it ſeems in ſome meaſure to agree to the Contract in the Civil Law, whereby the Vendee bindeth the Vendor, ſometimes in the ſimple Value of the Things bought, ſometime in the double, to *Warrant* the ſecure enjoying the Thing bought; yet there is this Difference between *the Civil*, and the *Common Law*, that the *Civil Law* binds every Man to warrant the Security of that which he ſelleth, which the *Common Law* doth not, except it be ſpecially covenanted.

The Proceſs whereby the *Vouchee* is called, is a *Summoneas ad Warrantiſandum*: And if the Sheriff return upon that Writ, that the Party hath nothing whereby he may be ſummoned, then goes out another Writ called, *Sequentur ſub ſuo periculo.*

A Recovery with a *ſingle Voucher*, is, when there is but *one Voucher*: And with a *double Voucher*, is, when the *Vouchee* voucheth over, and ſo a *treble Voucher.*

There is alſo a *Foreign Voucher*, when the Tenant being impleaded in a particular Juriſdiction of that Court, which might more aptly be called *a Voucher* of a Foreign.

Voucher ſignifies alſo a Leiger-Book, or Book of Accompt, wherein are entred the Acquittances or Warrants for the Accomptant's Diſcharge.

VOYDANCE, is a Want of an Incumbent upon a Benefice, and this double, either *in Law*, as when a Man hath more Benefices incompatible; or in *Deed*, as when the Incumbent is dead, or actually deprived.

UPRIGHT *South Dyals*: See *Prime Verticals.*

URACHUS, is one of the Umbilical Veſſels, being a ſmall Membranous round Pipe, with a very ſtrait Cavity ariſing from the bottom of the Bladder up to the Navel, out of which it paſſes along with the common Cover, and opens into the *Allantoides* of the *Fœtus*: 'Tis more pervious in ſome of the larger Brutes than in Men, in whom ſome have denied it to be hollow; but that ſeems contradicted by the Inſtances we have had of Mens making Water by the Navel, when the Paſſage of the *Penis* hath been quite ſtopped. *Bartholin* and ſome others ſay, That the *Uracus* in Men reaches no farther than the Navel: But how then comes that Humour into the *Allantoides*, which has perfectly the ſame Taſte with the Urine in the Bladder? The Miſtake ſeems to ariſe from that wrong Notion, That a Humane *Fœtus* hath no *Allantois*, which hath been by *Needham* and others ſufficiently refuted.

The Uſe of the *Urachus* is to convey the Urine from the Bladder of the *Fœtus* into the *Allantoides*, which is placed between the *Chorion* and the *Amnion.*

URETER, is a Fiſtulous Membranaceous Veſſel, which proceeds from both Reins, and opens between the Membranes of the Bladder, by which the Urine paſſes from the Reins to the Bladder; *Celſus* calls it the White Vein.

URETHRA, or *Fiſtula*, is the Urinary Paſſages, whereby the Urine is diſcharged: It ſerves in Males alſo for the Ejection of the Semen. The Seminal little Bladders empty themſelves into it by 2 Holes at the beginning of it, when there is occaſion; which Bladders or Veſſels are ſurrounded with Glandulous Proſtates, perforated with ſeveral Holes, to which there is a little piece of Fleſh affixed. *Blanchard.*

Mr. *Cowper* obſerves, That the *Urethra* hath a *Corpus Cavernoſum*, like to that of the *Penis*, which you will find deſcribed under the Words *Corpora Cavernoſa*; but this of the *Urethra*, differs much in Figure from them: The ſuperior Part of this *Corpus Cavernoſum* lying between the two *Crura* of the former, he calls *Bulbus*, from its Figure; it is covered with the *Muſculus Accelerator Urinæ*; it poſſeſſeth all the lower Part of the *Urethra*, extending its ſelf in the *Perinæum*; it hath moreover, a *Septum Intermedium* (tho' not taken Notice of by Anatomiſts) dividing the right Side of the *Bulbus* from the left, which deſcending to the End of the Bulbous Part, is there obliterated.

The Uſe of this *Septum* is (as Mr. *Cowper* thinks) to direct the Refluent Blood to the exporting Ducts, its two Veins that carry the Blood back.

As this *Corpus Cavernoſum* deſcends on the inferior Part of the *Urethra*, it is leſſened; but when it approaches the Extremities of the two other *Corpora Cavernoſa* it again dilates it ſelf and covers them, compoſing that Body which they call the *Glans* or *Balanus.*

URINOUS *Salts*, are that Tribe of Volatile Salts drawn from Animal, or other Subſtances that are contrary to Acids: And Mr. *Boyle* ſays, They are diſtinguiſhable from *Lixiviat Salts*, by this Teſt, That they will turn a Solution of Sublimate into a White Colour, whereas Lixiviate Salts turn it into a Yellow one.

URSA *Major*, a Northern Conſtellation, conſiſting of 27 Stars, and is otherwiſe called *Charles's Wain*, and the *Great Bear.*

USAGE: See *Preſcription.*

USE, in Law, properly ſignifies the Profits or Benefits of Lands or Tenements: For every Deed conſiſts of 2 principal Parts; namely, *The Premiſes*, and *the Conſequents.*

The Premiſes, is the former Part thereof, being all that which precedeth the *Habendum*, or Limitation of the Eſtate, which are the Perſons contracting, and the Thing contracted.

The *Conſequent* is that which follows the *Premiſes*, and that is the *Habendum*, in which are two Limitations: The one of the Eſtate or Property, which the Party Paſſive ſhall receive by the Deed: The other of the *Uſe*; which is to expreſs in the ſaid *Habendum*, to or for what *Uſe* and Benefit he ſhall have the ſame Eſtate, and of the Limitation of ſuch *Uſes* many Precedents are ſet down in Law Books.

USER *de Action*, a Term in Law, ſignifying the purſuing or bringing an *Action*, which in what Place and Country it ought to be; See *Bro. tit. Lieu* and *Country*, *Fol.* 64.

USUCAPTION, in Law, ſignifies the enjoying a Thing by continuance of Time, or receiving the Profits, long Poſſeſſion or Preſcription.

USURY, is the Gain of any thing above the Principal, or that which was lent; exact only in Conſideration of the Loan, whether it be Money, Corn, Apparel, Wares, or ſuch like.

UTERUS, the Womb, an Organical Part, wherein Generation and Conception are made, being ſeated in the *Hypogaſtrium*.

UTLAGATIO *Viri*.

UTLAGATO *capiendo quando utlagatur in uno comitatu & poſtea fugis in alium*, is a Writ, the Nature whereof is ſufficiently expreſt by the Name.

UTLARY, or *Utlawry*, is a Puniſhment for ſuch as being called into Law, and lawfully ſought, do contemptuouſly refuſe to appear after an *Original Writ*, with a *nihil habet*, three Writs of *Capias*, *Alias & Pluries*, returned by the Sheriff *non eſt inventus*, and an *Exigent* with a *Proclamation*, thereupon awarded. And *Bracton* ſays, he muſt be called at five Counties, a Month between every County; and if he appear not within that Time, he ſhall be pronounced out of the King's Protection, and deprived of the Benefit of the Law. The Effect of this is divers; for if he be *Outlawed* at the Suit of another in a civil Cauſe, he ſhall forfeit all his Goods and Chattels to the King. If upon Felony, then he ſhall forfeit all his Lands and Tenements which he hath in Fee, or for Life, and his Goods and Chattels. A Minor nor Woman cannot be *Outlawed*: For where a Man is ſaid to be *Outlawed*, a Woman is termed *Waived*.

UTRUM: See *Aſſiſe*.

UTTER-BARRISTERS, are ſuch, who for their long Study, and great Induſtry beſtow'd upon the Knowledge of the Common Law, are called from their Contemplation to Practice, and in the Face of the World, to take upon them the Protection and Defence of Clients; the Time before any ought to be called to the Bar, was formerly eight Years, but now reduced to ſeven; and the Exerciſes done by him (if he were not called, *Ex gratia*) was Twelve *Grand Moats* performed in the Inns of Chancery, in the Time of the Grand Readings, and Twenty four *Petty Moats*, at the Inns of Chancery, in the Term-times, before the Readers of the reſpective Inns of Chancery.

A *Barriſter* newly called, is to attend the ſix next long Vacations, the Exerciſes of the Houſe, *viz.* in *Lent* and *Summer*, and is therefore for thoſe three Years called, a *Vacation-Barriſter*.

And they are alſo called, *Utter-Barriſters*, *i. e.* Pleaders without the Bar, to diſtinguiſh them from Benchers, or thoſe that have been Readers, who are ſometimes admitted to plead within the Bar, as the King's, Queen's, or Prince's Council are.

UVA, the ſame with *Cion*; which ſee.

UVEA *Membrana ſive Tunica*, is the Fore-part of the *Choroides*; being almoſt altogether continuous on the Inſide to the *Tunica Sclerotis*; it is perforated in the Fore-part, and leaves a Space for the Apple of the Eye, which may be contracted or dilated: Its exterior Surface is of various Colours, whence it is called *Iris*, and in this is the Difference of Mens Eyes as to Colour; as Black, Grey, *&c.* The Inſide of this Uveous Tunick is cover'd with a Black Lining, that the Cavity of the Eye may be the darker.

UVIGENA, or UVIGERA, the ſame with *Cion*.

VULGAR *Fractions*: See *Fractions*.

VULTUR *Volans*: See *Aquila*.

UVULA, is a double Production of the Internal Membrane of the Mouth; its Subſtance is very lax, and it has a Number of ſmall Glands as in the Palate: It is ſomewhat long and of a Conick Figure: It hangs from the Roof of the Mouth near the Paſſage which comes from the Noſe, above the Seat of the Larynx between the Tonſils: It is moved by 2 Pair of Muſcles, called *Pterigoſtaphilinus Externus & Internus*: Its Uſe is to hinder Drink, *&c.* from falling down into the *Aſpera Arteria*.

WADHOOK, among the Gunners, is a Rod or great Wyre of Iron, turn'd in a Serpentine manner; and in its End, is put upon a Handle or Staff, to draw out *Wads* or *Okum*, that the Piece may be unloaded.

WAFT: To waft a Ship, is to convey her ſafe, as Men of War do by Merchants Ships. But to *make a Waft*, is to hang out ſome Coat, Sea-gown, or the like, in the main Shrowds of the Ship, as a Sign for Men to come on Board, *&c.* And often ſuch a *Waft*, is a Sign a Ship is in great Danger by a Leak, *&c.* and therefore wants Help from the Shore, or from ſome other Ship.

WAGONER: See *Charles Wayn.*

WAIFE, or *Weyfe*, is, when a Thief having felonioufly ſtolen Goods, and being nearly followed with *Huy and Cry*, or elſe overcharged with the Burden or Trouble of the Goods; for his own Eaſe, and more ſpeedy Flight, flies away and leaves the Goods behind him; then the King's Officer, or the Bailiff of the Lord of the Mannor, (within whoſe Juriſdiction they be left) who by Preſcription or Grant from the King, hath the Franchiſe of *Waife*, may ſeize the Goods ſo wav'd to his Lord's Uſe, except the Owner come with freſh Suit after the Felon, and ſue an Appeal within a Year and a Day, or give Evidence againſt him at his Arraignment, *&c.* In which Caſes, the firſt Owner ſhall have Reſtitution of his Goods ſo ſtolen and *waived*. *Waifes* alſo ſignifie Things loſt, and Eſtrays, which muſt by the Lord of the Franchiſe where they are found, be cauſed to be Cried and Publiſhed in Markets and Churches near about, elſe the Year and Day does not run to the Prejudice of the Loſer.

WAIVE, is a Woman that is Outlaw'd; and ſhe is called *Waive*, as forſaken of the Law, and not an *Outlaw*, as a Man is; for Women are not Sworn in Leets to the King, nor to the Law, as Men are, who therefore are within the Law; whereas Women are not, and for that Cauſe they cannot be *Outlawed*, ſince they never were within it.

WAKE of a Ship, is the ſmooth Water that runs from a Ship's Stern, when ſhe is under Sail. This is alſo called her Wake; and by it a good Gueſs may be made of the *Speed* ſhe makes. And particularly, they judge from this *Wake*, whether a Ship *go as ſhe looks*, (as they expect it) *i. e.* whether ſhe makes her Way right as her Head lies, as ſhe doth, when her *Wake is right a-Stern*: But if this *Wake* be a Point or two to Leeward, they judge that ſhe ſlides and falls to the *Leeward* of her Courſe.

They ſay alſo, when a Ship *ſtays a Weather of Wake*; that is, when in her Staying, ſhe is ſo quick, that ſhe don't fall to Leeward upon a Tack, but that when ſhe is tack'd, her *Wake* is to Leeward; then 'tis a Sign that ſhe feels her Helm very well, and is nimble of Steerage.

Alſo, when one Ship giving Chaſe to another, is got as far into the Wind as ſhe, and ſails directly after her, they ſay, *She is got into her Wake.*

WALE, or *Wail*; a Term at Sea for thoſe outmoſt Timbers in Ship's Side, on which Men ſet their Feet when they clamber up a Ship's Side. Theſe are reckoned from the Water, and called her 1ſt, 2d, or 3d *Wale* or *Bend.*

WALE-*Knot*, is a round Knot or Knob made with three Strands of a Rope, ſo that it cannot ſlip, by which (in a Ship) the *Tacks*, *Top-ſail Sheets*, and *Stoppers* are made faſt: As alſo, ſome other Ropes.

WALE-*Reared*; ſo the Seamen call a Ship, when after ſhe comes to her Bearing, ſhe is not narrow in her upper Work, nor *houſed in*, as their Word is, but is built ſtreight up. Which Way of Building, tho' it don't look well, nor is, as they ſay, *Ship-ſhaken*, yet it hath this Advantage, That a Ship is thereby more *Roomy* within-board; that is, ſhe is larger within, and alſo becomes thereby a *Holſom Ship in the Sea*, eſpecially if her Bearing be well laid out.

WALT; a Ship is *Walt*, when ſhe hath not her due Ballaſt, *i. e.* not enough to enable her to bear her Sails.

WALVIARIA *Mulieris*, a Term in Law, ſignifying as much as *Utlagatio Viri*, or the Outlawing of a Man: See *Utlagation.*

WAPP, is that Rope in a Ship wherewith the Shrowds are ſet taught with Wale-knots; one End is made faſt to the Shrowds, and to the other are brought the Laniards.

WARD, is a Word that has divers Significations; as a *Ward* in *London*, is a Portion of the City committed to the ſpecial Charge of one of the Aldermen of the City. Alſo, a Foreſt is divided into *Wards.* And a Priſon is called a *Ward.* As alſo, the Heir of the King's Tenant, that held by Knight's Service, or in *Capite*, was called a *Ward* during his Nonage. But this laſt is taken away by the *Stat.* 12. *Car.* 2. *cap.* 24.

WARDEN, being the ſame with Guardian, but is commonly uſed for him that hath the Cuſtody and Charge of any Perſon or Thing, by Office.

WARNING-*Wheel*, in a Clock, is the *Third* or *Fourth Wheel*, (according to its Diſtance from the *Firſt Wheel.*)

WARP; to *warp* a Ship, is to hale her up by a Hawſer, or any other Rope, (ſufficient for that purpoſe) with an Anchor bent to it. It's uſed when a Wind is wanting to carry her into, or out of a Harbour; and this is termed Warping; and the Hawſer, or any Rope ſufficient, and uſed to hale her up, is called a Warp.

WARRANT *of Attorney*, is that whereby a Man appoints another to do ſomething in his Name, and warranteth his Action. It ſeems to differ from a *Letter of Attorney*, which paſſeth uſually under the Hand and Seal of him that makes it before any creditable Witneſſes; whereas a *Warrant of Attorney*, in Perſonal, Mixt, and ſome Real Actions, is put in of courſe by the Attornies, for the Plaintiffs or Demandants, Tenants or Defendants. But a *Warrant of Attorney* to ſuffer a Common Recovery by the Tenant or Vouchee, is acknowledged before ſuch Perſons, as a Commiſſion for the doing thereof directs.

WARRANTIA *Chartæ*, is a Writ that lies for him, who being infeoff'd in Lands or Tenements with a Clauſe of Warranty, and is impleaded in an *Aſſize*, or *Writ of Entry*, wherein he cannot Vouch or Call to *Warranty*: For in this Caſe his Remedy is to take out this Writ againſt the Feoffer or his Heirs.

WARRANTIA *Diei*, is a Writ lying in Caſe where a Man having a Day aſſign'd Perſonally to appear in Court to any Action wherein he is Sued, is in the mean Time, by Commandment, employ'd in the King's Service, ſo that he cannot come at the Day aſſign'd; this Writ is directed to the Juſtices, to the End that they may neither take, nor record him in Default for that Day.

WARRANTY, is a Promiſe or Covenant by Deed made by the Bargainer, for himſelf and his Heirs, to *warrant* or ſecure the Bargainee and his Heirs, againſt all Men, for the enjoying any thing agreed on between them, and this *Warranty* paſſeth from the Seller to the Buyer, from the Feoffer to the Feoffee, from him that releaſeth, to him that is releaſed from an Action real, and ſuch like. *Warranty*, is either *real* or *perſonal*: *Real*, when it is annexed to Lands or Tenements granted for Life, *&c.* And this is either in *Deed*, or in *Law*: *Perſonal*, which either reſpects the Property of the Thing ſold, or the Quality of it. *Real Warranty*, in reſpect of the Eſtate, is either *Lineal*, *Collateral*, or *commencing by Diſſeiſin*; of which *Littleton* gives an Account in the laſt Chapter of his Tenure.

WASTE *Boards*, are Boards ſometimes ſet upon the Sides of a Boat, to keep the Sea from breaking into her.

WASTE-*Cloths*, are Cloths hung up on the uppermoſt Work of a Ship's Hull, to ſhadow the Men from an Enemy in the *Fight*; and therefore by ſome they are called *Fights*.

WASTE-*Trees*, are thoſe Timbers of a Ship which lie in the Waſte.

WASTE of a Ship, is that Part of her between the two Maſts, *i. e.* between the *Main-maſt* and the *Fore-maſt*.

WASTE, in Law, hath divers Significations.

Firſt, It is a Spoil, made either in Houſes, Woods, Lands, *&c.* by the Tenant for Life, or Years to the Prejudice of the Heir, or of him in Reverſion or Remainder; whereupon the *Writ of Waſte* is brought for the Recovery of the Thing waſted, and treble Damages.

Waſte of the Foreſt, is moſt properly where a Man cuts down his own Woods within the Foreſt, without Licence of the King, or Lord-Chief-Juſtice in *Eyre*.

Secondly, *Waſte* is taken for thoſe Lands, which are not in any Man's Occupation, but lie common; which ſeem to be ſo called, becauſe the Lord cannot make ſuch Profit of them, as of his other Lands, by reaſon of that Uſe which others have of it, in paſſing to and fro: Upon this none may build, cut down Trees, dig, *&c.* without the Lord's Licence.

WATCH, at Sea, ſignifies the Space of 4 Hours, becauſe half the Company or Crew *watch* and do Duty in their Turns, ſo long at a Time. All a Ship's Company is divided into two Parts, the *Larboard* and the *Starboard* Watch. The *Maſter* of the Ship Commands the latter, and the *Chief Mate* the former. Sometimes, when a Ship is in Harbour, they watch but a *Quarter-watch*, as they call it; that is, but a quarter of the Company watch at a Time; becauſe they have then but little to do, or look after.

WATCH *Glaſs*, being four Hours, is uſed at Sea, to ſhift or change their Watches. There are alſo *Half-watches*, *Hour-glaſſes*, *Minute*, and *half Minute-glaſſes*; by which laſt, they count the Knots when they leave the Log, in order to find the Ship's Way.

WATCH-*work*, is the internal Parts of any Movement or Watch, which is deſigned to ſhew the Hour, or any other Diviſion of Time without Striking; for whatever is contrived to produce that Effect, is called *Clock-work*; and that Part of the Movement is called the *Striking-part*.

The general Rules for the Calculation of *Watch-work*, are reducible to theſe Heads.

1. 'Tis certain that the ſame Motion may be perform'd either with one Wheel and one Pinion, or by many Wheels and many Pinions, provided that the Number of Turns of all thoſe Wheels bear the Proportion to all thoſe Pinions, which that one Wheel bears to its Pinion; or (which is the ſame thing) that the Number produced by multiplying all the Wheels together, be to the Number produced by multiplying all the Pinions together, as that one Wheel is to that one Pinion.

Thus, ſuppoſe you had Uſe for a Wheel of 1440 Teeth, with a Pinion of 28 Leaves, you may make it into three Wheels and Pinions, *viz.*

4) 36, 7) 8, 1) 5.

For if the three Wheels 36, 8 and 5, be multipy'd together, 'twill give 1440 for the Wheels, and if the 3 Pinions 4, 7 and 1, be alſo multiplied together, you'll have 28 for the Pinions.

It matters not in what Order the Wheels and Pinions are ſet, or which Pinion runs in which Wheel; only for Contrivance ſake, the biggeſt Numbers are commonly ſet to drive the reſt.

2. Two Wheels and Pinions of different Numbers may perform the ſame Motion. As a Wheel of 36 drives a Pinion of 4, all one as a Wheel of 45 drives a Pinion of 5; or a Wheel of 90 drives a Pinion of 10. The Turns of each are 9.

3. If in breaking your Train into Parcels, any of your Quotients ſhould not pleaſe you; or if you would alter any other two Numbers which are to be multiplied together, you may vary them by this Rule. Divide your two Numbers by any two other Numbers which will meaſure them; then multiply the Quotients by the alternate Diviſors; the Product of theſe two laſt Numbers found, ſhall be equal to the Product of the two Numbers firſt given.

Thus, if you would vary 36 times 8, divide theſe by any two Numbers that will evenly meaſure them; as 36 by 4, it gives 9; and 8 by 1, it gives 8; now (by the Rule) 9 times 1 is 9, and 8 times 4 is 32: (See the Operation.)

9 8
36 × 8
4 1

32 × 9

So that for 36 × 8, you have 32 × 9, which is equal to it, and each equal to 288.

And if you Divide 36 by 6, and 8 by 2, then Multiply, as before is ſaid, you'll have 24 × 12 = 36 × 8 = 288.

6 4
36 × 8
6 2

24 × 12

4. If it happens that you have a Wheel and Pinion fall out with croſs Numbers, too big to be cut in Wheels, and yet not to be altered by the former Rules; then in ſeeking for your Pinion of Report, you may find out two Numbers of the ſame, or a near Proportion, by this Rule, *viz.* As either of the two given Numbers Is to the other : : So is 360 To a fourth. Divide that fourth Number, as alſo 360 by 4, 5. 6, 8, 9, 10, 12, 15, (each of which Numbers doth exactly meaſure 360) or by any one of thoſe Numbers that bringeth a Quotient neareſt to an Integer.

As ſuppoſe you had theſe two Numbers, 147 the Wheel, and 170 the Pinion, which are too great to be cut into ſmall Wheels, and yet cannot be reduced into leſs, becauſe they have no other common Meaſure, but Unity; Say therefore, As 170 : 147 : : 360 : 311. Or as 147 : 170 : : 360 : 416. Divide the 4th Number, and 360 by one of the foregoing Numbers; as 311 and 360 by 6, it gives 52 and 60; Divide them by 8, you will have 39 and 45. Alſo, if you Divide 360 and 416 by 8, you'll have 45 and 52 exactly. Wherefore inſtead of the two Numbers 147 and 170, you may take 52 and 60, or 39 and 45, or 45 and 52, *&c.*

6) 311 (52
360 (60
8) 311 (39
360 (45

5. When you come to Practice in Calculating a Piece of *Watch-work*, the firſt thing you are to do, is, to pitch upon your Train or Beats of the Ballance in an Hour; as whether a ſwift Train, of about 20000 Beats, (which is the uſual Train of a common 30 Hour Pocket-watch) or a ſlower Train of about 16000, (the Train of the new Pendulum Pocket-watches) or any other Train.

Having choſen your Train, then reſolve upon the Number of Turns you intend your Fuſy ſhall have, and upon the Number of Hours you would have your Piece to go: As ſuppoſe 12 Turns, and to go 30 Hours, or 192 Hours (*i. e.* eight Days,) *&c.*

Then proceed to find out the Beats of the Ballance or Pendulum in one Turn of the Fuſy, by the Direction given under the Word *Beat*, thus in Numbers, 12 : 16 : : 20000 : 26666. Wherefore, 26666 are the Beats in one Turn of the Fuſy or great Wheel, and are equal to the Quotients of all the Wheels unto the Ballance multiplied together: But now this Number is to be broken into a convenient Parcel of Quotients; which is to be done thus:

Firſt, halve your Number of Beats, *viz.* 26666, and you'll have 13333; then pitch upon the Number of your Crown-wheel, as ſuppoſe 17. Divide 13333 by 17, and you'll have 784 for the Quotients (or Turns) of the reſt of the Wheels and Pinions; which being too big for one or two Quotients, may be beſt broken into three; chuſe therefore three Numbers, which when multiplied all together continually, will come neareſt 784. As ſuppoſe 10, 9 and 9, multiplied continually, gives 810, which is ſomewhat too much; therefore try again other Numbers, 11, 9 and 8; theſe drawn one into another continually produce 792, which is as near as can be, and convenient Quotients.

Having thus contrived your Piece from the great Wheel to the Ballance; but the Numbers not falling out exactly, according as you at firſt propoſed, you muſt correct your Work thus:

Firſt, (by the Direction given under the Word *Beats*) Multiply 792, (the Product of all the Quotients pitched upon) by 17, the Notches of the Crown-wheel, the Product is 13464. which is half the Number of Beats in one Turn of the Fuſy; then (by a Rule given under the Word *Beat*) find the true Number of Beats in an Hour.

Thus, 16 : 12 : : 13464 : 10098, which is half the Beats in an Hour.

Then find what Quotient is to be laid upon the *Pinion of Report* (by the Rule given under that Word.)

Thus, 16 : 12 : : 12 : 9, the Quotient of the *Pinion of Report.*

Now having found your Quotients, 'tis eaſie to determine what Numbers your Pinions ſhall have; for chuſe what Numbers your Wheels ſhall have, and multiply the Pinion by their Quotients, and that produceth the Number for your Wheels, as you ſee in the Margin. Thus the Number of you *Pinion of Report* is 4, and its Quotient 9, therefore the Number for the Dial-wheel muſt be 4 × 9 or 36; ſo the next Pinion being 5, its Quotient 11, therefore the great Wheel muſt be 5 × 11 = 55, and ſo of the reſt.

4) 36 (9
5) 55 (11
5) 45 (9
5) 40 (8
17

Thus you have the common and practical Method of Calculating the Numbers of a 16 Hour Watch.

And this Watch may be made to go a longer Time by leſſening the Train, and altering the Pinion of Report.

As ſuppoſe you could conveniently ſlacken the Train to 16000, then by the Rule given under the Word *Beat*, ſay, As ½ 16000, or 8000 : 13464 : : 12 : 20. So that this Watch will go 20 Hours.

Then for the Pinion of Report, ſay, (by the Rule given under that Word) As 20 : 12 : : 12 : 7. So that 7 is the Quotient of the Pinion of Report.

And as to the Numbers, the Operation is the ſame as before, only the Dial-wheel is but 28, for its Quotient is altered to 7.

But if you would give Numbers to a Watch of about 10000 Beats in an Hour, to have 12 Turns of the Fuſy, to go 170 Hours, and 17 Notches in the Crown-wheel.

4) 28 (7
5) 55 (11
5) 45 (9
5) 48 (8
17

The

The Work is the ſame in a manner, as in the laſt Example, and conſequently thus:

As 12 : 170 :: 10000 : 141666, which fourth Number are the Beats in one Turn of the Fuſy; Its half 70833 being divided by 17, gives 1467 for the Quotients. And becauſe this Number is too big for three Quotients, therefore chuſe four, as 10, 8, 8, $6\frac{3}{5}$, whoſe Product into 17 maketh 71808, nearly equal to half the true Beats in one Turn of the Fuſy.

Then ſay, as 170 : 12 :: 71808 : 5069, which is half the true Train of your Watch.

And ſay again, 170 : 12 :: 12 : $\frac{144}{170}$, (or 170) 144, which expreſſes the Pinion of Report, and the Number of the Dial-wheel.

But theſe Numbers being too big to be cut in ſmall Wheels, therefore they muſt be varied by the fourth Rule of this, ſaying,

As 144 : 170 :: 360 : 425.
Or 170 : 144 :: 360 : 305.

Then dividing 360, and either of theſe two fourth Proportionals, (as directed by the Rule) ſuppoſe by 15, you'll have $\frac{24}{28}$ or $\frac{20}{24}$; then the Numbers of the whole Movement will ſtand thus:

24) 20 ($\frac{20}{24}$

6) 60 (10
6) 48 (8
5) 40 (8
5) 33 ($6\frac{3}{5}$

17

Thus much may ſerve concerning the Calculation of ordinary Watches, to ſhew the Hour of the Day: But in ſuch as ſhew Minutes and Seconds, the Proceſs is thus:

Firſt, having reſolved upon your Beats in an Hour, then by dividing your deſigned Train by 60, find the Beats in a Minute; and accordingly, find out ſuch proper Numbers for your Crown-wheel and Quotients, as that the Minute-wheel ſhall go round once in an Hour, and the Second-wheel once a Minute.

As ſuppoſe you ſhould chuſe a Pendulum of ſix Inches to go 8 Days, with 16 Turns of the Fuſy; a Pendulum of 6 Inches (by Mr. *Smith*'s Tables in *Horal. Diſq.*) vibrates 9368 in an Hour; and conſequently, dividing it by 60, gives 156, the Beats in a Minute. Half theſe Sums are 4684 and 78. Now the firſt Work is to break this 78 into good Proportion; which will fall into one Quotient, and the Crown-wheel. Let the Crown-wheel have 15 Notches; then 78 divided by 15, gives 5; ſo a Crown-wheel of 15, and a Wheel and Pinion, whoſe Quotient is 5, will go round in a Minute, to carry a Hand to ſhew *Seconds*. Next for a Hand to go round in an Hour, to ſhew Minutes. And becauſe there are 60 Minutes in an Hour, 'tis but breaking 60 into good Quotients (as ſuppoſe 10 and 6, or 8 and 7, or *&c.*) and 'tis done.

8) 40 (5
15

8) 64 (8
8) 60 ($7\frac{1}{2}$
8) 40 (5
15

Thus 4684 is broken, as near as can be, into proper Numbers.

But ſince it don't fall out exactly into the above-mentioned Numbers, you muſt correct (as you were directed before) and find out the true Number of Beats in an Hour, by multiplying 15 by 5, which makes 75; and 75 by 60, makes 4500, which is the half of the true Train. Then find the Beats in one Turn of the Fuſy, thus, 16 : 192 :: 4500 : 54000; which laſt are half the Beats in one Turn of the Fuſy. This 54000 being divided by 4500, (which are the true Numbers already pitched upon) the Quotient will be 12, which being not too big for one ſingle Quotient, needs not be divided into more, and the Work will ſtand thus:

9) 108 (12
8) 64 (8
8) 60 ($7\frac{1}{2}$
8) 40 (5
15

As to the Hour-hand, the great Wheel which performs only one Revolution in 12 Turns of the Minute-wheel, will ſhew the Hour; or you may order it to be done by the Minute-wheel.

For the Calculation of the Striking Part of any Clock, obſerve theſe Directions.

1. Conſider that here you need have regard only to the *Count-wheel*, *Striking-wheel*, and *Detent-wheel*, which move round in this Proportion.

The *Count wheel*, commonly goes round once in 12 or 24 Hours: The *Detent-wheel* moves round every Stroke the Clock ſtriketh, or ſometimes but once in two Strokes; wherefore it follows, That,

2. As many Pins as are in the Pin-wheel, ſo many Turns hath the Detent-wheel in one Turn of the Pin-wheel; or (which is the ſame) the Pins of the Pin-wheel, are the Quotient of that Wheel, divided by the Pinion of the Detent-wheel. But if the Detent-wheel moveth but once round in two Strokes of the Clock, then the ſaid Quotient is but half the Number of Pins.

3. As many Turns of the Pin-wheel as are required to perform the Strokes of 12 Hours, (which are 78) ſo many Turns muſt the Pinion of Report have, to turn round the Count-wheel once: Or thus, the Quotient of 78 divided by the Number of Striking-pins, ſhall be the Quotient for the Pinion of Report, and the Count-wheel; and this is in caſe the Pinion of Report be fixed to the Arbor of the Pin-wheel, as is commonly done. This Example will make all plain: The Locking-wheel being 48, the Pinion of Report 8, the Pin-wheel 78, the Striking-pins are 13, and ſo of the reſt. Note alſo, That 78 divided by 13, gives 6, the Quotient of the Pinion of Report.

8) 48 (6

6) 78 (13
6) 60 (10
6) 48 (8

As for the *Warning-wheel* and *Flying-wheel*, it matters little what Number they have, their Uſe being only to bridle the Rapidity of the Motion of the other Wheels.

4. The following Rules will alſo be of great Uſe in this kind of Calculation; and by their Help theſe Problems may readily be reſolved.

1. *To find how many Strokes the Clock ſtriketh in one Turn of the Fuſy or Barrel.*

As the Number of Turns of the Great-wheel, or Fuſy, Is to the Days of the Clock's continuance : : So is the Number of Strokes in 24 Hours, *viz.* 156,

To

to the Strokes in one Turn of the Fuſy or Great-wheel.

2. *To find how many Days the Clock will go.*

As the Number of Strokes in 24 Hours, *viz.* 156, Is to the Strokes in one Turn of the Fuſy : : So is the Turns of the Fuſy or Great-wheel, To the Days of the Clock's Continuance or Going.

3. *To find the Number of Turns of the Fuſy or Barrel.*

As the Strokes in one Turn of the Fuſy, Is to the Strokes in 24 Hours, *viz.* 156 : : So is the Clock's Continuance, To the Number of Turns of the Fuſy or Great-wheel.

4. *To fit the Pinion of Report on the Spindle of the Great-wheel.*

As the Number of Strokes in the Clock's Continuance, or in all its Turns of the Fuſy, to the Turns of the Fuſy : : So are the Strokes in 12 Hours, which are 78, To the Quotient of the Pinion of Report, fixed upon the Arbor of the Great-wheel.

5. *To fix the Pinion of Report to any Wheel.*

Divide 78 by the Number of Strokes in one Turn of the Wheel you intend to fix your Pinion of Report upon, and your Quotient ſhall be that of the Pinion of Report.

6. *To find the Strokes in the Clock's Continuance*, viz.

As 12 : Is to 78 : : So are the Hours of the Clock's Continuance : To the Number of Strokes in that Time.

Or thus rather ; Multiply the Strokes in one Turn of the Great-wheel by the Number of Turns of the Fuſy, the Product are the Strokes in the Clock's Continuance.

The Uſe of theſe Rules appears plain by the following Examples.

1. In ſmall Pieces ; having pitched upon the Number of Turns, and the Continuance of your Clock, find (by *Rule* 6.) the Strokes in its Continuance ; then (if you make the Great-wheel the Pinion-wheel) divide theſe Strokes by the Number of Turns, and you have the Number of Striking-pins ; Or divide by the Number of Pins, and you have the Number of Turns.

Thus a Clock of 30 Hours, with 15 Turns of the Great-wheel, hath 195 Strokes.

For (by *Rule* 6.) 12 : 78 : : 30 : 195.

Dividing { 15 } 195 { 13, the Striking-pin.
by { 13 } 195 { 15, the Number of Turns.

2. In Calculating the Numbers of a Clock of much longer Continuance, you muſt make your Pin-wheel further diſtant from the Great-wheel : And having pitched upon your Turns, find out the Number of Strokes in one Turn of the Great-wheel or Fuſy, (by *Rule* 1.) Thus in an 8 Day Piece of 16 Turns, As 16 : 8 : : 156 : 78. Alſo, in a Piece of 32 Days and 16 Turns, 16 : 32 : : 156 : 312.

Theſe Strokes thus found, are the Number which is to be broken into a convenient Parcel of Quotients, thus :

Firſt, reſolve upon the Number of your Striking-pins, by which divide the laſt mentioned Number, the Quotient ariſing ſhall be one or more Quotients for the Wheels and Pinions. Thus in the Month-piece, if you take your Pins 8, divide 312 by it, the Quotient is 39 ; but that being too big for one muſt be cut into two Quotients for Wheels and Pinions, or as near as poſſible, which are either 7 and 5, or $6\frac{1}{2}$, and 6, which laſt is equal to 39, and therefore may ſtand, and 'twill be thus :

10) 65 ($6\frac{1}{2}$
8) 48 (6
6) 48 (8 Pins.

The Quotient being thus determined, and accordingly the Wheels and Pinions ; then find a Quotient for the Pinion of Report, to carry round the Count-wheel once in 12 Hours, or as you pleaſe. If you fix your Pinion of Report on the Great-wheel Arbor, you muſt work by the fourth *Rule*.

Thus in the laſt Example, the Strokes in the Continuance are 4992 (by *Rule* 6.) then (by *Rule* 4.) as 4992 : 16 : : 78 : $\frac{4992}{1248}$, or 4992) 1248, which is the Pinion and the Wheel.

But theſe Numbers being not the uſual Numbers of a Month-piece, but only made uſe of here for Illuſtration ſake ; and in Practice they commonly increaſe the Number of Strikings, and ſo make the Second-wheel the Striking-wheel. Suppoſe you take 24 Pins, divide 312 by it, and the Quotient is 13, which is little enough for one Quotient, and may therefore ſtand thus :

8) 104 (13
6) 72 (12, 24 Pins ;

Where the Quotient of the Firſt-wheel is 13. In the Second-wheel of 72 Teeth, are the 24 Pins, altho' its Quotient is but 12, becauſe the Hoop-wheel is double, and goes round but once in two Strokes of the Pin-wheel. In this the Pinion of Report is the ſame with the laſt, if fixed upon the Arbor of the Great-wheel. But if fixed on the Arbor of the Second or Pin-wheel, its Quotient is found by *Rule* 5, *viz.* 78 divided by 24, gives the Quotient of the Pinion of Report $3\frac{1}{4}$, thus 12) 39 ($3\frac{1}{4}$ The Pinion of Report being then 12, the Count-wheel will be 39.

The Calculation of a Year-piece is the ſame ; however, to perfect the Reader therein, we ſhall give this Example.

Suppoſe your Piece were to go 395 Days with 16 Turns, and 26 Striking-pins. There are 3851 Strokes in one Turn of the Great-wheel (by the *Rule* 1.) for 16 : 395 : : 156 : 3851. And 3851 divided by 26, leaves 148 to be broken into Quotients, for Wheels and Pinions, which may be 12 and 12 ; for 12 into 12, gives 144, which is as near as it can well be to 148 ; then the Work ſtands thus :

10) 120

10) 120 (12
8) 96 (12
78 (26 Pins.

In this Place, it would not be amiſs for you to correct your Work, and ſee how near your Number comes to what you deſigned at firſt, becauſe they did not fall out exact.

Firſt, for the true Continuance of your Clock, *Multiply the Quotients and Striking-pins together, and you'll have the true Number of Strokes in one Turn of the Great-wheel.* So here, 12 x 12 x 26 = 3744, which is the true Number of Strokes; then the true Continuance (by *Rule* 2) is 384, for

As 156 : 3744 :: 16 : 384

If this Continuance doth not pleaſe you, you may come nearer to your firſt propoſed Number of 395 Days by a ſmall Encreaſe of the Number of Turns, (by *Rule* 3) *viz.* making your Turns almoſt 16 ½; for,

As 3744 : 156 :: 395 : 16 ½ near.

But for the Pinion of Report, if you fix it on the Great-wheel, it will require an exceſſive Number; if you fix it upon the Pin-wheel, which is uſual, then (by *Rule* 5) it will ſtand thus, 13) 39 (3 the Quotient is 3, the Pinion of Report 13, and the Count-wheel 39.

If to any Clock it be required to fit *Quarters* or *Chimes*, &c. you may proceed thus.

1. You are to conſider, that Quarters are generally a diſtinct Part from the Clock-part, which ſtriketh the Hour; and the *Striking-wheel* may be the Firſt, Second-wheel, *&c.* according to your Clock's Continuance; unto which Wheel you may fix the Pinion of Report.

The *Locking-wheel* muſt be divided into 4, 8, or more unequal Parts, ſo as to ſtrike the Quarter, and lock at the firſt Notch, or the Half Hour, and lock at the ſecond Notch, *&c.* And in doing this you may make it to Chime the Quarters, or ſtrike them upon two Bells, or more.

'Tis uſual for the Pin-wheel or the Locking-wheel to unlock the Hour-part in theſe Clocks; which is eaſily done by ſome Jogg or Latch, at the End of the laſt Quarter, to lift up the Detents of the Hour-parts.

If you would have your Clock ſtrike at the Half Hour, as well as whole Hour, you muſt make the Locking-wheel of the Hour part double; that is, it muſt have two Notches of a ſort, to ſtrike 1, 2, 3, 4, *&c.* twice a-piece.

2. As for *Chimes*, I need ſay nothing of the Lifting-pieces and Detents, to lock and unlock; nor of the Wheels to bridle the Motion of the Barrel; only you are to obſerve, That the Barrel muſt be as long in turning round, as you are in Singing the Tune it is to Play.

As for the *Chime-Barrel*, it may be made up of certain Bars that run a-thwart it, with a convenient Number of Holes punched in them, to put in the Pins that are to draw each Hammer. By this means you may change the Tune, without changing the Barrel. Such is the *Royal-Exchange* Clock in *London*, and others. In this Caſe, the Pins or Nut which draw the Hammers, muſt hang down from the Bar, ſome more, ſome leſs, and ſome ſtanding upright in the Bar; the Reaſon whereof is, to play the Time of the Tune rightly.

For the Diſtance of each of theſe Bars may be a Semibrief, *&c.* of which hereafter.

But the uſual way is, to have the Pins that draw the Hammers, fixed on the Barrel. For the placing of which Pins, you may proceed by the way of Changes on Bells, *viz.* 1, 2, 3, 4 *&c.* Or rather make uſe of the Muſical Notes.

Where you muſt obſerve, what is the Compaſs of your Tune, or how many Notes or Bells there are from the higheſt to the loweſt; and accordingly, the Barrel muſt be divided from End to End.

Thus, in the following Examples, each of thoſe Tunes are 8 Notes in compaſs; and accordingly, the Barrel is divided into 8 Parts. Theſe Diviſions are ſtruck round the Barrel, oppoſite to which are the Hammer-tails.

I ſpeak here, as if there was only one Hammer to each Bell, that you may more clearly apprehend what I am explaining. But when two Notes of the ſame Sound come together in a Tune, there muſt be two Hammers to that Bell, to ſtrike it. So that, if in all the Tunes you intend to Chime, of 8 Notes compaſs, there ſhould happen to be ſuch double Notes on every Bell, inſtead of 8 you muſt have 16 Hammers; and accordingly, you muſt divide your Barrel, and ſtrike 16 Strokes round it, oppoſite to each Hammer-tail.

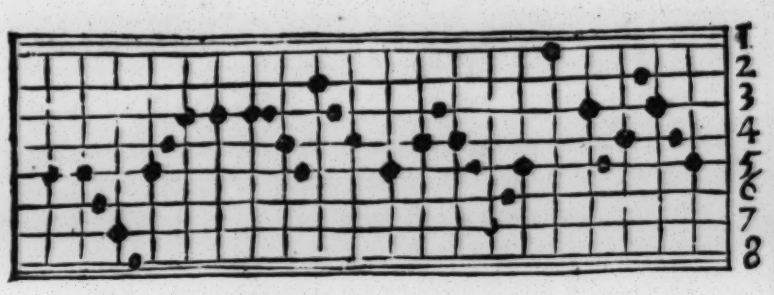
Then you are to divide it round about into as many Diviſions, as there are Muſical Bars, Semibriefs, Minums, *&c.* in your Tune.

Thus the 100th Pſalm-tune hath 20 Semibriefs; and each Diviſion of it is a Semibrief. The firſt Note of it alſo is a Semibrief, and therefore on the Chime-Barrel muſt be a whole Diviſion from 5 to 5, as you may underſtand plainly, if you conceive the Surface of a *Chime-Barrel* to be repreſented by the following Tables, as if the Cylindrical Superficies of the Barrel were ſtretch'd out at length or extended on a Plain. And then ſuch a Table ſo dotted or divided, if it were to be wrapped round the Barrel, would ſhew the Places where all the Pins are to ſtand in the Barrel: For the Dots running about the Table, are the Places of the Pins that play the Tune.

The Notes of the 100 *Pſalm.*

A Table

A Table for Dividing the Chime-Barrel of the 100 *Pſalm.*



If you would have your Chimes compleat indeed, you ought to have a Set of Bells to the Gamut Notes; ſo as that each Bell having the true Sound of *Sol*, *La*, *Mi*, *Fa*, you may play any Tune with its Flats and Sharps; nay, you may by theſe means play both the Baſs and Treble, with one Barrel.

And by ſetting the Names of your Bells at the Head of any Tune, you may eaſily transfer that Tune to your Chime-Barrel, without any Skill in Muſick. But obſerve, That each Line in the Muſick is three Notes diſtant; that is, there is a Note between each Line, as well as upon it.

To Calculate a Piece of Clock-work that ſhall repreſent any of the Celeſtial Motions.

To effect which, you may either make thoſe Motions to depend on the Work already in the Movement, or elſe you may meaſure them by the Beats of a Balance or Pendulum.

If you would proceed the latter way, you muſt however contrive a Piece to go a certain Time, with a certain Number of Turns.

But to determine the Motion intended, you muſt proceed one of theſe two ways; either,

1. Find how many Beats are in the Revolution; divide theſe Beats by the Beats in one Turn of the Wheel or Pinion, which you intend ſhall drive the intended Revolution, and the Quotient ſhall be the Number to perform the ſame; which, if it be too big for one, may be broken into more Quotients. Thus, if you would repreſent the Synodical Revolution of the Moon, (which is 29 Days, 12 $\frac{3}{4}$ Hours) with a Pendulum that ſwings Seconds, the Movement to go 8 Days, with 16 Turns of the Fuſy, and the Great-wheel to drive the Revolution, divide 2551500 (the Beats in 29 Days, 12 $\frac{3}{4}$ Hours) by 4200, (the Beats in one Turn of the Great-wheel) and you'll have 59 in the Quotient; which being too big for one, may be put into two Quotients.

Or,

2. You may proceed as directed before in Calculating a Piece of Watch-work, *viz.* Chuſe your Train, Turns of the Fuſy, Continuance, *&c.* And then, inſtead of finding a Quotient for the Pinion of Report, find a Number, (which is all one as a Pinion of Report) to Specificate your Revolution by this Rule following.

As the Beats in one Turn of the Great-wheel is to the Train; So are the Hours of the Revolution to the Quotient of the Revolution.

Thus, to perform the Revolution of *Saturn*, (which in 29 Years, 183 Days) with a 16 Hour Watch, of 26928 Beats in one Turn of the Fuſy, and 20196 the Train; the Quotient of the Revolution will be 193824. For as 26928 : 20196 :: 258432, (the Hours in 22 Years and 183 Days) To 193824.

Here Note, That the Great-wheel Pinion is to drive the Revolution-work.

But if you would have the Revolution to be driven by the Dyal-wheel, and the Work already in the Movement, then you muſt firſt know the Days of the Revolution. And becauſe the Dyal-wheel commonly goeth round twice in a Day, therefore double the Number of the Days in the Revolution, and you have the Number of Turns of the Dyal-wheel in that Time. This Number of Turns, is what you are to break into a convenient Number of Quotients, for the Wheels and Pinions.

1. *A Motion to ſhew the Day of the Month.*

The Days in the largeſt Month are 31; thoſe doubled are 62, which are the Turns of the Dyal-wheel, which may be broken into theſe two Quotients 15 $\frac{1}{2}$ and 4, whoſe Product is 62; therefore chuſing your Wheels and Pinions (by the former Directions) your Work is done, and will ſtand thus:

4) 62 (15 $\frac{1}{2}$
5) 20 (4

Or if a larger Pinion than one of 5 be neceſſary, by reaſon it is concentrick to a Wheel, you may take 10 for the Pinion, and 40 for the Wheel; then 'twill ſtand thus:

4) 62 (15
10) 40 (4

And the Work will lie thus in the Movement, *viz.* Fix your Pinion 10 concentrical to the Dyal-wheel (or to turn round with it upon the ſame Spindle) This Pinion 10 drives the Wheel 40; which Wheel has the Pinion 4 in its Center, which carrieth about a Ring of 62 Teeth, divided on the upper Side into 31 Parts or Days.

Or, without the Trouble of many Wheels you may effect this Motion, *viz.* By a Ring divided into 30 or 31 Days, and as many Fangs or Teeth, which are caught and puſhed forward once in 24 Hours by a Pin in the Wheel, that goeth round in that Time. This is the uſual way in Royal Pendulums, and many other Watches; and therefore being common, there needs no more be ſaid of it.

2. *A Motion to ſhew the Age of the Moon.*

The *Moon* finiſheth her Courſe in 29 Days and a little above an half. This 29 $\frac{1}{2}$ Days, (not regarding the ſmall Exceſs) makes 59 twelve Hours or Turns of the Dyal-wheel, which is to be broken into convenient Quotients; which may be 5, 9, and 10, as here.

10) 59

10) 59 (59 4) 59 (14 3/4
4) 40 (10 10) 40 (4.

Or 14 3/4 and 4; ſo that if you fix a Pinion of 10 concentrical with your Dial-wheel, to drive a Wheel of 40, which drives a Pinion of 4, which carries about a Ring or Wheel of 59 Teeth once in 29 1/2 Days; which Ring may be alſo be divided into 29 1/2 Parts; or carry an Index to point to a Circle ſo divided.

3. *A Motion to ſhew the Day of the Year, the Sun's Place in the Ecliptick, Sun's Riſing or Setting, or any other Annual Motion of 365 Days.*

The Double of 365, is 730, the Turns of the Dial-wheel in one Year; which may be broken into theſe Quotients, *viz.* 18 1/4 and 10 and 4, thus.

4) 73 (18 1/4
4) 40 (10
5) 20 (4

Or into 18 1/4, 8 and 5 thus,

4) 73 (18 1/4
4) 32 (8
4) 20 (5

So that a Pinion of 5 is to lead a Wheel of 20, which again, by a Pinion of 40; and that by a Pinion of 4, carrieth about a Wheel or Ring of 73 divided into 12 Months, and their Days; or into the 12 Signs, and their Degrees, or into the Sun's Riſing and Setting, *&c.* And for the ſetting on of this laſt, Mr. *Oughtred* has given a Table in his *Opuſcula*.

4. *To ſhew the Tides at any Port.*

This is done without any other trouble, than the *Moon*'s Ring (mentioned in the 2 of this) to move round by a fixed Circle, divided into twice 12 Hours, and numbred the contrary way to the Age of the Moon.

To ſet this to go right, you muſt find out at what Point of the Compaſs the *Moon* makes Full Sea, at the Place you would have your Watch ſerve to: Convert that Point into Hours, allowing for every Point North or South loſt, 45 of an Hour.

Thus at *London-Bridge*, 'tis vulgarly thought to be High-water the *Moon* at North-Eaſt, and South-Weſt, which are four Points from the North or South.

Or thus: By the Tide-Tables, learn how many Hours from the *Moon*'s Southing, 'tis High-water.

Or thus: Find at what Hour it is High-water, at the Full and Change of the *Moon*; as at *London-Bridge*, the full Tide is reckoned to be three Hours from the *Moon*'s Southing, or at 3 of the Clock at the Full and Change. The Day of Conjunction, or *New-Moon*, with a little Stud to point, being ſet to the Hour ſo found, will afterwards point to the Hour of the full Tide.

This is the common way: But this Ring being always in Motion, whereas the Tides are not, a better way perhaps may be found out; as ſuppoſe by cauſing a Wheel or Ring to be moved forward only twice a Day, and to keep Time (as near as can be) with the Accurate Mr. *Flamſteed*'s moſt correct Tables.

5. *To calculate Numbers, to ſhew the Motion of the Planets, the ſlow Motion of the fixed Stars, the Sun's Apogæum, the Revolution of the Dragon's Head and Tail, whereby the Eclipſes of the Sun and Moon are found, the Revolution of the ſeveral Orbs, according to the* Ptolemaick *Syſtem, or of the Celeſtial Bodies themſelves, according to better Syſtems*, &c.

Beſides the Direction already given, there needs only thus much in general; *i. e.* Knowing the Years of any of theſe Revolutions, you may break that Number into Quotients, if you will make the Revolution depend upon the Year's Motion which is already in the Movement, and deſcribed in the 3d of this. Or if you would have it depend upon the Dial-wheel, or upon the Beats of a Pendulum, enough is ſaid before to direct you in this Matter.

In all theſe ſlow Motions, you may ſomewhat ſhorten your Labour by endleſs Screws to ſerve for Pinions, which are but as a Pinion of one Tooth.

An Inſtance of this you have in the Account Sir *Jonas Moore* gives of his large Sphere-going Clock-work, in his *Math. Compendium*, p. 117. where a Motion of 17100 Years is performed by ſix Wheels, being for the Sun's *Apogæum*. His Words are theſe.

" For the Great-wheel fixed is 96, a Spindle-
" wheel of 12 Bars turns round it 8 times in 24
" Hours; that is, in 3 Hours; after theſe, there
" are four Wheels, 20, 73, 24, 75, wrought by
" endleſs Screws, that are in Value but one;
" wherefore 3, 20, 73, 24, and 75, multiplied
" together continually produceth 7884000 Hours,
" which divided by 24, gives 3285000 Days,
" equal to 900 Years. Now on the laſt Wheel,
" 75 is a Pinion of 6, turning a great Wheel that
" carrieth the *Apogæum* Number 114; and 114
" divided by 6, gives 19 the Quotient; and 900
" Times 19, is 17100 Years.

WATER, which the Chymiſts call *Phlegm*, is the 4th of the 5 Chymical Principles, and one of the Paſſive ones. 'Tis never drawn pure and unmix'd, which makes it a little more deterſive than common Water.

This Principle, probably, contributes much to the Growth of Bodies, in that it both renders and keeps the Active Principles fluid. So that they are capable of being convey'd by Circulation into the Pores of the Mix'd; and alſo, becauſe it tempers their exhorbitant Motion, and keeps them together, ſo that they are not ſo eaſily and ſoon diſſipated.

In all ſuch Bodies, whoſe Active Subſtances are joined and united pretty cloſely together, as in common Salt, Tarter, all Plants that are not odoriferous, and in many Animal Bodies this Principle is the firſt that comes in Diſtillation. But when Water is mixed with volatile Salts, or with the Spirit of Wine, or is in any odoriferous Mixts, then the volatile Particles will riſe and come away firſt.

WATER-*Born*, is when a Ship even and juſt with the Ground, firſt begins to float or ſwim, being born up by the Water.

WATER-*Line* of a Ship, is that which diſtinguiſheth that Part of her which is under Water from that above, when ſhe is duly laden.

WATER-*Shot*, is a ſort of Riding at Anchor, when a Ship is *Moored* neither croſs the Tide nor right up and down, but quartered betwixt both.

WATER-*Way*, in a Ship, is a ſmall Piece of Timber lying fore and aft on her Deck, cloſe by her Sides, to prevent the Waters running down there.

WATERY *Humour* of the Eye: See *Aqueous Humours*,

WATERY *Meteors*: See *Meteors*.

WAVED, or *Wavy*, a Term in Heraldry, when a Bordure, or any *Ordinary* or *Charge* in a Coat of Arms hath its Out-lines of this Shape

eaſily riſing and falling like the Waves of the Sea.

WAVES *of the Sea*, or *any Water*. Sir *Iſaac Newton* hath demonſtrated, *Lib.* 2. *Prop.* 45. *Princip. That their Velocity is always in half the Ratio of their Breadth*; and their Breadth is eſtimated to be the Diſtance between the two Summits, or top Edges of any two Waves; or a right Line drawn from the middle of one Hollow, to the middle of the other.

Let there be a Pendulum, whoſe Length from the Point of Suſpenſion to the Center of Oſcillation ſhall be the Breadth of any two Waves; then while the Pendulum makes it Oſcillations, the Waves will paſs over a Diſtance equal to their Breadth.

Hence he concludes, That thoſe Waves whoſe Latitude or Breadth is $3\frac{1}{18}$ Pariſian Feet, will paſs over a Diſtance equal to their Breadth in a Second of Time.

And in the Time of one Minute, theſe Waves will run $183\frac{1}{3}$ Feet, and in the Space of an Hour, 11000 ſuch Feet nearly.

WAY of a Ship, is ſometimes the ſame with the *Rake* or *Run* of her forward or aftward on: But 'tis moſtly uſed as to her Sailing: For when ſhe goes a-pace, they ſay, *She hath a good Way*, or makes a freſh Way. Alſo when they keep an Account how faſt ſhe ſails by the Log; they call it *keeping an Account of her Way*: And becauſe moſt Ships are apt to *fall a little to Leeward* of their true Courſe, they always in caſting up the Log-board, allow ſomething for her *Leeward Way*, or *Lee-way*; which is one Point or more according to her Way of Sailing.

WAY *of the Rounds* in Fortification, is a Space left for the Paſſage of the *Rounds* between the Rampart and the Wall of a Fortify'd Town. But it is not ſo much in uſe, becauſe not having a Parapet above a Foot thick, it may be ſoon overthrown by the Enemies Cannon.

WAYWISER, the ſame with Perambulator; which ſee.

WEAPON-SALVE: See *Armarium*.

WEATHER-COYLE; when a Ship being a Hull, has her Head brought about, ſo as to lie that way which her Stern did before, without looſing of any Sail, but only by the bearing up of the Helm, this is called *Weather-coyling* of her.

WEATHER-GAGE, that Ship is ſaid to have the *Weather-gage* of another, when ſhe is to Windward of her.

WEIGHT *of the Air*: See Air. Mr. *Boyle* calculates, That when the Mercury in the common Barometer, ſtands at 30 Inches, the Weight of the whole Atmoſpherical Column of Air, incumbent on an Inch Square of Space, is 18 Pounds $\frac{1}{8}$ *Troy*, or 15 Pounds $\frac{1}{17}$ *Averdupois*.

WEIGHT *of a Cubick-Inch of ſeveral Bodies.*

Mr. *Boyle* found that the Weight of a Cubick-Inch.

Of Water was 256 Grains.
Of Quickſilver 3580 Grains.

Foreign Weights.

Generally three ſorts of *Weights* are uſed for Merchandize.

1. Weights of great Content; as Hundreds, Kintals, Centeners, Talents, Thouſands, Weighs, Skippounds, *Charges*, Liſpounds, Rooves, *&c.*

2. Weights of leſſer Content; as Pounds, Mina's, Manehs' Rotuli, *&c.*

3. Small Weighrs as Ounces of 12, 14, 16, 18, 20, 30, *&c.* to the Pound, and the Subdiviſions of the Ounce.

Talents of the *Hebrews*, *Greeks*, are ſeen before.

Cantars, Centeners, or Kintals, ſometimes wrote Quintals, accounted by Merchants as Hundreds; are of 100, 112, 120, 125, 128, 132, and 140 Pounds.

Weighs, or Weys, are commonly 165 Pound, or 180 Pound, or 200 Pound and ½ for a Charge. Skippounds, uſed in many Places, *quaſi Shippound*, or *Shippond*; for as in *Italy*, and other Countries, the *Carga*, *Cargo*, or *Charge*, is the Loading of an

Horſe of 300 or 400 Pound: So is the Skippound taken for the Dividend of a Laſt of Corn laden in a Ship. Skippounds are of 300, 320, 340, and 400 Pound to the Skippound. *Cargo* is often taken for the whole Lading or Burthen of a Ship.

Liſpounds, of 15, 16, and ſometimes 20 Pound to the Liſpound.

Rooves, or Arrobas of 10, 20, 25, 30, and 40 Pound to the Roove.

Stone of 6, 8, 14, 16, 18, 20, 21, 24, 32, and 40 Pound to ſome Stones.

Poade of *Ruſſia*, by *Heylin* is 40 Pound.

Mixias, is commonly underſtood to be 10000 Drachms, of 8 to an Ounce, and 12 Ounces to a Pound.

Seſtertia's of *Cleopatra* in *Egypt*, and other Places in *Africa*, were two Pounds $\frac{1}{2}$, for 50 Seſtertia's make 125 Pound, but in *Thracia* it was but 2 $\frac{1}{2}$ of a Pound.

Pound is divided into more or leſs Ounces.

Mark Weight, commonly 8 Ounces.

Mark Pound 16 Ounces, that is 2 Marks.

Mina Ptolemaica, 1 $\frac{1}{2}$ *Rotuli*, or 18 Ounces, or 144 Drachms, and in leſſer Diviſions thus:

	Rotuli.	*Ounces.*	*Drachms.*	*Scruples.*	*Oboli.*	*Lupines.*	*Siliqua's,* or *Carrats.*	*Aereoli.*
Mina.	1 $\frac{1}{2}$	18	144	432	864	1296	2592	6912
Rotulus.		12	96	288	576	864	1728	4608

Drachm.				3	6	9	18	48
Scruple.					2	3	6	16
Obolus.						1 $\frac{1}{2}$	3	8
Lupine.							2	5 $\frac{1}{3}$
Siliqua, or *Carrat.*								2 $\frac{1}{2}$

Mane, or Maneh, in *Arabia*, double one of 16 Ounces, and one of 20 Ounces.

That called *Alialica*, *Baſaria*, *Alanthalica*, and *Ægyptia*.

This *Romana*, and is indeed of *Alexandria*, the Pound there being 20 Ounces.

Rotulus in *Arabia*, *Syria*, *Aſia Minor*, *Ægypt*, and *Venice*, reckoned for a Pound, is thus divided.

	Sachoſi, or *Ounces.*	*Sextaries,* or *Cicles.*	*Deniers,* or *Aureos.*	*Darching,* or *Drachms.*	*Scruples,* or *Garma.*	*Obolos,* or *Orloffs.*	*Danings,* or *Lupines.*	*Kirats,* or *Siliqua's.*	*Aereolus,* or *Keſtuffs.*
Rotulus, or *Pound.*	12	24	84	96	288	576	864	1728	3456
Sacros, Sachos, or *Ounce,*	2	7		8	24	48	72	144	288
Sextary. or *Cicle.*	3 $\frac{1}{2}$			4	12	24	36	72	144
Denier, or *Aureus, Aunius, Andanakus.*	1 $\frac{1}{7}$	3 $\frac{3}{7}$		6 $\frac{6}{7}$	10 $\frac{2}{7}$	20 $\frac{4}{7}$	41 $\frac{1}{7}$		
Drachm, or *Darching Alky, Oliginat,*	3	6	9		18	36			
Scruple, Garme, or *Kenmer.*	2	3	6	12					
Obolus, Orloff, or *Onolaffat, Onolum.*	1 $\frac{1}{2}$	3	6						
Daning, or *Danic Lupine.*	2	4							
Carrat, Kirat, or *Siliqua.*	2								

Some

Some mention the Phyſick Pound at *Venice* to have but 7 Drachms in the Ounce.

The Lupines at *Venice*, called *Sextula's*, becauſe 1 Ounce hath 72, which is 6 times 12.

Every Keſtuff, or Aereolum (or Areolum) is the Weight of 2 Barly-Corns, ſo is there in the Rotulus 6912 Grains.

The *Alexandrian* Pound 20 Ounces, the Ounce 8 Scruples.

The *Italian* Pound generally is divided into 12 Ounces, 1 Ounce into 2 Staters, and 1 Stater into 4 Drachms; ſo hath 1 Pound 24 Staters, 96 Drachms.

But in Phyſick, there and in other Places, thus.

Pound Weights of France.

The Weight us'd by the Merchants for the moſt part, is of 16 Ounces, called *Livre d' Anvers*, tho' in ſome Places but 14, others 18 Ounces. *Cotgrave* writes the *Liure*, or *Bund de Lyon*, to be 15 Ounces, that *de Spaigne* but 14 Ounces, and divides the Pound of 16 Ounces, into 30 Halfs, 64 Sezaines, 128 Treſeaun, 256 Groſs, 512 Demigroſs. And the Pound uſed by the *Farriers*, conſiſting of 12 Ounces into 90 Drams, 270 Scruples, 540 Oboles.

After *Malines*, the Ordinary, or Pound commonly uſed for Merchants, is parted thus.

The Pound Weight of Paris.

In the *Low-Countries* they uſe Pounds of 12, 14, 15, *&c.* Ounces.

At *Bruges* in *Flanders*, they have 1 Pound of 14 Ounces, and 1 Pound of 16 Ounces; the 100 Pound of 16 Ounces makes 108 Pound of 14 Ounces; but the Ounces of 14 to the Pound are the heavieſt, for 100 of theſe are 105 $\frac{1}{2}$ Ounces of 6 to the Pound; this Pound is thus divided.

					II

a. The *Mina* of 100 Drachms is called *Solon's Mina*, becauſe thought to be continued by him ſometime turned into *Latin* by *Mina*, often by *Libra*, tho' *Libra* be 4 Drachms lighter, the *Roman Libra* being but 96 *Attick* Drachms. The old *Mina* of 75 Drachms, now obſolete, for Memory ſake, hath found Room in this Table.

aa. The Phyſicians, as by *Dioſcordes* and *Galen* appears, uſed a *Mina*, or Pound of 16 Ounces, and a *Litra* or other Pound of 12 Ounces, conceived all one with the *Roman Libra*, conſiſting of 96 Drachms, as they did; and by Interpreters commonly rendred *Libra*, and ſeldom or never *Mina*; and *Mina*, and *Litra*, as alſo *Libra* commonly engliſhed a Pound.

aaa. The *Hippiatricks* had a *Mina* of 15 Ounces and a *Litera* of 12.

b. Oungia, in *Latin Uncia*, muſt not be taken for our Ounce, but for one of their Ounces, ariſing by the Diviſion of their Pound into Drachms differently, according to the Quantity of Drachms in one Pound.

bb. Among the *Hippatrical* Weights there was a *Denarium* of 4 Scruples, 5 1/2 whereof made one of their Ounces.

c. Drachme, *Drachma*, and *Drægma*, in *Greek* and *Latin*, in *Engliſh* a *Dram*, is the 8th Part of their Ounce, whereby the Pound hath 12 or 16 Ounces therein. By *Alſted* made to equal the *German* Weight *Quinclein*. Some call a Dram *Reſolus* ſome *Holke*, from the *Greek* ὁλκὴ.

cc. The *Ounce Hippiatrick*, that divided as well the *Mina* of 15 Ounces, as the *Litra* of 12 Ounces had but 7 1/2 Drams into it.

d. Drams of all ſorts were parted into 3 Scruples. A Scruple in *Greek* ſometime *Gramma*, ſometimes *Grammata*; in *Latin Scripulum*, *Scriptulum*, and *Scrupulum*.

e. Obolus, ſometime a Weight, ſometime a Piece of Money commonly rendred an Half Penny, becauſe always was the half of a Scruple.

f. Lupine, in *Greek Therma's*, was a Weight equal in poiſe to the *Lupine*, which is a Seed growing in a Cod like to a Peaſe, and both Plant and Seed bear that Name. And ſeeing there are many ſorts, as *Perkinſon's Theater of Plants*, Page 1073. which ſort of *Lupine* is meant, is uncertain; probably, the middle White, which are moſt in uſe, bigger than the Yellow, and not ſo big as the great Blue; and from the nearneſs in Weight thereto, if not exactneſs, might be ſo called.

g. gg. Siliqua, in *Greek Keration*, a Weight, a like heavy to the *Carobſeed* or ſweet Bean, common in many Countries ſubject to the *Grecian* Empire. Sometime called *Carat* or *Caract*, from whence the Word is ſtill in uſe with us.

h. Chalkos, in *Latin Aerolus* and *Aerolum*. *Aerolus* was alſo a Piece of Braſs Money currant in ancient Times among thoſe Countries of the *Grecian* Dominion.

i. Sitar, a Grain of Corn from Σῖτος *Frumentum*, likely to have been the Original of their Weight, two whereof make one *Chalkos*.

k. Lepton, from *Leptos*, in *Latin Minutum*, and *Minutia*, ſuppoſed to be ſome ſmall Scale of the Rhind or Bark of ſome Tree, 3 1/2 balanced the *Sitar*.

l. Beſides theſe, in the Table of Phyſical Weights ſome Books mention the *Aſſarian*, allowed for two Drachms, which is 1/4 part of an Ounce. Alſo, the *Exagion* wrote ſometime *Stagion*, ſometime *Agion* for Brevity, which was the *Roman Sextula*, the 6th part of their Ounce, whereof 12 make the *Litra*. Likewiſe *Orobus*, which was a Grain of a wild Vetch. And *Phaike* a *Lentil*; but whether Weights or no, is not worth the Enquiry.

ll. As the other Weights are divided into leſſer Diviſions, than the *Obolus*, ſo no doubt but the *Hippiatrick* alſo were, and may accordingly be done, when occaſion ſerves. The *Obolus* of all ſorts admitting the like ſmaller Denominations.

a. *Libra*, called alſo *As*, by Tranſlators commonly rendred a Pound, was divided into 12 Ounces, and for every Number of Ounces under 12, a proper Name uſed, as,

Deunx,	11
Dextans and Decunx,	10
Dodrans,	9
** Bes, Beſſis, and of old, Des,	8
Septunx,	7
Semis, Semiſſis, Semiſſius, Selibra, and Semibella,	6
Quincunx,	5
Triens,	4
Quadrans and Triunx,	3
Sextans,	2
Uncia,	1

} *Ounces.*

Malines, p. 24. of his *Lex Mercatoria*, divides *Pondus*, which he calls the Old Pond of the *Romans*, into

64 Denario's.
129 Quinario's.
256 Seſtertio's.
640 Aſſes.
1280 Semilibella's.
2560 Teruncio's.

A Reaſon is wanting, why *Legat* makes the *Roman Libra* of 12 Oz. but $10\frac{1}{2}$ Oz. *Troy*, ſince if he reckon by the Number of Grains (the Original of Weights) at 5760 Grains of Aſſize in the Pound *Troy*, it can be but 10 Oz. juſt; for 10 times 6912, the Grains in a *Roman* Pound, and 12 times 5760 are equal: But if he count the Pound *Troy* at 7680 Grains, according to the Statute at 32 Grains of Wheat to a Penny-weight, the *Troy* Pound will be $13\frac{1}{3}$ Oz. *Roman*.

** *Bes*, is the Mark Weight, two Thirds of the Pound, *Malines*, p. 24. aforeſaid, makes the *Bes*, or old Mark of the *Romans*, to be divided into

16 Loot, or Tetradrams.
$23\frac{1}{3}$ Tridrams.
32 Didrams.
64 Drachms.
96 Obolos, or Treobolos.
128 Triobolos.
384 Obolos.
768 Miobolos.
3840 Moments.

b *Semiuncia*, or the Half-Ounce, is ſometimes called *Aſſarion*, and *Aſſarius*, and by *Alſted*, *Lotho*, anſwering to a *German* Weight of that Name.

c *Duella* being double to the Weight of the *Sextula*, ſometimes called *Binæ Sextulæ*.

d *Sicilicum*, or *Sicilicus*, and by Abbreviation, *Siclus*, is $\frac{1}{4}$ of an Ounce.

e *Sextula*, us'd promiſcuouſly with *Sextans*, and underſtood by Import of the Name to be the ſixth Part.

f *Denarius*,

f *Denarius*, a Penny-weight, the 7th Part of an Ounce, whether uſed to weigh any thing but Money, as other; the Diviſions thereof, ſomewhat queſtionable, ſee among the Money. *Alſted* compares the *Drachmal Denarius* to the *German* Weight *Quintlein*.

g *Quinar*, was half the Penny-weight, and a Piece of Money ſet afterward among the *Roman* Coin.

h Between the *Quinar* and *Scruple* ſome mention a Weight called *Tremiſſis*, containing 32 Grains, being the 18th Part of an Ounce.

i *Quadrans*, here is $\frac{1}{4}$ of a Penny-weight, and ſo called *Quadrans Denarii*, to diſtinguiſh it from *Quadrans Libræ*, which was 3 Oz.

k *Sextans*, called *Sextans Denarii*, to difference it from *Sextans Libræ*, was the 6th Part of the Penny-weight, and ſometime called *Sextula*.

l *Obolus*, or half a *Scruple*, called ſometimes *Simplium*, weight 12 Grains. If there be another *Obolus*, as ſome ſay, which was the third Part of a *Quinar*, it ſeems to be a Piece of Coin, and muſt weigh $13\frac{5}{7}$ Grains, and ſo is all one with the *Sextans*, according to the *Tabulary* Diviſion; yet this ſort of *Obolus*, they make to contain but 10 Grains.

Between the *Obolus* and the *Siliqua*, ſome mention a *Cerates*, which they ſay contains ſix Grains, and ſo is $\frac{1}{2}$ the *Obolus*, or $\frac{1}{4}$ of the *Scruple*.

A Tabe of the Scripture-Weights, from Biſhop Cumberland.

1. A Shekel of Silver was juſt half the *Roman* Ounce, or our half Ounce *Averdupois*, and was equal to 219 Grains *Troy*; and its Value in our Money was 28 Pence, or 2 Shillings, 4 Pence, Farthing, and near $\frac{1}{8}$ Part of a Farthing; from whence 'tis eaſie to know the half and quarter Shekel.

2. The half Shekel was called *Bekoh*.

3. Its 20th Part was called *Gerah*, *Agurah*, and *Keſhitah*, and is well tranſlated by *Obolus Aticus*.

4. A Talent of Silver was 3000 Shekels, and in our Money its Value was 353 *l.* 11 *s.* 10 *d.* $\frac{1}{2}$.

5. A Talent of Gold was in Value of our Money 5076 *l.* 3 *s.* 10 *d.*

6. The *Maneh* was in Weight 100 Shekels, in Value or Coin 60 Shekels.

7. The Golden Darios or *Perſian* Drachmon, was in Weight 12 Gerahs, in Value 1 *l.* 0 *s.* 4 *d.*

8. The *Roman* Silver Denarius was 7 *d.* 3 *f.* Gold Coins double in Weight.

9. The *Roman* Brazen or Copper *As*, was of $\frac{1}{2}$ an Ounce Weight; in Value 3 Farthings, and one Tenth of our Farthing.

10. *Aſſarium* was the Half of the *As*, *viz.* 1 f. 55 nearly.

11. The *Quadrans* was in Value about 3 quarters of a Farthing.

12. The *Mite* or Λεπτὸν, was the Half of the Quadrans, in Value about $\frac{1}{3}$ of our Farthing.

WENDING, is a Term for bringing a Ship's Head about, and ſeems only to be a Corruption from Winding. They ſay, *How Wends the Ship?* i. e. Which way does her Head lie?

WEST *Erect-Dials*: See *Direct Dials*.

WHEEL, or Way-wiſer, an Inſtrument to meaſure Lengths upon the Ground: See *Perambulator*.

WHEEL-*Barometer*: See *Barometer*.

WHEEL-*Fire*, is the ſame with what the Chymiſts call *Ignis Rotæ*; that is, a Fire which covers the Crucible, Copple, or Melting-pot, entirely over; at Top, as well as round the Sides.

WHELPS; ſo the Seamen call thoſe Brackets which are ſet up on the Capſtan, cloſe under the Bars, and they give the Sweep to it, and are ſo contrived, that the Cable winding about them, may not *ſurge* ſo much as it would do, if the Body of the Capſtan were quite round and ſmooth.

WHIP, or *Whip-ſtaff*, in a Ship, is a Piece of Wood faſtned into the Helm, for him that ſteers to hold in his Hand, thereby to move the Helm, and ſteer the Ship. It goes through the Rowl, and is made faſt to the Tiller with a Ring. But this is not uſed in great Ships.

WHITE-LEAD, how made: See *Ceruſe*.

WHITENESS: This Colour, Mr. *Boyle* thinks, doth chiefly depend upon this, That the Surfaces of white Bodies are ſeparated into innumerable ſmall Planes or Superficies, which being of a Nature nearly ſpecular, are alſo ſo placed, that ſome looking one way, and ſome another, do reflect the Rays of Light falling upon them, not towards one another, but outwards, towards the Spectator's Eye. But the Account of Whiteneſs, according to the *Newtonian* Hypotheſis of Light and Colours, is, That 'tis the Reſult of the Mixture of all ſorts of Rays of Light together: See *Colours* and *Light*.

WHOODINGS, in a Ship, are thoſe Planks which are joined and faſtned along the Ship's Side into the Stern.

WILL, or *Laſt Will*: See *Teſtament*.

WIND, at Sea, they call bringing a Ship's Head about, *Winding of her*; and when ſhe comes to ride at Anchor, ſhe is ſaid to *Wind up*: Alſo when ſhe is under Sail, they uſe to require, *How ſhe Winds*, i. e. which way ſhe lies with her Head? So, to *Wind the Boat*, is to turn her Head about.

WIND is defin'd to be the Stream, or Current of the Air; and where ſuch Current is perpetual and fix'd in its Courſe, 'tis neceſſary that it proceed from a permanent unintermitting Cauſe. Wherefore ſome have been inclined to propoſe the Diurnal Rotation of the Earth upon its Axis, by which, as the Globe turns Eaſtwards, the looſe and fluid Particles of the Air, being ſo exceeding light as they be, are left behind, ſo that in reſpect of the Earth's Surface, they move Weſtwards, and become a conſtant Eaſterly Wind. This Opinion ſeems confirmed, for that theſe Winds are found only near the *Equinoctial*, in thoſe Parallels of Latitude, where the Diurnal Motion is ſwifteſt; but the conſtant Calms in the *Atlantick Sea*, near the *Æquator*, the Weſterly

Westerly Winds near the Coast of *Guinea*, and the periodical Westerly *Monsoons* under the *Equator* in the *Indian Seas*, seemingly declare the Insufficiency of that Hypothesis.

Besides, the Air being kept to the Earth by the Principle of *Gravity*, would in time, acquire the same Degree of Velocity, that the Earth's Surface moves with, as well in respect of the Diurnal Rotation, as of the Annual about the Sun, which is about 30 times swifter.

It remains therefore to substitute some other Cause, capable of producing a like constant Effect, not liable to the same Objections, but agreeable to the known Properties of the Elements of Air and Water, and the Laws of the Motion of Fluid Bodies. Such an one is the Action of the Sun's Beams upon the Air and Water, as he passes every Day over the Oceans, consider'd together with the Nature of the Soil, and Situation of the adjoyning Continents.

Therefore, according to the Laws of *Siaticks*, the Air, which is less rarified or expanded by Heat, and consequently more ponderous, must have a Motion round those Parts thereof, which are more rarified, and less ponderous, to bring it to an *Equilibrium*; also, the Presence of the Sun continually shifting to the Westward, that Part towards which the Air tends, by reason of the Rarefaction made by his greatest Meridian Heat, is with him carried westward, and consequently the Tendency of the whole Body of the lower Air is that way.

Thus a general Easterly Wind is formed, which being impressed upon all the Air of a vast Ocean, the the parts impel one the other, and so keep moving till the next Return of the Sun, whereby so much of the Motion as was lost, is again restored, and thus the Easterly Wind is made perpetual.

From the same Principle it follows, that this Easterly Wind should on the North-side of the *Equator*, be to the Northwards of the East, and in South Latitudes to the Southwards thereof; for near the Line, the Air is much more rarified, than at a greater distance from it; because the Sun is twice in a Year vertical there, and at no time distant above 23 Degrees $\frac{1}{2}$; at which Distance the Heat being at the *Sine of the Angle of Incidence*, is but little short of that of the perpendicular Ray. Whereas under the Tropicks, though the Sun stay long vertical, yet he is a long 47 Degrees off; which is a kind of Winter, wherein the Air so cools, as that the Summer Heat cannot warm it to the same Degree with that under the Equator. Wherefore the Air towards the Northward and Southward being less rarified than that in the middle; it follows, that from both sides it ought to tend towards the Equator. This Motion compounded with the former Easterly Wind, answers all the *Phænomena* of the general Trade Winds; which, if the whole Surface of the Globe were Sea, would undoubtedly blow all round the World, as they are found to do in the *Atlantick* and *Æthiopick* Oceans.

But seeing that so great Continents do interpose and break the Continuity of the Oceans, regard must be had to the Nature of the Soil, and the Position of the high Mountains, which are the two principal Causes of the several Variations of the Wind from the former general Rule; for if a Country lying near the Sun, prove to be flat, sandy, and low Land, such as the Deserts of *Libya* are usually reported to be, the Heat occasioned by the Reflexion of the Sun's Beams, and the Retention thereof in the Sand, is incredible to those that have not felt it; whereby the Air being exceedingly rarified, it is necessary that this cooler and more dense Air should run thitherwards to restore the Æquilibrium: This is supposed to be the Cause, why near the Coast of *Guinea* the Wind always sets in upon the Land, blowing Westerly instead of Easterly, there being sufficient Reason to believe, that the inland Parts of *Africa*, are prodigiously hot, since the Northern Borders thereof were so intemperate, as to give the Ancients cause to conclude, That all beyond the *Tropicks* was made uninhabitable by Excess of Heat.

From the same Cause it happens, that there are so constant Calms in that part of the Ocean, call'd the *Rains*; for this Tract being placed in the middle, between the Westerly Winds, blowing on the Coast of *Guinea*, and the Easterly Trade Winds blowing to the Westwards thereof, the Tendency of the Air here, is indifferent to either, and so stands in *Æquilibrio* between both, and the weight of the incumbent Atmosphere, being diminished by the continual contrary Winds blowing from hence, is the Reason that the Air here holds not the copious Vapour it receives, but lets it fall in so frequent Rains.

But as the cool and dense Air, by reason of its greater Gravity, presses upon the hot and rarified, 'tis demonstrative, that this latter must ascend in a continued Stream, as fast as it rarifies, and that being ascended, it must disperse it self to preserve the *Æquilibrium*; that is, by a contrary Current the upper Air must move from those Parts where the greatest Heat is; so by a kind of Circulation, the North-East Trade-Wind below, will be attended with a South-westerly above, and the South-easterly and North-west Wind above; that this is more than a bare Conjecture, the almost instantaneous Change of the Wind to the opposite Point, which is frequently found in passing the Limits of the Trade-Winds, seems to assure us; but that which above all confirms this Hypothesis, is the *Phænomenon* of the *Monsoons*, by this means most easily solv'd, and without it hardly explicable.

Supposing therefore such a Circulation as above, 'tis to be considered, that to the Northward of the *Indian* Ocean, there is every where Land within the usual Limits of the Latitude of 30, *viz. Arabia*, *Persia*, *India*, *&c.* which for the same Reason, as the *Mediterranean* Parts of *Africa*, are subject to unsufferable Heats, when the Sun is to the North, passing nearly vertical; but yet are temperate enough when the Sun is remov'd towards the other *Tropick*, because of a Ridge of Mountains at some distance within the Land, said to be frequently in Winter covered with Snow, over which the Air as it passes, must needs be much chilled.

Hence it comes to pass, that the Air coming according to the general Rule, out of the North-East in the *Indian Sea*, is sometimes hotter, sometimes colder, than that which by this Circulation is return'd out of the South-west, and by consequence sometimes the under Current, or Wind, is from the North-East, sometimes from the South-West.

That this has no other Cauſe, is clear from the Times wherein theſe Winds ſet in, *viz.* in *April*, when the Sun begins to warm thoſe Countries to the North, the South-weſt *Monſoons* begin, and blow during the Heats till *October*; when the Sun being retired, and all things growing cooler Northward, and the Heat increaſing to the South, the North-Eaſt enter and blow all the Winter till *April* again: And it is undoubtedly from the ſame Principle that to the Southward of the *Equator* in part of the *Indian* Ocean, the North-Weſt Winds ſucceed the South-Eaſt, when the Sun draws near the *Tropick of Capricorn*.

But in this latter occurs a Difficulty, not well to be accounted for, which is, why this Change of the *Monſoons*, ſhould be any more in this Ocean, than in the ſame Latitudes in the *Æthiopick*, where there is nothing more certain than a South-Eaſt Wind all the Year.

'Tis likewiſe very hard to conceive why the Limits of the Trade Wind ſhould be fix'd about the thirtieth Degree of Latitude all round the Globe; and that they ſhould ſo ſeldom tranſgreſs or fall ſhort of thoſe Bounds; as alſo that in the *Indian* Sea, only the Northern Part ſhould be ſubject to the changeable *Monſoons*, and in the Southern there ſhould be a conſtant South-Eaſt.

This Account of Wind is from the Learned Captain *Halley*'s Diſcourſe on this Subject. *Philoſoph. Tranſ. N.* 183.

WIND-GUN. Of this Inſtrument there are ſeveral Deſcriptions extant, but the following of Mr. *Papins* is in all reſpects the beſt. (See Continuation of Mr. *Boyle*'s *Phyſico-Mechanical Experiments*. Part 2. Iconiſm. 2. Fig. 4.)

A A, is a Copper Globe, hollow within; B B is a Tube, faſtned to that Globe. F is a Valve opening inwardly, and ſhutting the Globe B B; G is the Spring depreſſing the foreſaid Valve. H is a Gnomon affixed to the Globe A A, and making faſt the Spring G.

C C, is a Tube of Iron, faſtned to the Tube B B, and the Globe A A. D D is a Plug exactly adapted to the aforeſaid Tube. E E E is another Plug, fitted alſo to the Tube B B with an Iron Wire, reaching almoſt to the Valve F. R is the Protuberance of the Tube C C, ſomewhat hollowed above to receive the End of the Iron L L; and L L, is a crooked Iron, moving about the Extremity in R, ſo that it is like a Leaver to lift up the Plug E E E. O P O is a crooked Iron, faſtned in M, that the Thumb ſticking in the Angle P, the reſt of the Fingers may attract the Leaver L, and ſo force the Plug E E E upwards. But the Uſe of the Curvature is, that the one End O might be applied to the Shoulder, if it be thought fit to aim at any Mark.

T T, is a Rectangle of Iron, encompaſſing the Leaver L L, and the Iron O P O, to keep the Leaver in that Poſture which the preſent Scheme holds forth; for otherwiſe the Plug E E E would be thruſt out far away, whilſt we intrude the Air into the Globe A A.

I I, is an Elliptick Hole in the upper Part of the Globe very well ſhut with a Valve, opening inwardly, whoſe Uſe is to give liberty of Inſpection and of amending what is amiſs; for the Valve may be drawn through the Hole, by reaſon of its Elliptick Figure.

S S, is a metalline Plate tranſverſly placed above the Hole I I, and perforated to tranſmit the Screw V, by whoſe help the Valve ſhutting, the Hole I I is ſuſtained, and is applied cloſely to the Hole.

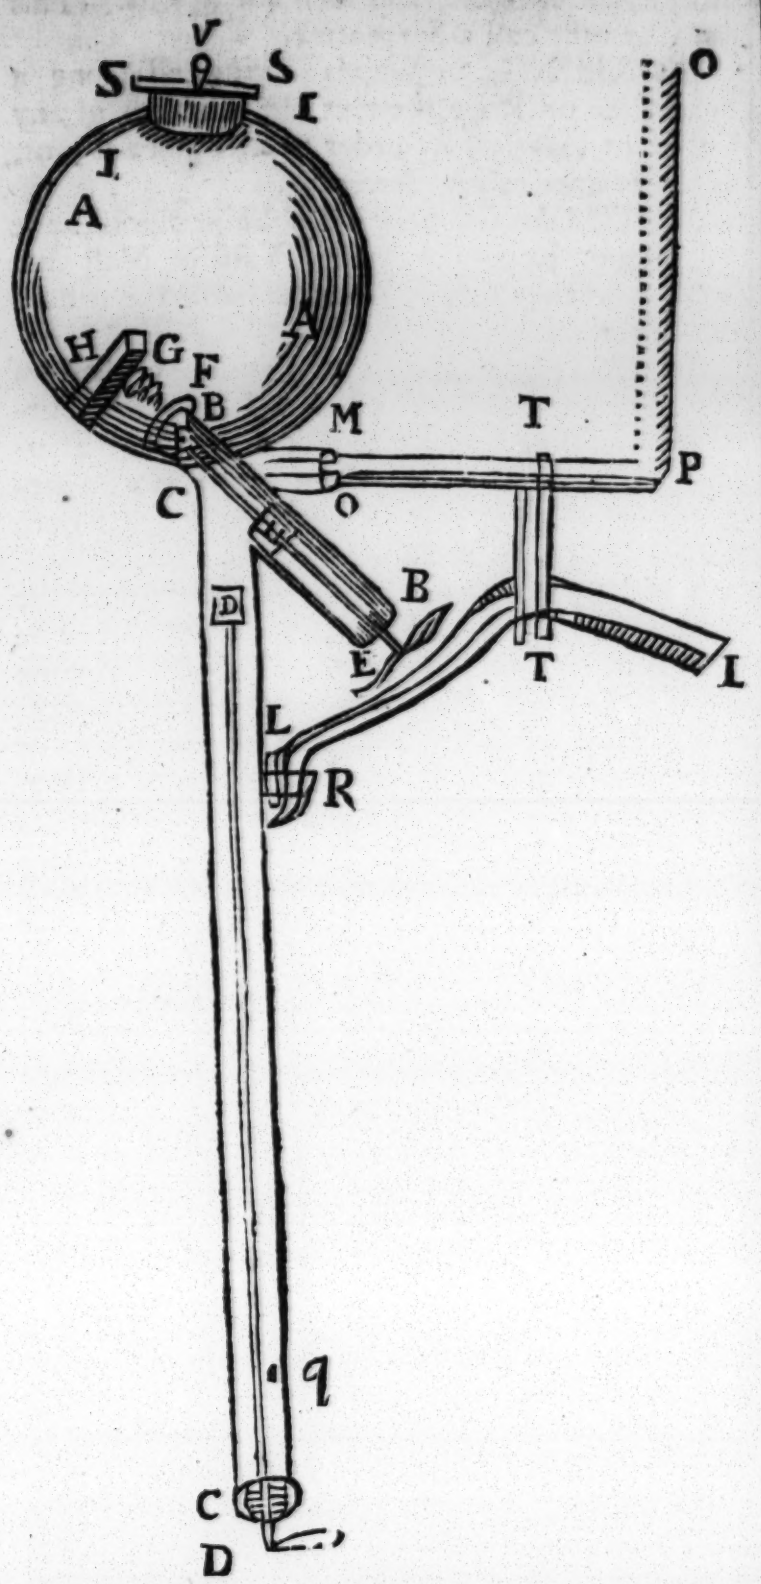
Q, is an Hole in the inferior part of the Tube C C, by which the Air enters into the Tube, whilſt the Plug D is brought to the loweſt part of the Tube.

The Air is thruſt into the Engine after this manner: The crooked End of the Plug D D is preſſed upon with the Foot, that it mayn't ſtir from the Ground; and the Engine being lifted upward till the upper part of the Plug be found below the Hole Q; then the Air entring through the aforeſaid Hole, doth wholly fill the Tube C C.

Then the Engine being forcibly depreſſed, the Air contain'd in the Tube C C, opens the Valve F, and is thruſt into the Globe A A; whence it cannot return, becauſe the Valves preſently ſtop the Paſſage; and thus by iterated Turns, we may condenſe the Air in the Globe, until the Force of its Spring cannot be overcome by our Strength.

Now to diſcharge the Air, ſo condenſed, the Plug D D is wholly to be drawn out, and a Bullet of Lead to be put into the bottom of the Tube C C, then by means of the Leaver L L L, the Plug E E E is to be impelled upward, as beforemention'd, and then the Extremity of the Iron Wire opens the Valve B, and the Air breaking out therefrom, expels the Leaden Bullet through the Tube C C with great Violence.

Note, That before the Plug D D is again put into the Tube C C from the Compreſſion of the Air, about half an Ounce of Water is to be poured into the foreſaid Tube. For by this means no Air at all can eſcape out by the Plug; and moreover, that Water filling exactly the upper part of the Tube C C, will cauſe that the whole compreſſed Air will be intruded within the Cavity A A, and ſo the Condenſation will be perfected much ſooner than if at every Turn part of the compreſſed Air did remain below the Valve F. See the Figure following.



This Engine is much better than any Wind-Guns hitherto mention'd in Print.

1. Becauſe that ſeeing one only Valve ſerves both for letting in, and diſcharging forth of the Air, it is leſs ſubject to be ſpoiled or impaired, than if two Valves were uſed for that Purpoſe.

2. If any Diſorder happen in other Guns, the Engine remains uſeleſs; but here by the Elliptick Hole, a Man may take out the Spring and the Valve, and ſo mend whatſoever is amiſs.

3. In other Guns, the Valves being cover'd with Leather, were put in before the Engine was on every ſide ſhut, and therefore Silver Solder could not be uſed in cementing the Parts, but only Lead Solder; by which the Air, being much compreſs'd, could by no means be reſtrain'd: But here all things are well cemented with Silver Solder, without danger of Burning, in regard the Valve cover'd with Leather is put in afterward through the Elliptick Hole II.

4. But this Engine is chiefly to be preferred before others on this account, becauſe we emit ſeveral Bodies into the Receiver, through the Elliptick Hole, and ſo make many Experiments in highly compreſſed Air.

WIND-*Taught*, a Sea Term, implying as much as Stiff in the Wind; for they ſay a thing is *Taught*, when 'tis Stiff. Thus too much Rigging, all high Ropes, or any thing catching or holding Wind aloft, is ſaid to hold a Ship *Wind-taught*; by which they mean, that ſhe ſtoops too much in her Sailing in a ſtiff Gale of Wind. So alſo, when a Ship rides in a main Streſs of Wind and Weather, they ſtrike down her Topmaſts, and bring her Yards down alongſt the Ship, which elſe would hold too much Wind, or be *Wind-taught*.

WINDING *Tackle-Blocks*; ſo the Seamen call thoſe *double Blocks*, with three *Shivers* in each, which are ſeized faſt to the End of a ſmall Cable which is brought about the Head of the Maſt, and ſo ſerves inſtead of a Pendant. This hath a *Guy* brought to it from the Foremaſt. Into the Block is reeved a Hawſar, which is alſo reeved through another double Block, having a Strap at the End of it, which being put through the Eye of the Slings, is lock'd into it with a *Fidd*, in order to hoiſe in Goods. The *Fall* of this Tackle is reeved into the *Snatch Block*, and ſo is brought to the Capſtan, whereby the Goods are heaved.

WINDLASS, in a Ship, is a piece of Timber having ſix or eight Squares, and is fix'd abaft the Stern aloft, where the Cables come in from the one Side of the Ship to the other, uſed now in ſmall Ships only, and in the *Flemiſh* Ships, which are highly mann'd: But this *Windlaſs* will purchaſe more by much than any Capſtan in the weighing of an Anchor, and without any Danger to thoſe that heave, becauſe they heave here about with Handſpikes put into the Hole at either End of the *Windlaſs*; of which, tho' one ſhould happen to break, yet would the *Windlaſs* paul of it ſelf, without any farther Danger.

WING: The *Romans* called by the Name of *Alæ*, the *Wings*, two Bodies of Men in their Army, one on the Right, and the other on the Left, conſiſting each of 400 Horſe, and 4200 Foot uſually; and being wholly made up of Confederate Troops: Theſe were deſign'd to cover the *Roman* Army, as the Wings of a Bird cover its Body. The Troops in theſe Wings they call *Alares*, and *Alares Copiæ*; and we at this Day diſtinguiſh our Armies into the Main Body, the Right and Left Wings.

WINGS, in Fortification, are the large Sides of Horn-works, Crown-works, Tenailles, and the like Out-works; that is to ſay, the Ramparts and Parapets, with which they are bounded on the Right and Left, from their Gorge to their Front. Theſe Wings or Sides are capable of being flank'd either with the Body of the Place, if they ſtand not too far diſtant; or with certain Redoubts, or with a Traverſe made in their Ditch.

WINTER *Solſtice*: See *Solſtice*.

WITHERNAM, is the taking or driving of a Diſtreſs to the Hold, or out of the County, ſo that the Sheriff cannot upon Replevin make Delivery thereof to the Party diſtrained: In which Caſe, a Writ of *Withernam* is directed to the Sheriff for the taking of as many of his Beaſts that did thus unlawfully diſtrain, or as much Goods of his into his keeping, until he hath made Deliverance of the firſt Diſtreſs. Alſo, if the Beaſts be in a Fortlet or Caſtle, the Sheriff may take with him

the Power of the County, and beat down the Caſtle.

Withernam, in ſome Statutes, ſeems alſo to ſignifie an unlawful Diſtreſs made by him that has no Right to Diſtrain.

WITT. Mr. *Locke*, in his *Eſſay on Humane Underſtanding*, B. II. C. XI. Sect. 2. defines *Witt* (and thereby diſtinguiſhes it from *Judgment*) to be a quick and ready Aſſemblage of Idea's; and putting thoſe together with great Facility and Variety in which can be found any Reſemblance and Congruity, thereby to make up pleaſant Pictures and agreeable Images in the Fancy. Hence it is that Metaphors and Alluſions are ſo generally entertaining and pleaſing; becauſe their Beauty appears at firſt ſight, and there is required no Labour and Toil of Thought to examine what Truth or Reaſon there is in them.

WOOD and *Wood*, a Sea Term of two pieces of Timber; being ſo let into each other, that the Wood of one joins cloſe to the other.

WORM; is that winding long Pewter Pipe which Apothecaries and Diſtillers place in a Tub of Water to cool and condenſe the Vapours in Diſtillations of Spirits. Formerly, and ſometimes now, this Worm, or ſomething like, was placed above the Head of the Still, and then a Refrigeratory at the upper end of it, which is very good to diſtil Spirit of Wine, and ſuch fine Spirits. This the Chymiſts call a Serpentine.

WORMING, at Sea, is laying all along a ſmall Line or Rope betwixt the Shrouds of any Cable or Hawſar, in order to ſtrengthen it; or, as the Seamen call it, *Succour it*.

WOULDING, a board a Ship, ſignifies the winding of Ropes faſt about a Yard or Maſt that is *fiſhed* (as they call it) in order to make it hold the better.

WREATH, in Heraldry, ſignifies a Roll of fine Linnen or Silk (like that a Turkiſh Turbant) conſiſting of the Colours born in the Eſcucheon, which in an Atchievment is placed between the Helmet and the Creſt, and which doth immediately ſupport the Creſt.

WRECK, is where a Ship has periſhed on the Sea, and no Man eſcapes alive out of it. The Civilians term it *Naufragium*. This *Wreck* being made, the Goods that were in the Ship brought to Land by the Waves, belong to the King, or whom he aſſigns it to. But if a Man, or a Dog, or a Cat eſcape alive, and that the Party to whom the Goods belong, come within a Year and a Day, and prove the Goods to be his, he ſhall have them again, by the Proviſion of the Statute of *Weſtm.* 1. cap. 4.

WRIGHT'S *Sailing*. See *Mercator's Sailing*.

XIP XYS

XEROPHTHALMY, a dry *Ophthalmy*, or Blood-ſhot of the Eyes, without Weeping, which happens uſually in dry Weather. *Blanchard.*

XIPHIAS, according to ſome, is a ſort of Comet, ſhaped like Swords; the Head being like the Hilt, and the Tail ſtreight and pointed, yet ſometimes bending like a Cymiter, but when it is of a leſſer, and of a more contracted Form, 'tis like a Knife, or Dagger.

XYPHOIDES, is a pointed Cartilage of the Breaſt, called *Cartilago Enſiformis*,

XYSTER, is a Surgeons Inſtrument to ſhave and ſcrape Bones with.

YARDS of a Ship, are thoſe long pieces of Timber which are made a little tapering at each End, and are fitted each to its proper Maſt to carry the Sails which are faſtned to theſe Yards at their Head, and are hoiſed up and let down together with the Yards, by the Halliards.

For the Proportions of the Yards of a Ship, they commonly allow $\frac{5}{6}$ of the Length of her Keel, or $\frac{6}{7}$ of the Length of her Main-maſt, for the Length of her Main-yards; and for the Thickneſs of them, they allow $\frac{3}{4}$ of an Inch for every Yard in Length; the Top-yard is $\frac{3}{5}$ of the Main-yard, and the Fore-yard is $\frac{4}{5}$ of the Main-yard, or as ſome ſay $\frac{8}{9}$: The Spritſail-yard and Croſs-jack, are of the ſame Length, *viz.* $\frac{1}{2}$ the Miſſen-yard; and the Thickneſs of the Miſſen-yard and Spritſail-yard is $\frac{1}{2}$ Inch to a Yard in Length.

All ſmall *Yards* are half the great Yards from Cleat to Cleat: When a great Yard is down a *Portlaſt*, it gives the Length of all Topſail-ſheets, Lifts and Ties, Jeers and Bunt-lines; as alſo of the Leech-lines and Halliards, meaſuring from the Hounds to the Deck: And when it is hoiſed, it gives the Length of Clew-lines, Braces, Clew-garnets, Tackles, Sheets and Bow-lines.

The Terms belonging to the *Yards*, are, 1. *Top the Yards*; that is, make them hang even. The Clew-lines do moſt properly Top the Main and Fore-yards; but when the Top-ſails are ſtowed, then the Topſail-ſheets will Top them. 2. *Brace the Yard*, i. e. Traverſe aft the Yard-Arm, whoſe Brace is haled. So that *Traverſe the Yard*, is the ſame as to ſay, *Brace it aft*. 3. *Square the Yards*, *i. e.* ſee that they hang right acroſs the Ship, and one Yard-Arm not traverſed more than the other.

YARE, is the Sea word for Nimble, Ready, Quick, or Expeditious.

YAWES. At Sea, they ſay a Ship makes *Yawes*, when through the Fault of him at Helm ſhe is not kept *ſteady* in her Courſe, but makes Angles in and out; to prevent which, the Conner crys, *Steady*, *Steady*, keep her Thus, Thus.

YEAR: The Time the Sun takes to go through the twelve Signs of the Zodiack. This is properly the Natural or Tropical Year, and contains 365 Days, 5 Hours, and 12 Minutes.

The *Sydereal Year*, is that Time in which the Sun departing from any fixed Star, comes to it again; and this is in 365 Days, 6 Hours, and almoſt 10 Minutes. But according to Sir *Iſaac Newton*'s New Theory of the Moon, the *Sydereal Year* is 365 D. 6 H. 9′ 14″; and the *Tropical*, 365 D. 5 H. 48′ 57″.

The *Civil Year*, which is commonly uſed by all Nations, is very various, both as to its Beginning, and alſo as to its Length, according as they follow the Courſe of the Sun, Moon, or both.

The *Civil Lunar Year* contains 12 Lunations or Synodical Months, and contains but 354 Days: This being 11 Days leſs than the Solar Year, its Head in about 33 Years will run through all the Months and Seaſons of the Year. This kind of Year is now uſed by the *Turks*, and ſeems to have had its firſt Riſe in Countries where the Difference between Summer and Winter is not ſo ſenſible as it is with us; and where, for want of Aſtronomy, they know not how to eſtimate the Solar Year, and therefore began their Account of Months from the Phaſes of the Moon. And hence, as the learned Aſtronomer Dr. *Gregory* hints, it came to paſs, that they began the Account of their Civil Day at Sun-ſet; for their Day muſt begin when their Month and Year did, and that was with the New Moon, which being to be determined by view, could not be diſcovered till after Sun-ſet.

The *Jews* had their *Secular Year*, which began at the Autumnal Equinox; and their *Sacred Year*, which began at the Vernal one.

The *Egyptians*, *Chaldeans* and *Aſſyrians*, firſt meaſured the Year by the Courſe of the Sun, which they ſuppoſed to contain but 360 Days; afterwards 5 more were added by *Mercury*, which he called ἐπαγομέναι, i. e. *added*; but yet no notice was taken of the 6 Hours; by which means the *Egyptian* Year hath fixed no place in reference to the true Solar Year; but anticipating a Day every four Years, runs quite round in 1460 Years.

This way of reckoning continued till *Egypt* becoming a Province of the *Roman* Empire, they took the *Julian* Account, only they kept the Names of their Months ſtill, and order'd their matter ſo, that their *Thot*, the firſt Day of the Year, always happen'd on the 29th of *Auguſt* in the *Julian Year*. So that the *Egyptian* or *Coptick Year* is 4 Months and 3 Days before the *Roman Year*, which begins with the Calends of *January*.

The *Perſians* account (according to the *Egyptian* way) 365 Days.

The *Arabs*, *Saracens* and *Turks*, count their Year by the Motion of the Moon, and make it conſiſt of 12 Moons or Months, whereof ſome have 30, and ſome 29 Days alternately; and theſe altogether make but 354 Days; ſo that their Month *Muharran*, in which they place the Beginning of the Year, in leſs than 34 Years will run quite round, and be in all Seaſons. The *Arabs* indeed, by a Cycle of 30 Years, do remedy this by means of an *Intercalation* or *Emboliſm* of 11 Days.

The *Greeks* counted their Year by the Motion of both Sun and Moon, and finding that there was 11 Days difference between the Lunar and Solar Year; at firſt they added an Intercalary Month every two Years, containing 22 Days, which therefore they called ἐμβολιμαῖον, the *added* or *inſerted* Month. Afterwards conſidering the 6 Hours alſo, they put their *Emboliſm* off till 4 Years end; and then making the 3 firſt Years to contain 354 Days a-piece, (which is the Lunar Year) this made the 4th Year to have 399 Days. And to make this *Intercalation* the more remarkable, they inſtituted the *Olympick Games* on every ſuch 4th Year; whence came the Computation by *Olympiads*; each of which contain'd 4 Years.

Nevertheleſs they found that this would not do in proceſs of Time; and therefore they firſt reduced the *Intercalation* to 8, and then to 11 Years; but ſtill there was great Confuſion, till one *Meto*, a Citizen and famous Aſtronomer of *Athens*, thought of joining the two laſt Periods 8 and 11 together;

together; which doing, he made a Period of 19 Years, in which the two Motions of the Sun and Moon are wholly accommodated, and the Moon changes on the ſame Day of the Month that ſhe did 19 Years before. This Diſcovery, for its Fulneſs, was much celebrated, and the Number of the Period 19, the *Athenians* ordered to be ſet up in a publick Place, and to be written in Characters of Gold; whence it took the Name it ſtill retains, being called the *Golden Number*.

The *Athenians* began their Year at the New Moon after the Summer Solſtice; in their Month *Hecatombæon*, as *Plutarch* ſays.

There were alſo ſome Nations who made their Year to conſiſt only of 4, or of but 3 Months, as *Macrobius* tells us in his *Saturnalia*, Lib. 1.

The *Carians* and *Acharnanians*, ſaith *Juſtin*, made their Year to conſiſt of 6 Months, and reckoned but 15 Days to their Month.

The *Romans* had three ſorts of Years: 1. That of *Romulus*, which contained but 10 Months; from whence the laſt Month of our Year retains the Name of *December*, as being the Tenth of his. This Year begun in *March*. 2. *Numa Pompilius* his Year; which had *Romulus* his groſs Miſtake corrected, and two more Months added to it, *viz.* *January* and *February*; and then it contained only 355 Days, or 12 Lunar Months. 3. The Year of *Julius Cæſar*, who diſcovering that there were 10 Days more than *Numa* reckoned, made the Year 365 Days: And reſerving the 6 Hours till every fourth Year, they then made another Day, which was added before the ſixth of the Calends of *March*; ſo that in this fourth Year they accounted the 6th of the Calends of *March* twice; *Bis-ſexto-calendas*, whence came the Word *Biſſextile* or Leap-year, as we call it; which hath 366 Days. This Account is now uſed in *England*, and is the *Julian* or *Old Stile*.

But becauſe there was ſtill found an Error in this Calculation, and that the *Equinoxes* did plainly, tho' inſenſibly recede from the Points where *Cæſar* had fixed them; as alſo, that the Year was diſcover'd to want about 11 Minutes of 365 Days and 6 Hours; which 11 Minutes will in 131 Years make the Equinoxes go back about a Day; Pope *Gregory* XIII. to reform (as he thought) this Error, ordered 10 Days to be taken from the Year, to bring the Equinoxes that Year (which was 1582) to *March* 21, and *Sept.* 22, 23. And this is what is called the *Gregorian* Account or New Stile, as is uſed by the Popiſh Nations every where.

The Great Year, or the *Annus Magnus*, about 25000 or 26000 Years; in which Time the fixed Stars will appear to come to the ſame Point again, exactly after one entire Revolution.

YEAR *and Day*, in Law, is a Time that determines a Right in many Caſes; and in ſome Works an Uſucaption, in others a Preſcription; as in Caſe of an Eſtray, if the Owner (Proclamations being made) challenge it not within that Time, it is Forfeit: So is the *Year and Day* given in caſe of Appeal, in caſe of Deſcent after Entry or Claim, and in caſe of a Man ſo bruiſed and wounded; of Protection, Eſſoigns in reſpect of the King's Service; of a Wreck, and divers other Caſes. *Co. Vol.* 6. *Fol.* 107.

YEAR, *Day* and *Waſte*, is a Part of the King's Prerogative, whereby he challengeth the Profits of their Lands and Tenements for a Year and a Day, that are attainted of Petty Treaſon, or Felony, whoever is Lord of the Mannor whereto the Lands or Tenements belong; and not only ſo, but in the End may waſte the Tenements, deſtroy the Houſes, root up the Woods, Gardens, Paſture, and plow up the Meadows, except the Lord of the Soil agree with him for Redemption of ſuch *Waſte*, afterwards reſtoring it to the Lord of the Fee.

YOKE: See *Sea-Yoke*.

ZENITH, or Vertex, is the Point in the Heavens, right over one's head, being neceſſarily 90° Degrees diſtant from the Horizon.

ZENITH *Diſtance*, is the Complement of the Sun, or Stars Meridian Altitude, or what the Meridian Altitude wants of 90 Degrees.

ZERNA : See *Lichen*.

ZETETICK Method in Mathematicks, is the Analytick, or Algebraick way, whereby the Nature and Reaſon of the thing is primarily inveſtigated and diſcovered.

ZEUGMA, is a Figure in Grammar, when an Adjective or Verb, agreeing with a nearer Word, is alſo by way of Supplement referred to one more remote. Thus, ſaith *Terence*, *Utinam aut hic ſurdus, aut hæc muta facta ſit.*

ZOCCO : See *Plinthus*.

ZOCLE, is a ſquare Member in Architecture, being lower than its Breadth, which ſerves to ſupport a Pillar, or any other part of a Building, inſtead of a Baſe, Plinth, or Pedeſtal.

Continued Zocle, is a kind of continued Pedeſtal, on which a Structure is raiſed, but hath no Baſe or Corniſh.

ZODIACK, is a great Circle of the Sphere, dividing it into two equal Parts, cutting the Equator in the Eaſt and Weſt Points of the Horizon. It cuts the Horizon and Equinoctial obliquely; making with the former an Angle equal to the Sun's greateſt Meridian Altitude in any Latitude; and with the Equinoctial, an Angle of 23° 30′ Minutes, which is the Sun's greateſt Declination.

This is a broad Circle, and through the middle of it is drawn a Line, called the Ecliptick, or *Via ſolis*, the Way of the Sun, becauſe the Sun never deviates from it in his Annual Motion; as the Planets do all more or leſs, (whence it hath its Breadth.)

The *Zodiack*, in the Globe, is mark'd with the Characters of the Twelve Signs, and in it is found out the *Sun's Place*, which is *under what Star or Conſtellation he appears to be at Noon.*

By this are determined the four Quarters of the Year; and accordingly it is divided into 4 Parts, and as the Sun goes on here, he hath more or leſs Declination, North and South.

Alſo from this Circle, the Latitudes of the Planets and fixed Stars are accounted, from the Ecliptick towards its Poles.

And thoſe Poles are 23 Degrees 30 Minutes diſtant from the *Poles of the World*, or of the *Equinoctial*; and by their Motions are the Polar Circles deſcribed.

In theſe Poles all the Circles of Longitude which are drawn through the *Zodiack*, do terminate, (as the Meridians and Hour Circles do in the Poles of the World) and as the Azimuth Circles do in the Zenith and Nadir.

The Breadth of this Circle, or rather Zone in the Heavens, is 20 Degrees, for beyond 10 Degrees North, or 10 Degrees South, the Latitude of no Planet ever reaches.

It ſeems to have been divided into 12 Parts, (which they call Signs) becauſe while the Sun in a Years time is running thro' the Zodiack or Ecliptick, there happen to be 12 Lunations: Or the Moon undergoes all her Changes and Phaſes, 12 times, pretty near. Each Sign is divided into 30 Degrees, ſo that the whole makes 360: And they begin to reckon at the Eaſtern Interſection of the Equinoctial and Ecliptick; or at the Vernal Equinox, where they place the firſt Point of *Aries*; going on thence to *Taurus*, *Gemini*, *Cancer*, *&c.* and when you count thus forward on according to the uſual Order and Courſe of the Signs, they call it, *in conſequentia*, but if you count backwards from *Taurus* to *Aries*, *&c.* they ſay, 'tis *in Antecedentia*.

The Reaſon of the Name of this Circle, and its Origin, was this.

The ancient Aſtronomers obſerved the Sun in his (apparent) annual Motion to deſcribe always one and the ſame Line or Track in the Heavens, and never to deviate from this Path either to the North or the South, as all the other Planets, they found, did more or leſs. And becauſe they obſerved the Sun to ſhift as it were backwards, thro' all the Parts of this Circle or Path, ſo that in his whole Years Courſe, he would Riſe, Culminate, and Set with every Point of it, they diſtinguiſhed the fixed Stars which appeared in or near this Circle into 12 Conſtellations or Diviſions, which they called Signs, becauſe they were Marks to diſtinguiſh whereabout the Sun was. Theſe Signs they painted uſually in the Form of Animals, and thence came the word *Zodiack*; and the very middle Line of it is called the Ecliptick, becauſe the Eclipſes only happen when the Moon alſo is in that Line.

ZODIACK of the Comets; *Caſſini* hath obſerved a certain Tract in the Heavens, within whoſe Bounds (by many Obſervations) he hath found moſt Comets, tho' not all, to keep. This he makes as broad as the other *Zodiack*, and marks it with Signs or Conſtellations like that, which are *Antinous*, *Peſagus*, *Andromeda*, *Taurus*, *Orion* the leſſer Dog. *Hydra*, the *Centaure*, *Scorpion*, and *Sagittary*.

ZONE, in Geography, is a Space contained between two Parallels; of theſe Zones there are five commonly reckon'd, *viz.* two *Frozen*, two *Temperate*, and one *Burning Zone*.

The *Frozen Zones*, are thoſe Parts of the Globe comprehended between the Pole and the Polar Circle; therefore one muſt be towards the North, the other towards the South: The *Frozen*, or *Frigid Zone*, towards the North, lying between the North Polar Circle, and the North Pole, contains part of *Iſland*, and *Norway*, *Lapland*, *Finmark*, *Samojeda*, *Nova-Zembla*, *Greenland*, and ſome other Parts of *North America*. The *Frigid Zone*, toward the South, lying between the South Polar Circle, and the South Pole, is not yet known whether it contains Land or Water.

The *Temperate Zones* are one on the North ſide of the Equator between the Arctick Circle, and the Tropick of *Cancer*; another on the South ſide beween the Tropick of *Capricorn*, and the Antartick Circle.

Torrid Zone, or *Burning Zone*, contains all that Space of Earth that lieth between the two Tropicks.

ZOOGRAPHY, is a Deſcription of the Nature and Properties of Animal Bodies, ſuch as Beaſts, Birds, Fiſhes, Inſects, *&c.*

ZOOTOMY, is an Artificial Diſſection of Brute-Animals, as *Androtomy* is of the Bodies of Men.

ZUGOMATICUS, is a Muſcle of the Face, ſo called by *Riolan*, becauſe it ariſes from the *Os Jugale*, or *Zugoma*. Its Origination is round and fleſhy from the external Part of the ſaid Bone; whence deſcending obliquely forwards, is inſerted near the Angle of the Lips. Whence the Muſcle and its Partner act, they draw both Lips upwards, and make a pleaſant Countenance.

ZYGOMA. or *Os Mali*, is one of the Bones of the Upper Jaw, it is of a triangular Figure; on the upper part it joins to the *Os Sphænoides*, on the lower to the *Os Maxillare*; its external part hath a long Proceſs, called *Proceſſus Zygomaticus*; it joins with the *Os Frontis*, at the Corner of the Eye.

ZYGOMATICUM, are Muſcles which draw both Lips obliquely to either ſide, and are otherwiſe called *Jugale*.

ZYMOMA, is any Ferment, as the Nitrous Air, the Watry Juice in the Mouth, the Acid Liquor in the Stomach, the Blood in the Spleen, *&c. Blanchard*.

ZYMOSIMETRE, is an Inſtrument whereby the Degree of the Fermentation ariſing from the mixture of divers Liquors, is meaſured; or the Temperament or Degree of Heat in the Blood of Animals, *&c.*

ZYMOSIS: See *Fermentation*.

TUSCAN
DORICK
IONICK
CORINTHIAN
COMPOSITE

The Explanation of the Plate for the Five Orders of Architecture.

In the Tuſcan *Column.*

a The *Ovolo* or *Egg:* In the *Ionick* and *Corinthian* Orders, and every where by ſome 'tis called the *Echinus.* The *French* call it the *Quart de rond.*

b The *Aſtragal* or *Baguette*, as the *French* call it: The *Italians* the *Tondino* or *Round*; below which is a ſmall Liſt, Reglet or Fillet.

c Is the *Crown*, the *French* call it the *Larmier.*

e The *Liſt* or *Fillet* under that.

f The *Gula* or *Talon* in *French.*

g The *Liſt* of the *Gula.*

H The *Frieze.*

i The Liſt of the *Architrave.*

k The *Architrave,*

l The Liſt of the *Abacus.*

m The *Abacas Cymatium* or *Saillou*, as the *French* call it.

n The *Ovolo* or *Echinus.*

o The *Liſt*, *Ring* or *Fillet* under that.

p The Frieze of the Capital: The *French* call it the *Gorgerin* or *Collarin.*

q The *Aſtragal* of

r The *Conge* or *Ceinture*, as the *French* call it; or of the Neck of the Column.

s The *Body* of the Column; in *French* the *Fuſt* or *Vif.*

t The *Liſtel* of the Baſe, or the *Netherband* or *Swath.*

u The *Tore*, or the *Gros Baton*, in *French.*

w The *Plinth.*

x The *Riglet*, *Liſt* or *Fillet.*

y The *Gula* reverſed, or the *Talon.*

z The *Ring*, *Liſt* or *Fillet.*

B The *Die* of the Baſe.

2 The Reglet or *Fillet.*

3 The Baſe of the *Pedeſtal*; in *French* the *Zocle.*

In the Dorick *Column.*

a The *Gula*, ſometimes the Grove or hollowing of the upper Liſt.

b The *Dentils* or Teeth.

c The *Capital* of the *Trygliph.*

d The *Trygliph*, of which thoſe Parts that are framed inwards or hollowed, are called *Flutes:* And the Square of the Frieze between the *Trygliph* is called the *Metops*, as *r*; and ſometimes the outermoſt towards the Right-hand is called a *Demi-Metops.*

e The *Cymatium* or *Bandelette.*

f The *Guttæ* or *Drops.*

g The *Platteband* or *Face.*

h The *Reglet.*

i The *Talon* or *Gula.*

k The *Ovolo* or *Echinus.*

l Three *Annulets* or *Fillets.*

m The *Frieze*, *Gorgerin* or *Collarin.*

S The *Fuſt*, *Shaft* or *Body* of the Pillar.

o The *Liſtel.*

p The *Tore.*

q The *Pinth.*

r The *Fillets* and *Gula.*

B The *Die* of the Baſe.

t The *Fillets* or *Reglets* of

u The Baſe of the *Pedeſtal.*

In the Ionick *Column, the Things in which it differs from the former, are theſe.*

1. The *Firſt Scotia.*
2. The *Second Scotia.*
3. The *Bands* or *Canal* of the *Volutæ.*
4. The *Volutæ.*
5. The Firſt or *Little Face.*
6. The Second or *Middle Face.*
7. The Third or the *Great Face.*
9. The Figure of *Eggs* carved there.

In the Corinthian *Column, the Things peculiar are.*

1. A *Tore*, *Reglet* and *Gula* finely wrought.
2. A *Reglet* and *Aſtragal*, with
3. *Frieze* about it.
4, 5, 6. The Ranks or Rows of Leaves, ſome ſay of the *Acanthus* or *Great Dock*, others of *Olive*, and others of *Palm.*
8. The *Abacus* of the *Capital.*
9. The *Flower.*

In the Compoſite Order.

The *Pedeſtal* of this *Column*, is the ſame with that of the *Corinthian*, except in the Members of the *Cymatium* and *Baſe.*

And the *Compoſite Capital* differs from the *Corinthian* only in this, That it hath *Volutæ* or *Scrolls* like the *Ionick*, when the *Corinthian* hath curled Stalks; and therefore 'tis called *Compoſite*, becauſe compoſed of the *Ionick* and *Corinthian* together.

The Explanation for the Plate of Fortification.

A *A Single Baſtion.*

B *A Double Baſtion* or *Cavalier*, to overlook the Enemy's Baſtions, and to ſcour their Trenches.

C *A Platt Baſtion*; which is made when the Line of Defence is too long; *i. e.* exceeds 150 Fathom, which is the Diſtance a Musket will be ſure to do Execution. Wherefore this *Platt-Baſtion* is placed in the middle of the Curtain.

D *A Half-Baſtion* placed on the Side of a River.

E *A Baſtion Tenailled*; when the Angle of the Baſtion is leſs than 70 Degrees

F *A Ravelin* which covers the Gates, Bridges and Curtains. Sometimes theſe Ravelins have Flanks made to them, as G.

G *A Ravelin* with Flanks.

H *An Half-Moon*, made to cover the Flanked-Angle of the Baſtion. The *Gorges* of *Half-Moons* are circular.

I *Counter-Guard*, which are raiſed inſtead of *Half-Moons.*

K *A Single Tenaille.*

L *A Queue D'yronde*, or *Swallow's-Tail:* So called, becauſe its Sides inſtead of being paralliel, open or ſpreads towards the Head, and grow narrow at the *Gorge.*

M *A Bonnet, a Peſtre*, or *Prieſt's-Cap:* Some call them *Double Tenailles.* But they differ from a *Tenaille*, becauſe its Sides are not parallel, but ſpread or open out towards the Campaign like a *Swallow's Tail.* This Work hath two Angles *Saillant*, and two Inwards.

N *A Horn-work*, whoſe Heads is fortified with two Demi-Baſtions, or *Epaulments*, joyn'd by a Curtain, and cloſed by parallel Sides ending at the *Gorge* of the Work. Theſe *Horn-works* are uſed to cover the Gates, *&c.* inſtead of *Tenailles.*

N 2, *A Horn work*, whoſe Sides are not parallel.

O *A Crown-work*, whoſe Deſign is to cover ſome large Spot of Ground to defend a Riſing-Ground, or to defend the Head of a Camp that is intrenched: 'Tis the largeſt of all Outworks, having a large *Gorge*, and two Sides, ending towards the Campaign in two Demi-Baſtions; each of which joyns by a Curtain, to an entire Baſtion that is at the Head of the Work.

P *Tenailles* to defend the Ditch.

Q *An Half-Moon* covered with two *Counter-Gaurds* R R, to make it the ſtronger.

S S *Places of Arms* on the *Counterſcarp*, being open Spots of Ground for the Garriſon to Rendezvous on an Alarm, *&c.*

↗ The *Ditch.*

Γ T, *&c.* The *Counterſcarp*, or *Covered-way.*

g g, &c. The *Glacis.*

V *A Retrenchment* within or behind a Breach; as X.

W *A Place* for a *Magazine.*

l l l Palliſades.

a a Redoubts.

b b b Batteries.

c Lines of Communication.

d d Trenches, by which the Approaches are carried on.

e Mine under the Glacis and Covered-way of the *Horn-work.*

f A Lodgment at the Foot of the *Glacis.*

Explanation of the Profile.
